It must be recognized that these are arbitrary classifications and that there is no sharp dividing line between them. If the numerical values are used, it should be borne in mind that these numbers do *not* have the properties or accuracy suggested by their commonly accepted values and that numerical manipulation of the results of several muscle examinations may easily lead to erroneous or ridiculous conclusions.

The questions of how many muscles to examine and, if not all are examined, which shall be subject to study, are difficult to answer. To examine every muscle in every patient is a task which would require a large personnel, and if many patients are seen such a task might be impossible. Because of the fact that poliomyelitis can affect almost any of the muscles, a large number must be examined and evaluated. Before commencing the investigation, a complete list of muscles to be studied should be prepared and agreed on by all investigators.

In making muscle examinations, particularly early in the disease, it is important to distinguish between paralysis and spasm. Furthermore, diminution of motion or pseudoparalysis due to pain must be distinguished from actual paralysis due to anterior horn cell damage. Therefore, there is need for repeated examinations and separate reporting of results in cases with and without pain.

Evaluation of Pain and Tightness.—Neither pain nor tightness lends itself to quantitative determination. The judgment of the observers will have to be relied on, and too much consideration should not be given to changes in these symptoms, unless the changes are large and dramatic.

Muscle Examiners.—Since differences in technique and in judgment affect the results of manual muscle examinations, it is not always possible to compare the results of an examination made by one group of examiners with those of another. However, in a collaborative study, where data are pooled, it is essential that the data derived from muscle examinations made at the various collaborating institutions be comparable. To meet this difficulty it appears advisable to have all muscle examinations made by the same persons.

The Committee recommends that in any collaborative study of poliomyelitis in which the evaluation depends on the results of muscle examinations a team of muscle examiners be established and trained in a uniform manner, and that they travel among the various collaborating institutions, examining all patients.

It is further recommended that the examiners not be informed as to which patients are in the control group and which in the test group. Furthermore, on repeat examinations of the same patient, the examiners should not be permitted to see the records of their previous examination. These recommendations are made with the view of preventing the results of a given examination from being influenced by unconscious bias on the part of the examiner or by observations made previously on the same patient.

Criteria of Evaluation.—The principal basis on which the effects of the agent on the outcome of the disease will be measured is the degree of difference in residual paralysis between the test and the control groups. This difference will have to be determined by comparison of the results of muscle examinations in the two groups. From a technical standpoint this is a difficult task and is one in which the services of a competent statistical consultant will be needed. Such a consultant should be a member of the joint planning group and attached to the central executive group.

The factors which enter into the final evaluation are the following: (1) rapidity of improvement in paralysis as shown by repeated muscle examinations; (2) the residual disability as revealed by muscle examination at the end of eighteen months after the onset of the disease; (3) the comparative incidence of paralysis in test and control groups for those first admitted in the preparalytic stage; (4) residual weakness; (5) muscle spasm with residual shortening and fibrosis; (6) atrophy; (7) evidence of vasomotor disturbances including cyanosis of extremities, thrombophlebitis, etc.; (8) total disability (this takes into account differences in importance of various muscle groups); (9) effects of therapy on pain and tightness.

It should be pointed out that the appraisal of the end result of therapy from the standpoint of the effectiveness of the tested agent is approached from a different point of view than an appraisal of the end result of the disease. From the standpoint of the rehabilitation of the patient it is more important that certain muscles regain useful function than it is for other muscles to recover from paralysis. From the standpoint of appraising the effects of a therapeutic agent, the effect on the muscle function *per se* without regard to its importance to the patient is the major aspect. It is also important to distinguish between objective measurable paralysis and purely functional results. Some patients are undoubtedly more effective in overcoming their handicaps than others. The fact that one patient could, somehow or other, walk and another could not would not necessarily mean a difference in their paralysis.

Method of Evaluation.—It should be obvious from the discussion of the criteria that the element of judgment based on experience plays an important role in the evaluation of the results. That this judgment may vary among those who might be called on to evaluate the results of an investigation is inevitable, and some means must be devised to reduce this variable. The precise determination of the end result in a given patient, while important, is not as important as that of insuring uniformity in evaluation of the end results in all patients.

It seems advisable, therefore, to recommend that the evaluation of results be performed on all patients by the same persons. For this purpose, a team of competent experts should be formed, whose duty would be to visit each institution, examine each patient in both the control and test groups at the end of the period of treatment and observation. At the time of examination of the patient these experts should not know whether the patient is in the test group or in the control group, so as to avoid any influence of unconscious bias on the judgment of the examiner.

The proper selection of these experts is an important matter. They should not be drawn from among the participating investigators for obvious reasons. They should be persons who have no strong convictions regarding the efficacy of any form of therapy but who are familiar with the results of orthodox treatments. It would seem advisable to include in the evaluating group an orthopedic surgeon, a physiatrist, a pediatrician and a neurologist, all of whom have had considerable experience with poliomyelitis and are recognized as authorities in their respective fields.

After all data have been collected, the task of evaluating them must be performed jointly by the participating investigators, evaluating group, and the statistician. The data which should be available for study are:

1. The results of the repeated muscle examinations on the patients.
2. The appraisal of the investigators as to the amount of pain, tenderness and tightness at various stages of the diseases in the patients.
3. The comparative incidence of paralysis in those patients admitted in the preparalytic stage.
4. The results of the examinations of the evaluating group with respect to:
 - (a) Residual disability of the patients at the end of observation.
 - (b) Residual weakness.
 - (c) Atrophy.
 - (d) Evidence of vasomotor disturbances.
 - (e) Total disability.

The participants and experts must evaluate the relative importance of the various observations in order that the statistician can apply the proper weighting to the data. Finally, any observed differences in results between the two groups, control and test, must be tested for their significance. The investigators must agree as to the magnitude of the difference which they will consider significant from a practical standpoint, and the statistician can inform them whether, from the data obtained, such a difference could have occurred from the operation of chance and what the probability is that chance would produce the observed difference.

SUMMARY

Poliomyelitis is a disease characterized by extreme variability in its course and in the degree of disability produced in victims.

Among the variables which must be controlled in any investigation of the efficacy of a therapeutic agent in this disease are the following: variations in diagnostic criteria, unpredictability of the course of the disease, unpredictability of outcome, effects of different immunologic types of the virus, effects of climatic and geographic variations, age distribution of cases, variations in technique of applying treatment and variations in measuring and judging extent of paralysis, deformity and disability.

Because of the many variables involved, it is necessary to observe a large number of patients in order to evaluate the effects of any therapeutic regimen in poliomyelitis; this, then, involves a collaborative effort of a number of institutions.

The methods proposed for investigation and evaluation involve acceptance of cases according to predetermined diagnostic criteria, classification of cases according to the stage of the disease on admission, establishment of control and test groups within each classification and assigning cases to these groups in a completely random manner, administering identical treatment to both the test and control groups with the single exception of the variant to be studied, administering treatment by physical therapists pretrained in uniform procedures, following the progress of each patient by semiquantitative standardized muscle examinations administered by a traveling group of specially trained examiners, evaluation of results in each patient by a group of experts especially chosen for this purpose and weighing of the results according to their reliability and importance and subjecting them to statistical analysis to determine the probable significance of any observed differences.

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

DESOXYCORTICOSTERONE ACETATE-U. S. P.—
Doca Acetate-Organon.—17-(β)-[1-keto-2-acetoxyethyl] Δ^4 androstene-3-one. The structural formula may be represented as follows:

For description and standards see the U. S. Pharmacopeia under Desoxycorticosterone Acetate.

Actions and Uses.—Desoxycorticosterone has been isolated from the adrenal cortex in small amounts and is prepared synthetically as the acetate. Desoxycorticosterone acetate is highly selective in its biologic activity. It has no demonstrable direct effect on protein or carbohydrate metabolism in man and little if any in experimental animals. It has no effect on estrogenic or androgenic activity and no effect on pigmentation. Its known activity is limited to that of the metabolism of sodium, potassium and water and is mediated through its action on the renal mechanism. It causes an increase in retention in the sodium ion and water and an increase in the excretion of potassium, presumably by modification of reabsorption of these substances by the renal tubules. In therapeutic dosages, in patients with adrenal insufficiency, it restores the serum sodium and potassium and the plasma volume to normal levels. It also elevates the blood pressure. Secondary to the increase in blood volume, there results an increase in cardiac output with a decrease in nitrogen retention, increase in the absorption of fat and glucose from the intestine and increase in strength as well as appetite.

It has been established that desoxycorticosterone acetate,

despite its limited range of physiologic activity, is of great value in the management of adrenal insufficiency, both in maintenance and in the treatment of crises. Many patients with chronic adrenal insufficiency are enabled to resume essentially normal activity by the administration of desoxycorticosterone acetate and sodium chloride alone. In patients with recurrent hypoglycemia and in patients with acute adrenal insufficiency, therapy with this synthetic adrenal steroid should be supplemented with adrenal cortical extracts containing other physiologically active steroids.

Dosage.—The dosage of desoxycorticosterone acetate required for maintenance varies from 1 to 7 mg. daily. It is dependent primarily on individual variation and on the amount of sodium salts in the diet; i. e., the higher the salt intake the lower the requirement of the adrenal steroid. Experience indicates that most patients require about 3 mg. daily when taking 3 to 6 Gm. of sodium chloride in addition to that contained in the normal diet.

In the management of acute adrenal crises, 10 to 15 mg. may be required twice a day for one or two days in conjunction with liberal quantities of whole adrenal cortical extract and with 1 or 2 daily infusions of 1,500 cc. of 5 per cent dextrose in isotonic sodium chloride solution. Transfusion of whole blood or plasma may also be indicated to combat shock.

Desoxycorticosterone acetate is insoluble in water and usually administered in oil by subcutaneous or intramuscular injection. After the maintenance dose has been carefully determined, pellets may be implanted subcutaneously to avoid repeated injections. A pellet of 125 mg. is approximately equivalent to a daily injection of about 0.5 mg. Pellets are usually effective for about one year. Symptoms of adrenal insufficiency begin to recur when the pellets are absorbed. Crumbling of pellets may result in increased absorption and evidence of overdosage.

Caution: Significant toxicity results from excessive amounts of desoxycorticosterone acetate. The most frequent signs are edema, pulmonary congestion, cardiac dilatation and failure. Arterial hypertension develops in about 30 per cent of patients with chronic adrenal insufficiency after treatment for several months or years. This may require a cautious reduction in the dosage of the steroid or salt or both. Occasionally toxicity due to a decrease in serum potassium concentration in the blood is associated with sudden bouts of weakness and characteristic changes in the electrocardiogram.

ORGANON, INC., ORANGE, N. J.

Solution Doca Acetate in Oil: 5 mg. per cc. in peanut oil, 1 cc. ampuls and 10 cc. vials.

U. S. patent 2,312,481; U. S. trademark 372,214.

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies 1948, p. 370).

The following dosage form has been accepted:

KREMERS-URBAN COMPANY, MILWAUKEE

Solution Estrugenone in Oil: 2,000 I. U. per cc. in sesame oil, 1 cc. ampuls and 30 cc. vials; 10,000 I. U. per cc. in sesame oil, 1 cc. ampuls and 10 cc. vials, and 20,000 I. U. per cc. in sesame oil, 10 cc. vials. Preserved with chlorobutanol 0.5 per cent.

U. S. Patent 377,549.

PENICILLIN (See New and Nonofficial Remedies 1948, p. 148).

The following dosage forms have been accepted:

COMMERCIAL SOLVENTS CORPORATION, NEW YORK

Tablets Crystalline Potassium Penicillin G: 50,000 units, 2 cc. vials, each containing two tablets for the preparation of sterile solution.

PREMO PHARMACEUTICAL LABORATORIES, NEW YORK

Crystalline Procaine Penicillin G in Oil: 300,000 units per cc. in sesame oil with hydrogenated peanut oil, 1 cc. disposable syringe.

THE WM. S. MERRELL CO., CINCINNATI

Crystalline Procaine Penicillin G in Oil: 300,000 units per cc. in sesame oil, 10 cc. vials.

SCHENLEY LABORATORIES, INC., NEW YORK 1

Ointment Potassium Penicillin: 1,000 units per gram, 28.35 Gm. tubes.

It must be recognized that these are arbitrary classifications and that there is no sharp dividing line between them. If the numerical values are used, it should be borne in mind that these numbers do *not* have the properties or accuracy suggested by their commonly accepted values and that numerical manipulation of the results of several muscle examinations may easily lead to erroneous or ridiculous conclusions.

The questions of how many muscles to examine and, if not all are examined, which shall be subject to study, are difficult to answer. To examine every muscle in every patient is a task which would require a large personnel, and if many patients are seen such a task might be impossible. Because of the fact that poliomyelitis can affect almost any of the muscles, a large number must be examined and evaluated. Before commencing the investigation, a complete list of muscles to be studied should be prepared and agreed on by all investigators.

In making muscle examinations, particularly early in the disease, it is important to distinguish between paralysis and spasm. Furthermore, diminution of motion or pseudoparalysis due to pain must be distinguished from actual paralysis due to anterior horn cell damage. Therefore, there is need for repeated examinations and separate reporting of results in cases with and without pain.

Evaluation of Pain and Tightness.—Neither pain nor tightness lends itself to quantitative determination. The judgment of the observers will have to be relied on, and too much consideration should not be given to changes in these symptoms, unless the changes are large and dramatic.

Muscle Examiners.—Since differences in technique and in judgment affect the results of manual muscle examinations, it is not always possible to compare the results of an examination made by one group of examiners with those of another. However, in a collaborative study, where data are pooled, it is essential that the data derived from muscle examinations made at the various collaborating institutions be comparable. To meet this difficulty it appears advisable to have all muscle examinations made by the same persons.

The Committee recommends that in any collaborative study of poliomyelitis in which the evaluation depends on the results of muscle examinations a team of muscle examiners be established and trained in a uniform manner, and that they travel among the various collaborating institutions, examining all patients.

It is further recommended that the examiners not be informed as to which patients are in the control group and which in the test group. Furthermore, on repeat examinations of the same patient, the examiners should not be permitted to see the records of their previous examination. These recommendations are made with the view of preventing the results of a given examination from being influenced by unconscious bias on the part of the examiner or by observations made previously on the same patient.

Criteria of Evaluation.—The principal basis on which the effects of the agent on the outcome of the disease will be measured is the degree of difference in residual paralysis between the test and the control groups. This difference will have to be determined by comparison of the results of muscle examinations in the two groups. From a technical standpoint this is a difficult task and is one in which the services of a competent statistical consultant will be needed. Such a consultant should be a member of the joint planning group and attached to the central executive group.

The factors which enter into the final evaluation are the following: (1) rapidity of improvement in paralysis as shown by repeated muscle examinations; (2) the residual disability as revealed by muscle examination at the end of eighteen months after the onset of the disease; (3) the comparative incidence of paralysis in test and control groups for those first admitted in the preparalytic stage; (4) residual weakness; (5) muscle spasm with residual shortening and fibrosis; (6) atrophy; (7) evidence of vasomotor disturbances including cyanosis of extremities, thrombophlebitis, etc.; (8) total disability (this takes into account differences in importance of various muscle groups); (9) effects of therapy on pain and tightness.

It should be pointed out that the appraisal of the end result of therapy from the standpoint of the effectiveness of the tested agent is approached from a different point of view than an appraisal of the end result of the disease. From the standpoint of the rehabilitation of the patient it is more important that certain muscles regain useful function than it is for other muscles to recover from paralysis. From the standpoint of appraising the effects of a therapeutic agent, the effect on the muscle function per se without regard to its importance to the patient is the major aspect. It is also important to distinguish between objective measurable paralysis and purely functional results. Some patients are undoubtedly more effective in overcoming their handicaps than others. The fact that one patient could, somehow or other, walk and another could not would not necessarily mean a difference in their paralysis.

Method of Evaluation.—It should be obvious from the discussion of the criteria that the element of judgment based on experience plays an important role in the evaluation of the results. That this judgment may vary among those who might be called on to evaluate the results of an investigation is inevitable, and some means must be devised to reduce this variable. The precise determination of the end result in a given patient, while important, is not as important as that of insuring uniformity in evaluation of the end results in all patients.

It seems advisable, therefore, to recommend that the evaluation of results be performed on all patients by the same persons. For this purpose, a team of competent experts should be formed, whose duty would be to visit each institution, examine each patient in both the control and test groups at the end of the period of treatment and observation. At the time of examination of the patient these experts should not know whether the patient is in the test group or in the control group, so as to avoid any influence of unconscious bias on the judgment of the examiner.

The proper selection of these experts is an important matter. They should not be drawn from among the participating investigators for obvious reasons. They should be persons who have no strong convictions regarding the efficacy of any form of therapy but who are familiar with the results of orthodox treatments. It would seem advisable to include in the evaluating group an orthopedic surgeon, a physiatrist, a pediatrician and a neurologist, all of whom have had considerable experience with poliomyelitis and are recognized as authorities in their respective fields.

A FEMALE ALEXIS ST. MARTIN

When William Beaumont treated Alexis St. Martin, whose stomach as a result of a shotgun wound could be viewed directly through an external opening, he made physiologic observations which greatly increased our knowledge of the physiology of the stomach. These studies were carefully made for many years and have become a classic example of research limited largely to simple and direct clinical investigation.

Since these pioneer studies, other observers have gained insight regarding gastric physiology by observing other persons who have, for one reason or another, presented external openings through which the interiors of their stomachs could be examined. Until recently all these patients were male. Now a woman patient with a large gastric fistula has become available for study and observations have been made which in some respects at least differ from those made in the male.

These recent observations were made on a Negro woman, 24 years old, by Drs. Crider and Walker¹ of the Washington University School of Medicine in St. Louis. The patient was first studied at the Homer Phillips Hospital and later at the Barnes Hospital and in the Department of Physiology of the Medical School. The patient's fistula followed an infection developing around a gastrostomy opening which had been made in order to feed her following a complete closure of the esophagus as an aftermath to the accidental swallowing of lye. The stricture was an extensive one, starting at the upper end of the esophagus and involving much of the rest of the glottis down to the cardia. A large number of plastic and other procedures were necessary in order to restore the lumen. During this period the patient consented to a proposed series of

physiologic studies, and indeed seemed eager to cooperate. Not only was this the first opportunity to observe directly the interior of the stomach in a woman, but, as pointed out by Crider and Walker, the opening in this instance was much larger than in any of the previous persons studied.

After establishing a standard base line of observation, Crider and Walker became interested in the response of the stomach to various emotional situations. In all men previously studied, beginning with Alexis St. Martin, resentment, anger and similar emotions were nearly always followed by hyperemia, hypermotility and hypersecretion of the gastric mucosa. It was unexpected, therefore, when such an effect failed to appear in the woman in spite of many trials. Indeed, emotional situations seemed to have the opposite effect in that a decrease in gastric activity followed. Repeatedly, situations involving anger, resentment, fear and anxiety were associated with decreased motility and secretion of the stomach with blanching of the mucosa. This was accompanied by a secretion which had a lower hydrochloric acid content. The investigators suggest that this difference may explain the well established fact that peptic ulcer has a much lower incidence in women than in men. Menstruation did not have any appreciable effect on the behavior of the stomach. Painful stimuli caused a pronounced increase of the motility, but had little effect on secretion or blood supply as shown by the color gradient of the mucosa. Heartburn, nausea, retching and reflux of bile-stained secretion could be readily produced by mechanical stimulation in the region of the cardiac sphincter, which was within reach through the large fistula.

Other observations were made² on the influence of intravenous injections. Solutions containing dextrose and sodium chloride alone did not provoke change in the resting activity of the stomach, whereas the addition of amino acid mixtures was followed by a decrease both in the motility and in the secretion. This inhibiting effect was produced by a mixture of pure amino acids as well as by hydrolyzed protein. On several occasions when amino acids were injected at a sufficiently rapid rate to provoke nausea and vomiting, a change was not observed in the stomach itself, thus suggesting that this effect was probably central in origin.

Further studies will no doubt be made in this woman; they may well provide further information regarding gastric physiology as influenced by many factors and particularly those of psychogenic nature with special reference to sex differences.

RECOVERY FROM CYANIDE POISONING

The annual number of reported deaths from cyanide poisoning in the United States since 1909 has varied from 79 to 245. Cyanide poisoning is commonly believed to be always fatal. Actually 22 cases of recovery after ingestion of sodium or potassium cyanide have been reported in the American, English and French literature. Additional cases of recovery from poisoning by cyanide from routes other than ingestion, including a number in which silver polish was supposed to have been the toxic agent, have also been recorded. As a rule, the exact quantity that has entered the body is difficult to ascertain. The patient's testimony is obviously unreliable, and seldom is there an adequate determination of the content of cyanide in the patient's blood or urine.

Liebowitz and Schwartz¹ have recently recorded the case of a chemist who was admitted to the hospital one hour after ingestion of potassium cyanide in a suicidal attempt. Shortly after admission a qualitative test of the stomach washings showed cyanide present in large amounts. Blood cyanide determinations revealed 20 mg. of hydrogen cyanide per hundred cubic centimeters of blood in a specimen drawn two hours after admission to the hospital, thus making an estimated total of 1.2 Gm. of hydrogen cyanide in the total blood volume. Assuming that there was twice this amount in the entire body, and since the patient weighed approximately 80 Kg., the concentration of hydrogen cyanide would have been 30 mg. per kilogram. This is about thirty times the estimated lethal dose. Nevertheless, the patient recovered, although specific therapy was not given. The paper by Liebowitz and Schwartz is believed to be the first in which blood cyanide determinations were recorded as having been done in the living person.

Treatment of cyanide poisoning has thus far been unsatisfactory, largely because cyanide is usually so rapidly fatal. Methylene blue was one of the first drugs used for cyanide intoxication. Originally, methylene blue was believed to act as a respiratory catalyst, but more recently it has been claimed that its specific antidotal effect was in producing methemoglobinemia. The methemoglobin then combines with the cyanide ion to form the relatively nontoxic cyanmethemoglobin. The latter is believed to be slowly converted by sulfhydryl groups to thiocyanate and eliminated as such. Glucose is also thought to have an antidotal effect. Combined therapy with amyl nitrite, sodium nitrite and sodium thiosulfate has been determined to be several times more effective than methylene blue alone in protecting dogs from otherwise fatal doses of cyanide. The currently favored treatment² includes the immediate use of amyl nitrite pearls followed by intravenous

injection of sodium nitrite and, finally, of sodium thiosulfate. Excess methemoglobin formation from administration of nitrites may be ascertained roughly by increasing cyanosis despite clinical signs of improvement and may be combated by repeated blood transfusions and the administration of oxygen.

SEXUAL REPRODUCTION IN VIRUSES

Bacterial viruses can enter bacteria, where they reproduce themselves in large numbers; later they are released by rupture of the bacterium and its conversion into a mass of bacteriophage or virus particles.¹ Bacteria and the viruses that feed on them have been considered one of the best and simplest systems for study of multiplication of viruses. Discussing the "interference phenomena" in virus diseases, Andrews² wrote that the existence of one virus in a host often precludes the entrance of a second virus. Such interference phenomena have been demonstrated many times in tissue cultures and with the bacterial viruses. With a variation of this principle, Delbrück and Bailey³ recently uncovered new information about the reproductivity and method of establishment of mutant strains of virus. They worked with viruses T₂ and T_{4r}, which are genetically related and can enter and reproduce in the same bacterium of a strain B. Differentiation characteristics of T₂ were that it produced a small colony and could destroy a mutant strain of a bacterium A; characteristics of virus T_{4r} were that it produced a large colony and could destroy a mutant strain of a bacterium C. When both were grown jointly in bacterium B, both parent types were released as expected. In addition, two new types of virus were released with the parent characteristics switched; i. e., one type with a small colony that destroyed bacterium C and a second type with a large colony that destroyed bacterium A. This obviously suggested an interchange of material between the parent viruses typical of the interchange of parent factors in formation of new individuals, which characterizes sexual reproduction.

Other experimentation relative to mutations in viruses by S. E. Luria, Indiana University, revealed that in viruses considered to be composed of a number of vital elements several elements could be destroyed by ultraviolet radiation. Evidence was advanced that a virus thus treated was singly unable to reproduce itself; when two or more partially destroyed viruses entered a single bacterium, however, an apparent combination of the remaining uninjured elements occurred, resulting in a new individual, which was able to reproduce itself and destroy the bacterium. This experimental process closely parallels the production of

artificial mutations in *Drosophila*, wherein selective destruction of genes is procured by irradiation of chromosomes. Although much further study of these apparent reproductive characteristics in viruses is necessary, the implications are startling. Most investigators hold that viruses are living organisms even though some of their characteristics, particularly their tendency to assume true crystallization forms, have led others to consider that viruses lie at the lowest level of life or on the borderline between life and nonlife. Biochemical studies which have demonstrated a close parallel between viruses and enzymes that can be synthesized in the laboratory have emphasized this latter view. Implications of the present studies are that viruses have a natural method for production of infinite numbers of new strains closely approximating the sexual mechanisms of higher organisms. The probabilities are that new disease-producing forms will occur frequently. Mutant strains of viruses have already been extremely beneficial to man. The 17 D strain of yellow fever virus and vaccinia virus are considered to be mutations of the viruses of yellow fever and smallpox. Therefore the probability of eventual development of an effective poliomyelitis vaccine exists. A much broader interpretation of virus, gene and enzyme studies is that the cell, as a sharp line of demarcation between life and nonlife, must be considered more relative than real.

Current Comment

ADDICTION LIABILITY OF METHADONE

Methadone, one of the newer synthetic analgesic drugs, has found wide usage as a substitute for morphine to relieve pain. In therapeutic doses methadone produces less sedative or hypnotic effects than morphine. The pharmacologic properties of the drug are already well established, as well as the fact that it is capable of producing addiction, similar to that produced by morphine. The addiction liability of methadone and tolerance to its analgesic action have been the subject of previous reports warning against this inherent danger.¹ Because methadone is not an opiate, physicians may have underestimated its addiction potentiality, despite the fact that the drug has been made subject to all the provisions of the Harrison Narcotic Act. Studies of morphine addicts have shown that while methadone produces less physical dependence than morphine, it does produce sufficient euphoria, emotional dependence and signs of abstinence on withdrawal to make it acceptable as a substitute for morphine in persons strongly addicted to that drug. The total addiction liability of methadone is thus con-

sidered to be almost as great as that of morphine. For this reason, physicians who prescribe methadone should do so with full awareness that this drug deserves the same respect and caution that is exercised in the prescribing of opiates such as morphine.

GRANULOMATOUS NOCARDIOSIS

Cuttino and McCabe¹ describe a new disease in man of which symptoms included are enlargement of the abdomen, malnutrition and an afebrile course. A recently discovered acid-fast organism which the authors assign to the family of Actinomycetaceae under the name of *Nocardia intracellularis* appears to be the cause. "In man the disease produced by this organism is a pure form of granulomatous inflammation, characterized by phagocytosis of the pathogen by reticulo-endothelial cells and proliferation of these cells." In the case described, the body was extremely emaciated with great abdominal distention by some 500 cc. of chylous fluid. Similar fluid was found in lesser quantities in the pleural cavities. The abdominal organs were displaced by a large mass consisting of conglomerate lymph nodes which, on section, were brilliant yellow. In the small intestine lesions were not apparent, but ulcers were strewn through the length of the colon and in the immediate vicinity the lymph nodes were enlarged and bright yellow. The spleen was only slightly enlarged, and scattered through it were yellowish areas which, on microscopic examination, consisted of phagocytosed macrophages. The marrow of the sternum, the vertebrae and femur was partially replaced by similarly yellowish tissue. Since the most numerous and largest lesions were found in the retroperitoneal and mesenteric lymph nodes and in the lymphoid tissue of the intestines, the gastrointestinal tract is suggested as the portal of entry. The authors state that the intracellular parasitism of an acid-fast organism resembling that of granulomatous nocardiosis finds its analogue in human and rat leprosy and in Johne's disease in cattle. However, in sections of rat leprosy compared with the new lesion, while extensive phagocytosis and macrophagic proliferation were found, the lymph node structures did not show the widespread alteration in the disease which they described. In Johne's disease the lesions are distributed chiefly through the gastrointestinal tract and the causative organism possesses cultural and morphologic characteristics which differentiate it sharply from the one that is responsible for granulomatous nocardiosis. As the causative organism is regarded as a species of *Nocardia* and as there are sharp differences between it and known species of this genus, the investigators conclude that the organism represents a hitherto undescribed variety. Furthermore, *Nocardia intracellularis* produces a nonlethal disease in guinea pigs, rats and mice but does not cause lesions in chickens, rabbits, frogs and goldfish; the lesions heal rapidly in the susceptible animal.

ORGANIZATION SECTION

Official Notes

EIGHT STATES NOW

The Delaware House of Representatives, on May 12, passed a resolution memorializing Congress not to enact legislation imposing compulsory health insurance on the people of the country. This makes eight states to date expressing objection from one or both houses to the federalization of medicine.

Washington Letter

(From a Special Correspondent)

June 6, 1949.

New Health Legislation Introduced as Hearings Continue

House and Senate committee hearings on proposed national health legislation, now approaching the end of the first month, won fresh interest late in May with the introduction of additional bills. Most noteworthy were the eight identical bills, filed simultaneously in Senate and House, on federal subsidization of voluntary prepayment plans and the Miller bill, which calls for an impartial, bipartisan study of the nation's health. The new measures have been referred to the health subcommittees which are in the midst of conducting public hearings.

Meanwhile, Federal Security Administrator Oscar R. Ewing continued his speech-making campaign in support of compulsory health insurance. Addressing the annual meeting of the Proprietary Association of America at White Sulphur Springs, W. Va., on June 3, he said that one of the benefits it would bring about is great improvement of the drug business. Another is its guarantee against racial discrimination, Mr. Ewing said two days earlier in an address before the Association of Freedmen's Internes.

During the week ended June 4, witnesses appearing before the Senate subcommittee on health (Senator James E. Murray, chairman) included Dr. Paul R. Hawley, Dr. Hugh R. Leavell, Dr. R. H. Hutcheson, representatives of the three national hospital associations, spokesmen for organized labor and others.

Medical, dental and nursing educators were scheduled to go before the Murray subcommittee during the week beginning June 6. Provisions of the Thomas-Murray-Dingell, Taft, Hill and Flanders-Herter bills for government assistance to professional schools and their students were to be the subject of their testimony. The same issue is scheduled to be taken up June 9-10 by the House subcommittee, of which Representative J. Percy Priest is chairman.

Senator Ralph E. Flanders (Vermont) and Representative Christian A. Herter (Massachusetts) are principal sponsors of the new all-Republican bill, which has seven other co-sponsors. They are Senator Irving M. Ives (New York) and Representatives Case (New Jersey), Javits (New York), Fulton (Pennsylvania), Hale (Maine), Morton (Kentucky) and Nixon (California). Theirs is an omnibus measure, with provisions for federal grants to medical and nursing schools, inducements to improve conditions in areas where there are shortages of medical and hospital facilities, increased government aid for hospital expansion generally and more funds for development of local public health units.

The bill's most novel feature, and the one expected to provoke the most discussion, is its plan to promote universal coverage in voluntary prepayment plans through sliding scales of premium payments. Rates would be based on the subscriber's income. Figured on a "yardstick" charge of 3 per cent, the family with a \$2,500 annual income would pay a monthly premium of \$6.25 for medical and hospital coverage, for example. Deficits would be made up through government subsidy.

Witnesses who presented arguments against adoption of compulsory health insurance were Dr. Hawley, speaking for the Blue Cross and Blue Shield Commissions; Mr. van Steenwyk, Associated Hospital Service of Philadelphia; Dr. Hutcheson, Tennessee health commissioner and president of the Association

of State and Territorial Health Officers; John H. Hayes, representing the American Hospital Association; John H. Olsen, for the American Protestant Hospital Association; Rev. Donald A. McGowan, National Catholic Welfare Conference, and Rt. Rev. Msgr. George Lewis Smith, president of the Catholic Hospital Association.

Supporters of the Thomas-Murray-Dingell bill who appeared before the subcommittee were James Carey and Nelson Cruikshank, for the Congress of Industrial Organizations and the American Federation of Labor, respectively. Dr. Leavell, representing the American Public Health Association, confined his presentation to a comparison of strength and weaknesses of various titles of the Taft, Hill and Thomas-Murray-Dingell bills.

Sole witness to be heard by the Murray subcommittee in support of S. 1106, which would provide "free" drugs and certain medical services at government expense, was the bill's sponsor, Senator Henry Cabot Lodge Jr., Republican, of Massachusetts.

Medical Legislation

Florida

Bill Enacted.—H. 138 became Law without Approval May 16, 1949. It grants to expert witnesses a witness fee in such reasonable amount as the trial judge may determine, the same to be taxed as costs in the case.

Oregon

Bill Enacted.—H. 530 was approved May 2, 1949. It provides for the establishment of a temperance and rehabilitation division of the Oregon liquor control commission which is authorized to continue, maintain and operate a rehabilitation clinic and agency for the treatment of persons addicted to the excessive use of alcoholic beverages.

Pennsylvania

Bills Enacted.—H. 911 has become Act No. 323 of the Acts of 1949. Among other things, it provides that the registration of a pharmacist or assistant pharmacist may be revoked for paying rebates to physicians or entering into any agreement with a physician for payment in any form for the recommending of the professional services of either party. S. 834 has become Act No. 378 of the Acts of 1949. It amends the law relating to prepaid medical service plans by authorizing the organization of prepaid dental service corporations.

Rhode Island

Bills Enacted.—H. 507 was approved May 9, 1949. It authorizes the appointment of a chief medical examiner to perform all autopsies and act as state pathologist. Such person must be a doctor of medicine, qualified in pathology, with at least one year of medicolegal training. He shall make examinations on the bodies of such persons only as appear to have met their death from violence, or suddenly when in apparent good health, or when unattended by a physician or in any suspicious or unnatural manner or as the result of an abortion or suspected abortion. H. 904 was approved May 13, 1949. It is a general amendment to and reenactment of the hospital licensing law. H. 923 was approved May 9, 1949. It requires the giving of instruction in health and physical education at least twenty minutes each school day in all grades, 1 through 12, of the public schools.

Vermont

Bill Enacted.—H. 330 was approved May 12, 1949. It provides an appropriation of \$350,000 for the construction of a public health laboratory and workshop in the city of Burlington, to be constructed under the supervision of the building council in consultation with the state board of health.

Coming Medical Meetings

- American Association of Railway Surgeons, Chicago, Drake Hotel, June 30-July 2. Dr. Chester C. Guy, 5800 Stony Island Ave., Chicago 37, Secretary.
- American Neurological Association, Atlantic City, Chalfonte-Haddon Hall, June 13-15. Dr. H. Houston Merritt, 710 W. 168th St., New York 32, Secretary.
- Idaho State Medical Association, Sun Valley, June 20-23. Dr. Alfred M. Popma, 220 N. First St., Boise, Secretary.
- Maine Medical Association, Poland Spring, Poland Spring House, June 19-21. Dr. Frederick R. Carter, 142 High St., Portland 3, Secretary.
- New Hampshire Medical Society, Newcastle, Hotel Wentworth, June 14-15. Dr. Carleton R. Metcalf, 5 S. State St., Concord, Secretary.
- Society for Investigative Dermatology, Atlantic City, Ritz Carlton Hotel, June 11-12. Dr. S. William Becker, 55 E. Washington St., Chicago 2, Secretary.
- Society of Biological Psychiatry, Atlantic City, Chalfonte-Haddon Hall, June 12. Dr. George N. Thompson, 1136 W. Sixth St., Los Angeles, Secretary.

PROGRAM OF THE AMERICAN MEDICAL ASSOCIATION FOR THE ADVANCEMENT OF MEDICINE AND PUBLIC HEALTH

A Federal Department of Health

1. Creation of a Federal Department of Health of Cabinet status with a Secretary who is a Doctor of Medicine, and the coordination and integration of all Federal health activities under this Department, except for the military activities of the medical services of the armed forces.

Medical Research

2. Promotion of medical research through a National Science Foundation with grants to private institutions which have facilities and personnel sufficient to carry on qualified research.

Voluntary Insurance

3. Further development and wider coverage by voluntary hospital and medical care plans to meet the costs of illness, with extension as rapidly as possible into rural areas. Aid through the states to the indigent and medically indigent by the utilization of voluntary hospital and medical care plans with local administration and local determination of needs.

Medical Care Authority with Consumer Representation

4. Establishment in each state of a medical care authority to receive and administer funds with proper representation of medical and consumer interest.

New Facilities

5. Encouragement of prompt development of diagnostic facilities, health centers and hospital services, locally originated, for rural and other areas in which the need can be shown and with local administration and control as provided by the National Hospital Survey and Construction Act or by suitable private agencies.

Public Health

6. Establishment of local public health units and services and incorporation in health centers and local public health units of such services as communicable disease control, vital statistics, environmental sanitation, control of venereal diseases, maternal and child hygiene and public health laboratory services. Remuneration of health officials commensurate with their responsibility.

Mental Hygiene

7. The development of a program of mental hygiene with aid to mental hygiene clinics in suitable areas.

Health Education

8. Health education programs administered through suitable state and local health and medical agencies to inform the people of the available facilities and of their own responsibilities in health care.

Chronic Diseases and the Aged

9. Provision of facilities for care and rehabilitation of the aged and those with chronic disease and various other groups not covered by existing proposals.

Veterans' Medical Care

10. Maintenance of existing high standards of medical care for veterans, including extension of facilities where the need can be shown and, where practicable, care of the veteran in his own community by a physician of his own choice.

Industrial Medicine

11. Greater emphasis on the program of industrial medicine, with increased safeguards against industrial hazards and prevention of accidents occurring on the highway, at home and on the farm.

Medical Education and Personnel

12. Adequate support with funds free from political control, domination and regulation of the medical, dental and nursing schools and other institutions necessary for the training of specialized personnel required in the provision and distribution of medical care.

GOVERNMENT SERVICES

NAVY

NEW FLIGHT SURGEONS

At graduating exercises at the Naval School of Aviation Medicine, Pensacola, Fla., April 13, seven newly designated flight surgeons received diplomas after having completed a nine month course. The new flight surgeons are:

Lieut. (jg) William F. Bennett Jr. Columbus, Ga.
Lieut. Sidney D. Bond Jr. Crawfordsville, Ark.
Lieut. (jg) Calvin J. Curtis. Kansas City, Mo.
Lieut. (jg) Wayne L. Erdbrink. Cincinnati
Lieut. (jg) John W. Reece. Birmingham, Ala.
Lieut. (jg) Lee W. Stewart. West Memphis, Ark.
Lieut. (jg) James I. Thorn. Vina, Ala.

NOMINATED FOR POSTGRADUATE INSTRUCTION

The following medical officers have been nominated for courses in postgraduate instruction: Comdr. Edward T. Byrne, to a fellowship in radiology at the Washington University School of Medicine, St. Louis; Comdr. William F. MacKoske, to a residency in general surgery at the Naval Hospital, San Diego, Calif.; Lieut. (jg) Thomas J. Coleman, to a residency in surgery at the Naval Hospital, Philadelphia; Lieut. (jg) Leo J. Frank Jr., to a residency in obstetrics and gynecology at the Naval Hospital, Oakland, Calif.; Lieut. Comdr. Jack C. McCurdy, to a residency in surgery at the Naval Hospital, Oakland, Calif.; Lieut. Alan Raftery, to a fellowship in pathology at the Henry Ford Hospital, Detroit; Lieut. (jg) Newman A. Hoopingarner, to a fellowship in children's orthopedics at St. Charles Hospital, Brooklyn; Lieut. Robert J. McCarthy, to a residency in internal medicine at the Naval Hospital, Bethesda, Md. Comdr. Ross P. Black of Amarillo, Texas, to a residency in urology at the Naval Hospital, Long Beach, Calif.; Comdr. Charles S. Hascall Jr., Baldwin, N. Y., to a residency in sur-

gery at the Naval Hospital, Chelsea, Mass., and Lieut. (jg) Donald E. Lloyd; Emporia, Kan., to a residency in psychiatry at the Naval Hospital, Bethesda, Md.

FIRST ACTIVE DUTY

The following lieutenants (jg) in the Reserve Medical Corps have been nominated for their first active duty: David E. Brown, Sacramento, Calif.; Kenneth D. Gaver, Santa Barbara, Calif.; Billy N. Golden, Hattiesburg, Miss.; John W. Lauder, Temple City, Calif.; John R. Marks, Madison, Wis.; Louis B. Matthews Jr., Franklin, Ind.; Roger P. Mattson, McVillie, N. D.; John A. Moore, Hampden-Sydney, Va., and Thomas C. Puchner, Wauwatosa, Wis.; Alan A. Basinger, Hayden, Colo.; William E. Bellamy Jr., Scotland Neck, N. C.; Henry J. Fowler, Walnut Cove, N. C.; Milton M. Lownes Jr., Philadelphia, and Warren L. Niccum, Muncie, Ind.; Samuel E. Feinman, Jersey City, N. J.; Quentin L. Green of Houston, Texas; Matthew Rosenschein Jr. of New York, and Carson E. Taylor of St. Louis; Arthur P. Kaupe, Neptune, N. J., and John W. Wilson Jr., Chattanooga, Tenn.

PERSONALS

The following reserve officers have been nominated for extended active duty: Lieut. (jg) Bruce A. Elrod, Birmingham, Ala.; Lieut. (jg) Frank J. Haufe, Middle Village, Long Island, N. Y.; Lieut. (jg) Daniel M. O'Toole, Los Angeles, and Lieut. (jg) Paul Pipik of Cleveland Heights, Ohio.

Comdr. Thomas A. Harris, M.C., recently addressed the Fairfax County Mental Hygiene Society, Falls Church, Va., on the clinical structure and community role of a child consultative clinic.

Lieut. (jg) David M. Spencer, Troy, Ohio, has been nominated for voluntary recall to active duty in the Medical Corps Reserve.

VETERANS ADMINISTRATION

THE 128TH VETERANS HOSPITAL OPENED

The Veterans Administration in May opened its one hundred and twenty-eighth hospital, at Grand Junction, Colorado.

The new six story 152 bed general medical and surgical hospital admitted its first patients two years and three months after ground was broken on the 40 acre site near the center of town.

The hospital contains some of the most up-to-date equipment designed for the well-being of both patients and staff members. Included is a suite of operating rooms adaptable to any major surgical procedure. The hospital also is equipped with small kitchens on each ward so that patients may get nourishment between meals, bedside radios giving patients their choice of three stations, "telecards" enabling patients to make telephone calls from their beds, a complete dental clinic and special services facilities such as recreation hall, library and chapel.

Among the hospital's officials are Dr. John D. Shea, acting chief of professional services; Dr. James K. McClintock, chief of surgical service; Dr. Geno Saccomanno, chief of the clinical laboratory, and Mr. C. I. Lemoine, chief pharmacist.

At the dedication ceremonies, April 27; addresses were delivered by Carl R. Gray Jr., Administrator of Veterans Affairs; Governor W. Lee Knous of Colorado, and Mayor John Harper of Grand Junction.

MERGE TWO MINNESOTA OFFICES

Veterans Administrator Carl R. Gray Jr. has directed consolidation of the Minneapolis Veterans Administration Regional Office with the Fort Snelling District Office into a new combined office. The merged offices will occupy space at Fort Snelling. The move is expected to improve service to veterans of the Twin Cities area by permitting more efficient utilization of personnel. The move to Fort Snelling will not delay processing of veterans' benefit claims and examinations. Effective date for completion of the moving is tentatively set for mid-April.

PERSONALS

Dr. W. Ivan King has been appointed to the staff of the Veterans Hospital at St. Petersburg, Fla. Dr. King, a graduate of Rush Medical College, Chicago, and a veteran of World War II, will become director of admissions at the hospital.

Dr. Thomas J. Hardgrove, formerly chief of professional services, Veterans Administration center, Waco, Texas, became manager of the Veterans Hospital at American Lake, Washington, May 1. Dr. Hardgrove has been with the Veterans Administration since 1935. He is a specialist certified by the American Board of Psychiatry and Neurology and formerly was in private practice in Milwaukee.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CONNECTICUT

Fifty Year Service Pins.—The Connecticut State Medical Society honored 26 fifty year members at a special ceremony during the society's annual dinner May 5 in New Britain. Dr. Samuel C. Harvey, New Haven, presented the service pins. The occasion marked the first time the society has extended formal recognition to its earliest living members. Among the twenty-six physicians is Dr. John C. Lynch, Bridgeport, who has been a member of the state medical society for sixty-two years. Dr. Charles J. Foote, New Haven, having joined the society in 1888, is second oldest, and third is Dr. William L. Higgins, South Coventry, who became a member in 1891.

Expand Facilities of Yale Plan Clinic.—Connecticut's facilities for the care and study of alcoholism were recently expanded with the opening of a state-supported outpatient clinic in New Haven and reorganization of the Yale Plan Clinic. Along with the transfer of headquarters and establishment of the new clinic by the Connecticut Commission on Alcoholism at 412 Orange Street, the Yale Plan Clinic has moved from 432 Temple Street to the Yale Laboratory of Applied Physiology. Since 1944 the Yale clinic has provided services for the treatment of alcohol addiction for persons in all sections of the country. While the reorganization program calls for the continuation of these services, they will be limited, and for the first time fees will be charged in accordance with the economic status of the patient. The clinic will continue to function as a consultant to industry and community agencies on problems of alcoholism, and will conduct research to correlate clinical experience and the work of the Yale Laboratory of Applied Physiology. Mr. Raymond G. McCarthy, executive director of the clinic, explains that the Yale clinic need no longer operate as a community service facility, since the Connecticut Commission on Alcoholism is operating a local clinic.

The new state outpatient clinic is organized to render services to alcoholic addicts in New Haven County without charge. Dr. Giorgio Lolli, associate professor of applied physiology at Yale and medical director of the university clinic, will direct the treatment program of the commission's local clinic. Similar clinics have been established in Bridgeport, Hartford, Stamford, the State Veterans Hospital at Rocky Hill and the State Farm for Women at Niantic.

IDAHO

State Medical Meeting.—The Idaho State Medical Association will hold its annual meeting June 19-22 in Sun Valley. Guest speakers include:

William D. Stroud, Philadelphia, Congenital Heart Disease.
E. W. Alton Ochsner, New Orleans, Carcinoma of the Lung.
William Boyd, Toronto, Canada, Structural Basis of Nephritis.
Rea E. Ashley, San Francisco, Allergy of Upper Respiratory Tract and Allergic Management.
Alexis F. Hartmann, St. Louis, Fundamentals of Carbohydrate Metabolism and Their Clinical Application.
Howard C. Stearns, Portland, Ore., Recognition and Treatment of Ovarian Carcinoma.

The annual banquet will be held Tuesday evening at the Lodge.

ILLINOIS

Dr. Cross Reappointed State Health Officer.—Dr. Roland R. Cross has been reappointed as state director of health, a post he has held since 1940. He has been employed by the health department since 1933, was promoted to assistant director in January 1940 and became director the following October. Before joining the state department, Dr. Cross had been in government and army service.

Army Deeds Hospital to State.—Mayo General Hospital at Galesburg, a World War II Army institution, was deeded to the Illinois Department of Welfare May 31 through the War Assets Administration. The hospital will be ready to care for aged and mental patients late in September. The hospital, built at a reported cost of \$5,000,000 with accommodations for 2,000 patients and personnel, opened in 1944 and was closed in October 1946.

Chicago

Renew Rothschild Grant to Institute.—The Hektoen Institute for Medical Research of the Cook County Hospital has received a second grant of \$2,000 from the Mildred Rothschild Memorial Foundation for the continued study of pemphigus disease in the departments of bacteriology and virology.

Discussion of School Health Services.—The health division of the Welfare Council of Metropolitan Chicago will hold its annual meeting June 14 at 12 noon at the Standard Club. Dr. George M. Wheatley of the Metropolitan Life Insurance Co., New York City, will speak on "Health Services for the School Child."

Memorial Fund for Diabetic Children.—Friends of the late Helen C. Baker, *Chicago Daily News* columnist, have started a memorial fund for diabetic children with contributions totalling \$1,020. The funds will be administered by the Chicago Diabetes Association, of which Dr. Arthur R. Colwell is president. Mrs. Baker was publicity secretary for the Chicago Council of Social Agencies, and her weekly columns related to social work.

Institution for Tuberculosis Research.—Ground was broken May 20 for the Institution of Tuberculosis Research, to be erected by the State Department of Public Health at the cost of about \$550,000, in the Medical Center District on Chicago's near West Side. The institution will supply BCG vaccine to health agencies in the United States and abroad. Research will be directed toward improvement of the vaccine and tuberculosis prevention. Another objective of the new unit will be to instruct health officers in the use of BCG. The

Architect's drawing of Institution of Tuberculosis Research

institution will be operated jointly by the University of Illinois, the Research Foundation and the Municipal Tuberculosis Sanatorium. Speakers included Gov. Adlai Stevenson, Mayor Martin F. Kennelly, Dr. Walter H. Theobald, president of the Medical Center Commission; Dr. Roland R. Cross, director of the State Department of Public Health; Dr. Ernest E. Irons, president of the board of directors of the Municipal Tuberculosis Sanatorium; Mr. Herbert R. DeYoung, president of the Tuberculosis Institute of Chicago and Cook County; Park Livingston, president of the board of directors of the Research Foundation, and Dr. Andrew C. Ivy, vice president of the University of Illinois. The Research Foundation, a recently established nonprofit organization, is coordinating the BCG activities of the various agencies which will be housed in the new building.

Hospital Affiliates with Loyola.—Loretto Hospital, 645 South Central Avenue, has become affiliated with the Stritch School of Medicine of Loyola University, the second important step in forming a new Loyola University Hospital Group. Last fall the University Hospital, 432 South Wolcott Avenue, was made available to the school as a teaching and research unit. The educational program at Loretto for training young physicians will be broadened and will be integrated by Loyola's clinical dean, Dr. Charles J. Thill. The eight story, 125 bed hospital, which overlooks Columbus Park, was built in 1923 as Austin Hospital, in 1929 became Frances E. Willard Hospital and was renamed Loretto Hospital in 1938. Surgical and obstetric facilities are being enlarged, and new operating rooms for neurosurgery and bone surgery have been added. Nursery facilities also are being altered and improved. A new 29 bed psychiatric unit was established in 1947 under the direction of Dr. John J. Madden, chairman of the department of neuropsychiatry at the medical school. The division of obstetrics and gynecology will be under the direction of Dr. George Z. Wickster. A general practice division of the hospital

staff will be maintained and will be unique in that these patients, as well as those admitted for specialized conditions, will be specially studied and incorporated in the teaching program. A research program will be carried on under the joint auspices of the hospital and the university.

LOUISIANA

History of Medicine Society Awards.—Student awards of the History of Medicine Society of Tulane University, New Orleans, were presented at the annual banquet May 12. The I. I. Lehmann Award for the best student discussion was presented to Mr. Isadore Yager for his paper "The History of Diabetes Mellitus." The Rudolph Matas Award for the best paper was given to Mr. Bruce Sullivan for "Medicine of the American Indians." The B. Bernard Weinstein Award for the paper showing the greatest amount of original research was presented to Miss Jeanne Marcoux for her paper "Women in New Orleans Medicine." The guest speaker was Emmett B. Carmichael, Ph.D., professor of biochemistry at the University of Alabama College of Medicine, who spoke on "Josiah Nott."

MARYLAND

Osler Anniversary Meeting.—The Johns Hopkins Medical History Club observed the hundredth anniversary of the birth of William Osler at its meeting May 19 in Johns Hopkins Hospital, Baltimore. Speakers were:

Alan M. Chesney, Baltimore, Osler's Attitude Toward Full-Time Clinical Chairs.

Eugene L. Opie, New York, Osler as a Pathologist.

Joseph H. Pratt, Boston, Osler as a Clinical Teacher.

MASSACHUSETTS

Course in Gastrointestinal Surgery.—The National Gastroenterological Association, in cooperation with Tufts College Medical School and the First and Second Surgical Services of the Boston City Hospital, will present a course in gastrointestinal surgery at the hospital October 27-29, under the personal direction of Dr. Owen H. Wangenstein, professor of surgery, University of Minnesota Medical School, assisted by Lord Alfred Webb-Johnson, president of the Royal College of Surgeons, London, England, and members of the surgical staff of the hospital. Enrollment is limited to 250. The fee will be \$35 a person. Veterans may take this course under the G.I. Bill of Rights. For information write to the National Gastroenterological Association, Dept. GSJ, 1819 Broadway, New York 23.

MINNESOTA

Dr. Matson Named Blood Bank Director.—G. Albin Matson, Ph.D., director of the centralized blood banking system for the Salt Lake City area, became director of the Minneapolis War Memorial Blood Bank May 1. He received his Ph.D. degree at Washington University, St. Louis, was associate professor of bacteriology at the Montana State University, Missoula, and from 1937 to 1948 was assistant professor and then associate professor of bacteriology at the University of Utah in Salt Lake City. The Minneapolis War Memorial Blood Bank is the result of the combined efforts of the Hennepin County Medical Society and the Junior Chamber of Commerce. The majority of hospitals in the county are now serviced with blood from the central blood bank, and it is hoped that the remaining few in the area will now avail themselves of the facilities of the community service.

NEBRASKA

Fifty-Year Practitioners.—At a staff dinner of the Lincoln General Hospital, Lincoln, Drs. H. Winnett Orr and Irvin C. Munger, emeritus staff members, were honored recently on the completion of their fiftieth year of practice. Both physicians have served the hospital since it opened in 1923. Dr. Munger, a surgeon, is a graduate of the Illinois Medical College, Chicago, 1900. Dr. Orr, a graduate of the University of Michigan Department of Medicine and Surgery, Ann Arbor, 1899, has practiced in Lincoln since 1899 and is a former president of the American Orthopaedic Association.

NEW YORK

Dr. Whipple Receives Kaiser Medal.—Dr. George H. Whipple, dean of the University of Rochester School of Medicine and Dentistry, is the 1949 recipient of the Albert David Kaiser Medal of the Rochester Academy of Medicine for "his distinguished services to medical science and the distinction he has brought to the city through the development of the University of Rochester School of Medicine and Dentistry." Dr. Whipple, a graduate of Johns Hopkins University School of Medicine, Baltimore, 1905, came to the University of Rochester

in 1921 as dean of the newly founded school of medicine and dentistry. Previously he was dean of the University of California Medical School, Berkeley-San Francisco. Dr. Whipple was a co-winner of the Nobel Prize in medicine in 1934 for his research on anemia.

Postgraduate Instruction.—Otsego County Medical Society will hear Dr. Milton L. Kramer, New York City, speak on "Management of the Failing Heart" at a meeting at the Sportsman Tavern, Fly Creek, June 15 at 8 p. m. This lecture has been arranged by the Medical Society of the State of New York in cooperation with the New York State Department of Health.

Hospital Expands Maternity Care.—Ellis Hospital in Schenectady has adopted a new program to contribute toward better prenatal maternity care in Schenectady County. Any maternity patient who anticipates being delivered at the hospital may be sent there by her physician at any time early in pregnancy to have a roentgen examination of the chest and a blood determination for the Rh factor. The hospital is extending these services without charge in the interest of improved obstetric practice.

New York City

Dr. Reiss to Lecture in Berlin.—Dr. Frederick Reiss, associate clinical professor of dermatology and syphilology, New York University-Bellevue Medical Center, has been invited by the U. S. Military Government, at the request of the Free University of Berlin, to lecture on Recent Advances in Dermatology and Mycology. The lectures will be given during July at the university. Dr. Reiss will be in Europe about two months.

Appointed Post-Graduate Dean.—Dr. Robert Boggs will become dean of the New York University Post-Graduate Medical School, New York University-Bellevue Medical Center July 1. He has been acting dean of the school since its formation by the consolidation of the former New York Post-Graduate Medical School with New York University. Dr. Boggs came to New York University after five years in the U. S. Navy. A graduate of the McGill University Faculty of Medicine, Montreal, Canada, 1933, Dr. Boggs was a research fellow in surgery at the Harvard Medical School and trained at the Peter Bent Brigham Hospital of Boston and was on the house staff of New York Hospital.

Dr. Von Storch Goes to New York.—Dr. Theodore J. C. von Storch, professor of neurology at Albany (N. Y.) Medical College, has been appointed chief of the Division of Neuropsychiatry of Montefiore Hospital, New York, effective July 1. Dr. von Storch is a graduate of Johns Hopkins University School of Medicine, Baltimore, 1931, and did most of his graduate work in neurology at the Harvard Medical School, Boston. He served with the Medical Corps of the United States Army throughout World War II. He succeeds Dr. H. Houston Merritt, who has been appointed professor of neurology in Columbia University College of Physicians and Surgeons, New York, and consultant in neuropsychiatry to the hospital.

NORTH CAROLINA

Open Blood Center.—The American Red Cross Regional Blood Center at Asheville was opened April 25. Dr. Ross T. McIntire, director of the Red Cross Blood Program, was the principal speaker.

Grants for Research.—The Bowman Gray School of Medicine, Winston-Salem, recently received grants of \$51,802 from the U. S. Public Health Service and the John and Mary Markle Foundation. Postdoctoral fellowships granted by the Atomic Energy Commission have been renewed for another year to Dr. Kingsley M. Stevens and Dr. Jerry K. Aikawa, both of whom are doing research with radioisotopes in the department of medicine of the Bowman Gray School of Medicine. Dr. Stevens is studying the synthesis of protein by bacteria, and Dr. Aikawa's research is concerned with the alteration in the distribution of body fluids in infectious diseases.

Appropriation for Hospitals.—The legislature of North Carolina at its 1949 session appropriated \$214,576 for general administration operating expenses for the biennium July 1, 1949 to June 30, 1951. This is an increase over the previous biennium appropriation of \$123,040. For permanent improvements in local hospitals and health centers, the legislature appropriated \$6,826,972, an increase of nearly \$577,000 over the previous biennium appropriation. To state-owned hospitals for permanent improvements including \$1,000,000 for building equipment for the dental school, the legislature made an appropriation of \$32,744,251, an increase of more than \$17,000,000 over the previous biennium. The sum includes \$533,645 of federal funds devoted to state-owned hospitals.

SOUTH CAROLINA

State Medical Election.—The South Carolina Medical Association at its recent annual meeting installed Dr. Robert B. Durham, Columbia, as president and selected Drs. Rosco D. McMillan of Red Springs as president elect and M. D. Hill of Raleigh, secretary-treasurer.

TENNESSEE

State Medical Election.—The Tennessee State Medical Association recently installed Dr. Nathaniel S. Shofner, Nashville, as president and chose Dr. Ralph H. Monger, Knoxville, as president elect. Dr. William M. Hardy, Nashville, was reelected secretary-editor of the association.

Appoint Assistant Dean.—Dr. Frank L. Roberts, professor of preventive medicine, has been given additional duties as assistant dean of the University of Tennessee College of Medicine, Memphis, effective July 1. He succeeds Dr. Robert H. Miller, who is retiring from the university. Dr. Roberts has been on the faculty of the university since 1937. He is a graduate of the University of Minnesota Medical School, Minneapolis, 1918, and holds a D.P.H. degree from Johns Hopkins University School of Medicine, Baltimore. Dr. Miller joined the university faculty in 1924 as an assistant professor of anatomy and was made assistant dean in 1939.

TEXAS

Reestablish Memorial Research Laboratory.—The Sealy and Smith Foundation for the John Sealy Hospital, Galveston, has reestablished the Memorial Research Laboratory in association with the hospital. This laboratory was originally developed by the late Meyer Bodansky, Ph.D., and closed at his death in 1941; it is designed to investigate the application of current biochemical and physiologic knowledge to the management of disease. Dr. Raymond L. Gregory, professor of internal medicine at the University of Texas Medical Branch, Galveston, will be director of the laboratory.

University Appointments.—Dr. Clarence S. Livingood, professor of dermatology and syphilology at Jefferson Medical College of Philadelphia, has accepted appointment as professor of dermatology and syphilology and chairman of the department at the University of Texas Medical Branch, Galveston. Dr. Elwood E. Baird, professor of clinical pathology at the University of Colorado School of Medicine, Denver, has accepted appointment as professor of clinical pathology. Dr. Baird, a graduate of Northwestern University Medical School, 1935, will have charge of the clinical laboratories at the University of Texas Medical Branch Hospital.

WEST VIRGINIA

Report on Premature Nursery.—During the first year of operation of the nursery for premature infants set up in Kanawha County as a demonstration project by the state department of health a total of 123 premature infants were given care. The nursery, which was opened Feb. 16, 1948, is located at the Herbert J. Thomas Memorial Hospital in South Charleston. Eighty-one or 66 per cent of the infants survived. This compares favorably with records of other centers for premature infants throughout the nation. In an effort to determine accurately the relationship between malnutrition and premature birth a dietary study of mothers of premature infants has been instituted by the chief nutritionist of the division of maternal and child health. This study is patterned after Harvard's Burke-Stewart research. The professional staff of the nursery includes the following pediatricians practicing in Kanawha County: Drs. Henrietta B. Marquis, Arthur A. Shawkey, Helen M. Belknap, Lloyd Cox, Harry Baldock, Jack Basman and Mary Gallagher.

Diagnostic Clinic for Children.—A children's diagnostic clinic, a cooperative project of the state department of health, the Kanawha-Charleston Health Department, the Kanawha County School System and local pediatricians, was opened in March at the City Building in Charleston. Clinics will be held the first and third Wednesday afternoon in each month. Referral will be made by private physicians, well-child conferences in the Kanawha Valley, school physicians and nurses, welfare clinics, and the general medical clinics in the county-city health department. Each child referred will be given a thorough physical examination for the purpose of diagnosis, and a report of the findings will be sent to the family doctor. A limited fund has been allocated by the Children's Bureau, through the Division of Maternal and Child Health, for hospitalization and treatment of the more deserving cases when the family is unable to assume this responsibility. The staff will be

composed of local pediatricians who will rotate their services, clinical nurses at the county-city health department, the state nutritionist and the state medical social worker. The clinic is the first of its kind in the state and was established as a demonstration project.

WISCONSIN

Testimonial to Dr. Marshall.—Dr. Victor F. Marshall, who has practiced medicine in Appleton for fifty years, was honored at a testimonial dinner May 12. Speakers at the dinner attended by about 150 persons included Dr. Ernest E. Irons, Chicago, then President-Elect of the American Medical Association, and Dr. Karl H. Doege, Marshfield, president of the State Medical Society of Wisconsin.

Chippewa River Basin Cleanup.—The State Committee on Water Pollution has ordered eight cities, two villages and seven industrial plants located in the Chippewa river basin to install sewage and waste treatment facilities to end gross pollution of the Chippewa and its tributaries. Studies of river samples collected by the Bureau of Sanitary Engineering during the past four years and a public hearing preceded the action. The municipalities were ordered to treat their sewage before discharging it into streams and gave deadlines for the completion of the projects step by step. All construction facilities are to be completed by Dec. 31, 1950.

GENERAL

French Welcome U. S. Doctors.—Last summer the French Medical Association founded the French Welcome Organization for the World Medical Corps. According to Dr. Valentin Charry, director of the corresponding center in Paris, the purpose of the organization is to welcome and help doctors from every country, in any field of interest to them. American doctors planning to visit France this summer are invited to obtain letters of introduction from the American Medical Association, and then communicate with the French organization. The address is 60 Boulevard de Latour-Maubourg, Paris VIIe. The organization expects to have offices in Chicago, New York and San Francisco.

Evarts Graham Receives Chest Physicians Medal.—Dr. Evarts A. Graham, St. Louis, who performed the first successful operation for cancer of the lung, was awarded the gold medal of the American College of Chest Physicians at a dinner at the Ambassador Hotel, Atlantic City, June 4. Dr. Graham is professor of surgery at the Washington University School of Medicine. It was in 1933 that he performed the operation of removing an entire lung for cancer. The patient, fifteen years later, is still alive and active. Since then similar operations have been performed with good results by surgeons in other countries. The gold medal award was presented to Dr. Graham by Dr. Jay A. Myers, professor of preventive medicine and public health at the University of Minnesota, a previous recipient of this award.

Library Association Scholarship.—The first Medical Library Association scholarships have been assigned to three foreign medical librarians from funds granted by the Rockefeller Foundation. The recipients are Miss Lydia Pazos Pérez, assistant to the director of the library of the Faculty of Medicine, University of Havana; Miss Maria Alicia Izquierdo Guzman, assistant of the Library of the Faculty of Medicine, University of Chile, and Mrs. Maria José Lessa da Fonseca, librarian of the Faculty of Medicine, University of São Paulo. A program planned to meet the individual interests of each fellow has been arranged to emphasize one or more of the following specialties: cataloging, classification and subject headings for medical literature, administrative methods of medical librarians, special service problems in medical libraries and medical bibliographic sources.

Demonstration Program in Pediatric Teaching.—The American Academy of Pediatrics and its state chairmen are working out a demonstration program with district medical schools and community hospitals. This program, involving decentralized teaching and pediatric services, is based at the medical teaching centers in Philadelphia and will emanate throughout Pennsylvania and into parts of New Jersey and Delaware. Dr. Glidden L. Brooks, Lewiston, Maine, has been appointed associate director of the academy's Committee for the Improvement of Child Health, Philadelphia. Dr. Brooks has been executive director and chief of pediatrics of the Central Maine General Hospital, Lewiston. He will aid in developing the action program for the nationwide improvement of child health based on the three year study of child health services just completed by the academy with the cooperation of the U. S. Public Health Service and the Children's Bureau. He

will work with Dr. John P. Hubbard, executive director of the committee, and Dr. Philip S. Barba, Philadelphia, academy district chairman for Pennsylvania, New Jersey and Delaware.

National Foundation Fellowship Awards.—The National Foundation for Infantile Paralysis has awarded twenty-one postgraduate fellowships to physicians in the fields of research, physical medicine and public health. Seven other physicians have been approved for fellowships in the same fields to be awarded later in the year. The latest awards total an estimated \$80,594 for training, which in some cases will require three years' work. National Foundation fellowships in physical medicine are made to physicians who wish to prepare for eligibility for certification by the American Board of Physical Medicine. Fellows must agree to practice as specialists in physical medicine for a minimum of two years following their training. Fellowships in public health are awarded to physicians who undertake studies leading to Master of Public Health degrees. They must agree to work as public health officers for at least two years following the study.

Squibb Research Appointments.—In a general regrouping of Squibb research responsibilities, the appointments of Dr. Geoffrey W. Rake, Millstone, N. J., as medical director and of Asger F. Langlykke, Ph.D., as director of the Research and Development Laboratories, New Brunswick, have been announced. Activities will be coordinated and directed by Mr. Roland J. Dahl, New York, vice president. Dr. Langlykke received his Ph.D. degree from the University of Wisconsin, Madison, in 1936. He will have two associate directors, Frederick Y. Wiselogle, Sc.D., to be in charge of chemical research, and Tillman D. Gerlough, to be in charge of the biologic research. Dr. Rake has also been appointed recently as director of the Squibb Institute for Medical Research. He will supervise Squibb fellowships and grants, publication of papers in scientific journals, the conduct of seminars, and the Squibb libraries. He succeeds Dr. James A. Shannon, New York, who has been appointed associate director of the National Heart Institute, Bethesda, Md., where he will be engaged not only in administrative work but also in original investigations.

Medical Film Service.—Medical Film Institute, a central clearing house for medical films, was opened April 27 at the Academy of Medicine Building, New York, under the auspices of the Audio-Visual Committee of the Association of American Medical Colleges. Dr. Walter A. Bloedorn, dean of the George Washington University School of Medicine, Washington, D. C., is chairman of the committee. Dr. David S. Ruhe will be director. The institute is now selecting for the State Department a group of medical films for showing abroad. It is also serving as a supervisory agency in cooperation with the National Department of Health and Welfare of Canada in making a film showing medical research's attack on cancer. In addition to Dr. Bloedorn the committee includes Francis Keppel, dean of Harvard's Graduate School of Education; Captain Robert V. Schultz, M.C., U.S.N., Washington, D. C., chief of the Bureau of Medicine's Audio-Visual Training Section and chairman of the Inter-Departmental Committee on Medical Training Aids; Orville Goldner, former head of Navy Training Films, Washington, D. C., and Dr. William L. Benedict, Rochester, Minn., chairman of the American Medical Association's Committee on Medical Motion Pictures.

International Society for Internal Medicine.—This society will hold its second meeting in Paris in the spring of 1950. The organization was founded as a result of the efforts of a group of Swedish and Swiss physicians with the approval and assistance of UNESCO. An organization meeting held in Basel, Switzerland, in September 1948 was attended by physicians from sixteen countries. Many of the founders' group, nearly all of whom are teachers of medicine in their respective countries, have traveled or studied in the United States. The organization is a member of the Association of International Medical Congresses, which met under the auspices of the World Health Organization and UNESCO in Brussels in April. The purpose of the society is "to contribute to the development of scientific knowledge and education in internal medicine and to promote personal relationship between internists in all countries."

Membership is restricted to qualified internists who have been accepted as members of the national associations of internal medicine in their several countries. Dues are nominal (10 Swiss francs per annum). Plans for the Paris congress are proceeding under the direction of Prof. A. Gigon of Basel, president of the society, Dr. Nanna Svartz of Stockholm and Dr. L. Justin-Besancon of Paris. American, Canadian and Latin-American physicians who may be interested in membership may direct their inquiries to Dr. Albert M. Snell, 102-110 Second Avenue Southwest, Rochester, Minn.

Committee on Abstracting.—The Interim Co-ordinating Committee on Medical and Biological Abstracting Services met at Unesco House June 1-4. The committee, created last year under the auspices of UNESCO, is organizing a system of cooperation among existing services to assure that medical and biologic abstracts cover the whole of the literature in this field. Certain agencies have been requested to give up medical fields already covered by others; a comprehensive system of exchanges has made it possible for each agency to profit from work done elsewhere. Agencies now represented in the committee are: *The British Medical Journal* (London); the Medical Library Association (United States); The Abstracts of World Medicine (London); the Biological Abstracts (Philadelphia); The British Abstracts (London), and the *Excerpta Medica* (Amsterdam). Other agencies have been invited to join the committee, such as the Bureau of Hygiene and Tropical Diseases, the Commonwealth Bureau of Animal Nutrition, the American Medical Association, the International Abstracts of Surgery, Chemical Abstracts, French Medical Abstracting Services and French Biological Abstracting Services. The World Health Organization and Food and Agriculture Organization were to be represented at the conference, along with the International Federation of Documentation and the International Federation of Library Associations. Among the observers were Dr. Lépine, Institut Pasteur, and Dr. Talice, professor of the Faculty of Medicine at Montevideo, for the Latin American countries.

Nutrition Awards.—At the annual dinner of the American Institute of Nutrition held in the Book-Cadillac Hotel, Detroit, April 20, the following awards were made:

The Mead Johnson and Company Award for work in the field of the B-complex vitamins was divided equally between two recipients, Karl A. Folkers, Ph.D., Research Development Division, Merck and Company, Inc., Rahway, N. J., and Mary S. Shorb, department of poultry husbandry, University of Maryland, Baltimore. The award was granted to Dr. Folkers for "isolating in crystalline form a new chemical substance, designated as vitamin B₁₂, that is active in the treatment of pernicious anemia and of importance in other phases of nutrition," and to Dr. Shorb for "pointing out the possible connection between the antianemia factor and a growth factor for bacteria and for developing a bacteriological assay procedure that materially assisted in the isolation of the compound designated as vitamin B₁₂."

The Borden Award in Nutrition was presented to Harry J. Deuel Jr., Ph.D.; University of Southern California School of Medicine, Los Angeles, for "research emphasizing the nutritive importance of components of dairy products."

The Osborne and Mendel Award, conferred in recognition of outstanding achievement in the general field of exploratory research in the science of nutrition, was presented to William C. Rose, Ph.D., professor of biochemistry, University of Illinois, Urbana, for "his contributions to our knowledge of nitrogen metabolism and the amino acid requirements of experimental animals and man."

The institute elected the following officers for the year beginning July 1: Charles G. King, Ph.D., New York, president; Joseph H. Roe, Ph.D., Washington, D. C., secretary, and Ned R. Ellis, M.S., Washington, D. C., treasurer.

Marriages

ROBERT BRYANT WALKER, Gunnison, Colo., to Miss Ruth M. Dunbar of Perrysburg, Ohio, in Toledo, Ohio, April 22.

MOSES EDWARD RICE JR., Aulander, N. C., to Miss Matilde A. McLaughlin of Medford, Mass., Sept. 5, 1948.

LAWRENCE THOMAS SMYTH, Allentown, Pa., to Miss Kathryn Elizabeth McKeown of Narberth, May 7.

JACK WILLIAMS SHIELDS, San Francisco, to Miss Patricia Elizabeth Gaw of Berkeley, Calif., in May.

WILLIAM HUGH GREY, Charlotte, N. C., to Miss Elizabeth Gooch Seay in Richmond, Va., May 14.

JOHN LAURENCE FELDMAN, Quincy, Ill., to Miss Mary Alice Harrington at Palmyra, Mo., April 16.

ALAN LOUIS ABRAMS, San Francisco, to Miss Barbara Zelinsky of Hanford, March 27.

JOHN L. SHIVELY to Miss Virginia Lee Carroll, both of Knightstown, Ind., March 6.

LEONARD M. LASSER, Gary, Ind., to Miss Anne Johnson of Wesleyville, Pa., May 1.

EDGAR A. KAHN, Ann Arbor, Mich., to Dr. Rose Parker of Los Angeles, April 24.

Deaths

William Washington Graves * St. Louis; born in La Grange, Ky., Nov. 13, 1865; St. Louis College of Physicians and Surgeons, 1888; professor emeritus of neurology and psychiatry since 1948 at St. Louis University School of Medicine, where he had joined the faculty in 1905, becoming professor of nervous and mental diseases in 1914 and director of the department in 1925, positions which he held until 1948; member of the American Neurological Association, American Psychiatric Association, Central Neuropsychiatric Association and the American Association of Anatomists; chairman, Section on Nervous and Mental Diseases of the American Medical Association, 1913-1914; past president of St. Louis Society for Mental Hygiene and St. Louis Medical Society, which in 1939 awarded the Certificate of Merit and gold medal for scientific accomplishment based on his classification of scapulae and other inherited characters; fellow of the American College of Physicians; at one time associated with the U. S. Public Health Service; at various times affiliated with the Frisco Hospital, St. Louis Maternity Hospital, St. Mary's Infirmary, St. Louis City Hospital, Alexian Brothers Hospital, St. John's Hospital, St. Anthony's Hospital and St. Mary's Group of Hospitals; died in St. John's Hospital April 19, aged 83.

Randolph West * New York; born in Princeton, N. J., Aug. 7, 1890; Columbia University College of Physicians and Surgeons, New York, 1917; professor of medicine at his alma mater; specialist certified by the American Board of Internal Medicine; member of the Association of American Physicians, American Society for Clinical Investigation, New York Academy of Medicine, Interurban Clinical Club, Society of Biological Chemists, the Society for Experimental Biology and Medicine, Harvey Society and the American College of Physicians; served during World War I; affiliated with Presbyterian Hospital of the Columbia-Presbyterian Medical Center; presented posthumously on June 6 the American Medical Association's first Joseph Goldberger Award in Clinical Nutrition for his research on the clinical use of vitamin B₁₂ (THE JOURNAL, February 12, p. 459); formerly editor of the *Journal of Clinical Investigation*; chairman of the U. S. Pharmacopoeia Anti-Anemia Preparations Advisory Board; died May 20, aged 58.

James Richard Tillotson * Lima, Ohio; born in Dunbarton, Ohio, Nov. 26, 1877; Medical College of Ohio, Cincinnati, 1904; specialist certified by the American Board of Orthopaedic Surgery; member of the Clinical Orthopaedic Society and the American Academy of Orthopaedic Surgeons; fellow of the American College of Surgeons; past president of the Allen County Academy of Medicine; served during World War I; affiliated with the Wilson Memorial Hospital in Sidney; on the staffs of St. Rita's Hospital and the Lima Memorial Hospital, where he died April 20, aged 71, of coronary thrombosis.

Anson Holden Bingham * New York; New York Homeopathic Medical College and Hospital, New York, 1900; professor and director of the department of orthopedic surgery at his alma mater, now known as the New York Medical College, Flower and Fifth Avenue Hospitals; specialist certified by the American Board of Orthopaedic Surgery; fellow of the American College of Surgeons; affiliated with Goshen (N. Y.) Hospital, Yonkers (N. Y.) Hospital, Prospect Heights Hospital in Brooklyn, Flower and Fifth Avenue, Metropolitan and Park East hospitals; died April 22, aged 70, of coronary thrombosis.

Augustus Clyde Shipp * Little Rock, Ark.; born in Edenburg, Ind., in 1879; Indiana University School of Medicine, Indianapolis, 1912; an Affiliate Fellow of the American Medical Association; member of the American Trudeau Society; formerly professor of medicine at the University of Arkansas School of Medicine; served as president of the Southern Tuberculosis Conference and honorary president and chairman of the executive board of the Arkansas Tuberculosis Association; a director of the National Tuberculosis Association; died March 22, aged 69, of arteriosclerotic heart disease.

Thomas Pennie Abernathy, Moundville, Ala.; Memphis (Tenn.) Hospital Medical College, 1899; member of the American Medical Association; died March 14, aged 73, of cerebral hemorrhage and hypertension.

Newton Samuel Bacon * Cambridge, Mass.; Harvard Medical School, Boston, 1899; resident physician at the Long Island Hospital in Boston; affiliated with Mount Auburn Hospital; died March 1, aged 76, of heart failure, following an operation.

David E. Bagshaw * Saginaw, Mich.; Saginaw (Mich.) Valley Medical College, 1902; Jefferson Medical College, Phila-

delphia, 1908; on the staffs of Saginaw General and St. Luke's hospitals; died in Los Angeles March 17, aged 72, of heart disease.

Jay Baird, Coffeyville, Kan.; Eclectic Medical Institute, Cincinnati, 1900; member of the American Medical Association; died March 19, aged 78, of heart disease.

William Halsey Barker * Baltimore; Johns Hopkins University School of Medicine, Baltimore, 1932; assistant professor of medicine at his alma mater, where he was assistant dean; member of the American Clinical and Climatological Association; certified by the National Board of Medical Examiners; member of the staff of Union Memorial Hospital; died in Johns Hopkins Hospital March 26, aged 42, of seminoma of the left testis.

Milton Bodenheimer * New York; Columbia University College of Physicians and Surgeons, New York, 1903; member of the founders group of the American Board of Surgery; fellow of the International College of Surgeons and the American College of Surgeons; served overseas during World War I; for many years affiliated with the Hospital for Joint Diseases and Mount Sinai Hospital; died March 25, aged 69, of coronary thrombosis.

Ramon Haddock Burrell * Creighton, Neb.; University of Michigan Medical School, Ann Arbor, 1900; died March 19, aged 75, of cerebral embolism.

Wesley Paul Damerow * Cincinnati; Rush Medical College, Chicago, 1928; served during World War II; affiliated with Bethesda Hospital; died March 20, aged 48, of coronary occlusion.

Charles William Decker * Pomona, Calif.; University of Southern California College of Medicine, Los Angeles, 1906; an Associate Fellow of the American Medical Association; formerly health officer of Los Angeles; served in France during World War I; died in March, aged 72.

Harry Harding Everett * Lincoln, Neb.; Northwestern University Medical School, Chicago, 1900; fellow of the International College of Surgeons and the American College of Surgeons; medical director and vice president of the Woodmen Central Life Insurance Company; on the staff of Lincoln General Hospital and Bryan Memorial Hospital, where he died March 30, aged 73, of bronchiectasis, emphysema and cor pulmonale.

Walter Sherman Garrison * Cedarville, N. J.; Jefferson Medical College of Philadelphia, 1913; on the staff of the Bridgeton (N. J.) Hospital; died March 5, aged 60, of hypertensive vascular disease with coronary occlusion.

Julien Auguste Gehrung, New York; Washington University School of Medicine, St. Louis, 1901; formerly on the faculty of New York Polyclinic Medical School and Hospital; for his services during World War I with the French army was named a chevalier of the Legion of Honor; served on the staffs of the New York Eye and Ear Infirmary, St. Vincent's Hospital and the New York Foundling Hospital; died in Metropolitan Hospital March 25, aged 70.

James Rieser Gerhard, Reading, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1901; member of the American Medical Association; served on the staff of Reading Hospital, where he died March 30, aged 75, of cerebral hemorrhage and arteriosclerosis.

Glenn Ira Goodrich, Dover, Ohio; Ohio Medical University, Columbus, 1903; member of the American Medical Association; past president of the Tuscarawas County Medical Society; affiliated with Union Hospital, where he died March 20, aged 70, of a broken hip received in a fall.

Oscar Edwin Hanscom, Greene, Me.; Medical School of Maine, Portland, 1899; member of the American Medical Association; served on the school board; died March 22, aged 77, of carcinoma of the prostate.

Robert Lee Hardy, Louisville, Ky.; University of Louisville Medical Department, 1904; died March 18, aged 79, of chronic myocarditis.

Clarence Orfield Harned, Tishomingo, Okla.; Hospital College of Medicine, Louisville, Ky., 1897; died in Wesley Hospital, Oklahoma City, March 11, aged 76, of uremia.

Lester Friedrich Harris, Washington, D. C.; George Washington University School of Medicine, Washington, D. C., 1945; served during World War II; certified by the National Board of Medical Examiners; affiliated with the Veterans Administration; died March 23, aged 27, of coronary occlusion.

William Ernest Holland, Chicago; Illinois Medical College, Chicago, 1897; died March 29, aged 82, of intestinal obstruction and pyloric stenosis.

Edward Joseph Horodko, Chicago; Loyola University School of Medicine, Chicago, 1941; member of the American Medical Association; served during World War II and was awarded the Bronze Star Medal for meritorious achievement in connection with military operations against the enemy at New Georgia, Solomon Islands, from July 22 to Sept. 8, 1943; on the staff of St. Elizabeth Hospital, where he died March 27, aged 33, of acute myelogenous leukemia.

Peter Helms Jamison, Nescopeck, Pa.; Medico-Chirurgical College of Philadelphia, 1898; member of the American Medical Association; died in Geisinger Memorial Hospital, Danville, March 22, aged 73, of injuries received in an automobile accident.

Martin Kerpel • Brooklyn; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1922; on the staff of the Lutheran Hospital; died March 15, aged 53, of coronary occlusion.

Shiam Lall, Holdenville, Okla.; University of Oklahoma School of Medicine, Oklahoma City, 1923; member of the American Medical Association and the State Medical Association of Texas; died March 7, aged 57.

George Bagnell Landers, Rochester, N. Y.; Tufts College Medical School, Boston, 1905; member of the American College of Hospital Administrators; for many years medical director of the Highland Hospital, where he was hospital consultant and member of the board of directors; formerly superintendent of the Memorial Hospital in Morristown, N. J., and assistant superintendent of the Presbyterian Hospital in New York; died in Jacksonville, Fla., March 23, aged 66, of gastric ulcer.

Arthur Ray Lannon • Denver; University of Colorado School of Medicine, Denver, 1916; member of the American Urological Association; on the honorary staffs of Presbyterian, St. Anthony's and Denver General hospitals; died March 24, aged 59, of coronary occlusion.

Israel Levine, Paterson, N. J.; Baylor University College of Medicine, Dallas, 1904; member of the American Medical Association; affiliated with the Nathan and Miriam Barnert Memorial Hospital; died March 27, aged 70, of embolism.

James Lang Lewis, Danville, Ill.; Northwestern University Medical School, Chicago, 1901; served during World War I; formerly affiliated with Veterans Administration hospitals in Alexandria, La., and Hines, Ill., where he was chief of the tuberculosis service for many years; served on the staff of the Indiana State Sanatorium, Rockville; died March 29, aged 75, of cerebral thrombosis.

Lily Dale Lighter, Montevideo, Minn.; Chicago Physio-Medical Institute, 1886; died recently, aged 90, of uremia and cardiac failure.

Anna Willard Locke-Henry, New York; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1897; for many years physician for the board of education; died in Nashua, N. H., February 14, aged 80, of carcinoma.

David L. McCarrell • Hickory, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1899; for many years member of the local school board; on the staff of the Washington (Pa.) Hospital; died March 31, aged 76, of cerebral hemorrhage.

James Herbert McKee, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1892; member of the American Medical Association and the American Academy of Pediatrics; served during World War I; formerly professor of pediatrics at the Woman's Medical College of Pennsylvania, Philadelphia Polyclinic and the Temple University School of Medicine; affiliated with Philadelphia General Hospital and Chestnut Hill Hospital, where he died March 24, aged 77, of coronary thrombosis.

John Drummond Maguire, Lexington, Ky.; Louisville (Ky.) Medical College, 1903; member of the American Medical Association; served during World War I; formerly county health officer; died in Nichols Hospital, Louisville, March 31, aged 72.

Charles Jacob Mark, New York; Long Island College Hospital, Brooklyn, 1906; died March 23, aged 68, of heart disease.

Perry French Marks, Walton, W. Va.; University of Louisville (Ky.) Medical Department, 1907; formerly county commissioner; health officer for Roane County; died in Spencer April 1, aged 69, of carcinoma.

James Frank Mayne, Ashland, Ohio; University of Wooster Medical Department, Cleveland, 1889; Western Pennsylvania Medical College, Pittsburgh, 1897; died in Samaritan Hospital March 26, aged 88, of cerebral hemorrhage and hypertensive heart disease.

Roger Depew Mead • Endicott, N. Y.; Syracuse University College of Medicine, 1908; member of the American Association of Industrial Physicians and Surgeons; for many years a member of the board of education; affiliated with Ideal Hospital; died in St. Petersburg, Fla., March 31, aged 65, of diabetes mellitus.

Carl Henry Metzger, Altoona, Pa.; Jefferson Medical College of Philadelphia, 1908; member of the American Medical Association; served during World War I; formerly police surgeon; city physician; member of the health department and civil service examining board; died March 31, aged 70, of angina pectoris.

James B. Miner Sr., Charles City, Iowa; the Hahnemann Medical College and Hospital, Chicago, 1894; member of the American Medical Association; formerly member and president of the school board; affiliated with Cedar Valley Hospital, where he died March 22, aged 80, of myocardial failure.

Morey David Miro, Detroit; Detroit College of Medicine and Surgery, 1932; member of the American Medical Association; served during World War II; affiliated with Deaconess and Grace hospitals; died in Rochester, Minn., March 30, aged 41, of ulcerative colitis.

Claude Edward Morrison, Bay City, Ore.; Washington University School of Medicine, St. Louis, 1910; died March 3, aged 69, of coronary occlusion.

Frank Wellington Murphy, Los Angeles; Pulte Medical College, Homeopathic, Cincinnati, 1894; served as health officer in Dayton, Ohio; died March 7, aged 78, of adenocarcinoma of the prostate.

Thomas Hayden Nelson, Park Hills, Ky.; Kentucky School of Medicine, Louisville, 1894; served during World War I; on the staff of Booth Memorial Hospital, Covington; died March 11, aged 81, of arteriosclerosis.

Alfred Benjamin Nesler • Dubuque, Iowa; University of Michigan Medical School, Ann Arbor, 1920; fellow of the American College of Surgeons; certified by the National Board of Medical Examiners; on the staffs of Finley, St. Joseph's and Mercy hospitals; died in Laurel Oaks March 25, aged 53, of coronary occlusion.

Harry Sidney Newman • Yonkers, N. Y.; Medical College of Virginia, Richmond, 1925; member of the American College of Chest Physicians and the American Trudeau Society; on the staff of Montefiore Hospital for Chronic Diseases in New York; died in St. James Hospital in Hornell, March 13, aged 50, of coronary occlusion and hiatus hernia.

Edward White Perkins • New York; College of Physicians and Surgeons, medical department of Columbia College, New York, 1889; served on the staffs of the Presbyterian and Sloane hospitals; died in the Eastern Long Island Hospital in Greenport, March 26, aged 83, of arteriosclerosis.

Anna Elizabeth Martin Ralston, Brooklyn; Eclectic Medical College of the City of New York, 1896; member of the American Medical Association; died March 10, aged 73.

Benjamin Franklin Randolph • Arrington, Va.; University College of Medicine, Richmond, 1912; died March 30, aged 72, of coronary thrombosis.

Edwin Thomas Redmond Jr., Farmingdale, N. Y.; New York Medical College, Flower and Fifth Avenue Hospitals, New York, 1943; resident physician at the Nassau County Sanatorium; died in Oyster Bay, March 28, aged 31, of cor pulmonale and pulmonary fibrosis.

Cecil Rigby • Spartanburg, S. C.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1916; instructor in surgery at Johns Hopkins University School of Medicine, Baltimore, from 1916 to 1920; fellow of the American College of Surgeons; served during World War I; on the staff of Spartanburg General Hospital; died March 26, aged 58, of coronary thrombosis.

Mary Bennett Ritter, Berkeley, Calif.; Cooper Medical College, San Francisco, 1886; formerly dean of women and physician at the University of California; in 1935 received the honorary degree of doctor of laws from the University of California; died March 17, aged 89, of chronic myocarditis and arteriosclerosis.

Homer Dudley Roads • Cincinnati; University of Cincinnati College of Medicine, 1923; fellow of the American College of Surgeons; formerly practiced in Cleveland, where he was for many years on the staff of St. John's Hospital; died in Cincinnati General Hospital, March 21, aged 51, of periarteritis nodosa.

John Cornelius Roe • Pittsfield, Mass.; Georgetown University School of Medicine, Washington, D. C., 1915; fellow

of the American College of Surgeons; served during World War I; affiliated with St. Luke's, Hillcrest and House of Mercy hospitals; consulting surgeon, W. B. Plunkett Memorial Hospital in Adams and the Fairview Hospital in Great Barrington; died March 13, aged 59, of coronary thrombosis.

Eva C. Roloson, Delaware, Ohio; Eclectic Medical Institute, Cincinnati, 1890; died March 18, aged 87, of cerebral hemorrhage.

Eugene Rush • Philadelphia; Jefferson Medical College of Philadelphia, 1914; a graduate in pharmacy; member of the American Academy of Pediatrics; served overseas during World War I; on the staff of Mount Sinai Hospital; died in Jewish Hospital February 19, aged 60, of coronary thrombosis.

Martin Joseph D. Ruzicka, Lincoln, Neb.; Marquette University School of Medicine, Milwaukee, 1934; served on the staff of Lincoln (Neb.) State Hospital and the Lincoln (Ill.) State School and Colony; died in March, aged 41.

Reverdy Sasscer, Upper Marlboro, Md.; University of Maryland School of Medicine, Baltimore, 1897; died March 28, aged 74.

Joseph Henry Sayer • Seattle; University of Nebraska College of Medicine, Omaha, 1909; an Associate Fellow of the American Medical Association; served overseas during World War I; member of the board of trustees of Doctors Hospital; for many years affiliated with Columbus Hospital; died March 17, aged 70, of carcinoma of the stomach.

Joseph Scattergood • West Chester, Pa.; University of Pennsylvania Department of Medicine, Philadelphia, 1894; for many years secretary of the Chester County Medical Society; formerly county medical director; for many years secretary of the Pennsylvania Railroad Surgeons Association; affiliated with Chester County Hospital and Darlington Sanitarium; died March 18, aged 79, of cerebral hemorrhage.

Rene George Schirber • New Brunswick, N. J.; Long Island College of Medicine, Brooklyn, 1935; served during World War I; served in the medical corps, Army of the United States, during World War II and was twice awarded the Bronze Star for bravery in action in the New Guinea and Philippine campaigns; on the staffs of St. Peter's and Middlesex General hospitals; died in New York March 19, aged 49.

Henry Junius Schireson, Philadelphia; notorious as an advertising plastic surgeon; Maryland Medical College, Baltimore, 1906; died March 27, aged 68, of chronic myocarditis.

Frederick William Schultz, Sarasota, Fla.; Milwaukee Medical College, 1903; served during World War I; died March 18, aged 78, of hypertension and cardiac failure.

Edgar Floyd Sewall • Somerville, Mass.; Tufts College Medical School, Boston, 1913; affiliated with the Somerville (Mass.) Hospital, Winchester (Mass.) Hospital and the Symmes Arlington Hospital in Arlington; died March 22, aged 63, of coronary artery disease.

Grace Edgar Spiegle, Philadelphia; Woman's Medical College of Pennsylvania, Philadelphia, 1898; for many years taught at the Philadelphia Normal School; died March 16, aged 95, of pneumonia.

John M. Stevenson, Moscow, Tenn. (licensed in Tennessee in 1913); died March 7, aged 72, of intestinal obstruction due to carcinoma.

Ralph Lincoln Sweet • Seattle; University of Pennsylvania School of Medicine, Philadelphia, 1913; served during World War I; on the staff of Columbus Hospital; died March 27; aged 62, of rupture of the heart.

David Taylor • Yellow Springs, Ohio; Rush Medical College, Chicago, 1934; past president of the Green County Medical Society; served during World War II; died March 26, aged 50, of brain tumor.

Mark Marcus Temkin, Beaver Dam, Wis.; University of Wisconsin Medical School, Madison, 1933; member of the American Medical Association; served during World War II; died in Wisconsin General Hospital, Madison, March 25, aged 39, of coronary occlusion with infarction.

Alphonse Aloisius Thibadeau, Buffalo; University of Toronto Faculty of Medicine, Toronto, Canada, 1906; formerly on the faculty of the University of Buffalo School of Medicine; on the staff of the Roswell Park Memorial Institute; formerly on the staffs of Emergency, Mercy, Millard Fillmore, Children's, and Buffalo General hospitals; died April 6, aged 64, of coronary thrombosis and diabetes mellitus.

Alvin Stewart Thurston • Council, Idaho; University of Illinois College of Medicine, Chicago, 1925; served during World War I; county health officer; founded Community Hospital; died April 8, aged 50, of heart failure and hypertension.

Oscar Byron Tiller, Chipley, Fla.; University of the South Medical Department, Sewanee, Tenn., 1908; died April 7, aged 70.

John Michael Toomey, Lancaster, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1923; served during World War I; died March 15, aged 52, of carcinoma of the jaw and mouth.

Hugh O. Turrentine, North Little Rock, Ark.; Kansas City (Mo.) College of Medicine and Surgery, 1920; affiliated with Baptist State Hospital and St. Vincent Infirmary in Little Rock; died April 10, aged 51, of acute coronary occlusion.

Emanuel Theodore Urban, St. Louis; Washington University School of Medicine, St. Louis, 1902; member of the American Medical Association; died in Barnes Hospital April 11, aged 71, of arteriosclerosis.

Harry Warren Vinson • Ottumwa, Iowa; Rush Medical College, Chicago, 1902; fellow of the American College of Surgeons; past president and for many years secretary of the Wapello County Medical Society; affiliated with St. Joseph Hospital and Ottumwa Hospital, where he died April 8, aged 73, of coronary thrombosis.

Heber H. Ward, Brooklyn; Kentucky University Medical Department, Louisville, 1905; on the staff of Samaritan Hospital; died March 31, aged 67.

Hobart Endicott Warren • Palm Beach, Fla.; Harvard Medical School, Boston, 1894; at one time on the staff of the Beverly (Mass.) Hospital; served on the staffs of the Good Samaritan Hospital and St. Mary's Hospital, where he died March 17, aged 80, of cerebral hemorrhage.

Charles M. Watson • Pittsburgh; Western Pennsylvania Medical College, Pittsburgh, 1900; on the staff of Presbyterian Hospital; died in Tucson, Ariz., March 11, aged 73, of cerebral hemorrhage.

Flora M. Watson-Reeves, Los Angeles; Hering Medical College, Chicago, 1893; died March 8, aged 93, of coronary occlusion and arteriosclerosis.

Caroline Weis, Los Angeles (licensed in California in 1918); died recently, aged 77, of a heart attack.

Walter Weller • Clearwater, Fla.; Cornell University Medical College, New York, 1918; member of the Medical Society of the State of New York; affiliated with the University of Florida Infirmary in Gainesville; died March 11, aged 57, of injuries received when the automobile which he was driving was struck by a train.

Frank Fay Williams • Canton, N. Y.; New York Homeopathic Medical College, 1883; for many years health officer and jail physician; on the staff of the Potsdam (N. Y.) Hospital, where he died March 13, aged 91, of injuries received when his automobile was struck by a train.

Arthur Carl Woggon • Rochester, N. Y.; University of Buffalo School of Medicine, 1920; specialist certified by the American Board of Obstetrics and Gynecology; chief of obstetrics and member of the board of directors of the Park Avenue Hospital; on the staffs of Monroe County Hospital, Strong Memorial Hospital and the Rochester General Hospital, where he died March 16, aged 52, of coronary occlusion.

Emil Edward Wolf, Orlando, Fla.; Western Reserve University Medical Department, Cleveland, 1916; served in France during World War I; died April 21, aged 57, of uremia.

Samuel Wolf • Philadelphia; Medico-Chirurgical College of Philadelphia, 1909; on the staff of Mount Sinai Hospital, where he died March 22, aged 77, of carcinoma of the colon.

Emil Rudolf Zak • New York; Medizinische Fakultät der Universität, Wien, Austria, 1901; on the staff of the Beth David Hospital; member of the New York Academy of Sciences; died in Montefiore Hospital March 22, aged 72, of cerebral hemorrhage.

Samuel Lutz Zurmehly, Rushsylvania, Ohio; Miami Medical College, Cincinnati, 1890; served during World War I; died April 7, aged 88, of heart disease.

DIED WHILE IN MILITARY SERVICE

William Calaway • Major, M. C., U. S. Army, San Bernardino, Calif.; Baylor University College of Medicine, Dallas, 1933; entered the medical corps of the U. S. Army in March 1939; surgeon at the Muroc Air Force Base; died Dec. 3, 1948, aged 40, of injuries received in an aircraft accident.

Innervation of the Digestive Tract

The second meeting of the Sociedad Española de Patología Digestiva y de la Nutrición on Dec. 17-18, 1948, in Madrid was attended by a large and very important audience. Drs. Vara Lopez, Lozano Blesa and Soler Roig spoke on "Surgical Methods to Improve Results in Treatment of Gastroduodenal Ulcers." Many took part in the discussion which followed this presentation.

Drs. Fernando de Castro, Pablo de Sala and J. M. Blanco spoke on "Peripheral Sensorial Routes of the Digestive Tract." The speaker with his collaborators stated that the afferent innervation of the gastrointestinal tract is identifiable. By using Irving's technic (stimulation of the inhibitory pupillary reflex through route of the third cranial nerve) and their own method of crossed anastomoses of the nerves, they confirmed the conclusions of other researchers that the sensorial endings of the stomach and of the intestines are stimulated by distension, whereas section and burning of the wall do not produce pain. They also found that during gastric digestion nerve endings are spontaneously stimulated and the impulse progresses through the afferent route of the vagus nerve and elicits reflex responses, whereas when the stomach is empty and its walls at rest, either reflexes do not occur or if they occur they are but few and of a limited transmission. The vagal innervation is very scanty in the duodenum, and even more scanty in the jejunum and in the ileum.

The speaker said that these experiments are not sufficient to determine whether or not the receptors of the vagus nerve which are physiologically stimuable by distension are the ones which in certain circumstances transmit pain. It is also difficult to find out whether the sensorial receptors of the splanchnic, which when stimulated provoke the inhibitory pupillary reflex, are predominantly pain receptors.

The results of these studies confirm the statements of Irving, McSwiney and Suffolk; namely, that all the segments of the gastrointestinal tract receive nerve supply from the vagus and the splanchnic nerves, with the exception of the jejunum and the ileum, which have only splanchnic innervation. However, the vagus and the splanchnic nerves do not contribute equally in the innervation of the duodenum and the stomach. These investigations showed that afferent fibers of the vagus supply the cardia, the fundus and the anterior portion of the body of the stomach. On the other hand, the innervation of all the remaining portion of the stomach, the antrum and the pyloric sphincter is constituted by a proportional number of afferent fibers of the vagus and of the splanchnic nerves. The innervation of the duodenum is predominantly splanchnic.

These studies also confirm those of McSwiney and Suffolk; namely, that the different segments of the digestive tract from the body of the stomach to the ileum are supplied by a rich afferent splanchnic innervation which is constituted by sensorial neurons corresponding to many spinal pairs. The areas receiving the largest innervation are the body of the stomach and the pyloric sphincter, which are supplied by fibers corresponding to no less than ten segments of the spinal cord.

The work carried on by de Castro, de Sala and Blanco is an important contribution to the histophysiology of the nervous system.

GENEVA, May 4, 1949.

Conference of the Red Cross

The opening session of the Diplomatic Conference of Geneva to revise the Conventions of the Red Cross was marked by a decision to humanize war. This effort has to be made in peace time, as it is impossible to realize such agreements once a conflict has broken out. Mr. Petitpierre, president of the conference, said that one often hears that "the Conventions of Geneva did not hinder the atrocities of the last war, so what good is it to prepare new texts which will not be respected?" Against this decidedly negative opinion, he advances the idea that humanizing war should not be abandoned, just because it cannot be realized as completely as is desired.

The continued efforts of the International Committee of Military Medicine, which the International Committee of the Red Cross supported and developed, resulted in a reunion of governmental experts at Geneva in 1937 and 1938. This reunion, which was resumed in 1947 and 1948, terminated in the present efforts.

Object of the Conference.—These debates will last several weeks and all the great moral principles of medicine will be discussed. It is necessary that the physician be concerned with the spiritual forces which must govern his profession. The humanitarian conventions constitute the veritable charter of medicine in times of war.

I. The Status of Captured Medical Personnel: This is one of the most controversial questions. The British want to consider him as a prisoner of war, but a majority of the delegates approve the position taken by the International Committee of Military Medicine, which holds that the physician, not being a combatant, cannot be treated as a prisoner of war; he must, on the contrary, continue his activity in full professional liberty to the benefit of his prisoner comrades.

II. Medical Service in Prisoner of War Camps: This service must offer absolute guarantees to avoid in both civil and military camps actions comparable to those during the past war. Moreover, it is necessary to augment the immunity conferred on the medical personnel which assures this service. One could even arrive at the concept that a physician of neutral nationality should have the medical direction of the camp.

III. Efficient Guaranties of the Convention: Until now the texts gave to protective powers the charge of the interests of the belligerents and especially those of the prisoners. Now there has been evoked anew the creation of an international organization which would have this mission. Without prejudging the decision which will be taken, it is evident that there will be considerable improvement; whatever the organization, the International Committee of the Red Cross, the Red Cross leagues, or an organization created only for this purpose in times of peace, the one or the other situation would be superior to the present situation.

IV. Charter of the Physician in Times of War: Many other points have been raised by the discussions: the guaranties of the medical profession in occupied territory, the immunities to be accorded to civilian victims or war and civil hospital establishments, the application to maritime wars and the regulations of aviation medicine. These problems constitute a veritable charter of the physician in times of war, and the physician, who is the principal beneficiary, is duty bound to interest himself in the evolution of this great historic document, which constitutes the Convention of the Red Cross. It is regretted that not all national delegations assembled at present in Geneva have a representative of our profession, because medical technics play a great part in the studies undertaken.

A Three Year Tuberculosis Survey in Oslo

On Monday, April 25, the tuberculosis department of the Oslo Public Health Service began a tuberculosis survey which will be uninterrupted, and organized in a way that everyone will be examined every third year. Dr. Eyolf Dahl, who is in charge of the tuberculosis department, is giving publicity to the survey, pointing out the many compensations for the few inconveniences imposed on the community. Persons under the age of 15 do not come within the scope of this survey, as school children under this age are already systematically examined for tuberculosis. The survey is compulsory, and all who wish to escape it must produce satisfactory evidence, such as a medical certificate, conferring exemption from medical examination. This is carried out in two stages. On the first occasion a tuberculin test is supplemented by a roentgenologic examination, and on the second occasion, three days later, the tuberculin reaction is read off. If it is negative, BCG vaccination is recommended. But it is not compulsory on this occasion, although recent legislation has provided for compulsory BCG vaccination under certain conditions. Had the new BCG law been invoked in connection with the present survey, it was feared that the medical examination would be shirked by some timid souls. The costs of this survey are borne in their entirety by the authorities, and the examinations are being carried out with such smooth efficiency that the loss of time and the minor discomforts they entail are negligible in comparison with the benefits conferred. At no cost to himself, every inhabitant of Oslo now has the chance to be reassured every third year with regard to his health from the tuberculosis point of view.

More and More Specialists

Professor Axel Ström has lately undertaken a statistical study of the conditions under which Norwegian doctors become specialists. His first point is that the proportion of doctors who become specialists has grown considerably during the past two decades. At the beginning of 1930, only 20 per cent of the members of the Norwegian Medical Association had qualified as specialists in one subject or more. In January 1949, as many as 31 per cent could claim to be specialists. Several of these doctors had taken the trouble to qualify as specialists in two or more subjects.

Professor Ström's account of the gauntlet doctors have to run in order to become specialists shows how well earned this title is. He shows that the average age of the doctors when they first qualified as specialists was 40 years, and the average length of the interval between qualifying as a doctor and qualifying as a specialist was thirteen years. These specialists had spent on the average eighty-five months in hospital studying medicine in general and certain specialties in particular. The would-be specialist who has fulfilled all that is required of him has to send in his application to rank as a specialist to a body representing the Norwegian Medical Association. This long via dolorosa does, however, lead the specialist into pleasant pastures, with the right among other things to charge a higher scale of fees than he did as a general practitioner working under the national insurance scheme. Besides, a specialty usually implies town life and all its advantages over the strenuous life of a relatively underpaid country doctor.

How and Where May a Doctor Advertise?

To some foreigners it may seem strange that the lay daily press contains the advertisements of doctors, many of whom are of high standing and holders of important academic appointments. But the advertising of doctors is kept within strict

limits by the Norwegian Medical Association. A doctor may, to be sure, advertise in the newspaper every day, but he must do so with discretion, preferably in a small space in the company of other doctors. An advertisement may state what the specialty is, but if it is surgery, for example, one does not announce the fact that one is particularly interested in some strictly limited field in surgery. If one wishes to supplement a special subject with general practice, one may advertise in both these fields, but there is at present a movement in favor of prohibiting such a blunderbuss policy. One may put a door plate over the office or surgery, but not in other houses, and one must not exhibit advertisements in hotels, railway stations or other public buildings. Advertising at cinemas and by the wireless as well as by postal circulars is also forbidden. If one has not qualified as a specialist, the services offered in the advertisement must be only those of general practice. It is the Norwegian Medical Association, to which about 90 per cent of all Norwegian doctors belong, which alone determines who is and who is not a specialist. It is also this association which decides what is ethical and what is unethical advertising. And the ethical prestige it enjoys helps it to prevent straying far from the narrow path of moral rectitude.

The Rarity of Cancer of the Stomach After Ulcer of the Duodenum

At the Drammen Hospital, Dr. O. Römcke and Dr. G. Sponland have lately given statistical proof of a hitherto rather vague impression that the subjects of duodenal ulcer do not die of cancer of the stomach. They examined 556 cases of cancer of the stomach with special reference to a history of roentgenologically demonstrated gastric and duodenal ulcer. They found 20 cases with such a history, but in 18 of them the ulcer was situated in the stomach. In 1 of the 2 cases of duodenal ulcer there was an interval of twenty years between the ulceration of the duodenum and the development of cancer of the stomach. Now the investigations of Knutsen and Selvaag in Drammen have shown what the incidence of gastric and duodenal ulcer is among persons over the age of 30 in this town, and the relative frequency of these two forms of ulcer. On the strength of these and certain other observations, Dr. Römcke and Dr. Sponland calculate that when one suffers from gastric ulcer, the chance of subsequently having cancer of the stomach is three times greater than the average, whereas when one suffers from duodenal ulcer, the chance of having cancer of the stomach is only one fifth of the average chance. They do not, however, indulge in any attempts to explain why duodenal ulcer seems to confer a certain immunity to cancer of the stomach. Incidentally, they draw attention to the considerable number (9) of cases of pernicious anaemia among their 556 cases of cancer of the stomach.

BRAZIL

(From Our Regular Correspondent)

SÃO PAULO, May 2, 1949.

Spinal Fluid and Gastric or Duodenal Ulcer

Prof. Dr. Loforte Gonçalves, of the Medical School of Porto Alegre, in Southern Brazil, performed a study on 23 patients with gastric or duodenal ulcer in connection with their spinal fluid. All the patients with a roentgenologically and/or surgically proved gastric or duodenal ulcer had an albumin content in the spinal fluid above 0.29 Gm. per thousand cubic centimeters (excepting 1 patient with a "suspected" gastric ulcer), and the cellular elements were within normal limits except in 1 patient with gastric ulcer, who had 3.8 per cubic millimeter, and another with a duodenal ulcer, who had 4.7 per cubic millimeter. They were then on the threshold of a tendency toward albumin-cytologic dissociation.

Patients with uncomplicated, nonulcerative bulboduodenitis, roentgenologically studied, presented an albumin-globulin ratio below 0.30 in the spinal fluid and cellular elements within normal limits.

With the exception of a patient who had epileptic seizures and another who was schizophrenic, all other patients presented a normal psychic status.

Prof. Loforte Gonçalves concluded that patients with gastroduodenal ulcers had spinal fluid reactions for albumin suggesting a condition of humoral reaction similar to that observed in the spinal fluid of a great number of patients with polyradiculoneuritis and encephalitis in the chronic or regression phase.

Correspondence

NEUROLOGIC COMPLICATIONS FOLLOWING ADMINISTRATION OF PERTUSSIS VACCINE

To the Editor:—Prompted by the disturbing report of Byers and Moll on the "Encephalopathies Following Prophylactic Pertussis Vaccine" which appeared in *Pediatrics* (1:437 [April] 1948), Toomey conducted a survey based on a questionnaire, the results of which were published in *THE JOURNAL*, February 12, page 448. He rejects the possibility that these reactions are due to an antigen antibody response because the children were not previously immunized. Although this is a plausible deduction based on the information Toomey had at his disposal, my reports on this problem which appeared in *The Brooklyn Hospital Journal* (2:107 [April] 1947), and with Sorley in the *New York State Journal of Medicine* (47:1016 [May 1] 1947) were apparently not available to him. In them is a description of a clinical experiment which offers conclusive evidence to the contrary. I take this opportunity to abstract the cases reported (for a detailed description, the reader is referred to the original papers) and to add a summary of a third.

CASE 1. R. T., a boy, was born at term April 12, 1943. There was a family history of allergic disturbances. At 4½ months an illness developed characterized by a persistent cough and vomiting at meal times. This probably was an undiagnosed attack of pertussis. In the second week of this illness he was given fluid pertussis vaccine (20 billion organisms). Two weeks later he became somnolent; weakness developed in the neck and sphincters, with gradual spread of the weakness and hypotonia to involve the entire body, with emphasis on the left side, in the period of a month. This was followed by a gradual improvement until the age of 8½ months, when he was considered normal. At nine months he received a second injection of pertussis vaccine (30 billion organisms). One week later a similar neurologic disorder appeared. The spread this time seemed more rapid, and, although this episode did not appear to be as severe as the first, there was little recovery. He received his third pertussis injection at ten months. Three days later another neurologic exacerbation developed with rapid spread. There was slow but steady improvement, although he remained spastic. He had a fourth exacerbation following an infection of the upper respiratory tract without any known exposure to pertussis or to the vaccine, and was never able to walk again. The parents were dissatisfied because of the child's lack of progress and consulted an immunologist, who gave the boy an intradermal injection of pertussis vaccine. The skin test was reported as negative, but twenty-five minutes later the child had sphincteric weakness, slept fitfully for twelve hours and awoke completely limp. He never recovered from the paralysis of the entire body, had difficulty in swallowing and aspirated. Death occurred from bronchopneumonia seven weeks later at the age of 43 months.

CASE 2.—In R. M., a male infant born Feb. 14, 1944, convulsions developed at the age of 7 months following a second injection with pertussis vaccine. The child received two more injections of the vaccine in quick succession, and his condition deteriorated after each injection. When studied at the age of 11 months, he presented mental deterioration, generalized convulsions and cortical atrophy. At the age of 34 months he could not walk or talk, but his convulsions had decreased somewhat. There was no note of epilepsy in the family. A maternal grandfather suffered from hay fever.

CASE 3.—In J. S., a female child, the third sibling, an encephalopathy (kernicterus) of erythroblastosis fetalis, due to sensitivity to agglutigen A, developed, and as a result she was left spastic and retarded. At seven months she received pertussis vaccine (20 billion organisms) in one arm, and 1 cc. of alum precipitate diphtheria toxoid in the other arm. Five

weeks later she was admitted to a contagious disease hospital listless, unable to cry, so rigid that meningitis was suspected and with a temperature of 106 F. The patient improved and returned to her norm. At the age of 13 months she was given a second injection of pertussis vaccine (30 billion organisms) and diphtheria toxoid. She became restless and cranky that day, had a "wheeze" the next day and could not sleep. She was readmitted to the hospital with a temperature of 104 F. and again was rigid and had difficulty in respirations. During both hospitalizations the attending physicians did not believe she had croup, could find no chest signs, and spinal fluid studies were normal. Following this episode her spasticity and weakness were much more marked. At 17 months the child was found dead in her crib. It is possible that she smothered as a result of her inability to turn the head. There was no autopsy. Because of the history of erythroblastosis one might suspect that the pertussis vaccine had been contaminated by blood; however, the vaccine used on this child was grown on sheep red cells rather than on human red cells.

I have since been informed of 4 other cases in which the administration of pertussis vaccine seemed to be followed by convulsions or some other neurologic complication.

It is questionable whether the first episode of case 1 could be ascribed to an encephalopathy complicating pertussis, or to pertussis vaccine or to both. The subsequent course of events in this case, with the last exacerbation following a minute amount of antigen, can be explained only on the basis of an antigen-antibody reaction. The other 2 cases offer confirmatory evidence. The neurologic complications described here, and by Byers and Moll, are as protean as the encephalopathies complicating whooping cough. These cases offer presumptive evidence for the supposition that the encephalopathy complicating whooping cough may be the result of an antigen-antibody reaction. Most disturbing is the fact that Byers and Moll observed 15 cases of encephalopathy complicating pertussis vaccine in a ten year period and 26 cases of encephalopathy complicating whooping cough in a like period. If these figures are generally applicable, it appears that a neurologic complication is as likely to develop following the vaccine as during the disease itself, since only 25 per cent of the children in that vicinity were immunized. Possibly, however, such a small series is not statistically significant, and Byers and Moll refrained from making such an observation.

How could such a response follow the first immunization? I can offer only partial explanations. Case 1 suggests the possibility that some of these patients may have had a previous undiagnosed attack of pertussis, but such a possibility could not be frequent. Also, Toomey selected his cases on the basis of a history of a convulsion following administration of pertussis vaccine. Such a series might be heavily loaded with epileptics and persons with low convulsive thresholds. Possibly a potentially epileptic child will convulse after an immunization as much from fright as from the antigen introduced. Significantly none of the cases seen in Cleveland and vicinity showed irreversible changes. To worry about patients with epileptic family histories would be futile, since this would include 17 per cent of the population, most of whom would not be epileptic. However, it must be admitted that Dr. Toomey's pertinent observation that such reactions may follow the first immunization will have to remain unexplained.

In view of the foregoing, it is of utmost importance to ascertain the frequency of neurologic complications following pertussis vaccine. I agree with Dr. Toomey that a report should be made of every important reaction, and complete data kept by the physician. Since an antigen-antibody reaction may be the cause of serious complications, a child should not be given a second injection of pertussis vaccine if a previous one was followed within five weeks by somnolence, irritability, convulsions or any other untoward neurologic complication. The size of the dose does not seem important. Case 1 suggests that skin testing is futile. The vaccine should not be administered in the presence of any undiagnosed disease of the nervous system, especially if such disease might possibly represent a complication of pertussis, which at times may not be recognized. The

question as to whether or not a child with a neurologic disturbance should receive pertussis vaccine will depend on the circumstances. It is better not to expose a child with an unstable nervous system to the danger of a convulsion, but a superintendent of a home for feeble-minded infants would be remiss in his duties if he did not protect his wards against the possibility of an epidemic of whooping cough. It might be wise to give an epileptic or potentially epileptic child some phenobarbital before and after the administration of pertussis vaccine. The vaccine should not be given in the presence of fever or lymphocytosis.

There are not enough reported aftermath reactions to discontinue the use of vaccine.

MATTHEW BRODY, M.D., Brooklyn.

[The letter of Dr. Brody was referred to Dr. Toomey who replies:]

To the Editor:—I have read Dr. Matthew Brody's manuscript. I was unfamiliar with the *Brooklyn Hospital Journal* report of April 1947.

As Brody states, his patient may have had undiagnosed pertussis, the patient producing his own antigen with the disease. This could institute an antigen-antibody reaction.

Patient 2 had a reaction following the second injection of pertussis vaccine, a clear-cut antigen-antibody phenomenon.

The third case is not clear—it was in a person with a neurologic disease who had a trigger type of response. There was a long incubation period of five weeks in a patient with kernicterus encephalopathy which followed the usual pattern. This might have been the etiologic factor.

I am glad to note that the author agrees that a second injection of pertussis vaccine should be cautiously given to anyone who has had a previous reaction, that injection should not be made in a person with a disease of the nervous system, except as circumstances warrant; that a patient should not be given the injection when acutely ill with something else and with fever.

Of course antigen-antibody reactions are generally accepted; possibly I did not make this clear. We only questioned how it could explain a primary reaction in children who had not received injections.

JOHN A. TOOMEY, M.D., Cleveland.

DIABETIC RETINITIS

To the Editor:—The statement has been made that in 80 to 100 per cent of diabetic persons retinitis develops within the first twenty-five years of the onset of the hyperglycemia. The thought should be expressed that these current statistics may have little validity from the point of view of future prognosis. It must be recalled that during this past twenty-five year period we have gone through three major changes in therapy. First, no insulin, then only the unmodified insulin, and, lastly, for the past approximately ten years the protamine zinc and other long-acting insulins were available. It must further be remembered that the general public distribution of these insulins postdates their availability.

The results of therapy with protamine zinc insulin cannot as yet be tabulated, as we must await a full twenty years after its introduction. Only patients whose hyperglycemia and glycosuria have precipitated after the introduction of protamine zinc insulin and who have been treated exclusively with this agent are valid subjects for statistical study of the rate of deterioration with this regimen. All patients whose diabetes antedate this era represent mixed therapy. It is to be expected that protamine zinc insulin, with its profound superior metabolic

influence, will alter the course of events. With the unmodified insulins it is to be remembered that for many hours of the day, particularly the overnight period, many of these patients were out of metabolic balance. It was common to see early morning ketonuria and decided hyperglycemia. Balance studies have shown that these patients were in negative nitrogen balance during this time. The plea must be made to avoid extreme pessimism as to the results of careful control of the diabetic person until sufficient time has elapsed to demonstrate the true validity of either the free glycosuria or the controlled glycosuria regimens with protamine zinc insulin. The burden of proof is on those who advocate free glycosuria. It is the type of study that should be made only in a large hospital center under adequate control and is not the therapeutic procedure of choice for the general practitioner.

There is still another concept in diabetic terminology which requires revision. The conventional indications for the degree of severity of diabetes must be reconsidered. The use of the total amount of insulin required to control one manifestation of this clinical syndrome should not be the index of the severity. A patient whose glycosuria is easily controlled by simple dietetic measurements but whose very existence is threatened by peripheral gangrene and retinitis cannot be considered to have mild diabetes. The extent and rapidity of deterioration should be the true index.

HERBERT POLLACK, M.D., New York.

THE DONORA DISASTER

To the Editor:—Not often is a relatively minor disaster so loaded with significance for the whole country as was that of October 30 at Donora. It deserved also more intelligent handling than it recently received in *THE JOURNAL's* Queries and Minor Notes columns (p. 1122, April 16, 1949). Highlighting as it did the growing problem of industrial air pollution, the Donora tragedy should be most closely studied in its public health aspects. Suddenly everyone realizes the prohibitive health costs to the community from industrial pollution of its atmosphere—which I have been pointing out since 1941.

Is the medical profession now to leave consideration of this serious health hazard to governmental health authorities and still further weaken its stand as the nation's health guardian? Is this profession to stand for health or for disease?

The Donora disaster offers a most pertinent case in point. The United States Public Health Service, now engaged in studying air pollution at Donora and elsewhere in the heavily industrialized Monongahela valley, had evinced no interest in this health problem previous to the October 30 disaster—it had in fact refused to grant requested financial support for our studies which have aided greatly in focusing the nation's attention on this major health hazard. Nongovernmental research opened up this problem and laid it before the public; why should medicine now stand quietly aside while governmental agencies take over the field?

Even the timely symposium on air pollution at the Atlantic City American Medical Association meeting gets off to a poor start when judged by the preliminary program printed in the April 23 issue of *THE JOURNAL* (p. 1172). With editorial emphasis (p. 1150 in the same issue of *THE JOURNAL*) on its public health bearing, the symposium program treats of this most important phase of the matter only as a tail end afterthought. Physicians and engineers in the field of industrial medicine have thus far evinced a major interest in the impact of industrial activities on the health of workers in the plant from the standpoint of economic hazards to management (in damage claims or lowered output). Only where industry's

liability showed signs of extending beyond the plant confines (as in the case of beryllium) had this group evinced much interest in the truly public health aspects of industrial air pollution. We need to make use of their skill and knowledge in curing the pollution evil but seemingly cannot rely on them in emphasizing its community dangers.

CLARENCE A. MILLS, M.D., Cincinnati.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers. June 20-22, Sept. 12-14. *Part III*. June, various centers. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written*. Various Centers. July 15. *Oral*. Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*. Oct. 17. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Chicago, June 19-19. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC. *Part I*. Various Centers. Feb. 3. Final date for filing application is Nov. 5. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part II*, New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Sec.-Treas., Dr. Harold A. Sohfeld, Room 1856, 122 S. Michigan Ave., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY: Chicago, Oct. 7-8. Final date for filing application is Sept. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

AMERICAN BOARD OF PEDIATRICS: *Written*. Under local monitors, June 24. *Oral*. Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec. Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: *Parts I and II*. New York, Oct. 22-24. Final date for filing application is July 22. Sec., Dr. Ernest L. Stebbins, 615 N. Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. *Special Examination*. October. Place to be announced. Final date for filing application is July 15. December, New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*. Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*. Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ALASKA: * Juneau, Sept. 6. Sec., Dr. W. M. Whitehead, Box 140, Juneau.

CALIFORNIA: *Examination*. San Francisco, June 21-23. Sec., Dr. Frederick N. Scatena, 1020 N St., Sacramento.

COLORADO: * *Endorsement*. Denver, July 5. Sec., Dr. W. W. King, 831 Republic Bldg., Denver.

CONNECTICUT: * *Examination*. Hartford, July 1. Secretary to the Board, Dr. Creighton Barker, 258 Church Street, New Haven.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

DISTRICT OF COLUMBIA: * *Examination*. Washington, Nov. 14-15. Sec., Dr. G. C. Ruhland, 4130 E. Municipal Bldg., Washington.

FLORIDA: * *Examination*. Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GUAM: *Endorsement*. Agana, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

HAWAII: * *Examination*. Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

ILLINOIS: Chicago, June 28-30. Superintendent of Registration, Mr. Fred W. Ruegg, Capitol Building, Springfield.

INDIANA: Indianapolis, June 21-23. Sec. Board of Medicine, Dr. Paul R. Tindall, 416 K. of P. Bldg.

MAINE: Augusta, July 5-6. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

MARYLAND: *Examination*. Baltimore, June 21-24. Sec., Dr. Lewis P. Gundry, 1215 Cathedral St., Baltimore. *Homopathic*. Baltimore, June 14-15. Sec., Dr. John A. Evans, 612 West 40th St., Baltimore.

MASSACHUSETTS: *Written*. Boston, July 12-15. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

MINNESOTA: * Minneapolis, June 21-23. Sec., Dr. Julian F. DuBois, 230 Lowry Medical Arts Bldg., St. Paul 2.

MISSISSIPPI: Jackson, June 21-22. Asst. Sec., Dr. R. N. Whitfield, State Board of Health, Jackson.

MONTANA: Helena, Oct. 3-5. Sec., Dr. Otto G. Klein, First National Bank Bldg., Helena.

NEVADA: Carson City, Nov. 7. Sec., Dr. George H. Ross, 112 N. Curry St., Carson City.

NEW HAMPSHIRE: Concord, Sept. 8-9. Sec., Dr. J. S. Wheeler, 107 State House, Concord.

NEW JERSEY: *Examination*. Trenton, June 21-24. Sec., Dr. E. H. Hallinger, 28 West State Street, Trenton 8.

NEW MEXICO: * Santa Fe, Oct. 10-11. Sec., Dr. Charles J. McGoe, Coronado Bldg., Santa Fe.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 28-July 1. Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

NORTH CAROLINA: *Examination*. Raleigh, June 23-25. *Endorsement*. Morehead City, July 23. Sec., Dr. Ivan Proctor, 226 Hillsboro St., Raleigh.

NORTH DAKOTA: * *Written*. Grand Forks, July 5-7. *Reciprocity*. Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

OREGON: * *Examination*. Portland, July 7-9. *Reciprocity*. Portland, July 22. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Building, Portland.

PENNSYLVANIA: *Examination*. Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

PUERTO RICO: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

RHODE ISLAND: * *Examination*. Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination*. Columbia, June 27-29. *Endorsement*. Columbia, June 27-28; Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * *Examination*. Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

UTAH: *Examination*. Salt Lake City, July 13-15. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VERMONT: Burlington, June 21-23. Sec., Dr. F. J. Lawliss, Richford.

WASHINGTON: * Seattle, July 18-20. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

WEST VIRGINIA: Charleston, July 7-9. Commissioner, Public Health Council, Dr. N. H. Dyer, State Capitol, Charleston 5.

WISCONSIN: * *Examination*. Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

WYOMING: Cheyenne, June 20. Sec., Dr. Franklin D. Yoder, Capitol Bldg., Cheyenne.

* Basic Science Certificate required.

IOWA: Des Moines, July 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: *Examination*. Detroit and Ann Arbor, Oct. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

NEBRASKA: Omaha, Oct. 4-5. Director, Bureau of Examining Boards, Mr. Oscar F. Humble, Room 1009, State Capitol Bldg., Lincoln 9.

OREGON: Portland, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

RHODE ISLAND: *Examination*. Providence, Aug. 10. Administrator of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WASHINGTON: Seattle, July 13-14. Sec., Department of Licenses, Mr. Edward C. Dohm, Olympia.

WISCONSIN: Milwaukee, Sept. 24 and Dec. 3. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Annual Registration Fee: Validity of Requirements for Reinstatement after Cancellation for Failure to Pay.—The plaintiff filed a complaint against the defendant, State Board of Medical Examiners, in which he asked to have his license to practice medicine reinstated. The trial court sustained the defendant's motion to dismiss the action and entered judgment in favor of the Board, so the plaintiff physician appealed to the Supreme Court of Colorado.

The court made the following material findings of fact: 1. The doctor was duly licensed and admitted to practice medicine in the state of Colorado Jan. 6, 1925. 2. March 1, 1933, the said license of the doctor was cancelled by the board, without hearing or notice to the doctor, under the asserted authority conferred on the board by section 11, chapter 109, 1935 C.S.A., which provides for the payment by all medical licentiates of an annual registration fee. The said statute contains the following language:

If any licentiate fails for three consecutive years to pay the annual registration fee it shall be the duty of the board without hearing or notice to cancel his license subject to reinstatement. If application for reinstatement is made the board shall reconsider the moral character and professional qualifications of the applicant upon notice and hearing before ordering reinstatement, and unless such showing shall thereupon be made to the board as would entitle the applicant to the issuance of an original license reinstatement shall be denied.

3. There was no requirement for the payment of an annual registration fee in 1925 when the doctor was licensed. The aforementioned statute was adopted in 1929. 4. The doctor paid no annual registration fee at any time prior to March 1, 1933, when the board cancelled his license. The doctor had no actual knowledge of the annual registration fee requirement provided by the 1929 statute. 5. The doctor became a nonresident when, from 1932 to 1934, he was engaged in the study of medicine at the University of Berne, School of Medicine, Berne, Switzerland, and on his return he was employed by the United States Government as a medical officer in its Industrial Medical Branch at the Port of Embarkation, Brooklyn, in which service he has continued ever since. 6. The doctor had no knowledge or notice of the cancellation action taken by the board until November 1944, when the Character Investigating Committee of the United States called that fact to his attention. 7. Jan. 15, 1945, the doctor by letter addressed to the board requested reinstatement of his license to practice medicine in Colorado and offered to pay any unpaid annual registration fees. 8. The request was denied by the board secretary who informed the doctor that he could only be reinstated pursuant to the statute of 1929; that under said statute he must possess qualifications entitling him to the issuance of an original license; that the medical school issuing the diploma on which the doctor was admitted to practice in 1925 was no longer on the accepted list; that to secure an original license he would be required to meet all the provisions of the basic science law adopted in 1937. 9. On Feb. 27, 1946, the doctor submitted a number of exhibits which, it is contended, established his further qualifications to practice. These were rejected by the board and returned to the doctor. 10. The doctor cannot meet the requirements of the basic science law and cannot meet the present requirements of the board for issuance of an original license. The plaintiff challenges the constitutionality of the annual registration law on the ground that it violates the Fourteenth Amendment of the Constitution of the United States, in that it denies to him the guarantee of due process of law; and that it is an arbitrary, discriminatory and oppressive exercise of the police powers of the state.

We consider, said the Supreme Court, only the question as to whether the statute authorizing a cancellation of the doctor's license for three years' consecutive nonpayment of registration fee, and requiring, as a condition precedent to reinstatement, that the doctor shall make such showing to the board as would

entitle him to the issuance of an original license, is a proper exercise of the police power of the state. It is a well established principle that the practice of medicine, affecting as it does the public health and safety of the people, is subject to reasonable regulation by the state in the exercise of its police power for the promotion of the general welfare and the only limit to this regulatory legislative power in prescribing conditions as to the right to practice a profession, the Supreme Court continued, is that the regulations shall be reasonable.

The statutory ground for cancellation of this plaintiff's license, said the Supreme Court, is the nonpayment for three consecutive years of an annual registration fee. Under the terms of the statute the doctor is permitted to apply for "reinstatement," but on such application he must possess qualifications, educational and otherwise, of an entirely different character from those required when he was admitted, licensed and accepted as qualified to practice medicine in 1925. The sole shortcoming on the part of the doctor, by reason of which he forfeited all his former standing as one fully qualified to practice medicine and subjected himself to tests not required when his license was granted, is that for three years he failed to pay the registration fee of \$10. Thus he is deposed as a practicing doctor, since the school of his medical training is not now on the "accredited" list, although it satisfied all requirements as of the date of his admission. The failure of the doctor to pay a small annual registration fee, concluded the court, has a very remote and disconnected relation to the promotion of morals, safety, general welfare or the public health. When, as here, a complete forfeiture is predicated on such nonpayment, and new conditions of eligibility for reinstatement, far above and beyond the payment of the delinquent fees, are attempted to be imposed, we believe that the limitations on a proper exercise of the police power have been exceeded, and that the "regulation," if such it can be called, is harsh, unwarranted and unreasonable. If this alleged "regulation" were held to be reasonable, many excellent physicians and surgeons might suffer the loss of their "valuable right" to practice their profession if, during an extended absence, or for whatever reason, they neglected for three years to pay a registration fee. They might find themselves unable, notwithstanding actual ability and experience, to meet the new qualifications for an original license. If, in fact, good and sufficient cause exists to deprive the doctor of the right to practice his profession, and if that cause or disqualification bears a fair relation to the public health, safety, morals or welfare, there is ample authority in other provisions of the medical practice act to accomplish the result of a revocation of his license.

Accordingly the judgment in favor of the board was reversed and the case remanded with directions to reinstate the plaintiff's license on payment of delinquent registration fees. *Lipset v. Davis*, 203 P. (2d) 730 (Colo., 1949).

Medical Motion Pictures

FILM REVIEW

Get Rid of Rats. 16 mm., black and white, sound, 374 feet, showing time ten minutes. Produced in 1948 by the National Film Board for the Department of National Health and Welfare, Ottawa. Procurable on rental or purchase from the National Film Board of Canada, 620 Fifth Ave., New York 20 and 400 West Madison Street, Chicago 6.

This film depicts why rats, known to be dangerous disease carriers, should be controlled. The breeding and feeding grounds of rats are dramatically featured. Control measures such as ratproofing of cellars and storage buildings and methods of depriving rodents of food and shelter so as to eliminate rat-spread epidemics are portrayed. The degree of destruction might have been more effective by presenting the damage in actual dollars and cents. More emphasis should have been placed on methods used to control rats in order to tie in more accurately with the film title. Although the scenes are taken in Canada, similar conditions are prevalent in many parts of the United States. Technically the film is well done; it can be recommended for showing to community groups to stimulate interest in connection with rat control campaigns.

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

- Religion and Psychiatry. F. R. Drake.—p. 111.

Clinical Intoxication with Potassium.—Keith and Burchell report 13 cases of potassium toxemia in 13 patients between the ages of 17 and 61 years with acute, subacute and chronic forms of bilateral diffuse nephritis. All patients died, and the clinical diagnosis was confirmed at necropsy in 10 cases. Potassium salts were administered as diuretic agents to 3 of the patients, 2 of whom had edema, and toxic effects resulted. Certain clinical symptoms such as paresthesias of the hands and feet after the ingestion of the potassium salts suggested the possible presence of potassium intoxication. The actual proof of the potassium intoxication rests on the demonstration of a coexisting hyperpotassemia and a characteristic electrocardiographic sequence in the following order of appearance: increased height of the T wave; a QRS of increased width; loss of P waves; gross intraventricular conduction defects, the electrocardiogram superficially simulating bundle branch block; cardiac arrest with irregular undulating potentials of low voltage. The serum potassium in the authors' cases varied from 7.7 to 10.5 milliequivalents per liter. Potassium toxemia produces a serious condition in the myocardium, which may be reversible but also can lead to fatal cardiac standstill. Beneficial therapeutic procedures such as the use of calcium and sodium salts and solutions of dextrose and blood can be applied and are particularly indicated in patients with early potassium intoxication. The administration of potassium salts to patients with severe renal insufficiency may be a dangerous procedure.

Streptomycin in Tuberculous Enteritis.—Mason and his co-workers treated 33 male patients between the ages of 20 and 58 years with active pulmonary tuberculosis and a complicating tuberculous enteritis with streptomycin. The daily dose of the drug varied between 1 and 2 Gm. Within this

range no difference in response was observed when the intramuscular route was used. This method may be preferable to the administration by mouth. Treatment was continued for sixty to one hundred and twenty days. Improvement was noticed by the patients practically from the time streptomycin was started. Relief of diffuse and localized abdominal tenderness, rigidity and distention came within a few days after relief of symptoms. The liquid stools became progressively soft and then formed and were reduced in number from an average of six per day to an average of two per day by the end of the first week. The presence of occult or gross blood, mucus and pus disappeared as the stools became normal. There was an average gain of 4.7 pounds (21.3 Kg.) in weight per month. Roentgen reports of 17 patients chosen because of adequate examinations before and after treatment revealed decided irregularities in the ileocecal area after ingestion of barium meal or on barium enema before streptomycin was started, and a normal cecum, terminal ileum and ascending colon fifty to three hundred days after streptomycin was started. The beneficial effect of streptomycin on ulcerating tuberculous enterocolitis secondary to pulmonary tuberculosis has thus been demonstrated clinically and roentgenologically.

Rooming-In of Baby with Mother.—Montgomery and his associates say that in July 1947 the policy of rooming the normal, full term, newborn baby with its mother was inaugurated in the Jefferson Medical College Hospital. Until April 12, 1948, 1,018 newborn babies were cared for in this fashion. Babies are kept in cribs at the mother's bedside unless one or the other is ill or unless at night baby is unusually noisy. A small crib wardrobe is hung on the end of each baby's crib. The top shelf contains covered jars for alcohol sponges, water sponges, dry cotton balls and used sponges. The larger lower shelf contains a supply of diapers, pads and blankets. With this arrangement, the mother can reach her baby and the materials for its care, and no one touches these materials except herself. If the baby has considerable mucus in its pharynx, it is kept in the central nursery until this had cleared and respiration is normal, but in not a few instances the baby is at the mother's bedside within two to three hours after delivery. The principal reasons for undertaking this project were (1) fear of contagious disease in the central nursery—infectious diarrhea, impetigo and respiratory infection—and (2) the impossibility of maintaining an adequate staff of trained nurses. Another consideration was the thought that the separation of baby from mother prevailing in the modern hospital might be destructive of a natural and normal relationship. This system has satisfied the requirements for which it was set up. There have been no ill babies. The care of the baby has been simplified. The babies seemed contented and happy; they have gained rapidly in weight, and the percentage

of breast feeding has increased. The mothers have learned to take care of the baby from the first postpartum day on and have left the hospital capable of managing the ordinary problems of infant care. The plan seems to work particularly well in small wards where mothers can watch and teach one another and can be under the frequent observation of the nursing personnel.

Use of Pooled Human Vitreous.—Fritz deals with the injection into the living human eye of pooled vitreous withdrawn from human eyes and sent to the laboratory of the Eye-Bank for Sight Restoration, Inc., as material for use in the operation of corneal grafting. He describes the technique of the collection of vitreous and the determination of its sterility. He also presents the histories of 5 patients in whom pooled vitreous was employed. He stresses that the aspirable portion of the vitreous of enucleated human eyes may be pooled and kept indefinitely under sterile conditions with no gross change in its physical properties. If withdrawn under aseptic conditions from donor eyes, the surfaces of which may be contaminated with bacteria, it remains sterile. This pooled material may be injected into the human eye without fear of bacterial contamination. The indications for this operation are loss of tone following retinal detachment, cataract extraction, injury or other reasons, and as a substitute for the aspirable portion of cloudy vitreous in a patient's eye when more conservative means fail to bring about clearing after a reasonable period of time. The further use of eye banks for the collection and storage and for the distribution of pooled vitreous to qualified ophthalmologists in addition to the original function of processing usable corneal material is apparent.

Anthrax of the Eye.—Barnshaw and Lovett say that owing to the fact that there are many leather industries in Southern New Jersey anthrax is occasionally observed. Lovett has seen 90 cases of anthrax at the Camden Municipal Hospital since 1924. There were 7 cases involving the eyes among these 90 cases; 2 of them were associated with malignant edema and 5 with malignant pustule. None of the patients with eye involvement died. The authors present the history of a patient who had worked on goat skins. The lower lid of the left eye started to swell on February 11. The swelling had increased greatly by the next morning, extending down over the cheek. The patient was hospitalized on February 12, and treatment with penicillin was ordered at once. The patient was given 30,000 units of penicillin every four hours. He received a total of 2,500,000 units. Local treatment consisted of ice compresses, boric acid ointment to the lower lid and penicillin drops. On March 1, 1947, vision was practically normal in each eye. There was a large eschar of the lower left lid which extended along the entire lid margin. The eschar slowly loosened, leaving a raw area. Ectropion developed and a tarsorrhaphy was performed. Later, Snellen sutures were placed, but proved unsuccessful to relieve the ectropion. A skin graft took successfully, but even after this there was a moderate ectropion. In July the ectropion had completely disappeared. There was only a slight amount of sagging of the lower lid.

Malignant Tumors of Cheek in Children.—Ward and Shipley report 1 case of a malignant anaplastic tumor of the right antrum in a Negro girl aged 4, and 1 case of a low grade malignant tumor arising from aberrant salivary tissue in a white female infant aged 8 months. The older child received a large and early course of radium therapy. Nineteen platinum iridium needles, each containing 2 mg. of radium element, were implanted into the tumor and left in place for 157 hours, giving a total dose of 2,993 milligram-hours, or 7 threshold erythema doses. The dose was a necrotizing one and has caused considerable deformity of the eyelid and upper lip, but with one or more plastic procedures a good cosmetic result is to be expected. The patient has had no recurrence and is living a normal life and is doing well in school five years later. The second patient received a relatively small dose of radiation (200 r per day for a total of 1,800 r), but the process continued and caused the death of the child. The favorable result obtained in the first case was due to the localized nature of the tumor, the early use of a large dose of radium and the sensitivity of the tumor to radium. Although salivary tumors of the cheek are rare, the possibility of their occurrence should be recognized and early therapy instituted.

Treatment of Cancer of Cervix Uteri.—Waterman and Tracy treated 489 of 621 patients with carcinoma of the cervix uteri, seen and examined at the tumor clinic of the Rhode Island Hospital during the period 1926 to 1941, with long,

radium element needles. The gross mortality for the 621 patients was 12 (2 per cent) and for the cases treated with radium needles it was 11 (2.2 per cent). All of these deaths were of patients with advanced disease and in anemic, debilitated and often septic states. All occurred before 1938. The fact that there was no immediate mortality from 1937 through 1946 except 1 death from embolism, which occurred on the ninth day, suggests that needles were not responsible for immediate mortality. When radium needles alone were used as the primary treatment in 258 cases, no fistulas occurred in stages I and II, and for all stages the incidence was 3.1 per cent. In 8 (10.4 per cent) of the 77 retreated patients, fistulas developed, showing the increased liability to such damage following retreatment. There seems to be a decided increase in incidence of fistulas when a combination of interstitial needles and external irradiation is used, as in the remaining 231 cases, the incidence rising from 3.1 per cent to 6.1 per cent in the primary group and from 10.4 to 18.5 per cent in the retreated group. Urinary complications other than fistulas occurred in 19 patients (3.8 per cent). Intestinal complications, fistulas not included, occurred in 16 patients (3.3 per cent). Severe inflammatory pelvic reactions occurred in 6 patients (1.2 per cent). The incidence of these complications has not exceeded that reported by other clinics using other methods. In the authors' experience, interstitial irradiation by the long radium element needles has been relatively a safe method because of the wide distribution of these weak sources, by which a more uniform irradiation of high total dosage has been attained.

Penicillin Syphilotherapy Prior to Pregnancy.—Tucker feels that it is important to know whether penicillin is required during each pregnancy in women who have received penicillin syphilotherapy. He reports 111 pregnancies during which syphilotherapy was withheld in 88 women treated with penicillin prior to these pregnancies. The original diagnosis in 72 of these patients had been primary and/or secondary syphilis and, in the remainder, early latent or early asymptomatic neurosyphilis. With one exception, all were given aqueous penicillin solution intramuscularly every two or three hours for 7.5 to 15 days and the majority received 3,000,000 units or more. Monthly clinical and serologic examinations were carried out throughout each pregnancy. Thirty mothers of healthy children were seropositive in low and constant titer at the time of

delivery. The only congenitally syphilitic child was one born of an uncooperative, seropositive mother who was not seen during this pregnancy and who was delivered at home. It is concluded that amounts of penicillin in excess of 2,400,000 units, to which the syphilitic pregnant or nonpregnant woman has responded satisfactorily, are sufficient to guarantee healthy offspring in subsequent pregnancies, provided that relapse and/or reinfection do not occur.

Streptomycin in Ambulatory Treatment of Venereal Granuloma.—Jacoby and his associates review observations on 37 patients with venereal granuloma, who were treated in the outpatient clinic with intramuscular injections of streptomycin in either an oil-beeswax mixture or an aqueous solution on each of seven to twelve consecutive days, omitting Sundays. Adequate blood levels were obtained for at least twenty-four hours. The majority of patients showed prompt symptomatic improvement. Two of this group failed to return for final evaluation, and one is still under treatment. Thirty-two of the remaining 34 were eventually cured, 28 of these after primary treatment and 4 after retreatment following relapse. Two are still not cured. Although this number is not sufficient for final conclusions as to value of this therapy, the high percentage of primary cures and retreatment cures after relapse shows a sufficiently favorable trend to indicate that this is a valuable therapeutic measure in granuloma inguinale. Equally favorable results in hospitalized patients reported by other investigators support this conclusion. A daily dose of 3 Gm. of streptomycin for seven to twelve consecutive days injected intramuscularly in ambulatory patients is a satisfactory method of treatment for granuloma inguinale.

Tuberculosis in Medical Students.—Meade says that the occurrence of several cases of clinical pulmonary tuberculosis in the student body of the University of Rochester School of Medicine prompted a study to determine the sources of infection. An intensive tuberculin testing program revealed that the majority of primary infections (as evidenced by tuberculin reaction conversions to positive) were occurring during the second academic year. Because contact with tuberculous tissues during the course in pathology seemed to be the most likely source of infection during the second year, all participation in tuberculosis autopsies and handling of tuberculous tissues by second year students were eliminated. Prior to this change of policy the average percentage of positive reactors in each class at the end of the first year was 54.2, and by the end of the second year it was 92. Following this change of policy the average percentage of positive reactors in each class at the end of the first year was 36.4; by the end of the second year it was 38.8, and by the end of the fourth year it was only 51.9. It may be argued that tuberculous infection in physicians is inevitable, that primary infections in young adults are innocuous and self limited and therefore preventive efforts are pointless. While it is true that some of the students who succeed in graduating with negative tuberculin reactions may acquire

infections later on in hospital residency or practice, it seems possible that the chances of this late infection, particularly after the hospital residency period, are less than during the undergraduate period. Studies are now in progress on the students who were tuberculin negative at graduation and who have remained for resident training. In 14 such persons followed for periods up to three years there has been only one conversion. This occurred in a pathology intern. Treatment with BCG might be advisable in exposed persons. Primary infections in young adults are not always innocuous and self limiting. The view is becoming more prevalent that the majority of cases of pulmonary tuberculosis are a direct consequence of late primary infection. If it is possible to avert the occurrence of even a very few such progressive, destructive lesions in young physicians, efforts to prevent primary infection are worth while.

Tuberculosis Among Food Handlers.—According to Boucot and Sokoloff annual physical examination is a requirement for licensure of about 43,000 food handlers in Philadelphia. In January 1947 the Division of Tuberculosis of the Department of Health inaugurated a program of annual chest roentgenograms on all food handlers. All physicians registered to examine food handlers were notified that, after completion of their examination it would be their duty to instruct the food handlers to present themselves to the food handlers' roentgenographic station, where a photofluorogram would be taken without charge. No food handler's certificate is valid unless the date of the chest roentgenogram is officially marked thereon. The authors stress that of 771 food handlers whose survey films were interpreted as tuberculous, subsequent clinical reports were available on 81 per cent after a period of follow-up varying from one to ten months. These reports confirmed the presence of tuberculosis in 76 per cent. Annual roentgenographic chest examinations in Philadelphia food handlers has proved practicable. It has resulted in the recommendation for hospitalization of 66 persons with active tuberculosis. This represents 0.25 per cent of the food handlers examined roentgenographically. Mass radiography is not merely a case-finding technic, but is a powerful method of education for both lay and professional groups.

Glomerular Nephritis.—Persike and Addis placed 2 male patients, aged 63 and 25, who were in the degenerative stage of glomerular nephritis, excreted large quantities of protein in their urine, had low concentration of serum protein and were edematous, on a diet containing adequate calories and vitamins and a carefully calculated amount of protein for four and three weeks respectively. The protein content of the diets was varied at weekly intervals and ranged from 0.2 Gm. to 2.5 Gm. of protein per kilogram of body weight. When the dietary protein was increased the proteinuria was augmented in both patients. Decreasing the amount of dietary protein resulted in a diminished proteinuria. Raising the protein intake above 0.5 Gm. of protein per kilogram of body weight did not increase the concentration of serum protein. During the week when the food protein consumed by patient 2 was reduced to 0.2 Gm. per kilogram of body weight, an inadequate amount, the con-

centration of serum protein diminished. It appears that the changes in proteinuria which occur when the dietary protein is altered are dependent not only on glomerular permeability and the rate of glomerular filtration, but also on the rate of tubular reabsorption of protein. The increased proteinuria may further tax the protein-reabsorptive ability of the tubule cells; this capacity already having been exceeded. The loss of protein in the urine may place an added burden on the mechanism by which plasma proteins are produced. Patients who have lost renal tissue should eat a minimum but adequate amount of protein, which as a rule should consist of 0.5 Gm. of protein per kilogram of body weight per day, plus an increment equal to that amount of protein lost in the urine.

Barbiturate Poisoning.—Eleven patients with severe barbiturate poisoning Newman and Feldman treated with massive doses of picrotoxin. Amounts ranging from 9 to 45 mg. per dose were given intravenously at fifteen-minute intervals. The total dose of the drug administered was 5,139 mg. in one case and 14,196 mg. in another case, much larger doses than those usually recommended. The amount of picrotoxin given must be varied according to the depth of coma, which can be judged not only by the amount of intoxicant ingested and the time elapsed before treatment is instituted, but also by the patient's response to the previous dose of picrotoxin. Pentamethylene-tetrazol is a valuable aid in the estimation of the depth of coma. There is no toxic dose of picrotoxin until a preconvulsive state is reached. After the patient begins to respond to smaller and smaller doses of picrotoxin with preconvulsive twittings, indicating an awakening of lower brain centers, therapeutic stimulation of the cortex by amphetamine is indicated, since picrotoxin is not primarily a cortical stimulant. Maintenance of fluid balance, constant vigilance in keeping the air passages clear and immediate administration of antibiotic substances to help prevent pulmonary infection are necessary if the analeptic agents are to have a chance to reverse the intoxication. Bronchopneumonia developed in 4 of the patients while they received penicillin; 1 patient had a complicating encapsulated empyema, which responded to local instillations of penicillin into the thoracic cavity. Ten patients recovered and 1 patient died. Treatment should in all cases be continued by placing the patient in the hands of a psychiatrist.

Meningeal Angiectasis of Newborn.—Potter reports 3 newborn infants with an abnormality of development in the meningeal vessels over the entire surface of the brain. The vessels were similar to those found in localized lesions in older persons which have been described under the name of meningeal angioma. The infants had a generalized involvement of all meningeal vessels, producing a diffuse angiectasis in the cranial meninges. It seems more than coincidence to the author that this abnormality of cerebral vessels has been observed on three occasions in infants who also had abnormalities of cardiac development. Could it be that the heart hypertrophied in order to supply the increased vascular bed in the meninges, or could the hypertrophy of the heart have caused a sufficient increase,

in cardiac output and pressure to be responsible for hyperdevelopment of the meningeal vessels? In either instance one would expect the arterial system to be as involved as the venous, but in all 3 infants the arteries appeared normal. It is interesting to speculate on the symptoms that would have been produced by this great increase in meningeal vessels had the infants survived. The fact that it is not a condition recognized in later life suggests that it may be incompatible with continued existence and that all those affected die in early infancy.

Acidification of Tissue Bordering Cancers.—Black and Ogle present photomicrographs showing eosinophilic cell, Paneth cell and acidophilic plasma cell reactions about carcinoma of the gastrointestinal tract. Local acidification of the tissue was found where these three groups of cells were increased, as indicated by the eosinophilic reaction of the tissue. Carcinoma cells were shown to be fragmenting and disintegrating in these acidophilic areas. It is concluded that local acidification of the tissue is a defensive response of the host. It seems plausible that the eosinophils, the Paneth cells and the acidophilic plasma cells commonly occurring in the small intestine and the appendix could be an important factor in explaining why cancer is so uncommon and tends to grow so slowly and metastasize so late in this region of the gastrointestinal tract. The large numbers of acidophilic cells occurring in the region of the pyloric fold may explain why carcinoma of the pylorus of the stomach seldom extends beyond the pyloric fold into the duodenum.

Subungual Hemorrhages and Hyperkeratoses.—Sullivan says that at the 1948 meeting of the American Dermatological Association several members from different sections of the United States reported a new entity affecting the finger nails. It is caused by the application of cosmetic preparations which are applied to the surface of the nail prior to the application of the lacquer to insure the adherence of the lacquer. Sullivan reports the case of a woman, aged 42, who, after the first application of a base coat under the regular polish, experienced a painful sensation under one finger nail. A week later another application of the base coat and nail polish was made, and that night and for several days thereafter she experienced increasing pain. When she removed the nail polish she noted a purple-brown discoloration under all of the nails. A lighter brown material had accumulated above the discolored area, beneath the nail. This material grew upward and pushed itself above the edge of the nail. Several physicians regarded the disorder as onychomycosis. Many scrapings of the material beneath the nails and cultures on Sabouraud's medium failed to support the diagnosis, and treatment for fungus infection of the nails was ineffective. She consulted the author nine weeks after the onset. He obtained no reaction to patch tests from the nail polish, but there were positive reactions to the used base coat, as well as to three other brands of base coats and to the rubber solution that is one of the ingredients of the base coats. The patient was advised to avoid further application of the base coat. Application of compresses of boric acid solutions under finger cots for one hour resulted in softening and maceration of the hyperkeratotic material, making it possible to cut away a small

amount of the protruding hyperkeratosis and to trim the nails. With this simple treatment there was symptomatic relief, and in five weeks the brown bands had grown upward and the hyperkeratotic material had been appreciably reduced. It is probable that the nail bases, when applied, are not confined precisely to the outside of the nail and that small quantities of the liquid spill behind the nail and gain access to the under surface. The author believes that if the condition remains unrecognized the patient is likely to continue the use of the nail base in an effort to cover up the unsightly appearance of the nails and thus further aggravate the condition. When the condition is severe, there is often excruciating pain, and surgical removal of the nails may become necessary.

Reflex Activity in Spinal Man.—Kuhn and Macht say that long survival when there has been complete severance of the cord has been rare until the recent world conflict with its large number of casualties from high velocity missiles. They studied the involuntary activity patterns of skeletal muscles innervated below the level of lesion in 27 verified cases of complete spinal cord transection. Observations were made on men who had survived for twenty-four to forty-two months. The levels of transection ranged from the second through the twelfth dorsal vertebra. During the periods of observation 2 patients exhibited flexor spasms alone; 2 showed approximately equal flexor and extensor spasms, and 18 displayed predominant extensor spasms. Five patients were completely flaccid below the level of the lesion. The most typical progression of reflex activity following spinal cord transection in this series of patients was: spinal shock, minimal reflex activity, flexor spasms, alternating flexor and extensor spasms and predominant extensor spasms. The length of time that different subjects remain in a given stage varies considerably. In general, stage 1 lasts for one to six weeks; stages 2 and 3, six weeks to one year; stage 4 rarely begins prior to four months after injury, and usually is terminated within one year, and stage 5 may appear as early as six months after the injury and may continue indefinitely. Extensor thrust is not common, but can be elicited occasionally in spinal man. "Spinal standing," similar to that seen in animals with transected cords, can occur in spinal man. Sustained patellar and ankle clonus frequently occurs in chronic spinal man. Primary extensor manifestations in chronic spinal man probably represent the reappearance of primitive and poorly integrated postural activity mediated by the isolated cord, the functional capacity of which seems greater than has been assumed. Although spinal man passes through a period in which flexion reflexes alone are active, he may frequently progress to a stage of activity characterized by predominantly extensor reflexes, amounting in many cases to extensor spasm. It is probable that many of the discrepancies between these observations and those of earlier investigators can be explained by the increased duration of life and, secondarily, by the better physical conditions of present day spinal men.

Treatment of Pneumococcal Meningitis.—Kershman and Peterson report 12 cases of pneumococcal meningitis treated during the last eighteen months at two Montreal hospitals. The ages of the patients ranged from 2 months to 73 years. Sulfonamide drugs and penicillin were employed in all patients.

In 9 patients sulfadiazine was given in a dosage of 2 Gm. initially and 1 Gm. thereafter every four hours. In 4 instances, soluble sulfadiazine or sulfathiazole was given intravenously or intramuscularly because the patients were not able to take oral therapy. The intramuscular dosage of penicillin varied from 5,000 to 100,000 units every three hours, the average dose being 30,000 units. In 9 of the 12 patients penicillin was also given intrathecally, and in 1 instance intraventricularly. The 1 death that occurred in this series was in a 73 year old man, who was improving clinically from his meningitis but died of bronchial obstruction caused by the aspiration of mucus and sanguineous discharge which accumulated immediately after a simple mastoidectomy and endonasal antrotomy. In 1 patient transverse myelitis developed after the intrathecal injection of penicillin. This patient also suffered intellectual deterioration, presumably the result of cerebral damage arising from his infection. The authors feel that a successful outcome in the treatment of his condition depends on the intrathecal as well as intramuscular use of penicillin and especially on early and radical treatment of the underlying focus of infection. The latter is usually found in the sinuses and mastoids.

Bronchial Aspiration.—According to Orange the most common postoperative pulmonary complication is atelectasis. This may occur as a massive lobar or lobular collapse, the latter resembling bronchopneumonia in the roentgenogram. The cause of postoperative atelectasis is usually some mechanical obstruction, such as the plugging of one or more bronchi by inflammatory exudate, thick tenacious purulent material, foreign bodies, blood, mucus, tumor or vomitus. The most critical time for the development of atelectasis is the first twelve hours postoperatively. Hypoventilation from intercostal paralysis, change in diaphragmatic action and postoperative muscle splinting due to pain, and respiratory depression due to excessive sedation are factors in its development. Chronic atelectasis may lead to lung abscess, bronchiectasis or suppurative pneumonitis. The anesthetist-bronchoscopist can prevent postoperative pulmonary complications by establishing adequate pulmonary ventilation and endobronchial drainage. Aspirated foreign material in the tracheobronchial tree should be removed bronchoscopically while the patient is still anesthetized and oxygen used liberally postoperatively. Early bronchoscopic aspiration of the postoperative atelectatic lung will usually be rewarded by a dramatic result. Posteroanterior and lateral roentgenograms, taken in suspected cases in which there may be only a slight rise in temperature, may show small areas of atelectasis which, without spontaneous cure in a few hours, should be subject to aspiration bronchoscopy. Temperature, pulse and respiration drop rapidly to normal levels soon after the bronchial tree is clear of secretions and the lung properly aerated.

*Simulation of Multiple Sclerosis and Other Degenerative Diseases of Spinal Cord by Herniation of Cervical Intervertebral Disks. P. C. Bucy.—p. 16.

Simulation of Multiple Sclerosis by Herniation of Cervical Disks.—Bucy points out that the degenerative diseases of the spinal cord, such as multiple sclerosis, primary lateral sclerosis and amyotrophic lateral sclerosis, are progressively disabling diseases for which there is no known treatment. It is of the greatest importance, therefore, to recognize other conditions with similar symptoms which can be relieved by appropriate treatment. Median herniation of a cervical intervertebral disk is such a condition. It is not a common occurrence and presumably it is generally due to injury of the cervical portion of the spine. In some cases there have been well authenticated injuries such as striking the head on the bottom or side of a swimming pool in diving, automobile accidents; falls on the head, neck and shoulder, etc. In many cases no specific injury or accident can be determined. The median herniations are usually found between the fifth and sixth or the sixth and seventh cervical vertebrae. They are of two types: those which lie in the midline and give rise to a

symmetric disturbance which is largely confined to the lower extremities and those lying a short distance lateral to the midline and compressing one side of the spinal cord. The second, less common, type gives rise to the neurologic picture known as the Brown-Sequard syndrome. The outstanding symptoms of a central herniation of a cervical intervertebral disk are muscular spasticity in the lower extremities and disturbance of equilibrium. The spasticity is out of all proportion to the muscular weakness. Patients presenting a typical picture of multiple sclerosis with relapses and remissions, multiple areas of involvement in the central nervous system, attacks of retrobulbar neuritis, diplopia and scanning speech present no diagnostic problem, but in patients with a spastic paraplegia and a disturbance of gait, with little or no involvement of the upper extremities and no abnormalities in the domain of the cranial nerves, median herniation of a cervical intervertebral disk should be considered. With these herniations conservative treatment is worse than useless. Only prompt removal is effective. Delay only aggravates the condition and may so damage the spinal cord that removal at a later date is ineffective.

Squint in Children.—Durham points out that frequently a mother consulting the ophthalmologist for the treatment of a squint in an older child will remark that the visit was delayed because the family physician assured her that the child would outgrow the deformity. Such advice is not compatible with present day teachings. From the psychologic standpoint alone, early correction of a squint is indicated, if possible, before the age of 4 to 5 years. Correct refraction with cycloplegia is the first requisite. Retinoscopy will often reveal a high hyperopia, or farsightedness, and the wearing of glasses will often reduce the deviation or relieve it. If there is subnormal vision in the squinting eye, glasses alone will not restore it, but occluding the better eye and thus forcing the use of the poorer eye, will be helpful. Occlusion, to be effective, must be total and continuous for weeks at a time. When vision of better than 20/70 is obtained in the squinting eye, orthoptic treatment may be commenced. Orthoptics is the functional part of the cure for squint, aimed at teaching fusion or the binocular use of the eyes. If the squint is of low degree, it is possible that with the adequate development of fusion, surgery can be avoided. However, even if fusion is obtainable in a squint of high degree, surgery will still be necessary to approximate ocular parallelism. Surgery is only used to obtain parallel visual axes. The surgical procedure has no effect on the visual acuity or the binocular coordination of the eyes.

Pulmonary Embolism and Coronary Insufficiency.—According to Dack and his co-workers cardiac involvement following pulmonary embolism has been so commonly attributed to acute cor pulmonale that the fact that the left ventricle

may be affected as often as the right ventricle has been overlooked. They describe clinical and pathologic studies on 40 fatal cases of massive pulmonary embolism in which electrocardiograms were recorded following the embolism. They believe that acute coronary insufficiency plays as large a part as does *cor pulmonale* in the cardiac sequelae of embolism. Electrocardiographic changes attributable to coronary insufficiency occurred more often than the classical *cor pulmonale* pattern. They were more common in older patients with antecedent coronary sclerosis and cardiac enlargement, whereas the classical *cor pulmonale* pattern occurred most often in patients with normal coronary arteries and heart size. Focal subendocardial infarction of the left ventricle, in the absence of acute coronary occlusion, was found post mortem in 9 cases. This resulted from coronary insufficiency precipitated by the pulmonary embolism in patients with antecedent coronary disease and cardiac hypertrophy who had sustained recurrent emboli. The precipitating factors of coronary insufficiency following pulmonary embolism were anoxemia, shock, right ventricular strain and reflex coronary vasoconstriction. Of these, shock associated with diminished cardiac output and coronary blood flow was considered the most important. The authors conclude that acute coronary insufficiency may be the predominant factor underlying the electrocardiographic changes and myocardial involvement in pulmonary embolism, even when right ventricular strain exists.

Cancer News. J. C. Norris.—p. 29.

Brachial Neuritis.—According to Walker rupture or herniation of a cervical intervertebral disk is the usual cause of pain which extends from the lower cervical portion of the spine into the upper extremity. The clinical picture is that of so-called brachial neuritis with pain involving one of the lower cervical nerve roots. The patient usually complains of pain over the suprascapular region, often radiating into the shoulder region and distally down the arm. If the nerve root is sufficiently damaged, there may be reflex or sensory changes, and these neurologic findings will be of considerable importance in determining which nerve root is involved and which disk is ruptured. Roentgen studies of the cervical part of the spine will aid in the diagnosis. In most cases the pain subsides spontaneously within a few days of conservative treatment consisting of rest and immobilization. Symptomatic therapy is given for the relief of pain. In the more persistent cases a cervical brace or even head traction may be useful. When the pain is severe and persists, surgical decompression of the nerve root is the treatment of choice.

Head Enlargement in Infants.—Dowman reports 1 case of internal hydrocephalus in a girl first seen at 19 days of age and followed up to 2 years of age; 1 case of communicating hydrocephalus in a boy seen first at 5 months of age and followed up to 26 months of age; 1 case of papilloma of the choroid plexus in an infant 1 month old who died three months after the removal of the tumor at the age of 4 months, and 1 case of meningomyelocele and bilateral subdural hematoma in a girl aged 2 days, with hematoma membranes removed at the age of 43 and 60 days, respectively. Routine maximum head measurements by means of a steel tape measure and comparison with a chart showing normal figures for girls and boys in the first year are recommended so that cases of head enlargement may be recognized early. Choroid excision offers the only hope for hydrocephalic patients, but the results are not dramatic. Subdural hematomas should be suspected in children with head enlargement who look intelligent, while the usual hydrocephalic patient does not look bright. Results of removal of the hematoma are rather favorable. Fontanel puncture offers considerable aid in the diagnosis of the nature of the head enlargement.

Fatal Menorrhagia in Thrombopenic Purpura.—Walsh and Donlon report 2 cases of fatal menorrhagia, both in young women aged 18. In the first patient the postmortem anatomic diagnosis was primary thrombopenic purpura. In the second patient the anatomic diagnosis on postmortem examination was secondary thrombopenic purpura, septicopyemia with milary abscesses in the kidney, serous pericarditis, cloudy swelling of the myocardium, bilateral fibrocystic disease of the ovaries and hemorrhagic cystitis. The authors emphasize that it is erroneous to consider all cases of menorrhagia, especially in the younger age groups, as due to complications of pregnancy, endocrine disturbances and pathologic changes in the uterus. Thrombocyte counts in these conditions should be as routine as red and white blood cell counts. Menorrhagia associated with blood dyscrasias is not as rare as might be suspected and is to be included in the differential diagnosis of menorrhagia. The choice of therapy is determined by hematologic and laboratory findings. The use of vitamin P is worthy of consideration. Splenectomy is indicated if megakaryocytes are present.

Prevention of Amputation Neuroma.—Teneff believes that the implantation of an amputated nerve into muscles has solved the problem of amputation neuroma. Proliferation of the neurofibrils of the severed nerves takes place in tissue which

is the same or similar to that in which the nerve endings of the amputated nerve were normally situated. It is of the greatest importance that the proliferating neurofibrils be able to proceed without interference or reactive proliferation of intermuscular connective tissue, which remains indifferent to their passage, from the sectioned surface of the nerve to the point where they take up solid connections with the muscle fibers. This method has been used in six amputations at the lower third of the thigh or the mid thigh. The sciatic nerve was implanted into an adjacent muscle, usually the biceps femoris. During the immediate postoperative period and in control examinations six to eight months after amputation, the stumps were painless and the sensation of the presence of the amputated limb was slight. In 1 case in which a thigh stump was painful the neuroma was resected and the severed nerve stump implanted into a nearby muscle, with complete recovery. Since according to most statistics painful stumps occur in more than one third of the amputations, it would seem reasonable to give this method a trial.

Sputum Cell Study for Pulmonary Carcinoma.—Shatz and his co-workers feel that examination of the sputum for neoplastic cells should be a routine procedure. They analyzed a group of 40 consecutive cases of proved carcinoma of the lung in which sputum examination were done. In 29 of the 40 cases the sputum contained obviously malignant cells. The authors outline the technic of preparing sputum slides, describe and illustrate the cellular elements encountered and set forth the characteristics of the obviously malignant cells. Since hyperchromasia is an important characteristic of malignant cells, overstaining with hematoxylin must be avoided, for it would make it impossible to appreciate the hyperchromasia of malignant cells that might be present. Another possible source of error may be the presence of degenerating normal cells. In chronic infectious diseases the normal bronchial epithelium may undergo squamous metaplasia. Fragments of the metaplastic epithelium are frequently exfoliated into the sputum and may resemble bits of well differentiated squamous carcinoma. However, these cells are arranged in an orderly fashion, have a definite polarity and usually do not contain visible nucleoli. There may be a temptation to make a positive diagnosis on the basis of one or two single cells which have all the characteristics of malignancy. It is wise in such instances to withhold the diagnosis until further specimens can be examined. When positive diagnoses are restricted to comparatively obvious cells the danger of false positive diagnoses is reduced.

Asexual Syphilis in Children.—The Municipal Social Hygiene Clinic of the Venereal Disease Control Program, Chicago Health Department, reports 20 cases of asexually acquired syphilis in children under 10 years of age during 1947. In this group there were 16 female and 4 male children. The average age was below 5 years; 4 children were siblings from two different families. In all cases one member of the household or family in a close relationship with the child had been given a diagnosis of secondary syphilis. None of the 20 infected children showed a primary lesion on examination in the clinic; in 15 children the first dark field examination was positive in results, while all 20 had positive serologic reactions. Overcrowded home conditions and lack of education in hygienic matters appear to be conducive to acquiring syphilis asexually. Education of the patient by the clinician and the epidemiologist should reduce this type of infection.

Cervical Sympathetic Block in Apoplexy.—Blain discusses the rationale for interrupting sympathetic impulses to the region of the brain involved in a vascular accident. In patients with acute apoplexy, lumbar puncture is performed immediately after admission. If the spinal fluid is bloody and under increased pressure, the diagnosis is assumed to be cerebral hemorrhage. Sudden onset of symptoms, greatly elevated blood pressure, increased white cell count, stiff neck and deepening coma are further signs of hemorrhage. In this type of patient,

cervical sympathetic or stellate ganglion block has not yet been employed. If the spinal fluid is clear with elevated pressure, if the coma is not deep and not progressive and the hypertension moderate, the presumptive diagnosis is cerebral thrombosis and the patient is referred to the surgical department for cervical sympathetic block. The results of sympathetic block in cases of long duration are not as favorable as in acute cases of cerebral thrombosis. About half of the 10 patients with disease of long duration treated by the author derived no benefit from this treatment. The technic of cervical sympathetic block can be mastered by any physician, if certain precautions are kept in mind. It is safer and easier and just as effective in apoplexy as is block of the stellate ganglion. General measures in the treatment of acute apoplexy, such as administration of oxygen and catheterization of the urinary bladder, should not be neglected.

Acute Total Body Radiation Illness.—Cronkite and Chapman analyze the importance of total body radiation illness in relation to atomic bombing and describe the clinical aspects of this disease on the basis of the Japanese experiences at Hiroshima and Nagasaki and of experimental data. They discuss the pathogenesis primarily from the standpoint of the initial injury of sensitive cellular systems, and the possible presence and influence of circulating toxins from injured tissues and the bowel. The authors feel that the stockpiling of therapeutic agents other than the antibiotics cannot be advised at the present time, but plans should be formulated by each geographic area for the decentralized operation of blood banks and blood transfusion services. In order to improve our understanding of this illness, it is necessary to investigate various factors such as the influence of diet and environmental factors on survival after exposure to doses in the lethal range; the relationship of the adaptation syndrome and the pituitary-adrenocortical mechanism to radiation illness, and the role of autosensitization and anaphylactoid phenomena in radiation illness. The development of an easily read dosimeter is desirable.

Aminophylline in Primary Dysmenorrhea.—According to Anderson and McIntyre primary dysmenorrhea is characterized by pelvic pain of various degrees unassociated with any demonstrable pathologic changes in the pelvis. This periodic pain is frequently accompanied by nausea and vomiting as well as severe headache and usually backache. Although this symptom complex is not a true disease entity, the disability frequently results in economic loss, and during the adolescent years the young girl may lose time from school. The authors tried

aminophylline because of the effect of this drug on smooth muscle. Patients from the clientele of one of the authors and nurses were the subjects of this study. A total of 100 cases were observed. The tablets used contain a combination of aminophylline, caffeine, acetophenetidin, acetylsalicylic acid and sodium iron pyrophosphate. The patient was advised to take two tablets every two hours with a maximum of five tablets per day. Placebos given to exclude the psychic element did not produce the same effect. Aminophylline alone produced slightly less favorable results than did the combination of drugs. The tablets containing the combination of drugs produced satisfactory results in 70 per cent of the cases and partial relief in an additional 16 per cent; the remaining 14 per cent obtained no relief.

Effect of Calcium Gluconate on Arachnidism.—According to Greer the black widow spider (*Latrodectus mactans*), is prevalent throughout North, Central and South America and especially in the Southern United States. These spiders may be found in dark corners and in closets. The author presents observations on 6 patients who had been bitten by black widow spiders in the course of seven days in a tropical area. The syndrome usually followed a similar pattern: transient excruciating local pain at the site of the spider bite and rapid local edema and redness of the skin at the site; in ten to fifteen minutes a "burning sensation" that spread centrifugally from the site of the bite and soon involved the whole body, passing off in about twenty to thirty minutes; a sudden abdominal pain, often cramplike as in an acute surgical condition of the abdomen; cramplike pains in the legs, arms and back; a general feeling of utter weakness; restlessness and extreme fear reaction, often hysteria; headache, nausea and vomiting, and burning of the soles of the feet. The patients in this series were immediately given 10 cc. of 10 per cent calcium gluconate intravenously. Subsequently they were given a saline infusion containing 10 cc. of 10 per cent calcium gluconate. An ice bag was applied to the affected area. Relief was obtained in a short time in all cases and was followed by profound sleep. The patients were out of bed the next day and back to duty on the fourth day. Even the 2 patients in profound shock responded. The author says that about sixty preparations have been recommended for arachnidism. Alcohol seems to be contraindicated, since fatal results have been reported from it. Other preparations are antivenin (*Latrodectus mactans*), convalescent serum, and neostigmine methylsulfate. Gilbert and Stewart recommended the calcium salts. The author stresses that arachnidism is more frequent than reports would indicate. It may simulate appendicitis, perforated viscus, peritonitis or any other acute surgical emergency. The syndrome following the bite of *Latrodectus mactans* may give symptoms referable to many systems of the body. Nervous, cardiac, renal, pulmonary and cutaneous manifestations may be present. Burning of the feet may be pathognomonic in arachnidism.

Perforation of Interventricular Septum.—Ford presents the history of a woman, aged 72, in whom there developed an interventricular defect at the site of an infarct high in the septum. The rupture developed just beneath the membranous septum. Electrocardiographic examination shortly before death showed second degree heart block as well as the characteristic changes of posterior infarction. A loud systolic murmur was heard at the apex, but the patient was not observed for enough time for the time of development of the murmur to be established.

Channeled Urethral Stone.—Drummond presents the case of a woman, aged 77, who had a urethral calculus with a tunnel down its center, through which the bladder was emptied. According to the author it has never been determined definitely whether calculi of the urethra in the female occupy preexisting pouches (diverticula) or whether these sacculations are formed by the stone. In this case it would seem that calcific deposits were arrested at a narrowed external meatus, and that the distensibility of the urethra proximal to the external meatus allowed the continual formation of stone deposits over a period of years, which gradually filled in a central opening through which the patient voided, largely involuntarily.

Dietary and Occupational Considerations in Urogenital Disorders.—Burkland shows that attention to the proper diet, fluid intake and bowel habits with the avoidance of irritating foods and beverages such as condiments, spices, alcohol, coffee, tea, cocoa and the cola drinks and avoidance of certain occupations and sports can be beneficial adjuncts in the treatment of irritative, inflammatory and calculous disease of the urogenital tract. The author also presents suggestions for the treatment of patients with solitary and polycystic kidneys and for the prevention of recurrence of urinary tract calculi. Emphasis is placed on a nutritious, high vitamin, nonirritative diet with

copious drinking of water and the elimination of certain foods rich in stone-producing substances such as calcium, phosphorus, oxalic acid and the purine proteins in the diet of patients who have had renal stones. Seven illustrative cases are presented.

Cyanosis in Infants Caused by Well Water.—Harper adds to the number of previously reported cases that of another infant in whom cyanosis developed apparently as the result of being fed with a formula that had been prepared with well water of an abnormally high nitrate content. The cyanosis disappeared after the formula was prepared with different water. The author points out that other investigators have demonstrated that the ingestion of nitrate will cause methemoglobinemia in only those infants who have a low acidity of the gastric juice (a pH higher than 4.0). The low acidity permits the growth of several organisms which are capable of reducing nitrate to nitrite in the upper gastrointestinal tract. The absorption of this nitrite by the blood stream produces the methemoglobinemia and cyanosis. The normally high values of gastric acidity in adults explain why they never exhibit cyanosis from drinking water with a high nitrate content.

Endometrial Carcinoma.—Diddle feels that the importance of endometrial carcinoma is underestimated because of two incorrect assumptions: that it is of infrequent occurrence and that the prognosis is generally good. This report is concerned with 221 women with a histologic diagnosis of endometrial carcinoma treated in Dallas, Texas, between 1935 and 1946, inclusive. The disease was often unsuspected and its true pathologic nature was not understood. Inappropriate surgical procedures were frequently used. Laparotomy was often done without an antecedent diagnostic curettage, indicating that cancer was not suspected. This mistake frequently precluded the proper use of irradiation and of suitable surgical measures. Endometrial carcinoma is predominantly a disease of the menopausal and postmenopausal periods of life. The early signs of the disease are usually scant vaginal spotting of blood or leukorrhea. Diagnosis is dependent on the microscopic study of tissue obtained by curettage. Since cervical, tubal and ovarian metastases may occur, the necessity of total hysterectomy and bilateral salpingo-oophorectomy is obvious. Five year survival rates of 65 to 75 per cent have been obtained with this radical surgical treatment. There is evidence that irradiation given a few weeks before operation produces a beneficial effect. It damages the neoplastic cells so that they apparently are less likely to survive if spilled into the surgical field. The optimum time for operation is four or five weeks after irradiation.

Folic Acid in Celiac Disease.—Hay reports on 22 infants and children who had celiac disease and were treated for a period with a low fat and high protein diet, liver extract and vitamins. Folic acid was then added to the treatment for a comparable period. The clinical condition of the children during these periods was compared by observations on rate of gain in weight and on the character of the feces as seen with the naked eye. No conclusive evidence was obtained of any beneficial effect of the folic acid.

Pneumonia in the Newborn from Inhalation of Gastric Contents.—Rhaney and Macgregor, in the course of performing postmortem examinations in cases of neonatal death, noted occurrence of pneumonia with certain special features, which they believe to be caused by the aspiration of stomach contents. An extensive survey of the available literature revealed that little attention had been devoted to this condition. The authors analyze clinical and necropsy data from 41 cases observed between 1939 and 1946. The main pathologic features were extensive consolidation with hemorrhage and a tendency to supuration. Microscopically, digestion of tissues and lysis of blood in relation to aspirated material were characteristic. Attention is drawn to predisposing factors with particular reference to prematurity. There seems to have been an increase in the condition during the last two years under review, and it is assumed that this may be related to a shortage of the nursing staff.

Erythema Nodosum After Administration of Sulfathiazole.—According to Doxiadis and McLean the occurrence after the administration of sulfathiazole of a rash similar to erythema nodosum (sulfathiazole erythema nodosum) has been reported frequently. Lofgren has investigated this problem most thoroughly in adults and has concluded that the eruption is not an ordinary drug rash, but is similar in nature to erythema nodosum, the sulfathiazole being a provocative factor only. The present investigation confirms Lofgren's general conclusions. The material for this investigation consists of (a) 17 children in whom a course of sulfathiazole preceded the first appearance of a skin rash similar to erythema nodosum and (b) 32 children to whom sulfathiazole was given for therapeutic or experimental purposes at varying intervals after an eruption of erythema nodosum. Twelve responded with an eruption of lesions similar to erythema nodosum and 20 did not. In addition the case histories of another 18 children with one or more courses of sulfathiazole for various infections were studied. On the basis of clinical biologic and histologic data the authors conclude that this manifestation is not a "drug rash" due to allergic sensitivity to sulfonamide compound, but is fundamentally the same as erythema nodosum. In order to elicit an eruption of erythema nodosum, sulfathiazole must be given to subjects who are in the active stage of one of the infections commonly associated with spontaneous erythema nodosum. It is, therefore, a provocative and not an etiologic factor.

*Heart in Pneumoconiosis of Coalminers. A. J. Thomas.—p. 282.

U Wave Inversion.—Palmer says that the U wave when first recognized in 1906 by Einthoven was regarded as pathologic. Since then the normality of upright U waves, except perhaps in cases in which they are unusually high, has been generally conceded. Various hypotheses have been advanced to explain the U wave, of which the most satisfactory is that of Hoff and Nahum (1938), who concluded that it undoubtedly forms part of the ventricular complex, and is coincident in time with the supernormal phase. Palmer's interest in negative U waves was stimulated by noticing their appearance in the after-exercise tracing of a patient with angina pectoris. Subsequently 6 further such patients were found. All were males, and in all of them pain was easily induced by effort. None gave a history of a previous clinical attack of coronary occlusion. Six of the 7 had hypertension. Temporary U wave inversion appeared during anginal attacks that were induced by exercise. The pattern of U wave inversion seen most frequently was made up of negativity in lead I and in the left chest leads, and positivity in lead III. The association in individual chest leads of sharply pointed, symmetric, positive T waves with inverted U waves occurs in patients with angina pectoris during exercise. Discordancy in direction of development of T and U may occur in the chest leads during exercise. Four cases are described of inversion of U in one or more leads as an isolated electrocardiographic abnormality. Inversion of U when seen in tracings showing bundle branch lesions is probably the result of associated myocardial damage rather than of the conduction defect as such. The R-U time interval may decrease as the heart rate increases. Inversion of U in one or more leads is pathologic.

The Heart in Pneumoconiosis.—According to Thomas, pneumoconiosis can cause pulmonary heart disease, a condition also called cor pulmonale. He presents the results of clinical studies on the cardiovascular system of 96 coal miners with pneumoconiosis. Patients with cardiovascular disease other than that resulting from the pulmonary disorder were excluded. Eleven of the patients had failure of the right side of the heart and another 24 had evidence of enlargement of the right ventricular outflow tract. Roentgenologic examination was of the greatest value in the early detection of involvement of the right side of the heart. Electrocardiographic examination has been helpful in some cases.

Pregnancy Complicated by Diabetes Mellitus.—Barns and Morgans observed during the past twenty years 45 patients with definite diabetes mellitus in fifty-eight pregnancies. The high incidence (1 in 580 deliveries) is due to the fact that a number of the patients were referred to the obstetric unit from the diabetic clinic of the hospital. Pregnancy in the diabetic patient is infrequent because of the decreased fertility of the diabetic patient and because diabetes is more common in women during the latter portion of the child-bearing period, when pregnancy is less frequent. In the majority of patients the carbohydrate tolerance was found to diminish as pregnancy

Channeled Urethral Stone.—Drummond presents the case of a woman, aged 77, who had a urethral calculus with a tunnel down its center, through which the bladder was emptied. According to the author it has never been determined definitely whether calculi of the urethra in the female occupy preexisting pouches (diverticula) or whether these sacculations are formed by the stone. In this case it would seem that calcific deposits were arrested at a narrowed external meatus, and that the distensibility of the urethra proximal to the external meatus allowed the continual formation of stone deposits over a period of years, which gradually filled in a central opening through which the patient voided, largely involuntarily.

Dietary and Occupational Considerations in Urogenital Disorders.—Burkland shows that attention to the proper diet, fluid intake and bowel habits with the avoidance of irritating foods and beverages such as condiments, spices, alcohol, coffee, tea, cocoa and the cola drinks and avoidance of certain occupations and sports can be beneficial adjuncts in the treatment of irritative, inflammatory and calculous disease of the urogenital tract. The author also presents suggestions for the treatment of patients with solitary and polycystic kidneys and for the prevention of recurrence of urinary tract calculi. Emphasis is placed on a nutritious, high vitamin, nonirritative diet with

copious drinking of water and the elimination of certain foods rich in stone-producing substances such as calcium, phosphorus, oxalic acid and the purine proteins in the diet of patients who have had renal stones. Seven illustrative cases are presented.

Cyanosis in Infants Caused by Well Water.—Harper adds to the number of previously reported cases that of another infant in whom cyanosis developed apparently as the result of being fed with a formula that had been prepared with well water of an abnormally high nitrate content. The cyanosis disappeared after the formula was prepared with different water. The author points out that other investigators have demonstrated that the ingestion of nitrate will cause methemoglobinemia in only those infants who have a low acidity of the gastric juice (a pH higher than 4.0). The low acidity permits the growth of several organisms which are capable of reducing nitrate to nitrite in the upper gastrointestinal tract. The absorption of this nitrite by the blood stream produces the methemoglobinemia and cyanosis. The normally high values of gastric acidity in adults explain why they never exhibit cyanosis from drinking water with a high nitrate content.

Endometrial Carcinoma.—Diddle feels that the importance of endometrial carcinoma is underestimated because of two incorrect assumptions; that it is of infrequent occurrence and that the prognosis is generally good. This report is concerned with 221 women with a histologic diagnosis of endometrial carcinoma treated in Dallas, Texas, between 1935 and 1946, inclusive. The disease was often unsuspected and its true pathologic nature was not understood. Inappropriate surgical procedures were frequently used. Laparotomy was often done without an antecedent diagnostic curettage, indicating that cancer was not suspected. This mistake frequently precluded the proper use of irradiation and of suitable surgical measures. Endometrial carcinoma is predominantly a disease of the menopausal and postmenopausal periods of life. The early signs of the disease are usually scant vaginal spotting of blood or leukorrhea. Diagnosis is dependent on the microscopic study of tissue obtained by curettage. Since cervical, tubal and ovarian metastases may occur, the necessity of total hysterectomy and bilateral salpingo-oophorectomy is obvious. Five year survival rates of 65 to 75 per cent have been obtained with this radical surgical treatment. There is evidence that irradiation given a few weeks before operation produces a beneficial effect. It damages the neoplastic cells so that they apparently are less likely to survive if spilled into the surgical field. The optimum time for operation is four or five weeks after irradiation.

Inunctions with Pyribenzamine® for Pruritus Vulvae.—

Zondek and Bromberg failed to effect improvement in vulval pruritus caused by allergy to endogenous hormones, by the oral administration of antihistaminic substances. They therefore resorted to local administration of the antihistaminic pyribenzamine hydrochloride®-(tripeleppamine hydrochloride). Glycerin seemed to be the most suitable vehicle for local administration, because it readily penetrates the skin. The 14 patients who were selected for this therapeutic trial had had vulval pruritus for six months to twelve years. Allergy to endogenous hormones was the etiologic factor in 3 of these cases, vitamin deficiency in 4 cases, diabetes mellitus in 2 cases, menopause in 1 case, vaginitis due to *Trichomonas* in 2 cases, vulvo-vaginal mycosis in 1 case and psychoneurosis in 1 case. In order to eliminate errors in the interpretation of the effects of tripeleppamine, each patient was first treated by local an-

between delayed union and pseudarthrosis (nonunion) is made from the roentgenogram. If a sclerotic plug of bone fills the medullary cavity pseudarthrosis is established and surgery is the only solution. The author reviews observations on 69 cases of uninfected pseudarthrosis of the long bones treated at his clinic from 1935 to 1946. Surgical procedures for the treatment of pseudarthrosis aim to break down the sclerotic barrier. By removing the pseudarthrosis tissue, including the sclerotic bone, conditions are made favorable for the development of granulation tissue with new vessels and osteoblasts from the surrounding tissue. If there is good contact between the bone fragments and little movement between them, some form of bone perforation—e. g., Beck's drilling—is sufficient, but usually a bone graft is preferable. In 70 per cent of the cases union was effected after one operation and in 13 after a second operation. The average consolidation time was 5.4 months for Beck's drilling, 7.2 months for inlay grafts and 15 months for Küntscher nailing.

advanced. In some, however, it increased prior to delivery, and it is possible that estrogens given therapeutically may have been a factor in this improvement. The tendency for hydramnios to develop in the pregnant diabetic was confirmed. It was found that hypoglycemic symptoms and coma tend to occur in early pregnancy, and ketosis and diabetic coma in the latter part of pregnancy. There is a greater tendency for late pregnancy toxemia to develop in the diabetic than in the non-diabetic. The maternal prognosis is good, and pregnancy does not make the diabetes worse provided that it is well treated. The late fetal mortality was 55 per cent in a first series of 43 pregnancies. In a second series, of 15 pregnancies, in which estrogens were given there were only 3 deaths. It is suggested that the factor affecting the viability of the fetus probably arises in the maternal anterior pituitary lobe. The incidence of abortion does not appear to differ from that for nondiabetic pregnancies and suggests, first, that diabetes mellitus is not a cause of abortion, and, secondly, that the factor which reduces fetal viability exerts its strongest influence toward the end of pregnancy. It is suggested that the tendency to gigantism is due to an excess of the growth hormone from the maternal pituitary gland.

Effect of Penicillin on Vaccine Virus.—Patel says that at his institute a chloroform process has been used to reduce the bacterial count of calf lymph. On some batches of lymph a repetition of the chloroform process was required, and since it was feared that this might reduce the potency of the vaccine, sulfonamide compounds were tried to reduce the bacterial count without success. Recently, as the supply of penicillin became freely available, experiments were carried out to test its effect. These experiments were confirmed by trials in the field with penicillin-treated lymphs. Penicillin can be safely used for the rapid purification of vaccine lymph and the dose required is usually not more than 150 units per cubic centimeter of lymph. In this dose it has not affected the potency of the vaccine virus even when the lymph has been used after being stored for more than six to twelve months at a temperature of minus 12 C. This was proved by results on the children vaccinated by this lymph. Treatment with penicillin in a dose of 5,000 units per cubic centimeter of lymph had no deleterious effect on vaccine lymph even after preservation in a refrigerator at 2 C. for four weeks and more. Penicillin used in a dose of 25,000 units per cubic centimeter of lymph exerts some destructive effect on the vaccine virus when kept at room temperature for seven days or more, but this is not observed when the lymph is kept in a refrigerator at 2 C.

*Head Noises of Muscular Origin: Audible or Objective Tinnitus. H. W. Schwartz.—p. 746.

Audible or Objective Tinnitus.—Schwartz reports the case of a man, aged 32, who complained of headaches and a sound like "the tick of an alarm clock" in both ears. Although the patient had noticed the "tick" on and off for three years, lasting for days or weeks, it had not caused him actual annoyance until three months before admittance. The observations made at this time were that a bilateral clicking-grating noise was easily audible at a distance of 2 or more feet from either ear. Up and down movements of the tongue and soft palate were noted as well as rhythmic contractions of the masseter and temporalis muscles on clenching the jaws; all were in time with the clicking noise. At a later examination it was

found that the rate of the click was about 100; the intensity varied, but at one time it could be heard at a distance of 8 feet. Schwartz points out that the number of reported cases of audible or objective tinnitus not associated with the circulation appear to be few. Those authors cited by Bredlau in bringing the subject up to date in 1934, when he himself reported a case of his own in a child aged 9, made no mention of any other muscle involvement than that of the soft palate and eustachian tube. The muscular type of tinnitus always produces a noise characteristically regular and rhythmic, either clicking or ticking, at the rate of about 100 per minute. The origin of the sounds heard in the muscular type of objective tinnitus had been explained in a number of ways. The only explanation of the origin of these sounds for which definite evidence has been offered ascribes it to the clonic contractions of the muscles about the eustachian tube and the soft palate. The opening and closing of the eustachian tube, with the accompanying alternate separation and contact of the two moist surfaces, best explains the peculiar clicking sound. Hysteria and neurasthenia have been hypothesized as predisposing or contributing factors.

Hypertension Following Renal Infarction. J. Wainwright.—p. 62.

Torulosis of Central Nervous System.—According to Daniel and his co-workers torulosis may involve any tissue, but disorders of the central nervous system account for about half of the reported cases. One of the 2 cases described here may be regarded as typical of the diffuse meningoencephalitic form of torulosis. Circumscribed "toruloma" of the central nervous system, the less common type of lesion, is illustrated by the second case. Both patients died. The clinical picture of torulosis of the central nervous system closely resembles that of tuberculosis of the central nervous system. Torula is one of the most resistant parasites of man. Its biologic characteristics are such that none of the usual physical or chemical agents will affect it either in vivo or in vitro; and it does not call forth effective antibody or cellular reaction. Penicillin, streptomycin and various sulfonamide compounds did not inhibit the growth of cultures of Torula. Of the sulfonamide drugs only soluthiazole® (disodium cynamylidene dibisulfite derivative of sulfathiazole) had such an effect. Gentian violet exerted a considerable inhibitory effect on cultures.

Diabetic Ketosis.—Black and Malins record the results of treatment in 170 cases of diabetic coma or ketosis and stress the effects of changing from orthodox methods to the intravenous use of large quantities of fluids and insulin. The diagnosis is rarely difficult; the authors see no similarity between diabetic and hypoglycemic coma. As soon as the diagnosis is established, an initial dose of 200 to 400 units of soluble insulin is given intravenously. An intravenous drip is set up, and within the first fifteen minutes a pint of isotonic sodium chloride solution is infused. A second pint is given in the second fifteen to thirty minutes, and perhaps a third pint at the same rate. Thereafter a solution of 5 per cent dextrose in isotonic sodium chloride solution is administered, usually at the rate of 1 pint hourly. As soon as the intravenous drip has been set up, a urethral catheter is passed and the bladder emptied. Thereafter the bladder is emptied every thirty minutes. Each specimen of urine collected is measured and tested with Benedict's solution and ferric chloride. Further soluble insulin in doses of 50 units is injected into the drip tubing every thirty minutes until the urine becomes free of acetone bodies by the Gerhardt test. The immediate objects of the treatment are: the abolition of ketosis, rehydration and restoration of chloride. These objects are quickly realized with the described treatment, and the mortality has been reduced from 28.7 per cent to 6.6 per cent.

Acta Medica Orientalia, Jerusalem

7:123-161 (July-Aug.) 1948. Partial Index

- *Treatment of Pruritus Vulvae by Local Inunctions with Pyribenzamine. B. Zondek and Y. M. Bromberg.—p. 123.
Clinical Experience and Immediate Results of Vagotomy in Intestinal Ulcers. F. Mandl.—p. 131.
Singultus. J. Kleberg.—p. 131.
*Oligospermia Associated with Impaired Dark Adaptation. J. Landau and Z. Polishuk.—p. 153.

Inunctions with Pyribenzamine* for Pruritus Vulvae.—Zondek and Bromberg failed to effect improvement in vulval pruritus caused by allergy to endogenous hormones, by the oral administration of antihistaminic substances. They therefore resorted to local administration of the antihistaminic pyribenzamine hydrochloride*-(tripelennamine hydrochloride). Glycerin seemed to be the most suitable vehicle for local administration, because it readily penetrates the skin. The 14 patients who were selected for this therapeutic trial had had vulval pruritus for six months to twelve years. Allergy to endogenous hormones was the etiologic factor in 3 of these cases, vitamin deficiency in 4 cases, diabetes mellitus in 2 cases, menopause in 1 case, vaginitis due to *Trichomonas* in 2 cases, vulvovaginal mycosis in 1 case and psychoneurosis in 1 case. In order to eliminate errors in the interpretation of the effects of tripelennamine, each patient was first treated by local applications of full strength glycerin for one week and by inunctions of 3 per cent procaine in glycerin for a second week. During the third week a 3 per cent solution of tripelennamine in glycerin was applied on the vulva in each patient at eight hourly intervals. Temporary relief from the itching was obtained in 7 patients, 6 were improved and 1 did not respond. Symptomatic relief or improvement was observed not only in cases due to allergy, but also in those due to diabetes, vitamin deficiency or vulvovaginal infections. The authors suggest that tripelennamine may interfere with release of continually increasing amounts of histamine due to injury of the vulvar tissue by scratching or inflammation. Factors other than antihistaminic ones may also be involved. The inunctions with tripelennamine have only a symptomatic effect, which does not persist beyond the cessation of treatment.

Association of Oligospermia with Impaired Dark Adaptation.—Landau and Polishuk made dark adaptation tests on 17 men with sterility due to oligospermia and on 19 men with normal spermatogenesis. In 6 of the 17 men with oligospermia a decided reduction in dark adaptation was found, whereas in the controls with normal spermatogenesis the dark adaptation values were within normal limits. Low vitamin A values were found in 2 cases of oligospermia associated with impaired dark adaptation and in 1 case of oligospermia with normal dark adaptation. In 2 other cases of oligospermia with normal dark adaptation, normal vitamin A values were noted. It is assumed that oligospermia associated with impaired dark adaptation might possibly represent a syndrome of a pituitary-hypothalamic disorder.

Nonunion in Fractures of Long Bones.—According to Hirsch the incidence of pseudarthrosis varies between 0.5 and 5 per cent. When pseudarthrosis has developed, the medullary cavity is closed by a sclerotic plug of bone, both bone ends are atrophic and there is a gap between them. The distinction

between delayed union and pseudarthrosis (nonunion) is made from the roentgenogram. If a sclerotic plug of bone fills the medullary cavity pseudarthrosis is established and surgery is the only solution. The author reviews observations on 69 cases of uninfected pseudarthrosis of the long bones treated at his clinic from 1935 to 1946. Surgical procedures for the treatment of pseudarthrosis aim to break down the sclerotic barrier. By removing the pseudarthrosis tissue, including the sclerotic bone, conditions are made favorable for the development of granulation tissue with new vessels and osteoblasts from the surrounding tissue. If there is good contact between the bone fragments and little movement between them, some form of bone perforation—e. g., Beck's drilling—is sufficient, but usually a bone graft is preferable. In 70 per cent of the cases union was effected after one operation and in 13 after a second operation. The average consolidation time was 5.4 months for Beck's drilling, 7.2 months for inlay grafts and 15 months for Küntscher nailing.

Dextrose Tolerance in Infectious Diseases.—Yoh Tse-Fei made dextrose tolerance tests on 100 patients with various infectious diseases, 40 healthy adults and 7 diabetic patients. In the patients with infectious diseases the test was made during the febrile stage and in 62 it was repeated during convalescence. It was found that during infectious diseases there is a temporary but definite decrease of dextrose tolerance with a curve simulating that of diabetes mellitus during the febrile or infective stage, and this decrease tends to disappear with the curve returning to normal or nearly normal as the infection subsides. The exact cause of this change in the carbohydrate metabolism is not known, but there is evidence that impairment of the hepatic function might account for it. Others assume that the pancreas or some other organ is involved. The author believes that the impairment of the carbohydrate metabolism in infectious diseases makes it advisable to provide a diet that is high in carbohydrate content so as to stimulate glycogenesis in the liver, because the higher the glycogen content of the liver the better is its resistance against infection and toxic influences.

Experiences with Peridural Anesthesia. A. C. Ohling.—p. 407.

Threat of Sarcoma from Use of Thorotrast*.—Bauer directs attention to the danger involved in the use of thorotrast*, a colloidal suspension of thorium dioxide. The radiation given off by this contrast medium is about 6 r per day, a quantity which is about 10 times as much as that usually cited as the maximum daily permissible dose in the regulations formulated for the protection against harmful exposures to rays. Studies on mice, rats, guinea pigs and rabbits have demonstrated that the use of thorotrast* involves the danger of sarcoma. These animal experiments suggest that in human beings the latent period between the introduction of thorotrast* and the development of sarcoma will be twelve to eighteen years. The author cites the case reported in the United States by MacMahon and his associates, in which a sarcoma developed twelve years after thorotrast* had been used for hepatography. He fears that in Germany the danger of thorotrast*-induced sarcomas is greater, because its use had not been discouraged to the same extent as in the United States, where it had been rejected by the

Council on Pharmacy and Chemistry as early as 1932. He believes that in view of the threat of sarcoma and of the fact that thorotrast® apparently also impairs the hemopoiesis in the bone marrow, spleen, liver and lymph nodes and that it may cause fragility or necrosis of bones, the further use of thorotrast® as a contrast medium is not advisable.

Damaging Effect of Thorotrast® on Tissues.—Wachsmuth reports the case of a man, aged 28, who sustained a shell missile injury in the region of the left temporal bones which resulted in the development of a cerebral abscess and osteomyelitis of the temporal bone. At the time a neurosurgeon had injected thorotrast® into the carotid artery for the purpose of encephalography. The percutaneous injection resulted in severe tissue changes, including necroses in the vascular walls. A tumor developed at the site of the lesion, probably as the result of paravasal deposit of thorotrast®. At the time of the removal of the tumor, the wall of the artery was found to be extremely friable and inelastic, but the tumor did not as yet show signs of malignancy. The author suggests that at the sites of storage of the thorotrast® in liver and spleen changes may develop which are similar to those at the site of injection, because of the continuous radioactive effect exerted by the thorotrast®. The author concludes that the use of thorotrast® for the visualization of vessels is no longer permissible, except perhaps in patients in whom life expectancy does not exceed a few years. Percutaneous injection, which involves the danger of small paravasal deposits of thorotrast®, is never advisable.

Carcinoma of Male Breast After Treatment with Estrogenic Hormone.—Liebegott presents the case of a man, aged 66, who was treated for inoperable carcinoma of the prostate by intramuscular implantation of tablets of an estrogenic substance. Two weeks after the first implantation the patient observed a swelling of the mammary glands, which did not subside again. Six months after a second implantation of hormone tablets, which was carried out four months after the first implantation, the right mammary gland was the size of a fist and two nodules could be felt in the upper and outer quadrant of the left breast. Four months later the left breast was amputated and the axillary lymph nodes were removed. Recovery after this operation was uneventful, but histologic examination revealed carcinoma of the breast and metastases in two axillary lymph nodes. The clinical and objective aspects of the carcinoma of the prostate had greatly improved during the treatment with the estrogenic hormone.

Modification of Gram Staining. H. Knothe and W. Maassen:—

Hypertrophy of Parotid Glands and Diabetes Mellitus.—Having observed a decided change in the facial contours of some patients with diabetes mellitus, which was found to be due to enlargement of the parotid glands, Mellinghoff decided to investigate whether this hypertrophy of the parotid glands is of significance in the metabolic disturbance that characterizes diabetes. He presents the histories of 5 patients which suggest that the hypertrophy of the salivary gland in the diabetic patient usually is a part of a syndrome of endocrine disturbances, in

which extrainsular disturbances play a part. The superimposed diencephalohypophysial system apparently plays the decisive role. In 3 of the 5 reported cases, a hypophysial factor seemed to be the dominating one; in a fourth case such a factor seemed probable. Cases like the fifth one are now regarded as of primary hypophysial origin. The author considers it as improbable that the enlargement of the salivary glands is the result of a compensatory function for the impaired carbohydrate metabolism, although this has been suggested by some. He is of the opinion that the enlargement of the salivary glands, particularly of the parotid and sometimes also of the lacrimal glands, is a reaction resulting from hormonal stimulation which can be compared with any other distant symptom in the course of endocrine disturbances, such as with exophthalmos, hyperostosis frontalis and striae distensae. The diencephalohypophysial factor seems to be the decisive one, either a primary lesion in this system being responsible or secondary retroaction on this cerebral sphere being involved. Parotid hypertrophy has been observed in obese patients without signs of disturbances in the carbohydrate metabolism, in various endocrine disorders and even after ovariectomy, most probably by the intermediate action of the hypophysial system.

*Prefrontal Lobotomy (Leukotomy) in 16 Patients with Chronic Schizophrenia. P. S. Eringa.—p. 3844.

Prefrontal Leukotomy in Chronic Schizophrenia.—Eringa reviews observations on 16 cases of chronic schizophrenia, in which leukotomy was performed according to the method of Freeman and Watts. In about half of the patients the operation exerted a favorable influence. One patient died shortly after the operation. The author discusses the personality changes that resulted in these patients and suggests that this operation be considered in cases of severe chronic schizophrenia in which the various types of shock treatments have been without effect.

Treatment of Pernicious Anemia with Special Reference to Hypersensitivity to Liver Extract.—Malmros and Herner report on 17 cases of pernicious anemia treated perorally with a maintenance dose of 1 or 2 tablets of folic acid and 5 Gm. of a stomach-liver preparation daily. The results were satisfactory in 15 cases observed for over a year. In 2 cases neurologic symptoms developed and injection treatment with liver, interrupted because of hypersensitivity reaction, had to be resumed; the patients were desensitized with strongly diluted and gradually more concentrated solutions of liver extract till the ordinary dose of undiluted liver extract could be given. Injection of 0.5 to 1 cc. epinephrine solution a few minutes before the injection of liver prevented allergic reactions. The neurologic symptoms disappeared on treatment with liver in sufficiently large dosage and in spite of continued administration of folic acid in 1 case, and are ascribed to a deficiency disorder. Folic acid treatment is potentially dangerous because of the risk of neurologic complications. Peroral treatment combining folic acid and stomach-liver preparation is also not without danger. If the treatment is applied, constant observation of the patient is called for. Numbness of the hands and feet or other unpleasant sensations from arms and legs should immediately be reported to the attending physician.

Difficulties in Growth of Newborn Babies. L. Ribadeau-Dumas, Héreaux, J. Debray and Boeswilwald.—p. 189.

*Neurologic Sequelae of Familial Hemolytic Disease; Integrity of Hepatic Parenchyma Verified Seven Years After Onset of Nervous Symptoms. R. Turpin and H. Duchène.—p. 203.

Comparative Study of Mortality of Infants During the Periods of 1937-1938 and 1945-1946. Causes of Its Increase. P. Beyer and M. Lagoutière.—p. 212.

Neurologic Sequelae of Familial Hemolytic Disease.—Turpin and Duchène report a boy aged 6½ years who was admitted to the hospital for a choreoathetoid syndrome with extrapyramidal symptoms of Little's disease and cerebellar disturbances. Involuntary movements and disturbance of speech made the utilization of Binet's test difficult, but, except for this reservation, the mental capacity could be considered normal. Two weeks before the admission of the patient his mother was delivered of her second child, a boy who had kernicterus for one month. Examination of the blood of the parents and of the newborn baby demonstrated isoimmunization of the mother in response to having been pregnant with an Rh-positive fetus. History of the older boy revealed that he had presented icterus for the first days after birth, difficulties in growth and nutrition, insomnia and convulsions and that at the age of 3 he could not walk and could pronounce only a few words with difficulty. A liver biopsy performed on the older boy at the time his younger brother presented icterus demonstrated that structure and function of the cells of the parenchyma were normal. The younger boy, now aged 2, cannot pronounce more than those few words that he had been able to pronounce when he was aged 1; he cannot walk and he can assume an erect position only with support. The younger brother thus presents neurologic disturbances similar to those of his elder brother. In both patients these disturbances may be considered as sequelae of kernicterus. From the case of the older patient and from others cited in literature it is concluded that the association of kernicterus and cirrhosis is an exception which seems to be the result of a local effect of the hemolytic process. This disturbance must be distinguished from the hepatolenticular degeneration in Wilson's disease in which the association of the hepatic and neurologic disturbances may result either from a linkage or from the spread to the liver of neurologic lesions by which certain metabolic centers are affected.

*Patients with Scarlet Fever Treated at Home with Depot-Penicillin; Experiences from Scarlet Fever Epidemic in Basel in 1948. F. Buser.—p. 912.

Sciatica as Sequela of Focal Necrosis and Mucous Degeneration in Ligamentum Flavum. W. Hf.—p. 915.

Depot Penicillin in Scarlet Fever.—An epidemic of scarlet fever attacked more than 1,000 persons within a few days in Basel in August 1948. There were not enough hospital beds available. Buser therefore treated 61 patients at home, 54 children between the ages of 3 and 14 years and 7 adults. Forty-nine patients were given daily injections of 1 cc. of procaine penicillin in oil (300,000 units) for four to five days, while 12 patients were treated without penicillin. In most of the cases the disease was of medium severity. The initial toxic phase subsided rapidly with return of temperature to normal within forty-eight to seventy-two hours. Complications such as mild nephritis, otitis media and cervical lymphadenitis occurred in only 3 patients (6 per cent) treated with penicillin, while hemorrhagic nephritis, cervical lymphadenitis and phlegmon of the angle of the jaw occurred in 4 of the 12 patients (33 per cent) who were treated without penicillin. There were recurrences of mild fever, probably abortive relapses, in 12 patients (25 per cent) treated with penicillin. Only 14 patients (about 30 per cent) remained definitely free of hemolytic streptococcus after the injections of penicillin. Not a single carrier of hemolytic streptococcus could be freed of the bacteria by oral administration of penicillin. Strict rest in bed was required for only eight to ten days because of the rapid clinical improvement, but convalescence lasted for at least two to four weeks. The

depot penicillin makes possible simple and successful treatment of scarlet fever at home. The favorable effect of penicillin on the toxic initial phase was similar to that obtained with a satisfactory antitoxin, but for the prevention and the treatment of complications penicillin is superior to antitoxin and to sulfonamide compounds. For cases of grave septic and toxic scarlet fever a combination of the various methods of treatment is the method of choice.

*Traumatic Cancer of Lung. P. C. Rospi.—p. 2508.

*Prevention of Headache Following Spinal Anesthesia. J. P. Caccia.—p. 2511.

Traumatic Cancer of Lung.—Rospi reports a man, 59 years of age, who suffered a severe trauma to the region of the left half of the chest. The trauma was followed by symptoms of pulmonary disease. A roentgenogram taken seven months later revealed a tumor shadow on the traumatized side. A biopsy taken by bronchoscopy showed basal cell epithelioma. The mechanism of the development of cancer in this case was probably one of trauma stimulating neoplastic proliferation of the lung which was constitutionally predisposed to cancer.

Prophylaxis of Headache Following Spinal Anesthesia.

—Caccia prevented headache after spinal anesthesia by administering vitamin B intraspinally. He mixed 2.2 cc. of vitamin B in sodium chloride solution, which contained 100 mg. of the substance, with the anesthetic solution to be injected intraspinally. The anesthetic effect was superior both in intensity and in duration. Headache was prevented. The author obtained favorable results from this method in more than 100 cases.

*Abscess of Lung and Abscess of Brain. M. Joselevicz and M. Kleimans.—p. 74.

Abscess of Lung and of Brain.—A man 34 years of age presented symptoms of bronchopulmonary disease, cough and fever which were controlled by penicillin. The roentgen examination of the thorax showed a cavity in the left lung. Examination of the sputum for tubercle bacilli was negative. Two months later the patient reentered the hospital complaining of loss of weight, aggravation of the bronchopulmonary symptoms, general cutaneous hyperesthesia and, for the preceding four days, constant acute headache and left hemiparesis. The cerebrospinal fluid was normal. Within four days meningitis developed, and the patient died in coma. An isolated, small abscess of the upper lobe of the left lung and an isolated abscess of the right cerebral hemisphere were found at necropsy. The case is unusual because of the development of only one cerebral abscess complicating the pulmonary abscess and also because of the seat of the abscess.

*Treatment of Late or Complicated Syphilis with Penicillin. C. Huriez and J. Dujardin.—p. 1.

Problem of Poliomyelitis and Orientation of Research. P. Lépine.—p. 2.

Frontonasal Encephalomeningocele Healed by Meningeal and Bone Plastics. G. Lazorthes, F. Deodati and P. Fage.—p. 3.

Penicillin in Late or Complicated Syphilis.—Huriez and Dujardin treated 200 patients having late or complicated syphilis with penicillin. The drug had a definite cicatrizing effect on tertiary skin lesions in 20 patients. In 28 of 33 cases of syphilitic meningitis, the lymphocytosis was reduced. In cases of this type a prolonged course with massive doses (10,000,000 units in twenty-five days) is to be preferred to the "standard" dose of 2,400,000 units. In 7 of 10 cases of cerebral syphilis the psychiatric syndrome was improved considerably, while the neurologic signs did not subside. Results obtained in 9 cases of atrophy of the optic nerve and in 3 cases of interstitial keratitis were not as constant and striking as those reported by American authors. Penicillin proved effective in 27 cases of tabes and particularly in those with lightning pains and in those with radicular attacks. Penicillin was well tolerated by patients

with cardiovascular syphilis associated with renal lesions, and the drug was fairly effective in syphilitic aortitis. Except for an occasional rise of temperature in 17 patients untoward reactions were not observed in the treatment of late syphilis with penicillin. Results obtained with penicillin in syphilitic patients with involvement of the liver, diabetes mellitus, and in pregnant syphilitic women were more satisfactory than those obtained with heavy metals. The high cost of the drug is largely counterbalanced by its rapid and effective action, particularly in cases with meningeal reaction, and also by the absence of toxic accidents. Penicillin is the drug of choice in complicated cases of syphilis.

Anatomic Observations in Fatal Cases of Bee and Wasp Sting. C. Wegelin.—p. 1253.

Fatal Cases of Bee and Wasp Sting.—Wegelin reports 2 fatal cases of bee sting in men aged 33 and 38 and 1 fatal case of wasp sting in a man aged 39. The first patient was stung in the hand, the second in the neck and the third in the forearm. Death resulting from a single sting in all 3 cases occurred within the first hour in the first and third case and within five days in the second case. In the second case an extensive lobular pneumonia followed the initial unconsciousness, and coma persisted until death. In all 3 cases life-threatening condition developed rapidly. Nausea, cyanosis of the lips, vertigo, vomiting, pallor and sweating were followed by coma. The second patient was almost pulseless, and respiration stopped temporarily; urticaria occurred over the trunk. Necropsy revealed hyperemia of the internal organs, edema of lungs and of larynx, petechial hemorrhages of skin and mucosa and occasionally of serosa, meninges and brain, and emphysema of the lungs. The first-mentioned changes suggest severe damage to the capillary walls; the pulmonary emphysema is suggestive of an allergic reaction. The poison is absorbed rapidly by the blood, as was demonstrated in the patients bitten in the upper extremity.

Acidosis Induced in Cirrhotic Patients by Large Doses of Methionine. H. Bénard, A. Gajdos, P. Rambert and H. Péquignot.—p. 17.

Methionine in Cirrhosis.—Bénard and his co-workers treated 7 patients, 4 men and 3 women between the ages of 30 and 70, who had cirrhosis of the liver with methionine. Five to 10 Gm. of the drug was administered daily by mouth. In 5 patients diuresis and general condition were considerably improved. In the 2 other patients the treatment failed. The drug was well tolerated except in 1 patient. Acidosis resulted from large doses of methionine in all patients but was not associated with clinical symptoms except in 1 patient in whom mental confusion took place. Confusion subsided after administration of sodium bicarbonate. In spite of the favorable effect of methionine, it does not cure the cirrhosis. The ascites did not disappear completely in any of the cases and there was no return to normal of the function tests. The drug does not seem to affect the late course of the disease. The biochemical mode of action of methionine on the liver is still obscure. It is probable that the drug may play the part of an agent of transmethylation because of its easily detachable methyl radical.

It also participates in the synthesis of choline. Combined with other methods of treatment methionine is capable of improving the condition of cirrhotic patients.

Tuberculous Meningitis and Its Relationship to Seasons. Observations on 44 Cases of the State Hospital "Mammolshöhe" for Children and on 124 Cases of University Clinic Frankfurt on Main During Periods of 1929 to 1946, Respectively 1935 to 1946 included. S. Röckl.—p. 791.

Pleurisy and Tuberculosis in Bones and Joints.—Holzhauer reports 369 patients with tuberculosis in the bones and joints who were admitted to the sanatorium Sonnenblick in Marburg (Lahn) during the period 1932 to 1947 and who presented signs of previous pleurisy. Changes in the pleura were revealed by past history in 28 patients (3.6 per cent), by history and roentgenologic examination in 154 patients (20.3 per cent) and by roentgenologic examination alone in 187 patients (24 per cent). Of 172 patients between the ages of 16 and 45 years who had pleurisy, 105 (61.2 per cent) were between the ages of 16 and 25 years. In 101 of 182 patients—i. e., in 55.5 per cent—the interval between the manifestations of pleurisy and those of tuberculosis in the bones and joints was one year or less. In the following years this percentage decreased, and only 8 patients (4.4 per cent) manifested tuberculosis in the bones and joints in the fourth year after pleurisy. A casual relationship between tuberculosis of bones and joints and a previous attack of pleurisy must be considered at least for a period of two years. An attack of pleurisy which at this interval is followed by a chronic disease of the bones and joints should arouse suspicion of tuberculous origin. The maximum incidence of pleurisy in patients between the ages of 16 and 25 and the hematogenous tuberculosis of the bones and joints which followed the pleurisy suggest that this type of pleurisy should be considered as a manifestation of the secondary stage.

- Anatomicopathologic Observations in Cases of Tuberculous Meningitis Treated with Streptomycin. H. Chiari.—p. 837.
Treatment of Miliary Tuberculosis with Streptomycin. O. Ruziczka.—p. 840.
*Observations on Fundus Oculi of Patients with Tuberculous Meningitis and Miliary Pulmonary Tuberculosis Treated with Streptomycin. F. Mejer.—p. 842.
Results of Cochlear and Vestibular Examination After Treatment with Streptomycin. E. H. Majer.—p. 844.

Fundus Oculi of Tuberculous Patients Treated with Streptomycin.—Mejer examined the fundi of 42 children, 15 with tuberculous meningitis without definite miliary pulmonary tuberculosis, 19 with tuberculous meningitis and miliary pulmonary tuberculosis and 8 with miliary pulmonary tuberculosis not associated with tuberculosis meningitis, who were treated with streptomycin. Choked disks were observed in more than one third of the patients with tuberculous meningitis whether or not it was associated with miliary pulmonary tuberculosis. Swelling of the papilla in the initial stage of the disease is of no importance with regard to diagnosis and prognosis, while complications may be expected in the presence of a choked disk. Late changes in the papillae constitute objective evidence of complications in the course of healing. Typical miliary choroidal tubercles or so-called solitary choroidal tubercles were observed in more than one third of the patients and most frequently in those with miliary pulmonary tuberculosis whether or not it was associated with tuberculous meningitis. In the majority of the children resolution of the foci was rapid after the initiation of the treatment with streptomycin, and the course of the disease was as a rule favorable. Complications or recurrences were observed in those children in whom resolution was slow. There were no toxic lesions of the optic nerve which could have been ascribed to the streptomycin. It is likely that those reported in the literature were sequelae of complications of the course of healing.

Book Notices

Shock and Allied Forms of Failure of the Circulation. By H. A. Davls, M.D., C.M., F.A.C.S., Associate Professor of Surgery, Director, Division of Surgery, Graduate School of Medicine, College of Medical Evangelists, Los Angeles Division. Cloth. Price, \$12. Pp. 595, with 55 illustrations. Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1949.

This work gives an extensive if not complete analysis of the pertinent literature. Each of the seventeen chapters closes with a bibliography. The text contains fourteen tables and fifty-five figures; one wishes the photomicrographs were better. A brief historical review is followed by twenty-six proposed definitions for shock, including one by the author.

Shock is recognized in numerous clinical conditions, and classified in seven categories: traumatic, hemorrhagic, burn, obstetrical, medical, anesthetic and operative. The author explains shock as "the triphasic response to stress"; i.e., to various conditions which disturb the internal environment of the organism. "The final result of all forms of stress, if sufficiently severe, will be anoxia of varying degree." The first phase is that of anoxic injury to cells. The second or catabolic phase is breakdown of body constituents, evidenced by increased non-protein nitrogen, urea, creatinine and polypeptides in the blood, hemolysis, hemoglobinuria and fever. The third or anabolic phase is reparative: regeneration of cells and the reestablishment of homeostasis by physiologic agencies.

Some will inquire by what mechanism stress produces anoxia and why anoxic effects on endothelium are of no importance. The triphasic description may fit cases reaching recovery, but those progressing to early fatality can hardly be described as triphasic.

Six chapters present details concerning degrees and stages of shock, its physiologic, biochemical and pathologic features, the effects of anoxia and other factors leading to irreversibility. Eight chapters are devoted to failing circulation incident to various clinical conditions. The findings of others are cited freely, and in most cases objectively. These discussions are both theoretic and practical, reflecting a broad survey of the literature. The final chapter, 60 pages, discusses the prevention and management of shock, therapeutics, restoration of blood volume, choice of anesthetics and contraindications for surgery in shocked patients.

The author recognizes anoxia, hemoconcentration, disturbances of fluid balance and abnormal distribution of electrolytes as factors in shock, but explanations of their origins and relationships are fragmentary or lacking. The extensive review of pertinent literature gives this treatise a scholarly tone, but by myopic perspective on major versus minor contributions the author fell short of a scholarly achievement. Appreciation of the significance of capillary phenomena as depicted by Starling, Krogh, Landis and others would have enhanced the value of this work. These defects do not lessen the value of this book to medical and surgical practitioners and specialists who inevitably must deal with shock. For them it was written, and it contains much practical information applicable to the prevention and management of shock.

The Commonsense Psychiatry of Dr. Adolph Meyer. Fifty-two Selected Papers edited, with Biographical Narrative, by Alfred Lief. Cloth. Price, \$6.50. Pp. 677, with portrait. McGraw-Hill Book Co., Inc., 330 W. 42nd St., New York 18, 1948.

A lay writer attempts to delineate the special historical position in psychiatry of a great man who developed far ahead of his time. The job is well done, and many of Dr. Meyer's most obscure writings are made more understandable. However, Meyer's work could have been summarized in a book of less than 670 pages by a psychiatrist, for today we may summarize his work that still lives in a few paragraphs. The modern psychiatrist understands Dr. Meyer's struggles to formulate a dynamic holistic approach to the human being and understands the difficulties of teaching such an approach. But he finds it difficult to fathom how a pioneer suddenly stopped short in his progress and became antagonistic to psychodynamic formulations of unconscious forces. For this other minds were necessary.

Obstetrics and Gynaecology: A Synoptic Guide to Treatment. By Beatrice M. Willmott Dobbie, M.A., M.B., F.R.C.S. Cloth. Price, 20s. Pp 358, with 22 illustrations. H. K. Lewis & Co., Ltd., 136 Gower St., London, W.C.1., 1948.

The author stresses that this book is intended for the general practitioner and particularly those that deal with the patient in the home. It is added, "The book deals almost exclusively with treatment, and lays a much needed emphasis on preventive treatment." There are few illustrations. Special commendation is offered for the lack of quotations and prior reference. Bibliography is avoided conveniently. The explanations are confidently expressed and carry the impression that the author writes from first hand experience.

Portions of the wording about the method of practice are certainly not fitting to those who do hospital deliveries exclusively.

In one hospital there were 62 cases of failed forceps. The fetal mortality from breach deliveries in the same hospital was 18 per cent. These two reports cast doubt on the quality of obstetrics in that community, but do give additional experience to the qualified obstetrician.

The chapters are appropriate in their sequence. The book has an appeal in its literary form and is easily read. It is not as complete in some portions as one might desire.

Many physicians doing obstetrics could profit by study of the diagnoses, the methods of treatment and the prognoses as presented by this writer.

Orthopsychiatry 1923-1948: Retrospect and Prospect. Prepared under the Editorial Supervision of Lawson G. Lowrey, M.D., and Victoria Sloane. Fabrikoid. Price, \$8.50. Pp. 623. American Orthopsychiatric Association, Inc., 1790 Broadway, New York 19, 1948.

This volume, marking the celebration of the twenty-fifth anniversary of the American Orthopsychiatric Association, provides essays on various aspects of the growth and development of orthopsychiatry through the past quarter of a century; twenty-nine eminent contributors have made this an impressive panorama. The whole volume indicates what stature and significance the orthopsychiatric movement has attained.

Orthopsychiatrists have reason to be proud of their twenty-five years of achievement. From simple beginnings with the study of conduct difficulties of delinquent children, the movement has expanded into the broad field of endeavor now represented by the child guidance clinics throughout the nation. Hand in hand with this physical expansion have gone refinement of treatment technics and a deepening of our understanding of the dynamics of human personality. "Orthopsychiatry 1923-1948" tells this story.

Orthopsychiatric points of view are coming to have more and more influence on pediatric thought and education. Thus pediatricians will welcome this opportunity to read about the origins of the movement, the manner of development of the child guidance clinics and the genesis of the underlying concepts. The keynotes of orthopsychiatry are sounded throughout the book: (1) that the surest attack on the problem of mental illness in our society is one of prevention, through mental hygiene work with children, and (2) that members of all the professions concerned with child care (psychiatry, psychology, social work, pediatrics, education, etc.) can most profitably work together in teams, to the common end of studying and treating childhood behavior problems. The emphasis throughout is primarily on treatment.

The book is large and perhaps not easily read. It is, nevertheless, full of rewarding material. Some of the articles are short, some long; some confine themselves largely to history and descriptions of clinical and teaching facilities; others discuss underlying concepts at some length.

From such rich and varied fare each reader will choose different essays to single out as individually noteworthy. The reviewer was particularly impressed by the following: William Healy and Augusta F. Bronner's story of the "Birth and Growth of an Idea—the Child Guidance Clinic"; Ben Karpman's scholarly review of "Milestones in the Advancement of Knowledge of the Psychopathology of Delinquency and Crime"; the

"Symposium—The Role of a Scientist in Society" with papers by Franz Alexander, Lawrence E. Cole and Margaret Mead, and Samuel J. Beck's evaluation of "Rorschach's Test in This Anniversary Year." Special note should also be made of the two papers on interrelationships between pediatrics and orthopsychiatry. For stimulating reading in an important field this book is recommended to everyone professionally concerned with children.

The 1948 Year Book of General Medicine. Edited by Paul B. Beeson, M.D., and others. Fabrikoid. Price, \$4.50. Pp. 821, with 158 illustrations. Year Book Publishers, 304 S. Dearborn St., Chicago 4, 1948.

Part I of the 1948 Year Book of General Medicine contains a review by Paul B. Beeson of the literature on the subject of chemotherapy and antibiotic therapy in various infectious diseases, and a review of literature on the use of para-aminobenzoic acid and chloromycetin in typhus and Rocky Mountain spotted fever. One chapter is devoted to the literature on the effectiveness of vaccine against influenza. There is also a brief discussion of more recently recognized and less widely known clinical entities such as Q fever, rickettsialpox, leptospirosis and toxoplasmosis. J. Burns Amberson reviews in part II diseases of the chest, the normal and abnormal physiology of respiration, the normal and abnormal anatomy and the diagnostic and therapeutic procedures. There is an adequate discussion of the vascular and circular disturbances which embrace such clinical entities as the tetralogy of Fallot, pulmonary arteriovenous aneurysm, pulmonary embolism, asthma, neoplasms and cysts and infectious diseases. A separate chapter is devoted to the subject of BCG vaccination. Literature on diseases of the blood and blood-forming organisms and diseases of the kidney is surveyed by George R. Minot and William B. Castle. A chapter is devoted to erythroblastosis fetalis and hemolytic anemias. Tinsley R. Harrison, in part IV, devoted to diseases of the heart and blood vessels, reviews in considerable detail the recent advances made in the field of congenital heart disease. This is followed by disorders of the blood vessels including hypertension, arteriosclerosis and disturbances of the circulation of the brain and the extremities. There are chapters dealing with normal and abnormal physiology, congestive heart failure and the arrhythmias. A special chapter is devoted to the anticoagulant therapy. Literature on diseases of the digestive system and metabolism is reviewed by George B. Eusterman. The therapy of gastric duodenal ulcer including vagotomy and various other methods is considered. Infectious hepatitis, biliary liver cirrhosis and lipotropic therapy of fatty liver are discussed.

The small volume offers to the general practitioner and the internist a comprehensive reference to the recent advances in the field of internal medicine.

Osteo-Arthritis of the Hip-Joint. By H. Warren Crowe, D.M., B.Ch., M.R.C.S. Cloth. Price, 35s. 6d. Pp. 70, with 5 illustrations and 14 plates. George Pulman & Sons, Ltd., 24-27 Thayer St., London, W. 1; Distributed by Rolls House Publishing Co., Ltd., Rolls House, 2 Breems Bldgs., London, E.C. 4 [n.d.].

This book is based on Crowe's personal experience with a large number of cases of osteoarthritis of the hip joint. He asserts that degeneration is not the main causal factor, that the relief of the patient's pain should never be the primary object of therapy but rather the arrest of the pathologic process together with measures of rehabilitation.

The scope of the book is chiefly medical. With two exceptions, operations are not described, because as soon as the methods advocated by Crowe become generally used the surgeon will no longer have to advocate fixation of the joint as the only remedy for intolerable pain.

The basis of this book is a series of 500 cases treated since 1927 with the full use of the facilities available at the Charterhouse Rheumatism Clinic.

Harry Coke's biochemical researches have been the main factor in deciding such issues as the degree of infection, of hepatic dysfunction or of endocrine imbalance. His differential sedimentation test has been helpful.

Osteoarthritis of the hip joint is a slow progressive disease leading to crippling deformity characterized by a variable proportion of inflammatory and of degenerative processes which involve all the joint structures associated with atrophy of muscle

nerve irritation and new bone formation. The most important of the pathologic processes is the synovial inflammation.

For the past twenty-five years, Crowe has treated every patient having osteoarthritis of the hip joint with vaccines, from time to time adding other useful auxiliary methods. In 60 or 70 per cent of patients who persisted in the treatment for twelve months, the disease has been arrested.

In addition to the intra-articular injections, exercises have been devised for increasing the strength of the muscles and maintaining mobility, more especially for counteracting the tendency of adductor spasm to produce the apparent shortening of the affected limb. Special instruments for separating the legs, worked by the patients themselves, have also been of great value, especially when both hips are involved. Lastly, the operation devised by Tavernier, of section of certain branches of the obturator nerve, has been performed with encouraging results, as the pain in the joint and the adductor spasm have been completely relieved.

The operation consists in section of the sensory branch of the obturator nerve which supplies the hip joint. The obturator operation was apparently first performed by Vulpian and Stoffel for displastic paraplegia. Seelig later divided the nerve intrapelvically.

Crowe gives full credit to Grant Waugh for introducing a valuable method which has gone a long way in revolutionizing the treatment of osteoarthritis. He found that the pH of fluid aspirated from a joint with acute synovitis was on the acid side of normal, whereas in the joint with chronic disease the reaction had become alkaline. Grant Waugh injected lactic acid into the joint cavity. Crowe and Koch substituted first acid potassium phosphate and then the magnesium salt.

Report of the Sanitary Commission of Massachusetts 1850. By Lemuel Shattuck and others. With a foreword by Charles-Edward Amory Winslow. [Dutton and Wentworth, State Printers, Boston, 1850.] Cloth. Price, \$4.50. Pp. 321. Harvard University Press, Cambridge, Mass., 1948.

This republication of the record of the sanitary commission of Massachusetts, dated 1850, is particularly timely as we approach the centennial anniversary of its publication. It is generally credited to Lemuel Shattuck and is known as the Shattuck report. Almost a century ago it made many fundamental proposals which are recognized as the essentials for public health organization and procedure today. Most notable was its proposal for creation of state and local boards of health, which were then nonexistent. Even today local boards are in such a state that their further development and extension is a major public health objective.

The Shattuck recommendations regarding vital statistics, community sanitation, health of the school child, training of nurses, house and slum clearance and medical research are still the principal areas in which medical progress is being made today.

The book is beautifully printed and bound with a frontispiece reproduction of the cover and title page of the original report, the latter containing a pencilled notation in brackets, "By Lemuel Shattuck." Many of the original illustrations are reprinted, as are the tabulations.

This is an epoch-making document in the history of public health. It can be recommended for study today by all those concerned with the progress of public health services from the present date onward. An honest appraisal of the progress that we have made in the hundred years since the Shattuck report would force the acknowledgment that in the fundamentals basic to further public health work we have made relatively little progress and that we had better look to these matters before we spread ourselves out more thinly over broader areas. Until we have a satisfactory status of vital statistics, public health laboratory services, communicable disease control, maternal and child health protection, community sanitation and health education—the six fundamentals—and until we have qualified public health units in all our counties we had better put away grandiose tones of a superbureaucracy for the alleged delivery of mythical medical care to all the people.

We need a modern Lemuel Shattuck to give us an incisive and comprehensive picture of the status of public health progress today as Shattuck gave it in this report to his contemporaries a century ago.

Your Baby: The Complete Baby Book for Mothers and Fathers. By Gladys Denny Shultz, Contributing Editor, Ladies' Home Journal, and Lee Forrest Hill, M.D. Photography by Joseph di Pietro. Line Drawings by Reisle Lonette. Cloth. Price, \$3.50. Pp. 278, with illustrations. Doubleday & Co., 14 W. 40th St., New York 20, 1948.

Described as the first book to recognize that babies have two parents, this volume might well also be termed probably the most complete of its kind. It carries parents through the various stages of motherhood and fatherhood from part 1, "A Baby on the Way," to the point where babyhood ends, at age 6. Illustrative of the detailed treatment is part 4, "Newborn to Yearling," in which parents are told "what to do" each month of the first year. There are ten parts, the last being a 34 page record section in which doting parents can enter minute details of the youngster's progress, including two pages devoted to mental, physical and nervous development.

Written in an easy, friendly and sympathetic style, the book should prove of much value both as a source of practical information for parents and as prophylaxis against the jitters of expectancy. Certainly it is an admirable mouthpiece for the busy physician, since the answers are exactly what he would give if it were humanly possible in the relatively brief interviews provided during prenatal, confinement, postnatal and pediatric periods.

In addition to excellent photographs that illustrate many of the instructions, attractive line drawing are scattered throughout the pages. Two especially helpful parts are those dealing with formulas and recipes with full details of preparation, and ailments and accidents.

This book can be recommended unreservedly to expectant mothers and fathers.

Technik der kinderärztlichen Differenzialdiagnostik für Studierende und Praktische Ärzte. Von Prof. Dr. Alphons Solé, Primarius des Karolinen-Kinderspitals der Stadt Wien. Cloth. Price, 20 Swiss francs. Pp. 384. Benno Schwabe & Co., Klosterberg 27, Basel 10; Imported by Grune & Stratton, Inc., 381 Fourth Ave., New York 16, 1948.

This book is written primarily for the general practitioner. With that objective in mind, the author reviews the basic facts about the child with special reference to physical examination and differential diagnosis.

The author devotes various chapters in his book to the discussion of rashes, disturbances of the sensorium, hemorrhage, anemia, cyanosis, respiratory disturbances, vomiting, diarrhea, convulsions, paralysis, icterus, edema and fever.

There are also chapters on examinations of the mouth and throat, the bones and joints, the abdomen, liver and spleen. The author also discusses the reasons for failure to gain weight and the significance of tuberculin reactions. Of special value are his tables on differential diagnosis.

Throughout the book, the author stresses the fact that the child is not a miniature adult and deplores this widespread misconception, which has been the source of many errors in diagnosis. He presents the child in a special pediatric setting with individual characteristics both in health and in disease.

Chemical Analysis: A Series of Monographs on Analytical Chemistry and Its Applications. Editorial Board: Beverly L. Clarke, I. M. Kolthoff, L. T. Hallett and Hobart H. Willard. Volume IV: Organic Reagents Used in Gravimetric and Volumetric Analysis. By John F. Flagg, Ph.D. Cloth. Price, \$6. Pp. 300, with 11 illustrations. Interscience Publishers, Inc., 215 Fourth Ave., New York 3, 1948.

This volume is the fourth in a series on analytical chemistry and its applications. It deals only with those organic reagents used as precipitants for gravimetric and volumetric analysis of inorganic ions.

The book is divided into two sections; namely, "General Discussion" and "Special Reagents." The first section deals largely with the theory of this method of inorganic analysis, discussing the types of salts formed by the different reagents, the various factors influencing salt formation, the structure and stability of the salt formed, the different methods employed in separation of inorganic ions and the general technics involved for a satisfactory analysis of this type.

In contrast to the theoretical considerations in the first division of the book, the second section deals entirely with the

practical side of analysis. Each of twelve chapters are devoted to a specific organic reagent or class of reagents, and detailed procedures are given for their use with various metals. A single chapter is devoted to seven organic reagents whose application is somewhat limited. One chapter also describes the use of organic precipitants for several anions.

The author has given numerous bibliographic references which seem to be rather complete through 1945, and this adds much to the usefulness of the book.

Elementary Anesthesia. By W. N. Kemp, M.D.C.M., Consultant Anesthetist, Children's Hospital, Vancouver, B. C. Cloth. Price, \$5. Pp. 289, with 100 illustrations. Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

This book represents the best judgment of the author, an experienced anesthesiologist, in presenting, on the basis of not only his own experience but also publications which appear valuable to him, the information that he considers is most important for the anesthesiologist. He has kept his text to the minimal amount that it is probably possible to have and still cover the entire field of activity of the present day anesthesiologist in clinical practice. One hundred illustrations are used to emphasize the points the author considers of moment. This book will be valuable to beginners in anesthesiology. It is a welcome addition to the too small list of books on the subject.

Health Instruction Yearbook 1948. Compiled by Oliver E. Byrd, Ed.D., M.D., F.A.P., H.A., Professor of Health Education, and Director, Department of Hygiene, School of Education, Stanford University, Stanford, California. Foreword by Ray Lyman Wilbur, M.D., Chancellor, Stanford University. Cloth. Price, \$3.50. Pp. 320. Stanford University Press, Stanford, California; Oxford University Press, Amen House, Warwick Square, London, E.C. 4, 1948.

This is the sixth in a series begun in 1943. They are excellent, if not essential, books for the library of the public health officer, the medical writer, the social worker or any one who is concerned with medical progress, social advances and the health of the people. If the reader remembers that when he wants the 1947 material he will look for it in the 1948 Year Book, an anomaly which the publishers have stubbornly refused to correct, he will find these volumes serviceable and interesting.

The Practice of Physical Medicine. By Heinrich F. Wolf, M.D., Consultant, Department of Physical Therapy, Mount Sinai Hospital, New York. Cloth. Price, \$5. Pp. 322, with illustrations. Wilcox & Follett Co., 1255 S. Wabash Ave., Chicago 5, 1947.

This volume contains the opinions of the author regarding the practice of physical medicine, but there is some question whether all of his opinions will coincide with those of the majority of physiatrists, especially in the treatment of pneumonia, asthma, rheumatism and other conditions. Eight chapters are included, among which are chapters on hydrotherapy, mechanotherapy, light therapy, electrotherapy and minor electrosurgery. There is much value in the book, and it can be used as a reference.

Gehirn und Rückenmark: Leitfaden für das Studium der Morphologie und des Faserverlaufes. Von Emil Villiger. Bearbeitet von Eugen Ludwig, o.o. Professor der Anatomie an der Universität Basel. Basel. Fourteenth edition. Cloth. Price, 36 Swiss francs. Pp. 481, with 326 illustrations. Benno Schwabe & Co., Klosterberg 27, Basel, 1946.

This book deals mainly with the morphology of the brain and spinal cord. It contains an enormous amount of information enhanced by illustrations. The first ten editions were written by Professor Villiger. Since his death, in 1931, Professor Ludwig has handled the revision of the book. This volume is of great value to anatomists, neurologists and neurosurgeons.

Baby Book. Prepared by New York State Department of Health Bureau of Maternal and Child Health. Paper. Pp. 48, with illustrations. New York State Department of Health, Albany, N. Y. [n.d.].

This is a handy, attractively made, concise and authentic little book prepared by the Bureau of Maternal and Child Health of the New York State Department of Health and reviewed and approved by the Committee on Public Health and Education and the Committee on Child Welfare and other representatives of the Medical Society of the State of New York. The book contains no indication of its availability outside of the state; within the state it is undoubtedly distributed by the state department of health.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

PREVENTION OF CORONARY SCLEROSIS

To the Editor:—Have cardiologists agreed on prophylactic "do's or don'ts" in regard to coronary sclerosis? Odell J. Kirksey, M.D., Mulberry, Ark.

ANSWER.—Universal agreement is lacking because we know so little about the etiology. It is wise to think in terms of two types of "sclerosis." One is arteriosclerosis, which is usually associated with age and heredity; the second is atherosclerosis, which may be thought of more as a disease than as a natural process. The second type admittedly will accelerate arteriosclerosis and possibly permits the greater preventive endeavor. It occurs in a younger age group.

Arteriosclerosis is considered to be a degenerative process, possibly also influenced by an inflammatory process due to a toxic action of intermittent disease (Aschoff, Virchow, MacCollum). Wear, or aging, with or without the inflammatory process, is considered by Virchow to be the result of stress and strain. There is a loss of elasticity of the arteries, replacement by fibrous tissue and ultimately even by calcium deposits. This type is arrived at in old age, and, while in certain families the condition develops earlier than usual, at present it is considered unresponsive to therapeutic measures. When the coronary arteries are involved, and if coronary thrombosis with infarction occurs, it is possible to institute procedures which will minimize the harmful results in some cases; while in some respects this does not alter the original process of arteriosclerosis, it does favorably alter the results and constitutes in some measure a retardation of the effects of arteriosclerosis.

Atherosclerosis is often considered to be synonymous with arteriosclerosis, and the two conditions may coexist. Atherosclerosis is probably the most commonly associated condition which accelerates the arteriosclerotic process. Atherosclerosis is attributed by Leary to accumulations of cholesterol in the intima. Winternitz earlier described yellow streaks in the intima which consist of newly formed connective tissue and fat-laden wandering cells (Morgan). While these two conditions may be independent or inseparable, from a clinical point of view the approach to both problems is the same. It is agreed that certain diseases accelerate both conditions, and for purposes of discussion it is unnecessary further to differentiate atherosclerosis from arteriosclerosis. The condition is accelerated by diabetes mellitus, obesity, hypothyroidism, overwork, stress and strain, hypertension, rheumatic heart disease, syphilis and many other toxic, infectious and metabolic diseases. Prophylactic measures are obvious in the prevention or amelioration of any or all of these accelerating diseases, together with the correction of modes of living associated with excessive labor or mental stress and strain. A notable example of considerable preventive measures being employed to prevent coronary disease is in the highly successful treatment of syphilis with penicillin. It is logical to expect that the current widespread use of antibiotics in almost all infectious disease will have an ultimate prophylactic influence on coronary artery disease. It is generally considered good practice to correct the obesity factor in patients showing signs of arteriosclerosis. How much reversal of the condition is to be accomplished by correcting obesity after coronary arteriosclerosis has occurred is conjectural, but it is good practice within certain limits.

The general principle of temperance in all things is a good rule to follow. Not only will this help retard the arteriosclerotic process, when the factors of intemperance accelerate it, but it will permit the patient to get along with whatever disability he may already have. Living within one's physical capacity is a good rule. There is rather general acceptance of the thesis that the stress and strain of business account for the current high incidence of coronary thrombosis in executives. Unhappily, not all of the stress and strain of business is induced by competition from outside business relations. The pyramidal system of authority, with constant and unwise pressure "for results," causes American business men to work under unnecessary tension, and often when they should be at home. No answer has been secured as to why coronary thrombosis develops in men at a rate of almost 2 to 1 compared with women. Whether this is due to less stress and strain, or to some glandular influence or lack of it, remains to be determined.

ANESTHESIA AND ROENTGENOLOGY

To the Editor:—The medical staff of our hospital is having a discussion with our radiologist on the dangers incident to the administration of ether anesthesia in the fluoroscopy rooms of the x-ray department. Sparking from the switches has been observed recently, and this may be an explosive hazard. The members of the medical staff feel that ether anesthesia presents far less physiologic hazard to many patients than do the other general anesthetic agents, especially when complete muscular relaxation is desired as for fracture work, even considering the explosive hazard, and it is their desire to continue to use ether anesthesia when it is deemed necessary. To minimize the explosive hazard the staff has made a number of recommendations. The staff has made inquiries of thirteen comparable hospitals in the area relative to this problem, and it appears that this staff has been following precautions equal to, if not superior to, those of the other hospitals. Can you supply information as to the number of ether anesthetic explosions that have been reported in any one year, with especial reference to such explosions occurring in fluoroscopic facilities? What concentration of ether is necessary for the explosion point? What relation does humidity play in the problem? What is considered the relative mortality between ether, nitrous oxide and oxygen and thiopental sodium when given to the point of muscular relaxation—in the average adult, in the young and in the aged? What particular precautions would be advised during such ether anesthesia?

John W. Bunting, M.D., Alpena, Mich.

ANSWER.—Only occasionally is the anesthetist faced with the necessity of administering an anesthetic agent while roentgenologic equipment is in use and sparks are therefore being generated. When such a necessity arises in the hospital, it is usually either in the operating room or the roentgenologic laboratory. Whatever the situation in the hospital, the anesthetist is always aware that where there is a spark there is danger of explosion. Such a disaster is so serious that avoidable risks of it should not be taken and all possible precautions against it should be observed. The precautions are both positive and negative.

Among the negative measures, the first can be stated in the form of a rule: No inflammable anesthetic agent should be administered in a room where roentgenologic equipment is being used. Accordingly, some of the commonly employed agents that should not be used near "live" roentgenologic equipment include ether, alone or in combination with any other gas, ethyl chloride and cyclopropane. Moreover, use of chloroform in these circumstances is not advised, although that agent is not inflammable. The darkened condition of the room makes it impossible to observe the patient well.

Of the positive safety measures, perhaps the first is the following: When roentgenologic equipment is brought into the operating room, the regular machine for administering nitrous oxide, which is equipped with an ether bottle, should be removed from the room and a special nitrous oxide oxygen machine, not equipped with an ether bottle, should be substituted. This same special machine is the one to be used in the roentgenologic laboratory if nitrous oxide is to be administered.

Further positive measures have to do with the choice of agent or method and, in some cases, with dose and technic. Some years ago it was not easy to find a safe anesthetic agent or method for use when roentgenologic equipment had to be employed. The range of choice was limited. Now, however, the range of choice is wide, and there is no good excuse for departing from safe principles. Where roentgenologic equipment is in use, therefore, local, regional, spinal or intravenous methods of anesthesia may be employed, with agents appropriate to these methods; if it is desirable to employ the inhalation method, the agent should be nitrous oxide combined with oxygen but without ether. Preliminary medication also is desirable. With morphine or atropine given by hypodermic injection and pentobarbital sodium (nembutal®) given by mouth, it is possible to control the patient by means of nitrous oxide and oxygen, without ether. An additional agent and method come up for consideration when a child who has aspirated a foreign body into the trachea is to be subjected to bronchoscopy. In these circumstances solution of avertin® (tribromoethanol) with amylene hydrate is administered by rectum, the usual dose being 100 mg. per kilogram of body weight. Preliminary medication is not used in such cases.

Because of the current favor in which intravenous anesthesia is held, it merits special consideration. Intravenous anesthesia may be used where roentgenologic equipment is employed, but the agent must be given in small doses so that the patient's invisible breathing can be heard and anoxemia eliminated so far as possible. Intravenous anesthesia, nitrous oxide 50 per cent and oxygen 50 per cent, and preliminary medication, make a safe combination that may be used in practically all circumstances. Probably this is the method of choice for use in the circumstances here discussed.

If additional relaxation is necessary small quantities of curare may be administered; at the end of 15-minute relaxation will be present and then the lights may be turned out and the

patient maintained on 50 per cent nitrous oxide and 50 per cent oxygen with small amounts of intravenous pentothal.

COBALT IN ANEMIA

To the Editor:—A chemist informed me that research in the field of nutrition for farm animals indicated the value of cobalt as a potential substitute for iron in the treatment of the severe anemias. His wife has a severe anemia which has not responded to treatment; he is anxious that I use cobalt—about 0.75 to 1 mg. per day. What information have you on this subject?

M.D., New York.

ANSWER.—Anemia has been observed in sheep and cattle grazing in areas where the soil and herbage are deficient in cobalt. The anemia is corrected by the administration of small amounts of cobalt (Wintrobe, M. W.: *Clinical Hematology*, Philadelphia, Lea and Febiger, ed. 2, 1946, p. 96). It is difficult to produce cobalt deficiency in animals because of the low requirement of this metal. Frost, Elvehjem and Hart (*J. Nutrition* 21: 93, 1941) observed an additional effect of cobalt over that of iron and copper on hemoglobin formation in certain weanling dogs with experimental anemia. Cobalt is not a substitute for iron in hemoglobin formation, but there is experimental evidence that iron is more completely utilized in the presence of cobalt.

Polycythemia has been produced in a variety of animal species by the feeding or ingestion of cobalt. This has not been observed in man. It is of further interest that crystalline vitamin B₁₂ (prepared from liver extract), which is effective in pernicious anemia in extremely small doses, contains cobalt. Cobalt alone is ineffective in pernicious anemia. There is not much evidence that cobalt is of value in anemia in human beings. Kato (*J. Pediat.* 11: 385, 1937) found that addition of cobalt to iron in the treatment of physiologic and nutritional anemia in infants accelerated the utilization of iron in hemoglobin synthesis and erythrocyte formation. James and co-workers (*J. Lab. & Clin. Med.* 33: 1607, 1948) recently stated that in preliminary observations the daily oral administration of 60 mg. cobalt chloride to patients with prolonged suppurative infection produced increases in the erythrocyte count, hemoglobin levels, hematocrit level and total circulating hemoglobin.

GURGLING SOUND AT CARDIA

To the Editor:—My interest in a certain physical sign has been revived during studies of peptic ulcer cases. The procedure consists of having the patient (in the erect posture) take a single large swallow of water. The stethoscope is placed to the right of the spinous process of the ninth dorsal vertebra. The sound of swallowing the water is audible and the interval between this sound and a "gurbling" sound as the cardiac sphincter relaxes and the water enters the stomach is noted. I have timed patients both with and without gastric pathologic conditions and have obtained figures of 8 seconds to 40 seconds for this interval. In view of a recent article on "heartburn" appearing in *The Journal*, January 29, page 292, which favors the theory of muscular imbalance of the cardiac sphincter, I am amazed that this method of investigation was not mentioned. Does this physical sign have any diagnostic usefulness and if so in what diseases?

M.D., Pennsylvania.

ANSWER.—The "gurgle" due to the passage of material through the cardia has been well known for years. The phenomenon has not been studied or used much diagnostically, because so much more can be learned in a moment with the help of roentgen ray. Thus, one would not want to attempt the differential diagnosis of cardiospasm, cardiac carcinoma, a short esophagus or diaphragmatic hernia on the basis of the gurgle. It is much better, simpler and quicker to give barium sulfate and observe results.

GLOBIN INSULIN

To the Editor:—A patient, 62 years of age, takes 80 units of globin insulin a day. She plans to spend next July and August in England, France, Switzerland and Italy. What is the solution of her insulin supply?

M.D., New York.

ANSWER.—Globin insulin is always available in England and presumably in France, Switzerland and Italy. It is manufactured by Burroughs, Wellcome and Company, whose home offices are in England. Deterioration in a few months would be negligible with ordinary precautions.

SYRINGE TECHNIC IN PREVENTING SERUM JAUNDICE

To the Editor:—In view of the belief that improperly sterilized syringes may be the cause of serum jaundice, is simple boiling sufficient to inactivate the virus believed to be the cause of this condition, or is autoclaving necessary?

Erwin Steinman, M.D., Washington, D. C.

ANSWER.—Submersion of contaminated needles and syringes in boiling water for a sufficient length of time is a reliable method for the destruction of most pathogenic organisms including the viruses. Thorough mechanical cleansing prior to a final sterilization is imperative in order to remove any protective coating (drugs or organic matter) from the microorganisms. The plunger should be separated from the barrel of the syringe to insure contact of all parts with the boiling water. Sterilization by this method should proceed for at least fifteen minutes and the timing process should begin only after the water has begun to boil. The utilization of a tray with a wire or perforated bottom, which allows rapid drainage and aseptic manipulation of the instruments, is recommended.

It has been shown that a syringe nozzle may become grossly contaminated with blood after a single administration of a drug and should be adequately sterilized before reuse. Such contamination results from back pressure from the tissues, spread of blood by diffusion from the needle point toward the syringe and suction when removing the needle from the syringe and aspirating the needle contents back onto the nozzle. A freshly sterilized syringe should be used for each patient; in mass inoculation where this is not practicable, the use of a tap connection between the needle and the syringe has been suggested. Manual manipulation of the tap prevents contamination of the syringe nozzle; the needle and tap are removed and freshly sterilized tap and needle are fitted for the next injection. This device is unsuitable for injecting a drug that must not enter a blood vessel.

CHRONIC DACRYOCYSTITIS

To the Editor:—A child 2 years old has had chronic dacryocystitis which has been probed three times without success. A fistula inside the lower lid connecting with the canaliculus is about 4 mm. in length and runs in the direction of the canaliculus, through which mucopus extrudes. The canaliculus is mostly intact except for the area corresponding to the fistula. I would appreciate your comments on treatment.

M.D., California.

ANSWER.—In the lower vertebrates the puncta open on the inner surface of the lid, not on the margin as in man; hence the fistula described is probably a congenital atavistic anomaly. The cure of the chronic dacryocystitis must be the primary aim, and until this is accomplished the fistulous tract should be left as a safeguard against an acute exacerbation of the infection. Chronic dacryocystitis at age 2 is a different picture from that present in congenital impatency of the nasolacrimal duct. Syphilis, tuberculosis and bone disease must be ruled out. Stallard (*Lancet* 2: 743 [Dec.] 1940) has devised an effective operation for chronic obstructive dacryocystitis following traumatism to the lower internal canthal angle that might be applicable to this case. It is essentially a conjunctival dacryocystostomy. The upper part of the sac is freed and the cupola brought up and stitched to an incision in the lacus lacrimalis, after which the summit is cut off. This will permit adequate probing and dilation of the nasolacrimal duct through the opened sac. The fistulous tract can then be destroyed by galvanocautery.

LUPUS ERYTHEMATOSUS

To the Editor:—Has anything recently been found of value in lupus erythematosus?

V. W. Pryor, M.D., Holdenville, Okla.

ANSWER.—The urgency for improvement in our attack against lupus erythematosus is different for the several varieties of this disease. The efficacy of tried agents in the discoid or chronic form is greater than in the acute and toxic types. The latter usually result in death, whereas the former produces, at its worst, disfigurement unless there is a transition into an acute phase.

Among the agents which have been proposed recently for use in lupus erythematosus are vitamin E and sodium para-aminobenzoate. Both of these drugs are said to be more valuable for the chronic and subacute types and less so for the acute toxic forms. Another agent which has received little trial but has excited much more theoretical analysis is the nitrogen mustard, methyl-bis(beta-chloroethyl)amine hydrochloride. This agent is said to be of help in acute lupus erythematosus, but it should not be used by the practitioner unless he has facilities

for engaging in serious investigations. The material has strong cytotoxic properties and can be dangerous. Acute lupus erythematosus calls for heroic measures, but this is not an excuse for unbridled license.

TUBERCULOSIS IN FOOD HANDLERS

To the Editor:—I am interested in a study of comparative results of effect of food handler examinations as a control of tuberculosis. Can you tell me in what cities adequate surveys have been made?

H. P. Miller, M.D., Newark, N. J.

ANSWER.—While rigid rules are laid down by health departments in many of our cities, with reference to preemployment and periodic examinations of foodhandlers for tuberculosis and the public is being reasonably well protected against the disease from this source, apparently there is a dearth of published reports of the actual findings among the foodhandlers themselves in comparison with the disease of the general public in the same vicinity. In 1934 Martin, Pessar and Goldberg (*Am. Rev. Tuberc.* 29:172, 1934) reported the results of a tuberculosis survey among 2,000 foodhandlers in New York city. They found approximately 2 per cent with active pulmonary tuberculosis. Unfortunately the diagnoses were made largely from roentgen shadows. All persons who showed a diffuse or circumscribed infiltration in the pulmonary parenchyma or those with numerous lesions in one or both lungs were regarded as having active tuberculosis. Obviously some of those so reported may have had nontuberculous disease, since roentgen shadows are not pathognomonic. Moreover, it is never safe to attempt to determine activity of the lesion from a single roentgenologic inspection. Nevertheless, it is likely that many cases of active tuberculosis existed in this 2 per cent. On the basis of these findings Martin and associates estimated that there were probably 6,500 cases of unknown and uncontrolled active tuberculosis among the 325,000 foodhandlers in New York city. They were of the opinion that this represented the average situation in all large urban communities.

In 1947 the New York Tuberculosis and Health Association made roentgen inspection of the chests of 3,460 employees of a company which operates a chain of restaurants. Seven (0.2 per cent) cases of active tuberculosis were found, 4 in the minimal stage, 2 moderately advanced and 1 far advanced. Two of the tuberculous persons were porters, 2 candy handlers, 2 dishwashers and 1 a salad maker. There were 4 others with questionably active tuberculosis and 70 more whose disease was thought to be inactive.

Boucot and Sokoloff (*Am. Rev. Tuberc.* 58:675, 1948) examined 32,535 Philadelphia food handlers between April 1, 1947 and Jan. 31, 1948. The reinfection type of tuberculosis was found in 2.3 per cent. This figure is identical with that reported in 1946 by Elkin and associates (*Am. Rev. Tuberc.* 53:560, 1946) in a study of 71,767 Philadelphia industrial workers. Among the 25,509 white food handlers, 2.5 per cent, and among the 7,026 nonwhite, 1.9 per cent were reported to have tuberculosis. There were 587 with disease classified as minimal, 147 moderately advanced and 20 as far advanced tuberculosis. As of March 1, 1948, 66 persons had been hospitalized or this had been recommended. Of all the food handlers whose survey roentgenograms were read as indicating the presence of tuberculosis, subsequent clinical reports were available in 81 per cent after a period of follow-up varying from one to ten months. These confirmed the presence of tuberculosis in 76 per cent.

In Detroit, 48,900 food handlers had roentgen inspections of their chests in 1947 and 135 (0.28 per cent) were found to have active tuberculosis. At the receiving hospital 18,891 persons had their chests inspected by roentgen ray, and 140 (0.74 per cent) were finally given a diagnosis of active tuberculosis. In a general survey of 9,494 persons, 131 (1.4 per cent) had final diagnoses of active tuberculosis. Among 981 practical nurses, 2 (0.2 per cent) had active disease. Under the category "general survey" the figure is somewhat misleading because it covered work in the midst of the heaviest Negro area and included some referrals of suspected cases by physicians and other agencies. Roentgen inspection of the chest is required of food handlers every three years.

In San Antonio all food handlers are required to have "health cards." To keep the cards valid examination of the chest must be made every six months.

In Chicago food handlers have not been examined as a group. However, Calumet City and Maywood (Cook County) recently passed village ordinances requiring all food handlers to have roentgen inspection of the chest annually. This work is in progress.

COLD AGGLUTININS IN SMALLPOX

To the Editor:—A 14 year old boy with a smallpox vaccination in the third, or healing, stage complained of low grade evening fever of four days' duration, general aching, transient abdominal pain and backache. He was obviously ill, pale and had a soft systolic functional murmur. Laboratory work showed a white cell count of 11,000 with a normal shift of the differential count. There was moderate anemia (12 Gm. hemoglobin and 4,200,000 red blood cells). The Westergren sedimentation rate on three consecutive days was 42, 48 and 53. The last determination was done by our pathologist, who noticed excessive agglutination grossly of the red blood cells. Cold agglutinins were found in dilution to 1:500. This child's clinical and laboratory findings were confusing to us. Two weeks later a repeat examination showed a normal sedimentation rate and complete absence of cold agglutinins. Are cold agglutinins commonly found after vaccination for smallpox?

C. S. Meeker, M.D., Butte, Mont.

ANSWER.—Most of the work reported in respect to cold agglutinins has had to do with atypical virus pneumonias. According to Platt and Ward (*A. M. J. Clin. Path.* 15:165 [May] 1945), they may occur in a number of conditions, including complicated mumps, scarlet fever, tonsillitis, measles and rheumatic heart disease. Evidence is not available which indicates that cold agglutinins are commonly found after vaccination for smallpox or during an attack of variola.

VASECTOMY FOR STERILIZATION

To the Editor:—In *Queries and Minor Notes* (The Journal, Jan. 29, p. 346), the consultant states that the consensus of urologists is against vasectomy for sterilization. What are the reasons for objecting to this procedure? It is performed rather frequently in this part of the country, and I have not heard of ill effects. Robert C. Tavlin, M.D., Mooreland, Okla.

ANSWER.—One of the principal reasons against performing vasectomy for sterilization is that later on in life the patient may wish to become fertile, and it is difficult to connect the vas deferens after vasectomy has been done. Unless epididymitis or an infection develops there are not any ill effects. Contrary to earlier reports in the literature, it has been well established that vasectomy does not affect the libido.

PELS-MACHT TEST FOR PEMPHIGUS

To the Editor:—Please furnish information concerning the value of the Pels-Macht test for pemphigus.

Richard S. Refowich, M.D., Philadelphia.

ANSWER.—Many dermatologists believe the test is of little or no value; others have kept records of cases of pemphigus in which a phytopharmacologic test was performed and found that in a large percentage of cases which eventually proved to be pemphigus the reaction was positive. The value of the Pels-Macht test has apparently been strengthened by a new test devised by Dr. Macht and known as the Macht-Ostro test.

PENICILLIN IN NEUROSYPHILIS

To the Editor:—In the reply to a query on "Penicillin in Neurosyphilis" (The Journal, January 29, p. 343) the statement was made that "according to Thomas, Lyons, Romansky, Rein and Kitchen sixteen daily injections of 300,000 units of procaine penicillin did not lead to any cumulative effect in the blood." This statement is correct for large size particles of procaine penicillin in oil gelled with 2 per cent aluminum monostearate. A distinction must be made between procaine penicillin in oil or water and procaine penicillin in oil gelled with aluminum monostearate. The latter preparation is now made with small size particles of penicillin and is much more slowly absorbed than procaine penicillin in oil or water alone or when large size particles of penicillin are mixed with oil and aluminum monostearate. Tests at Bellevue Hospital have shown that when daily injection of 300,000 units of small size particle procaine penicillin in oil and aluminum monostearate was made for ten days there was some cumulative effect of penicillin in the blood. Blood concentrations of penicillin varied from a low of 0.1 unit twenty-four hours after the first injection to a high of 0.4 unit on the tenth day of treatment. When 600,000 units was injected daily blood concentrations of penicillin varied from 0.25 unit per cubic centimeter twenty-four hours after the first injection to a high of 2 units on the tenth day of treatment.

Evan W. Thomas, M.D., New York.

THYROID MEDICATION IN PREGNANCY

To the Editor:—In *Queries and Minor Notes* (Oct. 23, 1948, p. 626) I read your answer to the question of thyroid medication in pregnancy. I think that some light has been shown on the subject by Heinemann, Johnson and Man in the *Journal of Clinical Investigation* (27:91 [Jan.] 1948). They found that an early elevation of protein-bound iodine (thyroid hormone) occurs in pregnancy and that threatened and actual abortion occurred in those who had a low level of protein-bound iodine.

TREATMENT OF DIABETES TODAY

ELLIOTT P. JOSLIN, M.D.
Boston

The detection of the unknown 1,000,000 diabetic persons should be relatively easy. We know that diabetes is hereditary and that the new million are chiefly the relatives of diabetic persons. Dr. Priscilla White found the incidence of diabetes seven times as great in the relatives of diabetic persons as in non-relatives. In Florida the incidence of newly discovered diabetes by the United States Public Health Service was four times as great among the relatives of diabetic persons as in their survey of the general population at Oxford. Diabetes is nearly fifty times as common after age 65 as it is under 15 years of age. Moreover, in the old the onset is usually unobtrusive, whereas in the young the violence of the symptoms usually makes the disease evident. Diabetes is overwhelmingly more common in the obese. Occurrence is more frequent in female subjects. The incidence is high in Jews. It is easy to find a diabetic person if one searches for him or her among these predisposed groups. It is up to each one of the medical practitioners in this country to find half a dozen new cases this next year.

DIAGNOSIS

During the next few weeks a great many patients with borderline diabetes will come into physicians' offices. It is most important to make the diagnosis promptly, preferably at the first visit. If another doctor or a diabetic friend has found sugar, consider the patient as having diabetes until the contrary is proved. If the urine is sugar free, it is often worth while to give the patient 50 Gm. of dextrose immediately and keep him waiting for a subsequent collection of the urine and a second blood sugar test at the end of an hour. Frequently the results of this procedure will be decisive. If not, the sooner a glucose tolerance test is carried out, after the patient has been on a full diet for several days, the better. One should be sure he is free from all signs of infection. Within a week I have revised the diagnosis of diabetes in a child made hesitatingly in 1933, when the result of the glucose tolerance test was positive by all criteria, because at the time I had recorded the temperature and it was 99.4 F. After fifteen years the patient returned to the office sugar free, apparently in perfect health, and

at the end of an hour after a meal the blood sugar was 90 mg. A bird in the hand is worth two in the bush, and that applies to all patients when they first appear, wondering whether they have diabetes. One should try to settle the point at once. However, even if one decides that diabetes is absent, one should counsel the patient, first, never to get fat and, second, to have the urine examined after a meal every three months. Do not quibble about diagnostic levels. If there is any doubt, keep the patient under observation and time will give the answer.

ONSET

The onset of diabetes by no means coincides with its diagnosis. I am sure that I have not seen 1 case in 5,000 in which the disease developed acutely in twenty-four hours. I have seen very few with the onset in the course of a week and only a moderate number with the onset dating back two months, leaving the vast majority with onset undetermined. Constantly on our combined medical-surgical rounds at the George F. Baker Clinic, to which you are all invited, beginning punctually at 8:00 a. m. on Mondays, we find serious diabetic complications, and yet repeatedly we cannot prove an onset within a year although the loss of weight began more than ten years earlier. To all of us it was evident that the seeds of the disease had been burrowing in the patient for a long period. Kendall Emerson¹ stated this very well in his discussion of arteriosclerosis. He commented on the direct relation between the severity of arteriosclerosis and the number of episodes of acidosis in young diabetic persons, as shown by Dr. Priscilla White, and then said, "It is just as important to remember, however, that the mild diabetic who is inadequately controlled for long periods of time, although never in critical acidosis, is even more prone to arteriosclerosis, because there is no obvious necessity for better control, as there is in the severe diabetic who must be continually treated to prevent a coma death." I am sure that all those who are interested in diabetes will heartily agree with that statement.

COROLLARIES

One should make a diagnosis early and begin treatment at once. Early diagnosis is the object of Diabetes Week, and our purpose and the advantage of early treatment are plain, because patients today live about three times as long as previously, die at over 64 years of age, instead of at 44, and few succumb to coma. If a patient with severe diabetes is acknowledged to be helped by insulin, how much more the patient with mild diabetes.

Read at the Interim Session of the American Medical Association, St. Louis, Dec. 3, 1948.

1. Emerson, K., Jr.: Nutrition in Diabetes, *Nutrition Rev.* 6: 257-259 (Sept.) 1948.

INSULIN

The use of insulin should be more widespread. Its value has been demonstrated in the treatment of patients in coma and of children. The spectacular improvement in the treatment of diabetes has occurred since its discovery. I would stress its importance in the group with milder diabetes. The question is not "Can you live without it?", because many can, and for some years; the point is that the patient with milder diabetes cannot afford to live without insulin. It is not "Must you take insulin?", but "You ought to take insulin. Your comfort in the future depends on it." I know that all in our group give insulin more and more for milder and milder diabetes now than ever before, and I do not know of any doctors who give it less. Irrespective of details of diet, bizarre though they may be, all doctors urge the use of insulin.

"Can I omit insulin?" You can, but you will probably rue the day. I have spent six months reducing the insulin dosage for a patient in whom the diagnosis was a bit doubtful. At the end of that time, when I finally omitted insulin, I arranged for the patient to come back at two and three week intervals; yet this patient, without having shown a single elevated blood sugar level in my office, later returned with 4.0 per cent sugar in the urine and an elevated blood sugar level. Over and over again I have seen patients apparently lose their diabetes. Years ago, before insulin was discovered, after treatment of a carbuncle or the removal of gallstones, I watched the diabetes seemingly disappear, but it came back. If it is difficult for me after fifty years, during which I have treated over 33,000 patients with sugar in the urine, to get through my head that I have never cured a diabetic person, how easy it must be for others, when queer results occur, to think that they have done so. When a so-called mildly diabetic patient comes back with 4.5 per cent sugar after three or four years, to whom earlier you did not give insulin because the patient objected, how do you feel? Test your patients who have done the best. Who is your best and standard patient—the model for the rest? How have you treated that one?

EXPERIMENTAL DIABETES

Experimental diabetes, akin to human diabetes, is preventable or reversible. Allen showed this for all his partially depancreatized dogs, and he further demonstrated that for these animals there was no inherent tendency to progression of the disease. It was his purpose to prove this in human beings, and he has cited evidence to support it. I will later make a contribution to his experience. In Young's anterior pituitary diabetic dogs diabetes was not maintained if measures of various kinds were adopted to keep the blood sugar normal. Diabetes due to alloxan can be prevented by previous injections of glutathione and a whole group of other substances. In Dohan and Lukens' cats, made diabetic with hyperglycemia, diabetes was reversed if within a few weeks their blood sugar levels were brought to normal by a low carbohydrate diet, insulin or phlorhizin. A high level of glutathione averts that type of diabetes in which there occurs an elevated level of uric acid in the blood.

(Incidentally, the work of Conn, with his experiments with adrenocorticotrophic hormone, lends credence to the observations in uric acid experiments which have been reported by Griffiths.) Such are the hopeful lessons from the laboratory. One cannot, one must not, disregard them.

DIET

Anyone who has read the literature of the treatment of diabetes from Rollo's time until the present, and especially that advocated by Bouchardat and Naunyn and, indeed, a host of others, cannot fail to see that the leaders and exponents of diabetic therapy, long before they knew much about the sugar in the blood, advocated strict control of the diabetic state. If glycosuria returned in his patient, Cantani locked him up again for a month before increasing the diet. Some physicians inadvertently helped to prove the correctness of these orthodox ideas by advocating other methods with disastrous results. The consensus based on experience in the last one hundred and fifty-two years and the results attained in experimental diabetes, therefore, impel me more and more to attempt to control the disease, to keep the blood sugar as nearly normal as I safely can, utilizing not only insulin but diet for this purpose. All will agree that the total diet should be restricted to prevent undue gain in weight. One should not forget that Allen's meat-fed partially depancreatized dogs could be kept in good condition although thin, but if extra meat was given to force gain of even 1 pound (0.5 Kg.) in weight, they showed glycosuria and became worse. Fortunately, insulin therapy enables one to avoid undue emaciation. All will agree that sudden changes in diet, particularly of carbohydrate, unless under the strictest supervision, are dangerous. All will agree that 150 Gm. of carbohydrate and at least a normal standard of protein are desirable, and in general, if more carbohydrate is given, it should be protected with insulin.

Responsibility for the treatment in the new 1,000,000 cases of diabetes devolves on physicians, and, if physicians do not meet it, then the state. The patients will require careful physical examinations, because in them complications will be rampant, for they have been neglected. No casual office visit will suffice. They must be stripped and examined from head to foot. As for treatment, the doctor will be swamped unless he has inexpensive assistance in his office, in nursing homes and in the hospital. More and more he must become an employer and introduce wholesale methods.

Doctors know that diabetes is a personal disease and to be managed by direct contact between the physician and the patient. Tuberculosis is contagious, and the government rightly steps in to care for the patients; but diabetes is not contagious and the only hope for its proper control rests on the doctor's impressing the patient who has it with the idea that, if he will not control it himself, the outcome will be a failure.

Diabetes is a disease for the doctor and not for the government to treat. Diabetes is a personal disease, and the patient who expects to live by the grace of insulin and the handout of food by the government or the community, instead of by his own zeal to get better and to recover the ability to earn a living, is

doomed to disappointment. Contrast the results of treatment in cases in outpatient clinics with their changing staffs, even though insulin is freely given, with results in cases of similar severity in private practice. Of course the new million diabetic persons and many of the old as well would like to have insulin and diets given to them free, but I doubt their being better for it.

CHOLINE

Should choline be used in the treatment of diabetic patients? Will it protect their livers or prevent them from having premature arteriosclerosis? Before one says yes, one should remember the aphorism of Plato, selected by Sir William Osler for the first edition of his "Practice of Medicine": "And I said of medicine that this is an art which considers the constitution of the patient, and has principles of action and reasons in each case."

Choline is one of the B complex vitamins. It came into prominence when Allan in Toronto, working with Best, found in the early days of insulin that, although their depancreatized dogs were treated with insulin, they would die in about three to nine months, though sugar free, with livers filled with fat. As soon as the diets of their depancreatized dogs included raw pancreas, they lived indefinitely. Later it was learned by Hershey that this also held when a constituent of the

Graphic formula for choline.

pancreas, lecithin, was substituted for the whole gland, and eventually it was found by Best and Huntsman that choline embodied in the lecithin molecule was the active principle and served as well. There is very little free choline in the body, but this wonder-working lipotropic vitamin has a wide distribution. The graphic formula for choline is given.

Choline has a profound effect on the storage and transport of fat, on growth and on various other physiologic mechanisms. Betaine and casein are similar to it, the latter acting because of its content of methionine. Choline, methionine and betaine tend to prevent fatty degeneration of the liver, and eventual cirrhosis, and accelerate the phospholipid turnover, but cholesterol, an antilipotropic factor, is their antagonist.

Dr. George R. Herrmann of the University of Texas, who has made a special study of hypercholesteremia and lipotropic agents for years, recently wrote, "The lipotropic agents warrant further clinical study in their application as possible therapeutic agents in atheromatosis." Before I shall advocate the prescription of 1 to 4 Gm. of choline daily for diabetes I shall await further evidence. As to its possible usefulness in preventing cirrhosis of the liver, from which as yet few of my diabetic patients suffer, recent experimental work has been favorable. Choline is wonderful. I hope that it will not be long before more proof of its protective power against cirrhosis of the liver and atheromatosis in diabetes is achieved.

INOSITOL

Inositol.— $\text{C}_6\text{H}_6(\text{OH})_6$ —is combined with phosphate in cereals and in the phospholipid of soy bean. It is present in liver and muscle. It is synthesized by bacteria in the intestinal tract, provided that pantothenic acid is present. The anticalcifying effect of cereal is due to the unavailability of the phosphorus in the cereal because it is combined with inositol. About inositol I feel at present as I do about choline and vitamin E. I shall remain open minded, but I want more facts.

VITAMIN E

Vitamin E (alpha tocopherol) has been recommended for the treatment of diabetes and especially for the vascular complications of the disease. Our group has not had sufficient experience with it in the treatment of our own patients to speak authoritatively, but, from what I have gleaned from the literature and my friends, I know of no reason why I should use it. Added to other proved methods of treatment, I do not know of its doing any harm. However, I have heard that, when it has been adopted simultaneously with the omission or diminution of insulin to dangerous levels, sad results have occurred. In general I hesitate to divert a diabetic person's attention from the use of diet, insulin and exercise and the constant control of his disease by giving other medicines, unless they are definitely indicated. Any of these other methods should first have convincing proof of usefulness by experiments on animals.

RESULTS OF TREATMENT OF PHYSICIANS WITH DIABETES

No one can enthusiastically and hopefully treat a chronic disease unless he is convinced that the methods used are producing encouraging results. For this reason one cannot too strongly advocate that each physician interested in diabetes compare the outcome in his cases formerly and now. Since Jan. 1, 1948, my co-workers and I have been engaged in the follow-up of our patients seen since 1898, with the assistance of a grant from The Diabetic Fund of the Boston Safe Deposit and Trust Company, a grant from the Life Insurance Medical Research Fund and the aid of the Statistical Department of the Metropolitan Life Insurance Company in compiling the reports. The data should be ready for display at the annual meeting of the American Medical Association in June 1949, but a brief reference can now be made to what has been learned regarding the physicians we have treated. I will add that all the doctors in the group have been traced.

Physicians with diabetes have a lower mortality rate than all my patients treated during similar periods. This is shown in table 1. Thus, the total death rate for physicians of all ages since the discovery of insulin was 50.6 per thousand as compared with 56.9 for all patients. But there is a significant difference for different age groups. Thus, between 25 and 39 years of age the death rate for doctors was 8, but for all patients 16.7; for the ages 40 to 59 the rate for doctors was 23.6, but for all was 33.1; whereas for the old, 60 to 79 years, the difference was negligible, 91.0 versus 93.3. Thus table 1 again demonstrates that a knowledge of their disease is an important factor in keeping those who have diabetes alive.

What insulin has done for doctors is shown in table 2. In the twenty-four years before its discovery the total death rate per thousand for ages 25 to 79 was 112.3, but for the subsequent twenty-five years, 50.6, or about 50 per cent less. For the younger doctors, 25 to 39 years, it changed from 125.7 to 8.0; for the middle aged, 40 to 59, from 55.3 to 23.6; and even for the old, 60 to 79, it fell from 164.8 to 91.0. No death has occurred among physicians aged 25 to 39 since 1938, and no death from coma among the entire group of 132 deaths during the same period. In fact, the last death of a doctor from diabetic coma was on Aug. 1, 1931. (Subsequently, 1 such death was reported.)

TABLE 1.—Comparative Mortality of 132 Diabetic Physicians and All Diabetics in Insulin Era*

Attained Age Groups	Death Rates per Thousand	
	Physicians (8/7/22-1947)	All Patients (8/7/22-1945)
25-39.....	50.6	56.9
40-59.....	8.0	16.7
60-79.....	23.6	33.1
.....	91.0	93.3

* Age-adjusted death rates per thousand on the basis of the age distribution of the total patients' experience Aug. 7, 1922 to 1945 (George F. Baker Clinic, Boston).

TABLE 2.—Mortality Among 132 Diabetic Physicians (1897-1947)*

Attained Age Groups	Death Rates per Thousand	
	1897- 8/6/22	8/7/22- 1947
25-39.....	112.3	50.6
40-59.....	125.7	8.0
60-79.....	55.3	23.6
.....	164.8	91.0
Number of Actual Deaths		
25-39.....	32	202
40-59.....	3	4
60-79.....	13	39
.....	10	159

* Death rates per thousand on the basis of the age distribution of the total patients' experience Aug. 7, 1922 to 1945 (George F. Baker Clinic, Boston).

Later the group of physicians will be studied in detail particularly to compile and report the causes of death, and for this I shall need the help of Dr. Dublin and Mr. Marks, so that the incidence of arteriosclerosis in diabetic and nondiabetic doctors can be compared. Of the 59 doctors who died since Jan. 1, 1944, cardiovascular-renal disease has claimed 83.1 per cent.

DIABETES CAMPS FOR CHILDREN AND THE NEW MODIFIED PROTAMINE INSULIN

In the summer of 1948 we placed 249 children in diabetes camps, 133 in the Clara Barton Birthplace Camp for diabetic girls and 116 in the Elliott P. Joslin Camp for diabetic boys. It seems a shame that only about 1 in 20 of the 15,000 diabetic children in the United States under 15 years of age had the opportunity of going to a diabetic camp. This year we know that we did more for the children than ever before, and partly this was due to a doctor's living

at each camp and more laboratory facilities. Not only did the camps accomplish a great deal for the children and the happiness and comfort of their families, by relieving them of responsibility for a period of two to eight weeks, but they also were constructive in that we tested in them the new modified protamine insulin. This insulin is nearly neutral in reaction, pH and contains only 0.50 mg. of protamine per hundred units of insulin, as compared with 1.25 mg. in ordinary protamine zinc insulin. It is a cloudy insulin and acts for about twenty-eight to thirty hours. It can be mixed directly with the unmodified or regular insulin with retention of most of the action of added insulin. It was a boon for the children, because one injection of it replaced two injections, namely, of crystalline or regular insulin and of protamine zinc insulin before breakfast.

I have had an opportunity to look over the charts revealing its action, compiled by Dr. Priscilla White and Dr. Ruth Reuting for the girls' camp and Dr. Alexander Marble and Dr. A. J. Gabriele for the boys' camp, and was struck by its superior power in controlling the diabetes. Their papers will soon be published. I think that this must in part be attributed to greater care in the adjustment of diets for the different parts of the day, the necessity of dependence on diet and not on insulin alone and a greater responsibility of the patient in adhering to the regimen. The new modified insulin is not a miraculous insulin, but it is distinctly a step forward, and one hopes that it eventually will be made available for wider use instead of distribution purely for investigational purposes.

The diabetic camps this summer demonstrated as never before their usefulness and the opportunity afforded for the intimate clinical study of the patients. It brought out the fact that more are needed. The loss of capital in utilization of the camps for only eight weeks a year was emphasized. At the girls' camp an experiment was made to keep the camp open one week longer for older girls, and this was most successful. We shall do our best another year, both to increase the size of the camps and to make the capital invested in them pay larger dividends by an extension of weeks of service.

NURSING HOMES

Great as is the need for diabetic camps, the necessity for nursing homes where diabetic persons can be taught is even greater. Hospitals are too expensive. Nursing homes can be built at a fraction of the cost, and in them multitudes of patients can learn how to care for themselves in the course of a week. The turnover is rapid and the good done so great as hardly to be estimated. Any young doctor who can persuade a diabetic person or some family to take an interest in caring for 1 or 2 or a few of his diabetic patients each week will advance significantly the standards of treatment of diabetes in his community and his own interests as well.

Between 1898 and 1914 the average age at death of my diabetic patients was 44.5 years and in 1944-1946 it had risen to 64.5 years. There are thus a great many patients who die of diabetes after 64 years of age. A provision must be made for their care during their final illness, which is often prolonged and preceded by invalidism so serious as to require hospitaliza-

tion. Everyone realizes the need for care for the aged, but I think that it has not been sufficiently emphasized that diabetic persons have grown 20 years older in a generation. We must begin to make provisions for them, because their diabetes is easily neglected. Diabetes camps for young persons and diabetes educational and nursing homes for older persons and the aged claim our consideration.

Diabetic persons are not living as long as they should, and the reason is that, in addition to the diet, insulin and exercise, each one of them needs personal follow-up by a doctor. If they were seen and examined every six months and their weight, blood sugar and urine reported on every three months, their expectancy would be far more than three-fourths that of the nondiabetic population and the average duration of all fatal cases would rise above 14.4 years. Today the deviation is 19.1 years for those with onset in the first decade, although the normal life expectancy is 55 years, but for those with onset above 60 years the duration is 9.1 years instead of a life expectancy of 12 years. Each diabetic ought to have a doctor to help him live longer and more healthfully. Talk as much as you like about the wonders of insulin and of diet, or the usefulness of exercise—all are of little avail unless the personality of the doctor enters into each case to see to it that treatment is followed. The patient must be made to realize this. He should know that he is being guided, protected and followed up year in and year out, and he must be shown that thereby his lot will be far better than that of the neglected person. Each doctor should have his own diabetic statistics. I know how long my patients are living today compared with those I treated formerly, and I know of what they are dying now; so guided, I try to make them live longer and escape the needless deaths to which so many in the past have succumbed.

QUARTER CENTURY VICTORY DIABETES MEDAL

For years we have given a medal to any diabetic patient who lived longer with his disease than he was expected to live without it, as estimated by life insurance expectancy tables. Probably 800 of these medals have been distributed, and I am sure, when we have followed up all our patients, that there will be many more who have earned it.

The Victory Diabetic Medal is of a different nature, because it requires health as well as duration of the diabetes to secure it. It is awarded by the Advisory Committee of The Diabetic Fund of The Boston Safe Deposit and Trust Company. The requirements are that the person shall have had undoubted diabetes for 25 years and be in sound health as certified by a physician, free from complications in the eyes as certified by an ophthalmologist and from arteriosclerosis in the arteries as certified by a roentgenologist. Thus far 4 patients have qualified for the medal. The onset of their diabetes has been at 1.9, 9, 14.1 and 14.9 years, respectively, and they have survived diabetes already 26 to 29 years.

Have you a candidate for the Diabetes Quarter Century Victory Medal? The Diabetic Fund would be happy to present your patient with its medal, because it is hoped that a study of the treatment and lives of these persons will yield definite hints for the care of other diabetic persons.

CHRONIC LYMPHATIC LEUKEMIA

A Study of 100 Patients Treated with Radioactive Phosphorus

JOHN H. LAWRENCE, M.D.
Berkeley, Calif.

B. V. A. LOW-BEER, M.D.
San Francisco

and
JAMES W. J. CARPENDER, M.D.
Chicago

In a previous article¹ were reported 129 cases of chronic myelogenous leukemia treated primarily with radioactive phosphorus (P³²). In the present paper a similar study of lymphatic leukemia is presented, based on our total experience in the use of P³² since we started these investigations. Included in the series of 100 cases are all patients with this condition who have been treated with radioactive phosphorus at the University of California in Berkeley and San Francisco since the work was started by one of us in 1936 until March 1, 1947, and followed until Sept. 1, 1948.

PREPARATION OF RADIOPHOSPHORUS

P³² in the form of isotonic sodium mono-hydrogen phosphate was prepared according to methods previously described.² The former source of the P³² was the P³¹ (n,p) P³² reaction in the cyclotron, but more recently the high yield of the S³² (n,p) P³² reaction which occurs in bombardment of sulfur by neutrons in the atomic pile has led to utilization of this source. The solution of P³² has been made isotonic by adding sodium chloride.³ Very little nonradioactive phosphate is present in the solution so obtained, and the total sodium phosphate content is less than 0.1 mg. per cubic centimeter. It is standardized against a uranium beta particle source and its activity expressed in microcurie radium equivalents.⁴

DOSAGE

The methods of dose determination have been discussed in previous reports.⁴ Briefly, the estimation is based on results with total body irradiation and the calculation that 1 microcurie of P³² per gram of tissue will give about 40 r of irradiation in twenty-four hours. Using data on percentage uptake, the rate of excretion and the rate of decay of P³², Dr. C. A. Tobias has derived formulas expressing dosage in roentgens equivalent physical whether for oral or intravenous administration. The formulas are based on the assumption of uniform distribution of P³² throughout the body (which does not occur). Correction is not made for the relative localization in the disease-involved tissues, and this is conditioned by size and frequency of dosage.

Dr. Carpende is now with the Department of Radiology, Division of Medicine, University of Chicago.

From the Radiation Laboratory and Divisions of Medical Physics (Donner Laboratory and the Department of Physics) and Radiology, University of California.

This work has been aided in part by a grant from the International Cancer Research Foundation and by the Henry Stevens Kiersted Memorial Fund for Medical Research.

3. Prior to 1945 the solution contained approximately 18 mg. of sodium phosphate (Na₂HPO₄) per cubic centimeter. From 1936 until 1945 the P³² was made in Berkeley 39 and 60 inch cyclotrons; after 1945, in an atomic pile and supplied by the Atomic Energy Commission. Valuable assistance was rendered by Mr. R. W. Dunn, Mr. R. G. Wolf, and Mr. H. O. Anger who processed and standardized the P³².

4. Lawrence, Dobson, Low-Beer and Brown,¹ Tobias, C. A.: Standardization of Radioactive Samples, in *Isotopic Tracers and Nuclear Radiations*, McGraw-Hill Book Co., N. Y., in press 1949.

With oral administration the retention of phosphate is less than after intravenous use, and this must be taken into consideration in evaluation of dosage.

DESCRIPTION OF CASES

The 100 patients under consideration were seen at the University of California before March 1, 1947. Seventy-seven of the patients consisted of the entire

Fig. 1.—Chronic lymphatic leukemia. The distribution of 24 living and 73 deceased patients is shown according to age (years) at onset (horizontal values). The vertical values show the number of cases studied.

group seen at one of the clinics up to that date, and the remaining 23 were seen and treated at the other clinic. No attempt was made to select the patients. Fifty-eight of the patients either had had roentgen therapy before receiving P³² or were given it afterward because indication occurred for local irradiation, such as large lymph nodes or a large spleen. Some of these

Fig. 2.—By infrequent administration of P³² intravenously, in doses from 0.5 to 4 millicuries, the white cells have been kept near normal in number and the patient, a 41 year old man with chronic lymphatic leukemia, has carried on a normal life without symptoms (P³² shown in millicuries, red blood cells in millions, hemoglobin in grams and white blood cells and thrombocytes in thousands).

patients have previously been reported, but this is the first attempt to study the entire series observed in the period 1936-1948.⁵ Follow-up studies were incomplete in 3 of the 100 patients.

HISTORIES

A review of the histories of these 100 patients shows 1 patient with a family history of blood dyscrasia. This patient had a sister who died of lymphatic leukemia. There were no patients with histories of tuberculosis, and in only 1 was it found at necropsy, in which case inactive pulmonary disease was observed. This low incidence is of interest in the light of the not uncommon concurrence of tuberculosis and leukemia.⁶

SEX AND AGE OF ONSET

The sex distribution was 71 per cent male (71 cases) and 29 per cent female (29 cases). These figures closely agree with those of Minot and Isaacs⁷ and others and indicate that lymphatic leukemia has an even greater predilection for male subjects than does myelogenous leukemia, in which 60 per cent of the

Fig. 3.—This chart demonstrates the difficulty of bringing many of the patients under control with present methods available. The patient, a 57 year old man with chronic lymphatic leukemia, had received P³² and radioactive colloids of yttrium and chronic phosphate (for liver and spleen irradiation), several doses of roentgen rays to the lymph nodes, and also several transfusions during 1948. At the time of writing, red blood cells and thrombocytes were beginning to increase, but one cannot be sure that the patient will continue to respond favorably.

cases are found in the male sex.⁸ The age of onset varied from 20 to 60 years, with the average at 53. The distribution is graphically illustrated in figure 1. This average agrees with the age incidence reported by Wintrobe.⁹ In myelogenous leukemia the greatest

number of cases appear at a younger age. In our series, which in general agrees with others, the average age was 41.¹⁰

TREATMENT DETAILS

At the initial visit a history was taken, a physical examination was carried out and blood studies were done. These often included a sternal puncture.¹¹ After this the patient was seen at what seemed to be the proper interval, the visits ranging from semiweekly to trimonthly, the frequency being determined by the activity of the disease. Dosage regulation was roughly similar to that described in the treatment of myelogenous leukemia,¹ although smaller and more frequent doses were given. In general, enough P³² was given to produce symptomatic relief. This, when achieved, with an improved red cell count and decrease in size of spleen and lymph nodes, was considered a good response, and an attempt to bring the white cell count down to normal or to near normal with a normal differential count was not made because of danger of too great a depression of the marrow and decreased production of normal cells. By this method the average patient received 1 to 2 millicuries per week for four to eight weeks. This dosage was repeated when indi-

Fig. 4.—This patient, a 59 year old woman with chronic lymphatic leukemia, had a spontaneous fracture of a cervical vertebra (presumably due to leukemic involvement) and during P³² therapy was in a body case. Excellent response and no further treatment necessary after 1942. Blood smear and marrow show evidence of leukemia, but the patient continues symptom free.

cated by a return of symptoms or other evidence of increased activity of the disease process. These small doses have been found adequate for controlling most patients for shorter or longer periods of time.

RESPONSE TO TREATMENT

The response to therapy in typical cases is shown in figures 2, 3 and 4. Figure 5 presents the picture with reference to length of life, and figure 6 suggests a favorable relationship between a high original hemoglobin and duration of life. Figure 7 suggests that with onset between ages 30 and 40, average survival is longer than in other age groups. This is not in complete agreement with other series,⁷ where better survival was observed in the 40 to 50 age group. Other analyses of the data showed no correlation between height of initial white blood cell count and survival time.

COMMENT

The series of cases under discussion is showing a small increase in the average duration of life with

this form of therapy as compared with series in which roentgen irradiation alone was used. The significance of this increase (average now approaching five years) cannot be evaluated without a greater number of cases followed for a longer period of time. Minot and Isaacs⁷ reported 80 cases with an average duration of 3.45 years with no essential difference between 50 irradiated

Fig. 5.—Results of P³² therapy in 97 cases of chronic lymphatic leukemia. The number of patients is plotted against average length of life after onset (September 1948). At present (May 15, 1949) the average for the whole group is 4.5 years, and the 22 living patients now have an average duration since onset of 6.8 years. (These durations have been calculated from the individual patient charts by a disinterested medical observer.) The vertical values show the number of cases studied and the horizontal values the duration in years.

patients and 30 treated by other methods. Wintrobe and Hasenbush⁹ reported 152 cases with an average duration of 3.29 years. The average duration in the present series is increasing, since 24 of the patients were still living at the time of writing; 35 per cent of the group had survived five or more years after onset, and 13 per cent of them eight or more years after onset.

In comparison with the series of myelogenous leukemia¹ in which the terminal picture in at least one third of the patients was one of acute leukemia with increased numbers of the blast cells in the blood smear, in the

Fig. 6.—Comparison of duration of disease (in years) with percentage of hemoglobin on admission in 95 cases of chronic lymphatic leukemia treated with P³². The dotted lines are for average duration of deceased patients.

cases of lymphatic disease there were only 2 that died with this picture. In attempting to depress the rapid growth of the young cells of leukemia one may also depress normal cell production, and leukopenia or anemia may result. While there is some selective effect with P³², one is aware of the possibilities of overdosage and deleterious effects just as

10. Lawrence, Dobson, Low-Beer and Brown.¹ Minot, Buckman and Isaacs.⁸ Wintrobe and Hasenbush.⁹

11. A detailed report of the marrow observations before and after therapy is now being written.

in the use of general body irradiation with roentgen rays or radium.¹² In consequence, a number of patients had decreases in thrombocyte counts to rather low levels and some showed low red cell counts after therapy. As these effects may be due also to the disease process itself, they constitute a major problem in determination of the amount of therapy advisable, whether it be P³², total body or local irradiation. Sternal bone marrow examination may be of assistance in making the decision, but one cannot be completely dependent on this, as leukopenia, anemia or thrombopenia due to irradiation may be present with a hyperplastic marrow which ordinarily constitutes an indication for therapy. Success of therapy depends on the greater sensitivity of the leukemic cells to irradiation, and often this is slight. In animals we have not been able to demonstrate greater sensitivity of leukemic cells over normal cells.¹³

In the total of 73 patients dying of lymphatic leukemia, postmortem examination was done in 21 instances. The observations were typically those seen

Fig. 7.—Comparison of age at onset in years (horizontal values) with duration in years (vertical values) in 96 cases of chronic lymphatic leukemia treated with P³². The dotted lines are for average of deceased patients.

in this condition with generalized infiltration of lymph nodes, spleen, liver and marrow. Several of the patients showed adverse effects on the normal blood components during the course of their disease, but in no case did the pathologist report observations suggestive of an aplastic marrow. There were, however, several patients on whom no postmortem examination was performed but who showed in the peripheral blood evidence of severe marrow depression. As in the myelogenous series some of the patients have received P³² for as long as ten years, but in this series the dosage has been lower, only 1 patient receiving a total greater

than 50 millicuries. In no case has there been evidence, at autopsy, of induced neoplasm, such as bone tumor as was reported by Brues and his co-workers¹⁴ after large doses of radioactive strontium in mice.

As in the case of myelogenous leukemia, we are limited by the adverse effect on normal cells and in some cases by what appears to be a gradual decrease in the ratio of sensitivity between leukemic and normal cells as the period of treatment lengthens. It is often necessary that one treat a patient in the face of falling red cells and thrombocyte counts in the hope that this decrease can be corrected or alleviated by inhibiting the leukemic marrow infiltration. Often palliation is all that can be achieved, but control of the disease is possible in a good percentage of the patients; it appears that the ease with which this is accomplished, by providing generalized irradiation, and the lack of radiation sickness in this form of therapy make the use of P³² advantageous. On these points all workers seem to agree.¹⁵ Despite the fact that these studies and also the studies of the cases of myelogenous leukemia indicate that P³² may be the best agent for the treatment of these conditions, either alone or in combination with roentgen irradiation, the failure to produce control or remarkable prolongation of life in many patients points to the need for much further research on this problem in the hope that, with a better understanding of the nature of leukemia, improved methods of therapy will result.

SUMMARY AND CONCLUSIONS

A study of 100 cases of chronic lymphatic leukemia treated with P³² alone or in conjunction with roentgen rays is presented. Comfortable life appears to have been prolonged as compared with the average life span after other methods of treatment. At the time of writing, 33 per cent of the group had lived five or more years after onset and 10 per cent eight or more years; these figures will be extended with the passage of time, since 24 of the patients are still living. When compared with five year end results in other types of neoplastic disease, such as carcinoma of the breast, prostate, lung, stomach and esophagus, these results are relatively good and do not encourage the prevalent hopeless attitude taken by many doctors confronted with the problem of treating chronic leukemia.¹⁶ This attitude is undesirable, since, when patients are first seen, one cannot rule out the possibility of long and comfortable life. This method of treatment is advantageous in its convenience for both patient and physician and in the lack of radiation sickness.

SPONTANEOUS REMISSION IN ACUTE LEUKEMIA

Report of a Case Complicated by Eclampsia

R. F. BIRGE, M.D.
ALONZO L. JENKS Jr., M.D.
and
STANLEY K. DAVIS, M.D.
Des Moines, Iowa

Wide interest has been aroused by a recent report that temporary remissions of acute leukemia have been produced in children with the aid of a so-called folic acid antagonist. Despite its toxicity, Farber, Diamond, Mercer, Sylvester and Wolff¹ have found that the administration of aminopterin® (4-aminopteroyl glutamic acid) produces, in the majority of patients treated, dramatic clinical improvement together with striking alteration toward normal of peripheral blood and bone marrow pictures. Comparable remissions of appreciable duration have never before been produced by numerous therapeutic agents.

On the other hand, sporadically, remissions of acute leukemia have been observed to occur without apparent relationship to therapy. Authenticated instances of spontaneous remission now seem worthy of review because they constitute a control group which may be compared with examples of drug-induced remission. Ten such cases have been described since 1931, and an additional example of unusually long remission (twenty-one months) is herein recorded. The latter case is unique in that its initial phase was complicated by eclampsia and is of especial interest because the bone marrow pattern of acute leukemia disappeared during remission.

REVIEW OF LITERATURE

Reporting a case of acute leukemia in which decided clinical improvement paralleled the return of the blood to an apparently normal state, Jackson, Parker, Robb and Curtis² stated in 1931 that they had been unable to find in the literature a description of a comparable case. Therefore, this review covers the literature subsequent to the report of these authors, excluding poorly authenticated cases, remissions of less than two months, and an example of clinical remission showing persistence of leukemic cells in the peripheral blood.³

In 1937 Forkner⁴ emphasized that spontaneous remission of acute leukemia is characterized not only by striking clinical improvement, but also by disappearance of enlargements of spleen, liver and lymph nodes, and by recession of the evidence of leukemia in the peripheral blood. In 1946 Pellegrini⁵ reported that there is a concomitant recession of the bone marrow picture during remission of acute leukemia. This observation is confirmed by study of the case herein described.

The incidence of remission of acute leukemia cannot be expressed mathematically. Although short incom-

plete remissions are not uncommon, many hematologists have not observed an instance of complete spontaneous remission lasting as long as two months. Sometimes, in reviews of acute leukemia, incomplete or very short remissions are described, while in other reviews the subject is not mentioned.

Including our case, 11 instances of acute leukemia, showing clearcut clinical and hematologic remissions of two to twenty-one months, have been recorded.⁶ Four of the patients were girls, aged 3 to 14 years. The remaining patients numbered 3 men and 4 women, ranging in age from 33 to 58 years. Every case had a febrile onset, and every case except 1 showed mucous membrane involvement at some time during the course of the disease. Enlargements of lymph nodes and spleen were observed in the majority of cases. Hemorrhagic phenomena were encountered in 8 cases and not mentioned in 3 cases. Thrombocytopenia and anemia were always present.

The initial leukocyte count was usually within the limits of normal. One patient was leukopenic throughout the early phase. Another had a count of 22,000, which was not repeated. In our case transient leukopenia trailed the onset of clinical remission, and when the leukocyte count again reached a normal level stem cells could no longer be found in the peripheral blood smears.

However, in 6 cases the disease followed an interesting pattern. As illness progressed, leukopenia appeared and became profound. Unexpected clinical improvement followed, and the leukocyte counts rapidly increased to normal or temporarily high levels while stem cells disappeared from the blood.

During remissions, the patients were ambulatory and felt well. Splenomegaly, hepatomegaly and lymphadenopathy subsided. Blood cell counts were normal, or so nearly normal that evidence of leukemia was not detected by examination of peripheral blood smears.

In 2 of Pellegrini's cases and in our case the sternal marrow was studied in the initial phase as well as at remission. In each instance, the marrow picture was characteristic of acute leukemia at the onset and essentially normal during remission.

With recurrence, almost invariably the leukocyte count was initially elevated or rapidly rose to a high level. Peripheral blood and bone marrow pictures were typical for acute leukemia. Lymphadenopathy and splenomegaly, if previously present, returned. The clinical observations at the time of recurrence were those of classic acute leukemia, and there was rapid downhill progression with early death. The case recorded by Whitby and Christie^{6d} was a remarkable exception, however, in that there were two remissions before death occurred, with observations typical of acute leukemia.

Although clinical manifestations were so similar, there was wide variation in classification of the 11 cases. In 4 cases the disease was classified as monocytic, in 3 as lymphatic and in 2 as myelogenous, while in 2 it was designated simply as acute leukemia.

REPORT OF A CASE

On Sept. 1, 1942, a white married woman, aged 33, noticed slight edema of the feet and ankles. On the evening of September 3 she had several chills. She entered the hospital the following morning for observation, stating that she was in the seventh month of her second gestation. A right salpingectomy and ovariectomy had been performed in 1940 for ectopic pregnancy. Her maternal grandmother had had profound anemia at the age of 50 and died four months later.

The temperature was 100 F. Physical examination revealed generalized slight puffiness of the skin and moderate edema of the ankles. The throat showed hyperemia. The blood pressure was 150 systolic and 84 diastolic. The abdomen was enlarged, consistent with the seventh month of pregnancy. Fetal heart tones were normal. The spleen and liver were not palpated, and enlarged lymph nodes were nowhere encountered.

Urinalysis showed albumin 1 Gm. per liter, an acetone reaction of 4 plus and a positive diacetic acid reaction; microscopic study of a centrifuged specimen revealed 12 to 15 erythrocytes and an occasional leukocyte per high power field. The initial hemogram showed: hemoglobin 9.2 Gm. per hundred milliliters, erythrocytes 2,480,000 per cubic millimeter and leukocytes 9,200 per cubic millimeter, with 81 per cent stem cells, 9 per cent neutrophils, 2 per cent monocytes and 8 per cent lymphocytes. Results of Kline and Kahn flocculation tests and a heterophil antibody test were negative. The icterus index was 10.7 units.

Blood smears contained many peroxidase negative stem cells. The normochromic anemia was accompanied with moderate polychromatophilia. Thrombocytes were moderately decreased.

A sternal puncture on September 7 showed a hyperplastic marrow containing a pronounced preponderance of stem cells similar to those observed in the peripheral blood.

On September 15 she had numerous convulsions. The blood pressure had risen to 180 systolic and 90 diastolic. The urine contained 20 Gm. of albumin per liter, and the serum protein was 4.4 Gm. per hundred milliliters. The spinal fluid pressure was normal; the cell count was 1, and the protein level was 20 mg. per hundred milliliters.

Intravenously administered pentobarbital sodium (nembutal®) controlled the convulsions, but the patient remained comatose through the following day. In the evening she gave birth to a nonviable infant.

At autopsy, the female infant weighed 1,240 Gm.; it showed slight maceration and no other grossly recognizable changes. In the placenta, numerous small fresh hemorrhagic infarcts were observed. Microscopic studies revealed no evidence of leukemic involvement of the infant's tissues or of the placenta.

After delivery, the patient remained in a comatose state for several days, but she gradually improved. Her temperature fluctuated from 100 to 105 F., but was normal after September 29. The content of albumin in the urine gradually decreased, until only a slight trace was present on October 1.

On September 24, the total leukocyte count was 5,400 with 50 per cent stem cells. Five days later the count was 4,500 with 26 per cent stem cells. The heterophil antibody reaction was negative. The serum protein was 4.6 Gm. per hundred milliliters, and the blood uric acid was 2.9 mg. per hundred milliliters. A blood culture was negative.

During October she gradually improved. The leukocyte count dropped to 2,250 on October 7 and then gradually rose to a level of 6,200 ten days later. Stem cells decreased in number until it was impossible to find them after October 12. A sternal puncture, performed on October 14, revealed a remarkably different picture from the previous one. The picture was that of an essentially normal marrow.

Interval History.—The patient was placed on a highly nutritious diet, especially rich in butter. She was given yellow bone marrow, vitamin B complex, vitamin A and vitamin D. After discharge from the hospital on Nov. 16, 1942, she gained strength and by March 1943 was doing much of her housework. By October she seemed to be entirely well, doing all her housework and taking part in social activities.

For a period of almost two years, blood cell counts were taken first at weekly intervals and then at fortnightly intervals.

Her erythrocyte count was always close to the lower limit of normal. The hemoglobin was normal. Slight macrocytosis was always present. The leukocyte count remained around 5,000, and no immature cells were observed in the smears.

The Recurrence.—On July 15, 1944, she had an abscessed tooth treated by a dentist. Afterward she felt perfectly well, but on July 26 the hemogram showed: hemoglobin 13.9 Gm. per hundred milliliters, erythrocytes 3,770,000 per cubic millimeter and leukocytes 4,350 per cubic millimeter, with 54 per cent stem cells, 1 per cent band cells, 2 per cent neutrophils, 1 per cent eosinophils, 3 per cent monocytes and 39 per cent lymphocytes.

During the middle of August she had several attacks of mild urticaria. On the morning of August 17, menstruation began. Later in the day, a mild chill occurred and the temperature was 102 F.

When she was readmitted to the hospital on August 21, physical examination revealed a few cutaneous petechiae. There was no demonstrable lymphadenopathy, splenomegaly or hepatomegaly. The blood pressure was 98 systolic and 70 diastolic.

The admission hemogram showed: hematocrit 33 volumes per cent, hemoglobin 9.7 Gm. per hundred milliliters, erythrocytes 3,010,000 per cubic millimeter and leukocytes 40,400 per cubic millimeter, with 88 per cent stem cells, 1 per cent band cells, 2 per cent neutrophils and 9 per cent lymphocytes. The urine was normal. The result of a Friedman test was negative. The sedimentation rate was 136 mm. per hour (Westergren), blood urea nitrogen 16.3 mg. per hundred milliliters, uric acid 3.1 mg. per hundred milliliters and total protein 6.6 Gm. per hundred milliliters.

The course was irregularly febrile, marked by occasional chills. Almost every transfusion was accompanied with chilling and fever. Malodorous vaginal discharge appeared, and at intervals there was passage of increasing amounts of blood and blood clots. Examination revealed ulcerative necrosis of the cervix. The hemorrhage could not be controlled by blood transfusion, by administration of vitamin K or by other measures. An abscess of the buttock developed and drained persistently. Scattered petechiae and ecchymoses appeared in the skin, and from time to time she complained of urticaria.

Blood cultures were repeatedly negative. Although the urine contained very few leukocytes, urine cultures were persistently positive for *Aerobacter aerogenes*, *Escherichia coli* and *Proteus vulgaris*.

The leukocyte count varied from 40,000 to 85,000. On August 30, she was given 3 millicurie equivalents of radioactive phosphorus in 5 per cent dextrose and isotonic sodium chloride solution intravenously. Similar amounts were given on September 4 and September 22. The leukocyte count rose to 101,000 on September 6 and then gradually dropped to 18,000 on October 2. Thereafter it fluctuated from 8,000 to 18,000, with stem cells persisting in high percentage. Anemia and thrombocytopenia persisted, the thrombocyte count falling to 9,000 on October 4.

She was maintained on a highly nutritious, high fat diet supplemented by yellow bone marrow and vitamin B complex. She received many blood transfusions and several courses of penicillin. There was very little response to any therapeutic measures attempted. She died on October 18.

Necropsy.—At necropsy, slight generalized lymphadenopathy was encountered. The liver weighed 1,955 Gm. and the spleen weighed 205 Gm. A few petechiae were found in the pleurae and endocardium. The dilated heart weighed 285 Gm. No important changes were observed along the respiratory, gastrointestinal or urinary tracts. The endometrium was represented by a thin, hyperemic irregular surface, to which a few shreds of soft red tissue were attached. The patulous cervical canal was filled with thin malodorous sanguineous fluid, and the hyperemic granular endocervix showed small areas of necrosis. The ribs and vertebral bodies showed normal density and contained abundant thick, pale red bone marrow.

The bone marrow was heavily infiltrated by cells resembling those found in the peripheral blood and in the bone marrow during life and contained few megakaryocytes, normoblasts or granulocytes. Large mononuclear cells were scattered along the

liver sinusoids and along the sinusoids of the lymph nodes, which showed preservation of architectural pattern. However, the architectural pattern of the spleen was obliterated because of proliferation of large numbers of mononuclear cells. The inflammatory process in the cervix proved to be a necrotizing one, characterized by little evidence of repair and by the presence of very few segmented neutrophils and small numbers of large mononuclear cells. Other organs did not show evidence of leukemic involvement.

COMMENT

The diagnosis of leukemia was amply confirmed when the patient was originally seen and again at the beginning of the remission. In an interesting letter, dated Oct. 24, 1942, Dr. Lawrence H. Beizer of the Mayo Clinic, Rochester, Minn. (now of Philadelphia), said:

Dr. Frank J. Heck and I have reviewed the original smears and the recent ones which you sent in the case of Mrs. E. R. We still feel that the original smears are typical of acute leukemia, probably leukemic reticuloendotheliosis. The recent peripheral blood and bone marrow smears show no evidence of leukemia. Dr. Heck tells me that in the past the men here have seen several cases in which the peripheral blood showed no evidence of leukemia during a remission. At the time those patients were seen, bone marrow studies were not being done, so that we do not know what the marrow would have shown. Subsequently, the leukemic picture returned. Because of this, I think that it would be well to give a very guarded prognosis.

The immature cells, found in the peripheral blood on both admissions and in the bone marrow initially and after death, were all similar. However, stem cells were predominant in the early phase, and large monocytic cells, many resembling reticuloendothelial cells, were predominant in the recurrent phase. Stem cells possessed large nuclei and one or more nucleoli; the cytoplasm was scanty and pale without granules. Other immature cells showed abundant cytoplasm in which fine azurophil granules could often be seen; the large nuclei frequently showed slight grooving or indentation and contained one or more prominent nucleoli. Peroxidase stains were consistently negative.

The final diagnosis, based on clinical, cytologic and postmortem observations, was acute monocytic leukemia recurrent after a long remission. The case might have been classified as one of leukemic reticuloendotheliosis. The occurrence of so-called reticuloendothelial cells in leukemia is perhaps better understood if one accedes to the view of Wiseman,⁷ who recently discussed the relationship of leukemia to the reticuloendothelial system. He stated the belief that the reticuloendothelial system has blood as well as tissue components and that the monocyte is a derivative of the reticuloendothelial system. He stated that monocytic leukemia, therefore, may be regarded, fundamentally and in fact, as leukemic reticuloendotheliosis.

In the case herein described rapid improvement followed spontaneous termination of eclamptic pregnancy. We encountered no parallel case in the recent medical literature. The experience of others has been that the course of acute leukemia is not significantly altered by termination of pregnancy. Therefore, although it is intriguing to consider the possible relationship of endocrine factors to the onset of remission in our case, such speculation seems valueless except as it may suggest a course for future investigation. A pronounced effect of estrogens on the bone marrow

and peripheral blood pictures of dogs has been reported,⁸ and a definite increase in the incidence of leukemia in mice receiving estrogens has been observed.⁹ Remarkably little information is available concerning endocrine influences on the morphologic aspect of the peripheral blood and bone marrow of human beings.

Although remission in the case of Jackson and his co-workers² followed administration of adenylic acid, there was no response to its administration during the recurrence, and other patients with acute leukemia failed to show response to this therapy. Numerous other drugs, for example ascorbic acid,¹⁰ have been tried, with doubtful success, in the management of acute leukemia. Roentgen therapy is usually considered contraindicated in these cases, and radioactive phosphorus appears to induce at best no more than temporary improvement in occasional cases.

Haines,¹¹ observing that a leukopenic phase frequently precedes the onset of remission in acute leukemia, theorized that administration of an agent toxic to leukocytes might artificially "set the stage" for a remission. His attempt to accomplish this, using neoprontosil[®] (disodium 4-sulfamido-phenyl-2-azo-7-acetyl-amino-1-hydroxy-naphthylene, 3,6-disulfonate), was unsuccessful. A similar effort was made in our case at the time of recurrence. After intravenous administration of 9 millicurie equivalents of radioactive phosphorus,¹² the leukocyte count fell from a high level to nearly normal, but clinical improvement did not ensue.

When aminopterin,[®] a folic acid antagonist, was administered intramuscularly to 16 children with acute leukemia by Farber, Diamond, Mercer, Sylvester and Wolff,¹ remarkable clinical improvement was noted in 10 cases. Leukocyte, erythrocyte and thrombocyte counts approached normal values. There was recession, if present, of enlargements of spleen, liver and lymph nodes. There was a decided effect on the bone marrow, which showed changes that varied from a decrease in number to a disappearance of the leukemic cells.

Thus, remissions induced with aminopterin[®] seem to be as dramatic as those which occur spontaneously. However, the aminopterin[®]-treated patients had not been followed long enough at the time of publication (June 3, 1948) of the preliminary report of Farber and his co-workers to determine whether or not remissions of longer than three months can be maintained. Unfortunately, the drug is rather toxic. The authors warn that their studies do not warrant the application of the term "cure" to any of the cases reported.

SUMMARY

Acute leukemia in a 33 year old woman had its onset in the seventh month of gestation. Symptoms of eclampsia developed, and she prematurely delivered a nonviable infant which showed no evidence of leukemia at autopsy. After delivery, she improved rapidly and was in good health for twenty-one months, whereafter again the clinical and hematologic picture of acute leukemia developed and the patient died.

During the remission, cytologic evidence of leukemia in the sternal marrow and in the peripheral blood disappeared. The administration of radioactive phosphorus, in an attempt to induce a second remission, was followed by reduction in the leukocyte and thrombocyte counts without clinical evidence of improvement.

The foregoing case exemplifies a unique form of acute leukemia which has been characterized by an acute febrile onset, frequent involvement of mucous membranes and less frequent splenomegaly and lymphadenopathy. Initially, severe anemia, leukopenia and thrombocytopenia are observed. There follows a remission, lasting as long as twenty-one months, characterized by apparent restoration of health, by disappearance of demonstrable lymphadenopathy and splenomegaly and by return of the peripheral blood and bone marrow pictures to normal or nearly normal. Suddenly, fever and other clinical manifestations of acute leukemia reappear; lymphadenopathy and splenomegaly, if previously present, return. The leukocyte count rises rapidly in most instances, and evidence of acute leukemia in the peripheral blood and the bone marrow is again apparent. Death ensues.

Ideally, remissions induced by aminopterin® (4-aminopteroyl glutamic acid) or by other means should simulate the spontaneous ones described.

EFFECT OF SYMPATHECTOMY ON BLOOD PRESSURE IN HYPERTENSION

A Review of Thirteen Years' Experience at the Massachusetts General Hospital

and

STEWART R. COOPER, M.D.
Montreal, Canada

The difficulty of assessing the effectiveness of various forms of treatment for essential hypertension is due to several causes, of which the most important are the necessity for following each patient over a period of many years, the variability of the course of the disease in different patients and the lack of adequate statistics concerning the natural history of the disease in a series of patients large enough to include all possible variations in duration and severity. In addition to these fundamental sources of difficulty, the task of carrying out an accurate follow-up study is further complicated by the large number of clinical manifestations of the disease which must be taken into account and the absence of completely satisfactory methods for measuring the severity of the damage done to each of the organs affected. The net result of all these difficulties

is reflected in the fact that various authors employ a wide variety of criteria of therapeutic benefit in essential hypertension, without having arrived at general agreement as to the relative importance of each factor. For example, it is customary to evaluate the beneficial effect of treatment in terms of reduction in blood pressure, improvement in the status of the cardiac, renal and central nervous systems, favorable changes in the appearance of the ocular fundi, reduction of the severity of miscellaneous symptoms, such as headache, improvement in the patient's capacity for physical activity and increase in life expectancy. While all these criteria are generally accepted as reasonable indexes of successful therapy, there is a surprising amount of disagreement as to the reliability of various methods which are used to assess the degree of improvement or deterioration which has occurred in each of the factors mentioned. For example, in evaluating the patient's cardiac status, some authors attach great significance to changes in the size of the cardiac shadow on the roentgenogram of the chest and to certain changes in the T waves on the electrocardiogram, while other authorities consider these so-called objective observations to be less reliable than the conclusions reached by the ordinary methods of history taking and physical examination. Equally divergent methods which have been used to evaluate the degree of blood pressure reduction produced by various forms of therapy will be discussed elsewhere in this report.

In view of the large number of factors which must be taken into account in assessing the value of any type of treatment for essential hypertension, no single over-all index of therapeutic success has yet been devised, by means of which each patient can be categorized as cured, improved, unchanged or worse. Therefore, until some such over-all index of therapeutic benefit is agreed on, doctors will be forced to rely on separate assessments of each factor. This is far from being an ideal approach to the problem, but, if the assessments of individual factors are made as accurately as possible, the data obtained will eventually be sufficient to allow each observer to evaluate the results according to whatever system of weighting appears most reasonable in the light of his own experience. For example, we realize that some authorities are inclined to minimize the importance of mere reduction of blood pressure, and there are many who believe that it may actually be harmful to lower the blood pressure of certain hypertensive patients. However, as long as blood pressure reduction continues to be regarded as beneficial by most internists, and as long as sympathectomy is so often recommended to the patient as a means whereby this desirable result may be achieved, it is important that as much data as possible be published in order to determine the frequency and permanence of blood pressure reduction after sympathectomy. Because of limitation of time, this report will deal only with the specific question of the effect of sympathectomy on the blood pressure, but the follow-up study, from which the blood pressure data were obtained, was carried out on very broad lines, in order to obtain as much information as possible about all the other factors involved in a complete assessment of the value of the operation.

CLINICAL MATERIAL

During the period 1935-1947, approximately 400 patients underwent sympathectomy for the treatment of hypertension on the public wards of the Massa-

This project was undertaken by the Hypertension Committee of the Massachusetts General Hospital with the aid of a grant from the Life Insurance Medical Research Fund.

Read in a Symposium on Hypertension in a joint meeting of the Section on Experimental Medicine and the Section on Internal Medicine at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 25, 1948.

Dr. Evelyn directed the project during a period of leave of absence from McGill University, which was granted in order to allow him to accept a temporary appointment at the Massachusetts General Hospital. Dr. Evelyn's present address is Medical School, McGill University, Montreal.

Dr. Robert Sterling Paimier placed at our disposal data collected over a period of years in the Hypertensive Clinic of the Massachusetts General Hospital. Valuable services were also rendered by Drs. W. P. Chapman, R. H. McFarlane and G. R. Turgeon, and by Mrs. Jean Barkin Waldstein, Miss Mary Butler, Miss Jean Emery, Miss Phyllis Hoffman, Miss Grace Lockwood and Miss Margaret O'Grady. The nature of the services rendered is indicated by appropriate footnotes throughout the text.

chusetts General Hospital. In order to obtain a more homogeneous series for follow-up purposes, we decided to exclude from the study all patients who were not residents of the State of Massachusetts at the time of the operation. The application of this rule reduced the series to 292 patients, who may be divided into three

Fig. 1.—Illustration of variations in the extent of average ganglionectomy during the years 1935 to 1947 at Massachusetts General Hospital. The black bars indicate male patients and the hatched bars female patients.

groups according to the type of operation performed. The first group consists of 35 patients who were operated on by the supradiaphragmatic route during the years 1935-1938. The second group is composed of 223 patients who underwent sympathectomy by the Smithwick¹ lumbodorsal procedure between March 1939 and May 1946. The third group consists of 34 patients who were operated on by the surgical members of the Hypertension Committee² of the Massachusetts General Hospital from June 1946 to May 1947. The third group is still rather small, but its significance is likely to increase as the series grows, because it is made up of carefully selected patients who have been operated on by several different technics designed to give a more radical resection of the sympathetic trunk than the Smithwick operation.

Figure 1 shows how the extent of the ganglionectomy has varied as a result of the three major changes of policy described, together with several minor modifications of technic which have been introduced during the period covered by this study. The average ganglionectomy obtained with the supradiaphragmatic operation was from the tenth to the twelfth dorsal ganglion, but this was increased in both directions by the Smithwick technic so that the average ganglionectomy extended from the eighth or ninth dorsal to the first or second lumbar ganglion. The diagram shows that during the first five years of performance of the Smithwick operation there was a tendency to increase the extent of the ganglionectomy in the lumbar area with a consequent reduction of the height of the dissection in the dorsal area. However, during the years 1944-1946, there was a reversal of this trend which eventually resulted in the adoption of a more or less standardized ganglion-

ectomy extending from the eighth dorsal to the first lumbar ganglion. It will be noted, also, that even in the years when an effort was being made to extend the ganglionectomy in the lumbar region, the operations tended to be less extensive in this direction in the male patients in order to reduce the possibility of damage to the ejaculatory function. The last entry in figure 1 shows the increased extent of the average ganglionectomy performed in the first year, during which the more radical operations were performed by members of the hypertension committee. Although the average ganglionectomy of the sixth dorsal to the second lumbar ganglion was only slightly more extensive than that produced by the Smithwick technic, several operations extended from as high as the second or third dorsal to as low as the second or third lumbar ganglion. We have stressed these differences in the extensiveness of the ganglionectomy because one of the important objectives of this study is to determine whether the more radical operations will produce a large enough improvement in therapeutic effectiveness to offset any increase in morbidity which may occur.

Many other features of the clinical material have been examined in detail, but the most striking result of these studies is the relative constancy of most of the characteristics of the group from year to year. For example, the ratio of female to male subjects in the whole series is 1.8 to 1, and this ratio was found to have remained constant within the range of statistically allowable error during the periods 1935-1938, 1939-1942, 1943-1946 and even in the small group of patients operated on by the more radical methods during 1947. Even more surprising, in view of the various methods of case selection which have been tried at different times, is the relative constancy of the average age of the patients operated on in each year. This is illustrated in figure 2, in which it must be noted that the averages for many of the early years were based on relatively small numbers of patients, so that the agreement is all the more significant. For the series as a whole the average age of the 187 female patients was

Fig. 2.—Diagram of variation of average age of male and female patients who underwent sympathectomy in each year from 1935 to 1947. The black bars indicate male patients and the hatched bars female patients.

1. Smithwick, R. H.: A Technique for Splanchnic Resection for Hypertension, *Surgery* 7:1-8 (Jan.) 1940.

2. The Hypertension Committee of the Massachusetts General Hospital was set up in May 1946 to take charge of the sympathectomy program when Dr. R. H. Smithwick left the Massachusetts General Hospital to become Professor of Surgery at Boston University. The original surgical members of the group were Drs. R. R. Linton, F. D. Moore, F. A. Simeone, W. H. Sweet, C. E. Welch and J. C. White.

39.6 years, and that of the 105 male patients was 40.2. The age distribution of all 292 patients is shown in figure 3, from which it is evident that the largest group was from 40 to 45 years of age and that 70 per cent of the patients were between 30 and 50 years of age. Of the remainder, 18 per cent were below 30 and 12 per cent were above 50 years of age.

In the great majority of cases in the series the operation was performed for essential hypertension, but there were a few patients in whom some form of secondary hypertension was present, for example, 4 cases of glomerulonephritis, 2 cases in which sympathectomy was combined with unilateral nephrectomy, 3 cases of coarctation of the aorta and 2 cases of pheochromocytoma. These patients were studied as a matter of interest, but their data are not included in any results which refer specifically to essential hypertension. In several cases which were considered to be of essential hypertension, there was evidence suggestive of coexistent pyelonephritis, but since it was difficult to be certain that the pyelonephritis had any etiologic significance, we have not excluded these cases from the classification of essential hypertension. Finally, it may be of interest to record that the incidence of papilledema in the various subdivisions of the series was 20 per cent in the 35 cases of the supradiaphragmatic series, 14 per cent in the 223 cases with operation by the Smithwick technic and 18 per cent in the 34 cases of the most recent series.

Fig. 3.—Diagram of age distribution of 292 patients who underwent sympathectomy during the period 1935 to 1947. The vertical values show the number of cases, and the horizontal values indicate the age at the time of operation.

METHOD OF STUDY

The chief objective of the investigation was to prepare a detailed analysis of all aspects of the case record of each patient and to supplement this as much as possible by obtaining additional information from the living patients by means of a personal follow-up. At the beginning of the study a list was made of all the questions about which data should be obtained, and these were classified into three main groups: clinical, biographic and statistical. The biographic section was responsible for reconstructing the patient's home life, employment record and capacity for physical activity, in order to evaluate the beneficial or detrimental effect of the operation on the patient as a person. The statistical section was responsible for verifying and recording all numerical data, such as the patient's birth date, age at operation, date of operation, extent of ganglionectomy and other similar information obtainable from the record. In this connection, the most important task of the statistical section was to prepare a list of all blood pressure readings recorded for each patient with notes on the date of each reading and the circumstances in which each reading was taken. In addition, because of the special importance of the problem, an independent project was carried on concurrently by Dr. William P. Chapman in order to evaluate the effect of the operation on the symptom of headache. Although there was a certain amount of unavoidable overlapping, four independent analyses were made of each record in order that each of the four types of data could be summarized separately

and relatively free from other types of information. This system had the advantage of simplifying the task of transferring the raw data to the comprehensive data sheets from which the final statistical analyses were made, but it also resulted in highly efficient utilization of personnel. The clinical data from each case were extracted by one of the authors and checked by another, the biographic material was handled by a professional social service worker,³ and the statistical data by specially trained statistical clerks⁴ who routinely double checked each protocol. Dr. Chapman was responsible for the fourth independent analysis, which summarized only information relevant to the problem of headache.

The record summaries were completed on schedule ahead of the date of the patient's appointment for personal follow-up study, so that discrepancies and omissions in the record could be clarified as much as possible during the patient's interviews with the physician and social worker. It was a standing rule that the patient's statements at the time of the follow-up interview, which were based on memory of events which took place several years previously, could not be used to over-rule statements recorded in the original case history at the time of their occurrence. However, we considered it justifiable to obtain certain data, such as the family history and the dates of pregnancies, operations and illnesses, which were not adequately covered in the original record. It was also considered safe to obtain certain important items of the personal history which were required to complete the biographic record. Additional useful information was often obtained by writing to hospitals to which the patients had been admitted or to physicians from whom they had received medical care during the period covered by the study. Naturally, the patient's statements, so far as they were in accord with the general trend revealed by recent entries in the record, were our main source of information regarding his general condition at the time of the follow-up interview. Occasionally, when the patient's memory was impaired, an attempt was made to obtain more reliable information from relatives or friends who were asked to accompany the patient on the visit to the Hypertension Laboratory or who were interviewed by the social service worker by the telephone. Additional information was sometimes obtained by making contact with the patient's employer.

During the early months of the project, while the system of record analysis was being developed, another member of the staff⁵ was making an effort to trace each patient in the series, to obtain details concerning the time and manner of death in those who had not survived and to arrange a suitable date for each of the surviving patients to be studied in the Hypertension Laboratory. The appointments were made at the rate of 1 case per day, so that each patient spent approximately eight hours in the laboratory, during which time the attention of all members of the staff was focused exclusively on him. In addition to the careful interviewing and history taking described, the follow-up study consisted of a complete physical examination, which included a standardized ophthalmoscopic grading of the ocular fundi.⁶ Routine laboratory tests included urinalysis, intravenous phenolsulfonphthalein test, examination of the chemical content of the blood, electrocardiogram and roentgenogram of the chest. Physiologic studies consisted of an attempt to evaluate the completeness and permanence of the effect of the operation on certain autonomic nervous functions, skin temperature measurements being used as an index of peripheral vasodilatation and electrical skin resistance measurements⁷ as an index of sudomotor activity.

The blood pressure of each patient was taken shortly after arrival under conditions simulating as closely as possible those which would exist on a routine clinic visit. Later in the

7. The skin temperature and skin resistance measurements were made by Miss Grace Lockwood.

morning the standard posture and cold blood pressure test⁸ was performed, and thereafter throughout the remainder of the day the blood pressure was taken approximately once every hour at convenient intervals between various items of the follow-up program. The purpose of these frequent blood pressure readings was to provide an indication of the variability of the blood pressure, since some phases of the program caused mild anxiety in the patient, while other tests were performed after the patient had spent an hour in an air-conditioned room at a temperature which was either uncomfortably cold or pleasantly warm.

In the majority of cases, the follow-up study was completed in the course of a single day without producing undue fatigue in the patient, but whenever a patient was unable to undergo all the tests in one day a second appointment was made to complete the study.

At the time when the list of patients to be followed up was closed, the series consisted of 292 patients, of whom 219 were alive and 73 were dead. Of the 219 surviving patients, 210 were willing to cooperate to the extent of coming to the laboratory for the follow-up examinations. Six patients who were too sick to come to the laboratory were studied as well as possible at home with the collaboration of their private physicians, while 2 patients could not be located and 1 was located but declined to cooperate.

RESULTS

Although our main interest, as far as the blood pressure data were concerned, was devoted to the long term results of the operation over a period of several years, an analysis was also made of the "immediate" results of the operation, as indicated by a comparison between the average blood pressure at the end of the first week in the hospital before the operation and the average pressure just before the patient was ready to be discharged from the hospital after the second stage. For this portion of the study, patients with postoperative complications were not used, and only those records in which the blood pressure readings were entered regularly throughout the hospital stay were considered suitable. Patients who were operated on before the seventh day in the hospital and those who were discharged before the twelfth postoperative day were also excluded. With these restrictions, 114 cases were considered suitable for study; figure 4 shows a comparison of the preoperative and postoperative blood pressures of these 114 patients in the form of a scattergram. On the left hand side of the graph are shown the preoperative systolic and diastolic blood pressures of each patient obtained by averaging all readings taken before the operation on the sixth, seventh and eighth days after admission to hospital and on the right hand side the corresponding pressures obtained by averaging all readings taken on the eighth, ninth, tenth, eleventh and twelfth days after the second stage. The systolic pressures are represented by black dots and the diastolic pressures by open circles. The average preoperative systolic blood pressures ranged from 120 to 245 mm., with an average of 177 mm., while the corresponding average postoperative systolic pressures ranged from 90 to 225 mm., with an average of 152 mm. In the case of the average diastolic pressures, the preoperative range was from 70 to 170 mm., with an average of 116 mm., while the postoperative range was from 65 to 135 mm., with an average of 100 mm. The low preoperative readings obtained in such a large proportion of the patients is further

evidence of the variability of the blood pressure even in patients with long-standing hypertension, since the blood pressures of these patients in the clinic or on admission to the hospital were usually high enough to justify performance of sympathectomy. While these figures have not proved of value in predicting the long term outcome of the operation, we feel that they are of interest because they show that the average reduction of the blood pressure taken while the patient is lying in bed in the hospital at the end of approximately ten days after lumbodorsal sympathectomy is only about 25 mm. systolic and 16 mm. diastolic, in spite of the fact that in this early postoperative period there is almost invariably a drastic reduction of the standing blood pressure with symptoms of postural hypotension. This striking reduction of the blood pressure in the standing position usually tends to disappear gradually until it becomes barely noticeable at the end of the first postoperative year, except in a few patients in whom, for unknown reasons, a more or less permanent postural hypotension develops, which is always annoying and may, in extreme cases, be quite disabling.

In dealing with the long term effect of the operation on the height of the blood pressure, we have found it convenient to plot all the available clinic blood pressure

Fig. 4.—Scattergram to illustrate the differences between average preoperative and postoperative blood pressures of 114 patients taken while the patients were in the hospital. The left hand scattergram is for the preoperative period, six to eight days after admission. The right hand scattergram is for the postoperative period, eight to twelve days after the second stage.

data of each patient on a standardized chart in which the time scale is greatly compressed, so that it is possible to obtain a panoramic view of the blood pressure fluctuations during the preoperative and postoperative periods. In all these graphs the systolic blood pressures are represented by black dots and the diastolic pressures by open circles.

It has been our policy to enter on the blood pressure diagrams only those readings which are taken under so-called casual conditions, that is to say, in circumstances such as usually prevail in the average outdoor clinic where blood pressure readings are made in the course of an ordinary physical examination, without any standardized preliminary period of rest. Since such casual blood pressures are taken about as often in the lying as in the sitting position, we have plotted on the same graph all blood pressures taken in either of these two positions. We are aware of certain advantages which have been claimed for blood pressures taken under more or less "basal" conditions, but since the variability of blood pressure readings cannot be abolished by any type of environment known to us, we believe that accurate statistics can only be obtained when a relatively large number of individual blood

8. Smithwick, R. H.: Surgical Treatment of Hypertension: The Effect of Radical (Lumbodorsal) Sympathectomy on the Hypertensive State of One Hundred and Fifty-Six Patients Followed One to Five Years, *Arch. Surg.* 49: 180-193 (Sept.) 1944.

pressure readings are available for analysis no matter what conditions may have prevailed when the readings were made. This point has been adequately stressed by Ayman,⁹ who recommended that the desired frequency of blood pressure readings be obtained by teaching the patient, or members of his family, to take blood

Fig. 5.—Variations in blood pressure of a woman who received medical treatment for ten years, from age 34 through age 43.

pressure readings twice a day over periods of months or years. We recognize the value of this so-called "home" blood pressure method, but on account of the immense administrative difficulties involved in its large scale application over a period of ten or more years, it is unlikely to become accepted as a routine method of studying the effect of sympathectomy on the blood pressure. In any event, no such data were available to us; we therefore tried to make the best possible analysis of the clinic blood pressure data, while fully realizing the variability of the conditions under which the blood pressure readings were made. We feel that this lack of standardization is in some respects desirable, because a graph made from a relatively large number of readings obtained under such variable conditions

Fig. 6.—Variations in blood pressure of a woman who received medical treatment for nine years, from age 44 through age 52.

tends to give a fairly accurate indication of the range of variation of the patient's blood pressures under ordinary conditions of every day life outside the home.

9. (a) Ayman, D., and Goldshine, A. D.: Blood Pressure Determinations by Patients with Essential Hypertension: The Difference between Clinic and Home Readings before Treatment, *Am. J. M. Sc.* **200**: 465-474 (Oct.) 1940; (b) Blood Pressure Determinations in Patients with Essential Hypertension: Evaluation of Sympathectomy over a Three Year to Five Year Period, *New England J. Med.* **229**: 799-811 (Nov. 25) 1943.

Since an evaluation of the significance of any observed alteration in blood pressure can be made only in terms of the frequency with which similar variations may occur spontaneously in a medically treated patient, we have also analyzed clinic blood pressure data of patients who have not been subjected to sympathectomy, in order to obtain approximate statistics on the variability which may be expected in "casual" blood pressure readings from day to day. Figures 5 and 6 are presented to illustrate the type of blood pressure variations which are usually encountered in medically treated hypertensive patients. Figure 5 illustrates a common feature of such data, namely, the tendency of the blood pressure to be at a very high level on the first visit to the clinic, with subsequent reduction due to an early favorable response to medical treatment and with eventual stabilization at an intermediate level. However, no matter how familiar the patient becomes with the environment of the clinic, the blood pressure level never becomes stabilized in the strict sense of the word, since what actually occurs is that the blood pressure as taken in the clinic continues to fluctuate above and below the mean. In the average case, in which eight

Fig. 7.—Illustration of the successful result of a sympathectomy performed on a girl at the age of 16 years. The postoperative blood pressure had remained normal for nearly seven years. The horizontal row of figures shows preoperative (left) and postoperative (right) years.

or ten clinic visits are made every year for several years, it is usual for the systolic pressure to vary over a range from 20 per cent above to 20 per cent below the average of all systolic readings recorded for the patient and for the diastolic pressure to vary about 15 per cent above and below the average diastolic. These figures apply to the great majority of ambulatory hypertensive patients, although occasional patients in the advanced stages of the disease may show relatively "fixed" blood pressures.

In presenting the results on patients who underwent sympathectomy, a series of diagrams is shown illustrating some of the typical blood pressure responses which have been observed in this series. Each graph is condensed to show the blood pressure readings for seven years before and seven years after the operation, which is represented by the double vertical line at the center of the graph.

Figure 7 shows what we regard as an excellent response in a female patient who underwent sympathectomy at the age of 16 years. It will be noted that there is an adequate control period of nearly three years during which the patient made frequent visits to the

clinic, the average blood pressure during this time being about 155 systolic and 115 diastolic. After the operation, however, throughout the seven years of observation, the blood pressure remained within normal limits, the highest postoperative systolic and diastolic readings being lower than the lowest corresponding preoperative readings. The gap in the blood pressure data during the last three or four years is due to the fact that the patient did not attend our clinic during the course of the antenatal and postnatal periods of two successful pregnancies.

Figure 8 is an example of a less satisfactory response in a 41 year old woman whose blood pressure was significantly reduced for six to seven years after the operation, although there was a slight indication of a tendency to higher levels during the seventh year. While the postoperative blood pressures in this patient were definitely not normal, there can be no doubt of the significance of the reduction as compared with the preoperative levels.

Figure 9 presents a somewhat similar, but even less favorable postoperative course in a 20 year old female patient who suffered from hypertension associated with

Fig. 8.—A less successful result in a woman operated on at the age of 41 years. The blood pressure had been significantly reduced for six years, although the postoperative blood pressures remained definitely above normal. The horizontal figures show preoperative (left) and postoperative (right) years.

long-standing pyelonephritis. It is difficult to state definitely that the pyelonephritis was the cause of the elevated blood pressure, but it seems probable that the recurrence of the pyelonephritis postoperatively may have been responsible for the progressive relapse during the fifth, sixth and seventh years. This case has been presented in order to illustrate the fact that hypertension associated with pyelonephritis is often favorably influenced by sympathectomy, even though the pyelonephritis may persist or recur with eventual return of the blood pressure to its preoperative level.

Figure 10 illustrates the case of a 49 year old man in whom the initial reduction of blood pressure was much smaller than in any of the 3 previous patients. In addition, the rate at which the postoperative blood pressures tended to return to the preoperative level was more rapid, so that a considerable degree of blood pressure relapse had occurred at the end of the fourth year. This is probably the commonest pattern of post-sympathectomy blood pressure behavior which we have observed in this series, namely, a significant reduction of blood pressure in the first year or two, followed by

a progressive increase toward the preoperative level. The frequency with which this pattern occurs provides a simple explanation of the gradual reduction of the percentage of favorable results which are obtained in a series of follow-up studies made at increasing intervals after sympathectomy.

Fig. 9.—Variations in blood pressure over a seven year postoperative period of a female patient suffering from hypertension and pyelonephritis who was operated on at the age of 20 years. The progressive tendency of the blood pressure to return to the preoperative level during the fifth, sixth and seventh years was associated with persistence of the pyelonephritis.

Another type of disappointing result which occurs fairly frequently is shown in figure 11. In this 54 year old woman the operation produced little or no effect on the diastolic pressure even in the first postoperative year, although a slight reduction of systolic pressure persisted until the fourth year. The approximate average preoperative systolic pressure of 260 mm. was definitely higher than the average systolic pressure during the fourth postoperative year, which was about 230 mm. In our system of grading, the diastolic pressure is given much more weight than the systolic; therefore, such a result is not considered a significant reduction of blood pressure.

Fig. 10.—Blood pressure record of a male operated on at the age of 49. There was a brief period of postoperative reduction of blood pressure and tendency of the blood pressure to return to preoperative levels in a relatively short time. The horizontal values indicate preoperative years (left) and postoperative years (right).

Finally, there is a surprisingly large number of cases in which the operation appears to have had little or no effect on either systolic or diastolic pressure even

in the early stages of the postoperative period. In order to illustrate this disappointing type of result, figure 12 has been chosen, because it serves to emphasize two other important points. First, the fact that the patient was a 35 year old woman serves to show that the failures do not occur only in the older age

Fig. 11.—Preoperative and postoperative blood pressure record in a woman operated on at the age of 54 years. There was no reduction in the average diastolic pressure, although the systolic pressure remained slightly reduced during the fourth postoperative year. The horizontal figures show preoperative years (left) and postoperative years (right).

groups. The second important point is illustrated by the course of the preoperative blood pressures in this patient. It will be noted that the blood pressure on the first clinic visit was at the relatively high value of 230 systolic and 130 diastolic, but because of a division of medical opinion it was decided that the patient should continue with medical treatment. On this regimen the blood pressure fell considerably in the first few months, but was eventually stabilized at an average level of about 170 systolic and 115 diastolic during the next two years. At the end of this trial of

Fig. 12.—Illustration of an unsuccessful result of sympathectomy in a woman operated on at the age of 35. The blood pressure on the patient's first visit to the clinic was very high, but it became stabilized at a much lower level after two years of medical therapy. The operation did not produce significant reduction of the blood pressure as judged by a comparison of the readings in the fourth and fifth postoperative years with those in the last year before the operation. The horizontal row of figures indicates preoperative (left) and postoperative (right) years.

medical therapy, the patient requested that a sympathectomy be performed, and her request was granted. The diagram shows that the operation caused only a slight transient reduction of blood pressure below the immediate preoperative level, although the postoperative

blood pressure levels would appear to be greatly reduced if they were compared with the readings obtained when the patient was first seen in the clinic. The record of this patient illustrates an extremely important precaution which must be taken if a reliable assessment is to be made of the significance of an apparent postsympathectomy blood pressure reduction. From the purely statistical point of view, it is most unfortunate that enthusiastic endorsement of sympathectomy, in many cases by the patient or the referring physician, so often leads to the performance of the operation within a few weeks of the discovery of hypertension, so that no time is available for the accumulation of adequate preoperative data. Although it is admitted that there are a few patients in whom the indication for sympathectomy may be regarded as urgent, there are few patients indeed for whom it would not be profitable to advise a year of conservative treatment, which would afford an opportunity to build up an adequate preoperative base line not only of the blood pressure levels but also of other important clinical data.

We selected the cases shown in figures 7 to 12 in order to illustrate some of the common types of postsympathectomy blood pressure responses, and, in order

Status of 100 Hypertensive Patients Five Years After Sympathectomy*

	Males (30), Percentage	Females (64), Percentage	Total (100), Percentage
Blood pressure normal.....	11	6	8
Blood pressure significantly reduced	8	16	13
Blood pressure not significantly reduced	45	56	52
Dead patients.....	36	22	27

* When this table was presented at the Ninety-Seventh Annual Session of the American Medical Association, only 78 patients had completed their five year follow-up, but during the interval between the original presentation and the submission of the manuscript for publication, the number increased to 100.

to make as clear a demonstration as possible, we selected cases in which the preoperative and postoperative blood pressure data are adequate for statistical analysis. It must be emphasized, however, that such well documented cases are unfortunately far from characteristic of the bulk of our material. Owing to the many departures from the ideal conditions required for accurate statistical analysis which are unavoidable in every day clinical work, there are many cases in which deficiencies of preoperative and postoperative data make it necessary to introduce some degree of personal judgment in deciding the degree of significance to be attached to the recorded observations. We have tried to evaluate these cases as objectively as possible by basing the final judgment on the average of six independent assessments by six different physicians,¹⁰ of whom three were not familiar with the clinical observations in any of the cases. In the few cases in which there was uncertainty or disagreement, it was our invariable practice to resolve the controversy in favor of the operation. With these admissions of the imperfections of our data, we venture to present a brief summary of our conclusions, not in any sense as a final statistically valid solution of this much studied problem but merely as another approximate solution the chief merit of which is that it has been arrived at by a method not previously employed on such a large scale.

10. Dr. William P. Chapman, Dr. R. H. McFarlane and Dr. Guy R. Turgeon assisted in this project.

Since the number of cases in the two other subdivisions of the series is too small for accurate analysis, data are presented only on the 223 patients operated on by the Smithwick procedure. After eliminating 10 patients operated on for conditions other than essential hypertension, 8 patients who on account of illness or other reasons were not adequately followed up and 4 patients for whom the blood pressure data were entirely inadequate, we were left with a total of 201 cases. In order to simplify the tables, we have taken the liberty of eliminating the last case in the series in order to obtain an even 200 cases. All of these 200 cases have been followed up for at least two years and a few for as long as nine years. However, we have strong statistical objections to the practice of presenting data based on varying follow-up periods, such as one to five years or five to ten years; therefore, we present the salient features of our data in a single table giving the status of the blood pressure of the first 100 patients who reached the end of the fifth postoperative year. We believe that data derived from studies in which all patients are assessed at the same time after the operation are more easily understood than the results of studies in which the follow-up time is variable; therefore, even if a patient is known to have died in the sixth postoperative year he is listed in the fifth year table strictly according to his status at that time. Our reasons for selecting a follow-up period of five years are, first, that it is now a well established fact that the early favorable results of sympathectomy are to a large extent transitory, and, secondly, we believe that it is desirable to evaluate therapeutic success in a chronic disease such as hypertension in terms of a follow-up period of five years as is the general practice in the evaluation of the surgical therapy of certain forms of cancer.

The table presents our evaluation of the degree of blood pressure reduction in 100 patients followed five years, the status of the blood pressure at the end of the period being listed under three headings as normal, significantly reduced and not significantly reduced, the word "significantly" having the meaning described in the text. There is also a separate listing for those patients who died before the end of the follow-up period.

In the table separate figures are shown for the male and the female patients because of the widespread interest in the difference in prognosis between the sexes. On the whole, the difference between the results for male and female patients is not striking, because the percentage of patients in the first two "favorable" categories, normal and significantly reduced, is 19 per cent for males and 22 per cent for female patients, the percentage in the unfavorable categories being 81 per cent for males and 78 per cent for female patients. The only striking difference is the definite preponderance of dead among the male patients. In view of the interest in the importance of age as a factor in determining the outcome of the operation, we have calculated the average age at the time of operation of the patients in each of the four categories with the following results: normal, 34.8 years; significantly reduced, 39.3; not significantly reduced, 40.1, and dead, 38.9 years. While these figures do show a slight trend toward lower ages for the patients with normal blood pressures, the significance of age as a determinant of prognosis in this series is not striking.

Although it was not our original intention to present it in support of the hypothesis that the early favor-

able results of the operation are largely of a temporary nature, it may be of interest to compare the results of a two year follow-up of these 100 patients with the five year results already described. For this comparison we have divided the series into the two categories used previously, namely, favorable and unfavorable, the former consisting of patients whose blood pressure was either normal or significantly reduced and the latter of those whose blood pressure was not significantly reduced together with those who had died before the end of the follow-up period. On this basis, the two year results were 41 per cent favorable and 59 per cent unfavorable, while the five year results were 21 per cent favorable and 79 per cent unfavorable. The two year blood pressure status of patients 101-200 was rated 35 per cent favorable and 65 per cent unfavorable, a result which is somewhat less satisfactory than that in the first 100 cases.

COMMENT

Most of the points of interest in connection with our methods of analyzing the preoperative and postoperative blood pressure readings of patients who underwent sympathectomy have been adequately discussed as they arose in the text. The principal remaining point of interest is in comparison of the results of this study with those of other published reports. Unfortunately, our material and methods differ considerably from those used by many other investigators¹¹ who have published results of postsympathectomy follow-up studies. For example, this material consists of public patients only, while the patients studied by the authors quoted contain large percentages of private patients. Another important difference exists between the conditions under which the blood pressure readings used for follow-up comparison are made. For example, Smithwick^{11a} relied on blood pressure readings taken under the closely controlled more or less basal conditions which prevail in his posture and cold test, while Peet and Isberg^{11b} used as a base line the average of several blood pressure readings taken under conditions which were not described in detail, but which were apparently not as standardized as those used by Smithwick. The method used by Poppen and Lemmon^{11c} is the least controlled of the three, since they took as their preoperative base line a single reading obtained on the patient's admission to the clinic or on the last visit before hospitalization. The home blood pressure system of Ayman^{9b} involves the recording of large numbers of readings taken twice daily by the patient or one of his relatives over long periods of time before and after the operation. This method has many points of merit, although the administrative difficulties involved have prevented its widespread adoption. The use of repeated routine clinic blood pressure readings in our method bears little relation to any of the methods previously described; therefore, direct comparisons of data are almost impossible.

On the whole our material and methods are most nearly comparable to those of Palmer,¹² except that this author evaluated blood pressure reductions by means of a single criterion, according to which he clas-

sified all patients with readings below 150 systolic and 110 diastolic as "normal or near normal." Although this method of grading differs greatly from ours in theory, it is probable that the patients graded "normal or near normal" by Dr. Palmer's system will correspond fairly closely to those graded "normal" and "significantly reduced" by us. According to our results the number of patients in these two categories has decreased from 41 per cent at two years to 21 per cent at five years, a progressive reduction which is in general agreement with the trend indicated by four separate studies which have recently been summarized by Palmer.¹² In these studies the percentage of patients "normal or near normal" fell from 69 per cent at the end of a follow-up period varying from a few months to two years, to 38 per cent at the end of one to four years and eventually to 24 per cent at the end of a follow-up period varying from three to six years. Allowing for the considerable differences in method, the agreement between our results and those published by Dr. Palmer are quite satisfactory; indeed, we consider our results merely as independent confirmation of Dr. Palmer's observations by a somewhat more elaborate method.

Since the number of cases in this series is too small to make it authoritative on the basis of mere size, we feel that its only real significance is due to the fact that it is a review of the entire sympathectomy experience of the ward services of a large teaching hospital during the thirteen years which have elapsed since the operation was first performed at the Massachusetts General Hospital. In spite of the great difficulty of matching one series of hypertensive patients against another with respect to all aspects of the disease, we believe that the patients in this series are a fairly accurate cross section of the type of patients who might be considered suitable candidates for sympathectomy in any other large teaching hospital. For this reason we believe that our data may be of value as a basis for comparison with the results at any other comparable institution as long as the same method of analysis is used. Similarly, as regards the future, we hope that the data presented in this report may be of value as a standard of reference by means of which the results of any new surgical technic can be compared against the results obtained by the regular Smithwick procedure. In this connection, a word of caution may be in order, in view of the apparently discouraging trend of our results. While it cannot be denied that there is a disappointingly long list of dead patients and patients whose blood pressures returned to the preoperative level, this should not be allowed to obscure the importance of the small percentage of excellent and good results. The genuineness of these results is beyond question, and it is most unlikely that any of them could have been produced by any other method of treatment now available. This fact alone makes it highly desirable that one should continue to regard sympathectomy as an important weapon in the therapeutic armamentarium. At the same time workers must search for methods of improving the results of the operation, not only by means of better selection of cases but also by the development of improved technical procedures. It is to be hoped that the results presented in this report, together with the clinical and physiologic data which will be published at the conclusion of other phases of the parent project, may provide a few useful leads for future research.

SUMMARY

A detailed analysis has been made of the records of all ward patients from the State of Massachusetts who underwent sympathectomy for the treatment of hypertension on the public services of the Massachusetts General Hospital during the period 1935-1947. In addition, personal follow-up studies have been made of 98 per cent of the 219 surviving patients. The follow-up study was designed to summarize all information required for an assessment of the effectiveness of sympathectomy in the treatment of essential hypertension, but this report deals only with the effect of the operation on blood pressure. Diagrams have been presented to illustrate some of the typical blood pressure responses to lumbodorsal sympathectomy, and data have been presented on the status of 100 patients who were followed for five years after the operation. The results indicate that at the end of five years the blood pressure had been reduced to normal in 8 per cent of the patients and that significant reductions, though not to normal, had occurred in an additional 13 per cent. The results in the remaining 79 per cent were unfavorable, since 52 per cent of the patients had blood pressures which were not significantly lower than the preoperative levels and 27 per cent of the patients were dead. Comparison of these results with those at the end of a two year follow-up shows that the results of sympathectomy tend to become less favorable as the length of the follow-up period increases. However, it seems certain that the results of sympathectomy in the most favorable cases are valuable enough to justify continued interest in methods which will improve the selection of cases and in the development of technics which will increase the effectiveness of the operation.

ABSTRACT OF DISCUSSION

DR. KEITH S. GRIMSON, Durham, N. C.: Dr. Evelyn is to be congratulated on his careful analysis of results in the large series of patients treated by splanchnicectomy at Massachusetts General Hospital. Present confusion in the literature concerning results of sympathectomy is caused in part by multiplicity of operative technics and in part by variations in methods of classification of patients and of follow-up study. Because of the possibility of regeneration of sympathetic nerves and because of experimental evidence that splanchnicectomy does not prevent neurogenic hypertension, subtotal to total paravertebral sympathectomy was started eight years ago. A contrast of these results with those of splanchnicectomy may aid evaluation of Dr. Evelyn's paper. Of 108 hypertensive patients, usually seriously ill, 2 died shortly after operation of respiratory arrest, 1 of uremia and 1 with myocardial infarction. During a follow-up period of six months to eight years, 8 have died of sudden vascular accidents and 3 of other causes. Ninety-three patients are now living. Of these, supine blood pressure is now normal in 25, reduced but not normal in 44 and not reduced in 24. Each of the 93 patients has, however, subjective or objective evidence of improvement. A recent review of interpretable literature and of our own results indicated that, of 950 splanchnicectomies reported by others, 47 per cent have maintained some degree of lowering of supine blood pressure. Similarly, 41 per cent of our splanchnicectomies have maintained some lowering of pressure. Seventy-one per cent of the patients treated by complete or almost complete sympathectomy, which includes denervation of cardiac, cerebral and pulmonary vascular beds as well as denervation of the splanchnicectomy areas, have maintained significant reduction of supine blood pressure. Although treatment with etamon® (tetraethylammonium chloride), dibenamine® (N,N-dibenzyl beta-chloroethylamine hydrochloride) and priscol® (2-benzyl-4,5-imidazoline hydrochloride) has failed to maintain medical total sympathectomies or to predict results of sympathectomy, it is hoped that some of the

many sympatholytic drugs now being developed and tried clinically may in the future succeed and eliminate the present frequent necessity for exceedingly uncomfortable operations.

DR. GEZA DE TAKATS, Chicago: I think that this statistical study by Dr. Evelyn and his co-workers illustrates the necessity of revising our technics, possibly, and our selection of cases from time to time. I think that all groups interested in hypertension, particularly the surgical treatment of hypertension, are well aware that failures exist and all of us are trying to hammer at the causes of failure. The question arises, "Is one justified in saying that a patient with a blood pressure of 170 systolic and 100 diastolic five years after operation is in a more favorable position than before the operation with that same blood pressure?" In other words, has a certain load been taken off his heart and kidneys? One other point I would like to make, which obviously cannot be brought out in this short time, is that it is certain that some patients ought to be excluded from operation. In the study by my co-workers and me in which the medical men, such as Dr. Gilbert, Dr. Fenn and Dr. Scupham, have participated, it has been our principle never to operate on a patient with sclerotic hypertension. A patient with a high systolic and comparatively low diastolic pressure does not benefit from a splanchnicectomy. In fact, it may do serious harm. The second point is that a patient with a comparatively low diastolic pressure, such as 100 or 110 mg. of mercury, should be observed and treated medically if effective medical treatment is available. Sympathectomy should be considered only when the patient's diastolic pressure suddenly begins to rise, and rises 30, 40 or 50 mm. of mercury within a few months, not to cure the hypertension but to arrest or prevent the malignant phase. One other point concerns the immediate poor response to splanchnicectomy as shown in one of Dr. Evelyn's charts. This does not mean that at a later date the reduction of blood pressure cannot be obtained. Dr. Poppen of Boston has published such records. I have seen this type and am beginning to feel that this perhaps is the same type which Dr. Schroeder mentioned—these are the patients exhibiting a chronic renal factor, and their immediate response to sympathectomy has been very poor. However, a delayed response may occur from three to six months later, indicating that splanchnicectomy, perhaps by some means which we do not understand, may slowly affect the pituitary-cortico-adrenal mechanism.

DR. DAVID AYMAN, Boston: I am sure that you are all surprised to hear the results Dr. Evelyn has presented today, especially after reading the papers on sympathectomy reported in the past—first those reporting splanchnicectomy and then those after lumbodorsal sympathectomy. Something is obviously wrong. When my co-workers and I follow a patient with hypertension for several years, it is common to find that his blood pressure levels are lower than what they rise to when the patient enters the hospital for possible sympathectomy. The hospital frequently is far from home or from the patient's local surroundings. If one reads papers on the subject of preoperative study, one finds that most studies are completed in a brief period, since it is not practical to keep many patients in the hospital for three or four months of observation. Actually, the preoperative study is done during a three to ten day period, and during that period there is no way that the investigator can remove the great preoperative tension while the preoperative tests are being done. During this brief period the patient is on edge; he knows that he is being considered for an operation that may result in his death, or at least failure to be cured. He is tense, and there is nothing one can do about it. As a result his blood pressure levels are at a higher than usual level. During the weeks, months and years after operation the patient is in a relaxed state. What, therefore, should be considered the result of operation on the blood pressure? Should it be a comparison of the levels during the tense three to ten day period of preoperative hospital study? Should it be the period representing months or years of observation by the family doctor before the patient's entry into the hospital? It is clearly stated in the reports on sympathectomy that the level in the horizontal resting position done during the entrance to the hospital is the level to use for comparison with the relaxed

periods in later years. Such criteria give the tremendous change in blood pressure between the level during the brief tense preoperative state and the relaxed postoperative state. Actually, the relaxed state months before operation should be the correct one to use for the upper preoperative levels of blood pressure. On the other hand, surgeons have perhaps often not given themselves enough credit. I have a chart which shows the readings in the office as well as those taken daily at home by the patient's husband, indicating that during the seven month period of observation there is a distinct difference between the home readings and the much higher ones taken at the office. Therefore, as many of you have known, and as Dr. de Takats mentioned, there may be an improvement in the patient's heart size, cardiograms and fundi after operation without the improvement in the blood pressure readings in the office or clinic. Yet, in such cases the home readings may be remarkably improved. In such cases the home readings immediately rise when the patient returns to the doctor for a checkup, because this pressor reaction to the doctor or hospital cannot be removed by repetition, acquaintance with the doctor or any other such method. Therefore, many hypertensive patients have been benefited by therapy of many kinds which is not recognized unless one uses this sort of home blood pressure technic that we have used the past ten years at the Hypertension Clinic of the Beth Israel Hospital. I think that, as has been mentioned, until certain standards of evaluation, care and severity of disease are evolved, there will be no progress in the statistical determination of the results of sympathectomy. However, there is no doubt that sympathectomy has a place in the therapy of hypertension.

DR. MAX M. PEET, Ann Arbor, Mich.: It is gratifying to me to hear this much needed, careful and unbiased study of Dr. Evelyn's, since my especial interest lies in the field of surgical treatment of hypertension and, therefore, I have been exposed to all types of criticism of the procedure. I was exceedingly pleased with Dr. Evelyn's outline of the essential studies for proper evaluation of the preoperative status and postoperative results of splanchnicectomy, since it represents exactly the same program of preoperative and postoperative analysis of cases which my co-workers and I have used since 1933. Each case has been carefully studied with particular reference to cardiovascular-renal status as well as general physical condition. All studies have been carried out by unbiased independent workers in the separate specialties concerned with the problem of hypertension. Cyrus Sturgis' Department of Internal Medicine and its subsection of cardiology, headed by F. N. Wilson and his associates, F. D. Johnston and Paul Barker, have evaluated the general physical and cardiac status in each case. Eyeground changes and renal function have been evaluated by individual, unbiased workers in the departments of ophthalmology and urology. All studies have been reevaluated at yearly intervals since the work was begun by these groups independent of the surgeon. This forms the background for all of our published work pertaining to the surgical treatment of hypertension. Years ago I pointed out the need for a common denominator with which to evaluate all surgical approaches to the problems of the hypertensive state. Dr. Ward Woods, formerly of my staff, attempted such liaison with other groups without success. I wish to make one minor correction. The supradiaphragmatic splanchnicectomy which we developed and have been using regularly on hypertensive patients since 1933 was a little more than simply removing the tenth, eleventh and twelfth thoracic sympathetic ganglions. At first we removed only that number of ganglions and a long strip of the greater splanchnic nerves, but very shortly we included the ninth and many times the eighth, and for several years now I have frequently gone as high as the fifth or sixth thoracic ganglion and sometimes much higher. We have not seen any remarkable difference in our final results in patients in whom we have done a more extensive sympathectomy. It is my hope that this careful study of Dr. Evelyn's will stimulate the acceptance of such a common denominator by all workers. I am particularly pleased that his unbiased conclusions are based exactly on the same type of study which we have utilized for the past fifteen years.

DR. KENNETH A. EVELYN, Montreal, Canada: I was trying to call attention to the need of a certain change in the philosophic approach to the problem of the evaluation of evidence and not to make any criticism of any individual method of going about it. As long as one can present data which are in fact in conflict with what has been said by others and, by making every effort to keep it at a purely scientific level, have the point accepted that one is not casting any aspersions on any one method, then I feel that this may plant some seed for the joint acceptance of a completely objective method of appraisal not only of this operation but of many other forms of therapy.

THE CONTACT LENS PROBLEM

CONRAD BERENS, M.D.
New York

The American Committee on Optics and Visual Physiology¹ has been interested in the contact lens problem for some time and authorized the investigation which is the basis for this report. This committee is composed of ophthalmologists from the Section on Ophthalmology of the American Medical Association, the American Ophthalmological Society, the American Academy of Ophthalmology and Otolaryngology, and the Association for Research in Ophthalmology.

Contact lenses were first suggested by Sir John F. W. Herschel, a British astronomer, in 1827. However, it was not until the latter part of the nineteenth century that wearable lenses were made chiefly by the Zeiss Optical Company in Jena, Germany. These lenses were used primarily for pathologic conditions which could not be corrected by spectacles.

During the last few years considerable progress in the manufacturing and fitting of contact lenses has taken place in the United States. Not only are contact lenses now used for conditions which spectacle lenses will not correct, but many persons wear these lenses for cosmetic reasons, as well as for safety in certain sports and occupations. Nevertheless, despite the recent avalanche of commercial advertising, contact lenses will not take the place of spectacles in most cases in which ordinary eye glasses give serviceable vision. In these cases contact lenses may be a useful adjunct to spectacles, but they do not enable most persons to discard their glasses completely.

Most ophthalmologists believe that the increased sales of contact lenses by lay persons, not properly licensed by state laws to care for ocular conditions, is dangerous to the public. Sensational advertising in the past few years has resulted in luring many persons into spending thousands of dollars in the hope of throwing away their glasses. The largest group of aspiring contact lens wearers are those who have a psychologic aversion to wearing spectacles. Modern practitioners realize the importance of this mental attitude. Some individual feeling of inferiority is undoubtedly accentuated by the need to wear spectacles. For such persons contact lenses may be a great boon. However, the public should not be oversold on the use of contact lenses. Some manufacturers of contact lenses and certain practitioners have misused the public vanity through advertising unwarranted claims for their products and their services.

It was for these reasons that the American Committee on Optics and Visual Physiology determined to carry out an investigation of the contact lens situation. A questionnaire was sent out to 2,000 certified specialists of the American Board of Ophthalmology asking for a report from experience and observation on the following points:

1. Bad results in the fitting of contact lenses
2. Unusual cases
3. Complaints or suggestions concerning the practice of fitting contact lenses
4. The best method—(a) molded plastic, (b) Feincone, (c) trial or test plastic sets—for fitting from the point of view of (1) ease of fitting, (2) comfort of the patient and (3) expense to the patient

In response to this questionnaire, 575 ophthalmologists replied. Of this number 75 answered by letter, giving much more information than the space on the questionnaire card permitted. A summary of their comments follows:

Out of the group of 575 physicians, 162 have had no experience with contact lenses, or so little that they had no comments to offer, 373 prefer the molded plastic technic, 22 use the Feincone technic and 18 the trial or test plastic sets.

Many doctors prefer to have technicians fit the lenses, and several specifically mentioned the Oribg-trained technicians as being very satisfactory. On the other hand, an equal number of ophthalmologists believe that most of the bad results from contact lenses are caused by placing the fitting of the lenses into the hand of unskilled technicians and that a patient should not be entrusted to a technician except under the direct supervision of the ophthalmologist. Several reported having seen corneal abrasions, corneal ulcers and even the loss of an eye resulting from clumsy technic. Some objected to the length of time required for fitting the lenses and gave that as the reason for not doing it themselves.

The opinion was expressed frequently that success in the fitting of contact lenses depends to a large degree on the motivation of the patient. If the patient needs the contact lenses for optical or occupational reasons, he will put up with minor discomfort, but he is much less likely to do so when the lenses are prescribed for cosmetic purposes. Athletes, dancers and other patients who need protection from occupational hazard will endure a great deal more than those who wear the lenses for cosmetic purposes.

Practically all agreed that the patients deriving the greatest benefit from contact lenses are those with keratoconus. Others report success with patients having monocular aphakia, younger patients following cataract operations and those with high astigmatism and aniridia. Several unusual and interesting cases were reported—for example, a patient had a severe pyocyanous ulcer of the cornea which caused complete scarring of the right cornea.

Among the complaints concerning contact lenses, the most frequently mentioned by this group of physicians were the following:

1. The limited time that most patients can tolerate wearing the lenses.
2. The solution is unsatisfactory. More research work should be done to produce a better solution whereby foggy conditions might not develop so rapidly.

1. The American Committee on Optics and Visual Physiology is comprised of the following members: Drs. Thomas D. Allen, S. Judd Beach, Conrad Berens, Frederick C. Cordes, Alfred Cowan, Henry A. Imus, Walter B. Lancaster (chairman), Kenneth N. Ogle, Lawrence T. Post, Avery D. Prangen, Richard G. Scobee, Kenneth C. Swan.

3. Lenses are too expensive.
4. Many patients who buy the lenses discard them because of dissatisfaction with them.

Many suggestions were made for improving the contact lens situation, and the following represent the opinion of the majority of ophthalmologists:

1. Ophthalmologists should learn more about contact lenses by courses given at association gatherings or by the establishment of contact lens centers.
2. Patients should be discouraged in attempting to wear contact lenses except for pathologic or occupational reasons.
3. There is too much commercialism and exploitation by manufacturers, and this should be controlled.

In general, it was agreed that the whole subject of contact lenses is still in a research period.

Letters were also written to some of the leading men in the allied sciences, many of whom have made noteworthy contributions to the development of contact lenses, so that their opinions would contribute toward a well rounded picture.

About this time a request from the National Better Business Bureau was referred to the committee asking for an expression of opinion regarding contact lens advertising. This request resulted from complaints received both by the National Better Business Bureau and some local Better Business Bureaus involving misunderstandings which have resulted from the advertising of contact lenses.

RECOMMENDATIONS

Finally, from a conscientious study and evaluation of the contact lens situation as it exists in this country at the present time, the American Committee on Optics and Visual Physiology makes the following recommendations, which have been endorsed by its four participating societies:

1. National and local ophthalmologic societies should regulate the prescribing of contact lenses and the dissemination to the public of information regarding contact lenses.
2. The prescribing and/or the fitting of contact lenses by persons not properly licensed under state or national laws should be prohibited.
3. Medical opinion should be secured in every case before contact lenses are prescribed.
4. Ophthalmologists should establish standards for approving the fitness of technicians who wish to engage in fitting contact lenses.
5. Competent impartial research should be initiated toward the solution of unsolved problems concerning contact lenses. The main problem at the present time, provided that the fitting of the lenses is correct, is that of hazy or cloudy vision. Blurring of vision occurs inevitably after wearing a contact lens for some hours because of the altered metabolism of the cornea.
6. The public should be warned against those who advertise the superiority of their services or of any particular type of contact lenses. It should be pointed out that the public should not patronize such advertisers because competent professional practitioners do not resort to commercial advertising.

The ethical practice of medicine and high professional standards do not mix with self aggrandizement or advertising in any form; the organized medical profession in the country (The American Medical Association) does everything in its power to enforce the rules of professional conduct through the boards of censors in the county and state medical societies. The public should be more fully informed of these facts.

Clinical Notes, Suggestions and New Instruments

ANTI-HISTAMINE THERAPY OF BEE STINGS

WILLIAM THEODORE STRAUSS, M.D.
Upper Montclair, N. J.

The stings of members of the genus Hymenoptera, which includes bees, wasps and ants, produce harmful effects on human beings ranging from slight local pain or discomfort to a shocklike syndrome or even sudden death. Until a comparatively few years ago it was thought that the effects were purely toxic in character, but more recent investigations have indicated that an allergic factor may be involved in some instances at least.

STINGING MECHANISM OF THE BEE

The common honey bee, *Apis mellifica*, has an anatomic structure which is especially adapted for stinging. The venom glands are found only in the female and are situated under the last few abdominal segments between the uterus and the rectum. There are two types of glands, one being a larger, long tubular structure having an acid secretion derived from polygonal cells, each with a chitinous tube discharging directly into the main lumen. The other type of gland is also tubular, but somewhat shorter, and produces an alkaline secretion. These two secretions are mixed and injected into the tissues of the recipient (man) through a hollow barbed lancet. The average dose of venom received during a "sting" is about 0.3 cc.

NATURE OF VENOM

The honey bee produces a venom which is a clear colorless fluid, acid to litmus, and giving a protein reaction. The poisonous properties of the venom are destroyed by common oxidizing agents, digestion with pepsin, trypsin or papain, or precipitation by alcohol or ammonium hydroxide. Heat at 150 C. also inactivates these characteristics.

The chemical nature of the poison is not clearly understood. Langer¹ collected the venom from 12,000 bees and after careful analysis concluded that the active element was a basic alkaloid which is soluble in certain acids. The formic acid in bee venom, often believed to be the principal factor causing the reaction in man, is present in only small amounts. Actually it is said by experts not to be responsible for any of the phenomena of bee stings. It is thought to be an antiseptic to insure the keeping qualities of honey, each working bee injecting a dose of venom into the honey cell before it is closed.

Phisalix-Picot² stated the opinion that there are three constituents of bee venom:

1. An inflammation-producing substance, the results of which are seen usually in human bee stings. It is destroyed by temperature of 100 C. for 15 minutes and does not pass through a Berkefeld filter.
2. A convulsant poison which is destroyed by temperature of 100 C. for 30 minutes and likewise does not pass through a Berkefeld filter.
3. A stupefying and paralyzing poison which resists inactivation by 100 C. heat and passes in part through the Berkefeld filter.

The acid poison gland probably produces the inflammation-producing and the stupefying substances, while the alkaline gland gives rise to the convulsant factor.

SIGNS AND SYMPTOMS OF HUMAN BEE STINGS

Personal idiosyncrasy is to some extent responsible for the degree of severity of a bee sting. For example, some persons can be stung eight or more times at once with no more consequence than the development of a few small painless papules.

1. Langer, J.: Ueber das Gift unserer Honigbiene, Arch. f. exper. Path. u. Pharmacol. 38: 381, 1896-1897.
2. Phisalix-Picot, M.: Animaux venimeux et venins, Paris, Masson & Co., 1922, vol. 1, pp. 359-431.

It is possible that the phenomenon of desensitization enters into the picture as will be noted later. On the other hand, there are cases on record in which a person received a single sting and died within a few minutes.

The commoner symptoms of a bee sting include local pain of varying intensity, urticaria and other cutaneous eruptions which are suggestive of a local release of histamine. Less frequently occurring symptoms are motor weakness, areas of anesthesia, headache, muscle spasm, dyspnea, ocular paralysis, abdominal cramps, convulsions and a shocklike syndrome.

ALLERGIC FACTOR IN BEE STINGS

It is now generally believed that allergy plays some role in the human response to bee stings. Probably extreme reactivity is an acquired condition.³ Since it is known that bee venom is protein in nature, it is not surprising that it can act as an antigen. Numerous attempts have been made to desensitize human beings by inoculation with gradually increasing doses of either the venom itself or an extract of the whole bee. Success has been reported by Benson,³ Braun⁴ and Fisher.⁵

A particularly important consideration is the histamine-like action which has been ascribed to bee venom.⁶ Benson and Semenov⁷ found that 1 part of bee venom in 100,000 parts of isotonic sodium chloride solution produced a distinct histamine-like response in a strip of virgin guinea pig uterine muscle.

TREATMENT

Until recently the immediate symptomatic treatment of a bee sting was directed toward the local application of any alkali, such as a weak solution of household ammonia or washing soda. Mud packs are still frequently used, the rationale being obscure. The severer symptoms may be counteracted sometimes by injections of caffeine, epinephrine or nikethamide.

Because of the probable presence of histamine in bee venom and because of the close resemblance of the symptoms to those induced by histamine, I tested the effectiveness of thephorin,[®] an antihistamine of proved clinical value in allergic disorders.⁸

Chemically, thephorin[®] is 2-methyl-9-phenyl-2,3,4,9-tetrahydro-1-pyridindene hydrogen tartrate. It is distinguished clinically by a remarkably low incidence of side effects. In particular, drowsiness, so common with other antihistamines, is said to occur in less than 3 per cent of patients.

Thephorin[®] was employed by me in the form of a 5 per cent ointment.⁹ In each of the 8 cases (including several of ant bites) the ointment was applied liberally at the site of the sting as soon as the patient came to our attention, usually within a few minutes after the sting occurred. Gentle massage was used to decrease the time of absorption.

In every instance the intense pain and stinging sensation was relieved within one or two minutes. One patient stated

that the pain seemed to "melt away." The majority of patients did not have any local swelling, a factor which in itself tends to indicate a true antihistaminic action of the drug. No secondary effects, such as nausea, headache and muscle weakness, were observed.

REPORT OF A CASE

One particularly interesting case is presented in some detail:

T. S., a 5 year old boy, accidentally walked into a swarm of bees. He was attacked by the insects and received seven individual stings, four on the right leg just above the ankle and the remaining three around the left ankle.

Within a few minutes thephorin[®] ointment was applied to the lesions and the surrounding area of skin. The cries of the child subsided in less than one minute, and he stated that all of the pain had disappeared. A short time later, while at play in the same area, he received another sting on the left thigh. The pain of this lesion also responded rapidly to treatment with thephorin[®] ointment. No swelling whatsoever was observed, and the only evidences of the stings were minute, pinpoint areas of petechial hemorrhage at the sites of the actual stings. These disappeared after seventy-two hours.

COMMENT

The symptomatic treatment of insect bites has been unsatisfactory in the past. The most popular medication has been weak alkali, probably based on the misconception that the formic acid in the venom produced the symptoms. My successful use of thephorin[®] ointment, an antihistaminic preparation, is based on the theory that histamine, known to be present in the venom of certain insects, produces many of the commoner immediate symptoms of a sting. The mere fact that relief was obtained so rapidly lends credence to this concept.

Personal communications from colleagues indicate that thephorin[®] ointment may also be valuable in alleviating the intense pain associated with "bites" of hornets, wasps, mosquitoes and ants. Here, too, the nature of the lesions and their rapid response to thephorin[®] indicates that histamine is a major causative factor.

SUMMARY AND CONCLUSIONS

The nature of bee stings is reviewed.

Thephorin[®] ointment (2-methyl-9-phenyl-2,3,4,9-tetrahydro-1-pyridindene hydrogen tartrate) was employed in a group of patients who were stung by bees or other insects. Relief of pain was almost immediate, and swelling of the affected part rarely occurred. No side effects of any kind were observed.

In my opinion there is no longer any place for outmoded forms of therapy for insect bites and stings. A locally applied antihistamine, thephorin[®] ointment, may be used to advantage in all such instances when it is suspected that a liberation of histamine is a factor in the causation of symptoms.

8 Chester Road.

Dissecting Aneurysm.—The important clinical feature to recognize is the dramatic suddenness of the onset of the pain and its initial overwhelming severity. Tearing, stabbing, choking pain strikes the patient usually across the chest and arms, but may spread to the back and down the abdomen to the labia or testicles, later to the legs. It may be intermittent and disappear gradually, to recur in subsequent attacks at lower levels as the dissection extends. Unlike the pain of cardiac infarction it is singularly maximal at its onset; a sense of constriction is unusual, hypertension is invariably present, and the dissection commonly begins during an act of physical exertion or sudden emotional strain. Severe pain in the back or spine indicates splitting up of the walls of the descending aorta, with rupture of the intercostal and lumbar arteries (Shenpan, 1934). The dissection may obliterate the coeliac axis to cause infarction of the bowel, or the renal arteries may be involved.—Lovibond, J. L.: Extrathoracic Pain in Cardiovascular Disease, *British Medical Journal*, May 14, 1949, page 835.

Council on Pharmacy and Chemistry

NEW AND NONOFFICIAL REMEDIES

The following additional articles have been accepted as conforming to the rules of the Council on Pharmacy and Chemistry of the American Medical Association for admission to New and Nonofficial Remedies. A copy of the rules on which the Council bases its action will be sent on application.

AUSTIN SMITH, M.D., Secretary.

STARCH-DERIVATIVE DUSTING POWDER.—
"Bio-Sorb"—Ethicon.—A biologically absorbable powder prepared from cornstarch by etherification with epichlorohydrin. The starch polymer chains are presumably cross-linked by 1,3-diether glycerine group to the extent of not more than 2 per cent of the original starch weight. The starch derivative is mixed with magnesium oxide, 2 per cent, and small residual amounts of sodium sulfate and sodium chloride.

Actions and Uses.—Starch derivative dusting powder is a light dusting powder suitable for use as a lubricant for the hands in donning rubber gloves and for other uses to which talcum powder is ordinarily applicable in general hospital routines. As a substitute for ordinary powdered talc, it has been shown to have the advantage of biologic absorbability and is thus comparatively nonirritating and nontoxic. Its use therefore avoids the known hazards of talcum powder.

Starch derivative dusting powder should be autoclaved for the purpose of sterilization. Slight clumping which occurs after repeated autoclaving may be readily broken up with moderate pressure. Dry wall heat sterilization is not recommended for bacteriologic reasons and should be avoided because of the possible inflammability of the powder. However, even in contact with red hot cautery, the powder will flash only to about the same degree as cotton, so that this property is not considered to constitute a hazard to its use in surgery.

Dosage.—An amount just sufficient to lubricate the skin or article for which a dusting powder is indicated should be employed in the same manner as for the use of ordinary talc.

Tests and Standards.—

Starch-derivative dusting powder is an odorless, white powder. The pH of a 10 per cent suspension of starch-derivative dusting powder in distilled water is 10.4-10.8.

Determine the particle-size distribution of starch-derivative dusting powder with Tyler screens of 60, 100 and 200 mesh: no more than 0.1 per cent of starch-derivative dusting powder should be retained on the 60 mesh screen, no more than 3.0 per cent on the 100 mesh screen and no more than 8.0 per cent on the 200 mesh screen.

Determine the amount of swelling of starch-derivative dusting powder in hot water as follows: Boil 100 cc. of a 10 per cent suspension of starch-derivative dusting powder in distilled water for 20 minutes. Pour the cooled suspension into a 100 cc. graduated cylinder, add water to the 100 cc. mark and allow the graduate to stand, undisturbed, for 24 hours: the settled starch-derivative dusting powder should occupy a volume of not more than 60 cc.

Dry about 2 Gm. of starch-derivative dusting powder accurately weighed, contained in a tared weighing dish of 40-50 mm. diameter, to constant weight at 105 C. (2 hours): the normal moisture content is 10 per cent.

Char 1 Gm. of starch-derivative dusting powder, accurately weighed, in a covered platinum crucible until most of the carbon is burned away (avoid igniting the sample). Remove the cover and ignite the residue to constant weight: the ash does not exceed 3 per cent of the sample as received.

Dissolve the ash obtained in the ignition of starch-derivative dusting powder in a few cc. of diluted hydrochloric acid. Transfer the solution to a beaker and make it up to 100 cc. with distilled water. Add 20 cc. of ammonium phosphate, dibasic, T.S., then add strong ammonia solution, dropwise, until the solution is neutral to litmus, and finally add 10 cc. excess. Allow the precipitate to settle 4 hours or overnight, filter the mixture through ashless filter paper, and wash the precipitate with cold ammonium hydroxide (1:20). Transfer the precipitate to a tared crucible, ignite it to magnesium pyrophosphate, and weigh. Each Gm. of magnesium pyrophosphate is equivalent to 0.3623 Gm. of magnesium oxide: the magnesium oxide content does not exceed 2 per cent of the sample weight.

Place 1 Gm. of starch-derivative dusting powder, accurately weighed, in a 50 cc. crucible and fuse it with 5 Gm. of a 1:1 mixture of sodium carbonate and potassium nitrate. Cool the crucible, leach the fused mass with water and transfer the solution to a beaker. Dissolve any residue in a few cc. of nitric acid and add it to the aqueous solution. Make the combined solution up to 150 cc. with distilled water, filter if not clear, heat, and add 5 cc. of silver nitrate T.S. Allow the beaker to stand overnight in the dark. Filter the silver chloride onto a tared Gooch crucible, wash with dilute nitric acid (1:1000) until the washings are free of silver, and then wash successively with small portions of water, alcohol and ether. Dry to constant weight at 100 C., and weigh. Run a blank on the fusion mixture and make the appropriate corrections. Each Gm. of silver chloride is equivalent to 0.2473 Gm. of chloride: the chloride content does not exceed 0.2 per cent of the sample weight.

Place 1 Gm. of starch-derivative dusting powder, accurately weighed, in a 50 cc. porcelain crucible and add 20 cc. of concentrated nitric acid saturated with bromine. Cover the crucible with a watch glass and allow it to stand for 1 hour. Then heat the crucible gently until all of the bromine has evaporated. Remove the watch glass and rinse the adhering liquid into the crucible with a small amount of distilled water. Evapo-

rate the contents of the crucible to dryness on a steam bath. Cover the residue with 5 Gm. of a 1:1 mixture of sodium carbonate and potassium nitrate and fuse, heating gently until the reaction is complete. Break up the fused mass and transfer it to a beaker with the aid of a stream of distilled water, and then add 5 cc. of concentrated hydrochloric acid. Make the solution up to 200 cc. with distilled water. Filter the solution if it is not clear, heat it to boiling, and add, dropwise and with constant stirring, 10 cc. of hot barium chloride T.S. Allow the beaker to stand overnight. Filter the barium sulfate formed onto a tared Gooch crucible. Wash the precipitate with hot water, dry at 100 C. for 20 minutes and ignite the crucible and contents to constant weight. Each Gm. of barium sulfate is equivalent to 0.4115 Gm. of sulfate: the sulfate content does not exceed 0.8 per cent of the sample weight.

ETHICON SUTURE LAB'S., DIVISION OF JOHNSON & JOHNSON, NEW BRUNSWICK, N. J.

Bio-Sorb (Powder): 2.27 Kg. cans.

U. S. trademark pending.

ALUMINUM HYDROXIDE GEL-N. N. R. (See New and Nonofficial Remedies 1948, p. 338).

The following dosage forms have been accepted:

WYETH, INCORPORATED, PHILADELPHIA 3

Suspension Amphojel (Flavored): 180 cc. and 360 cc. bottles. An aqueous suspension containing the equivalent of 3.6 to 4.4 per cent of aluminum hydroxide, 5 per cent glycerin, and not more than 0.5 per cent sodium benzoate. Flavored with oil of peppermint.

Suspension Amphojel (Unflavored): 180 cc. and 360 cc. bottles. An aqueous suspension containing the equivalent of 3.6 to 4.4 per cent of aluminum hydroxide, 5 per cent glycerin, and not more than 0.5 per cent sodium benzoate.

Tablets Amphojel: 0.3 Gm. and 0.6 Gm. Each tablet contains the equivalent of 0.3 Gm. or 0.6 Gm. of aluminum hydroxide with excipients and flavoring agents.

U. S. trademark 370,518.

METHADONE HYDROCHLORIDE (See New and Nonofficial Remedies 1948, p. 25).

The following dosage forms have been accepted:

THE WM. S. MERRELL COMPANY, CINCINNATI 15

Solution Methadone Hydrochloride: 10 mg. per cc., 20 cc. vials. Preserved with chlorobutanol 0.5 per cent.

Tablets Methadone Hydrochloride: 5 mg.

THE UPJOHN COMPANY, KALAMAZOO 99, MICH.

Elixir Methadone Hydrochloride: 1 mg. per cc., 500 cc. bottles.

Hypodermic Tablets Methadone Hydrochloride: 10 mg.

Solution Methadone Hydrochloride: 10 mg. per cc., 30 cc. vials.

Tablets Methadone Hydrochloride: 2.5 mg., 5 mg. and 10 mg.

HEPARIN SODIUM (See New and Nonofficial Remedies 1948, p. 352).

The following dosage form has been accepted:

THE UPJOHN COMPANY, KALAMAZOO 99, MICH.

Solution Heparin Sodium: 100 mg. per cc., 4 cc. vials. Each cc. contains 10,000 units of heparin sodium. Preserved with chlorobutanol 5 mg.

ESTROGENIC SUBSTANCES (WATER INSOLUBLE) (See New and Nonofficial Remedies 1948, p. 370).

The following dosage form has been accepted:

WARREN-TEED PRODUCTS COMPANY, COLUMBUS 8, OHIO

Aqueous Suspension Estrovarin: 20,000 I. U. per cc., 1 cc. ampuls and 15 cc. vials.

DIETHYLSTILBESTROL-U. S. P. (See New and Nonofficial Remedies 1948, p. 378).

The following dosage form has been accepted:

GOLD LEAF PHARMACAL COMPANY, INC., NEW ROCHELLE, N.Y.

Solution Diethylstilbestrol in Oil: 1 mg. and 5 mg. per cc. in sesame oil, 1 cc. ampuls and 30 cc. vials. The vials are preserved with chlorobutanol 0.5 per cent.

EPHEDRINE SULFATE-U. S. P. (See New and Nonofficial Remedies 1948, p. 231).

The following dosage form has been accepted:

STRONG-COBB COMPANY, INC., CLEVELAND 4

Solution Ephedrine Sulfate: 25 mg. and 50 mg., 1 cc. Amps.

SATURDAY, JUNE 18, 1949

THE PROGRAM OF THE WORLD HEALTH
ORGANIZATION

In an address before the annual meeting of the Association of State and Territorial Directors of Local Health Services, Calderone¹ pointed out that international health agencies confined themselves in the past to dissemination of epidemiologic information and the establishment of quarantine regulations and sanitary conventions but that the World Health Organization advances a new and revolutionary concept of health, namely, "a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity."

In the first World Health Assembly held in Geneva in 1948 the delegates from sixty nations outlined a six point program for positive action in the field of health. The program involves the mass use of insecticides, water sanitation and sewage disposal technics. Effort will be concentrated on maternal and child health, venereal disease, tuberculosis, malarial control, public health administration, training, health demonstrations and fundamental health education of populations. One of the most fertile fields is malaria control. The World Health Organization is collaborating actively with the Food and Agriculture Organization of the United Nations in establishing antimalarial campaigns, especially in regions where increased food production is possible. Large scale operations under joint action are planned for rural restoration of approximately 10,000,000 acres where malaria control will be associated with general improvement of health standards, including economic, agricultural, sociologic and other considerations.

1. Calderone, F. A.: An Address at the Annual Meeting of the Association of State and Territorial Directors of Local Health Services, Peabody Hotel, Memphis, Tenn., April 28, 1949.

Important on the agenda is the campaign against tuberculosis. This will include traveling fellowships for personnel from countries most in need of assistance; the provision of demonstration teams; the development of uniform procedures on classification of tuberculosis, roentgenologic interpretation, laboratory diagnosis of the presence of tubercle bacilli and the evaluation of new chemotherapeutic agents such as streptomycin. Even more important is the mass immunization program which is being carried on by the International Children's Emergency Fund with the cooperation of the World Health Organization, the Danish Red Cross and Scandinavian societies, bringing tuberculin testing and BCG vaccination to Europe, Asia, South America and North Africa. Another top priority is venereal disease control. The World Health Organization and United Nations' International Children's Emergency Fund have initiated extensive activities to combat prenatal and infantile syphilis with penicillin. Model demonstration projects for the treatment of this disease are under way in Poland, Yugoslavia, Hungary, Bulgaria and Greece, the Eastern Mediterranean and South East Asia. The program will be extended to Albania, Czechoslovakia, Rumania, India, Pakistan and Siam.

Since adequate nutrition in all stages of life is an important factor in safeguarding and restoring health, the World Health Organization is collaborating with the Food and Agriculture Organization of the United Nations both in scientific and in operating programs which aim to increase the production of food in many areas in the world.

The World Health Organization also plans to conduct epidemic control activities and special research on typhus, trachoma, yellow fever, smallpox and plague. It is investigating new pharmaceutical and biologic products; it is implementing the sanitary conventions; it is standardizing health statistics, biologic and pharmaceuticals, and unifying the pharmacopeias.

An interesting feature of the program is the establishment of fellowships providing extensive periods of training for public health and medical personnel for many countries by which they can improve their knowledge and return to their own countries better equipped to contribute to local health programs. Already four hundred and sixty-one fellows from twelve countries have been trained under the auspices of the World Health Organization in the outstanding institutions of the United States, England, Canada, Denmark, France and other countries. During 1950 it is planned to train about five hundred additional fellows from almost every country of the world. Six fellowships for study in Europe will be awarded to the United States this year for work in the fields of malaria, tuberculosis, maternal and child health, nutrition and sanitation. For many areas, of greatest importance are programs for the

increase of food production by means of insecticide projects, introduction of modern agricultural methods, improved animal husbandry, introduction and modernization of water and food sanitation and sewage control.

The program envisages a vast undertaking for the eradication of the disease wherever it exists by positive methods based on the newest advances made by medical research.

MILK-BORNE CANCEROGENIC VIRUS

In 1933 Little¹ of the Jackson Memorial Laboratory, Bar Harbor, Maine, reported the results of several years' genetic study of inbred "high tumor" and "low tumor" strains of mice. In the high tumor strains over 90 per cent of the females died of spontaneous mammary cancer by the age of 12 months. In less than 10 per cent of the low tumor strains and in less than 1 per cent in some strains mammary tumors developed. Reciprocal crosses between high tumor and low tumor mice gave data not in accord with mendelian laws of genetics. From this, Little concluded that some unknown extrachromosomal factor played a major role in the hereditary transmission of a high tumor diathesis.

Three years later, Bittner² identified this unknown extrachromosomal factor as some substance or deficiency in the breast milk of high tumor mice. If immediately after birth the young of high tumor mice were foster-fed by low tumor mothers, they did not acquire the usual high tumor tendency.

An attempt to determine the nature of the cancerogenic factor in high tumor milk was made by Visscher³ and his associates of the University of Minnesota.

Using a specially devised procedure for preparation of homogenized high cancer breast tissue, they developed a substance which was injected into 84 young mice which survived such administration. By the age of 12 months 10 (or 71 per cent) of the 14 surviving mice given the homogenized tissue had verified mammary carcinoma. Fifty-five per cent of those given the ultrasediment had cancer. Progressively smaller percentages developed in mice given the first sediment and the fat fraction. Cancer did not develop in any of the mice given the final supernatant fluid.

From this, Visscher concluded that most of the cancerogenic agent of the lactating breast from high cancer mice is present in the secondary sediment obtained by ultracentrifugation. This sediment is virtually free from matter above colloidal dimensions and contains a large share of the soluble material of high molecular weight. From this he concluded that the cancerogenic agent is either a colloid of high molecular weight or a virus.

Attempted identification of this factor was subsequently made by Graff⁴ and his associates, who examined the ultracentrifugates of milk of high cancer and low cancer mice by means of the electron microscope. They report that high cancer strain milk contains a "heavy particle" which has "virus-like dimensions." Passey⁵ and others made similar examinations of aqueous extracts of normal and cancerous breast tissues. In extracts from the tissues of high cancer mice they found a "particulate component" about 200 angstrom units in diameter, which was not present in extracts from low cancer strains.

Both these observations are subject to criticisms, since the alleged agent was easily confused with cytoplasmic detritus. To avoid this difficulty, Porter and Thompson⁶ of the Rockefeller Institute made electron micrographs of intact mammary epithelial cells grown from explants on formvar[®]-coated slides. When, after a few days, small peripheral sheets of epithelial cells were obtained, the explants were removed. The remaining cell sheets were then washed with Tyrode's solution, fixed by exposure to the vapor of osmium tetroxide, mounted on screens and dried.

Electron micrographs of these dried cells showed numerous small spherical particles readily differentiated from the normal cytoplasmic components. Most of the particles showed a dark or dense nucleus-like center with an average diameter of about 75 millimicrons. This was surrounded by a capsule-like envelope about 135 millimicrons in diameter. The particles thus resembled the viruses of equine encephalomyelitis, influenza A and B and vaccinia, as previously described by Sharp,⁷ Green⁸ and others.

The particles were associated only with the epithelial cells. Fibroblasts observed in the same tissue cultures did not carry them. The particles occurred singly, in pairs or in clumps. Clusters of four bodies, two large and two small, were fairly common. Occasionally an unusually large particle was composed of two, four or more nuclei in a single capsule. The particles were not found in any normal tissues thus far examined.

These and other data led Porter to assume that the observed particles represent a virus identical with Bittner's milk-borne cancerogenic agent. Further evidence for or against this assumption is being sought from a study of cells cultivated from tumors in mice free from the Bittner factor.

Current Comment

THE PRESIDENT-ELECT—DR. ELMER LEE HENDERSON

The President-Elect of the American Medical Association, chosen unanimously by the House of Delegates in the Atlantic City Session, is Dr. Elmer Lee Henderson of Louisville, Ky., a distinguished surgeon and a leader in the work of the Association for many years. Dr. Henderson was elected to the House of Delegates in 1937, and in 1939 to the Board of Trustees; he has been Chairman of the Board since 1947. He was formerly president of the Jefferson County Medical Society and of the Kentucky State Medical Association and counselor and chairman of the Surgical Section of the Southern Medical Association. Dr. Henderson was born in Garnettsville, Ky., in 1885, graduated from the University of Louisville Medical School in 1909 and has been engaged in the practice of surgery in Louisville since 1911. He is a specialist certified by the American Board of Surgery, a fellow of the American College of Surgeons, a former vice president and president of the Southeastern Surgical Congress, a recent past president of the Southern Medical Association and of the Alumni Association of the University of Louisville. Dr. Henderson is Director of the Kossair Crippled Children's Hospital and a member of the staff of the Kentucky Baptist Hospital and of the St. Joseph Infirmary.

In World War I he served as a major in the U. S. Army Medical Corps, nine months of which service was overseas. For many years he was a lieutenant colonel in the Medical Reserve Corps. In World War II Dr. Henderson was chairman of the Fifth Service Command Committee, Procurement and Assignment Service for Physicians, Dentists and Veterinarians. Since 1942, he has been a special surgical consultant to the Air Surgeon's Office. In choosing Dr. Henderson the House of Delegates recognized the innumerable days devoted to the cause of the medical profession, often at great personal sacrifice; his skill in diplomatic negotiation, evidenced by his activities in the World Medical Association; his financial acumen, dem-

onstrated by the progress of American Medical Association affairs under his leadership. In his address of acceptance Dr. Henderson pledged himself unwaveringly to opposition against nationalized medicine.

ETIOLOGY OF HODGKIN'S DISEASE

Grand¹ has recently described cytoplasmic inclusion bodies in tissue cultures of lymph nodes affected by Hodgkin's disease. Similar inclusions were not found in cultures of normal lymph nodes, or those involved by lymphosarcoma or leukemia, or in lymphadenitis. The cells of normal human lymph nodes in tissue

cultures exposed to cell-free supernatant fluid from cultures of Hodgkin's nodes also developed the characteristic inclusion bodies. Cultures of Hodgkin's nodes and of normal lymph nodes exposed to supernatant fluid from Hodgkin's node cultures rapidly underwent cell degeneration. Such cultures produce liquefaction of the culture medium. Similar degenerative changes are not seen in cultures of tumors. The cultures can be maintained viable for months or years. The author suggests that the degeneration might be due to an overwhelming virus infection of the cultures. The inclusions closely resembled morphologically those described in cells infected with known viruses. Both results support the conception of a virus causation of Hodgkin's disease and suggest that it is inflammatory rather than neoplastic in nature. Claims for a virus

ELMER LEE HENDERSON, M.D.
PRESIDENT-ELECT OF THE AMERICAN MEDICAL ASSOCIATION

causation of Hodgkin's disease have previously been made on numerous occasions. Proof has always been lacking. One of the strongest contenders for a virus causation was Gordon,² who published photographs of elementary bodies which he regarded as the probable causative agent. The relation of the bodies which he illustrated to the inclusion bodies now described by Grand remains to be determined. If Grand's findings can be confirmed the understanding of this disease will have been greatly advanced.

THE DISTINGUISHED SERVICE MEDAL AWARDED TO SEALE HARRIS

The House of Delegates of the American Medical Association at the meeting in Atlantic City selected Dr. Seale Harris of Birmingham, Ala., as recipient of the Distinguished Service Medal, which is the highest scientific award granted by the Association. Dr. Harris has won international recognition for his research on hyperinsulinism and its control. He was born in Cedartown, Ga., on March 13, 1870. After academic training at the University of Georgia, he studied medicine and received his degree from the University of Virginia in 1894. He began practice in Union Springs, Ala., and after twelve years moved to Mobile, where he remained for nine years. He then moved to Birmingham, where he became professor of medicine in the medical department of the University of Alabama. He is a member of the American College of Physicians. He served as president of the Southern Medical Association in 1921. He served with the armed forces as major in 1917 and retired as colonel in 1919. He edited *War Medicine*, published in Paris during World War I, and was secretary of the Research Committee of the American Red Cross in France. At that time he was cited by General Pershing "for conspicuous and meritorious service in France." In 1939 he was cited by the Medical Association of the State of Alabama for contributions to medicine beneficial to mankind. One year after the discovery of insulin, Dr. Harris spent a week in Toronto with Banting, Best, Collip and McLeod studying many cases and witnessing insulin reactions. These observations led him to recognition of the effects in nondiabetic patients of excessive secretion of insulin. Dr. Harris has contributed notably in his medical writings, including chapters on food poisoning, hyperinsulinism and pellagra in various systems of medicine. He published in 1946 a book entitled "Banting's Miracle" and has now in process of preparation a biography of Marion Sims. Dr. Seale Harris is in the tradition of the true physician, caring for his patients, serving his community and his nation as a great citizen, advancing the science of medicine and earning the devotion and respect of the people he serves.

SEALE HARRIS, M.D.
AWARDED DISTINGUISHED SERVICE MEDAL

COMBINED AUREOMYCIN AND DIHYDRO- STREPTOMYCIN TREATMENT IN BRUCELLOSIS

Mice infected with *Brucella* organisms, after treatment with aureomycin or with chloromycetin,¹ still had great numbers of *Brucella* organisms in their spleens, according to Heilman.¹ Aureomycin combined with streptomycin or dihydrostreptomycin proved to be most effective. The addition of a sulfonamide compound to the combination of aureomycin and dihydrostreptomycin did not yield better results. Herrell and Barber² treated four acutely ill patients who had culturally proved brucellosis with the combination of aureomycin and dihydrostreptomycin. The average daily dose of aureomycin was 3 Gm. by mouth given in divided doses every six hours. Dihydrostreptomycin was given simultaneously in divided doses intramuscularly, the average daily dose amounting to 2 Gm. The patients did not receive other treatment except rest in bed and the usual supportive measures, which included vitamin supplements. This combined treatment was continued for twelve to fourteen days. In brucellosis complicated by some localizing lesions, such as involvement of the skeletal system, urinary tract or endocarditis, the course of treatment should be extended to twenty-one to twenty-eight days. All patients so treated promptly recovered without recurrence. The administration of aureomycin was associated with little or no toxic manifestations. Aureomycin is much less toxic than sulfadiazine.

The toxic effect on the eighth nerve associated with the administration of streptomycin can be reduced by the employment of dihydrostreptomycin. The combination of aureomycin and dihydrostreptomycin is apparently most effective as measured by bacteriostatic activity. This combination reduces and to some degree eliminates the undesirable toxic effects which might be encountered with regular streptomycin alone or sulfadiazine or the two in combination.

2. Herrell, W. E., and Barber, T. E.: The Combined Use of Aureomycin and Dihydrostreptomycin in the Treatment of Brucellosis. *Proc. Staff Meet., Mayo Clin.* 24: 138-143 (March 16) 1949.

ORGANIZATION SECTION

PROCEEDINGS of the ATLANTIC CITY SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF
THE AMERICAN MEDICAL ASSOCIATION, HELD IN
ATLANTIC CITY, JUNE 6-10, 1949

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 6

The House of Delegates convened in the American Room of the Hotel Traymore, Atlantic City, N. J., and was called to order at 10:10 a. m. by the Speaker, Dr. F. F. Borzell.

Preliminary Report of the Reference Committee on Credentials

Dr. H. B. Everett, Chairman, stated that 154 delegates had registered, and the Speaker appointed as Sergeants-at-Arms Drs. Joseph F. Londrigan, New Jersey, Chairman; John J. Masterson, New York, and John J. Curley, Massachusetts.

Roll Call

At the request of the Speaker, the Secretary called the roll, and those who entered after their names had been called reported to the Secretary.

Photograph

The House paused long enough so that a photograph of the House could be taken.

Tellers

The Speaker appointed the following to serve as tellers at this Annual Session:

Ernest E. Shaw, Iowa, Chairman	Leonard W. Larson, Section on
Clarence G. Bandler, New York	Pathology and Physiology
H. Russell Brown, South Dakota	Roscoe H. Reeve, Wyoming
Jesse D. Hamer, Arizona	George A. Woodhouse, Ohio

Distinguished Service Award

Dr. E. L. Henderson, Chairman of the Board of Trustees, presented a report of the Board as follows:

The Committee on Distinguished Service Award of the American Medical Association submitted five names to the Board of Trustees.

In accordance with Division Three, chapter XIV, section 3, of the By-Laws, the Board has selected by ballot the following names for presentation to the House of Delegates in alphabetical order: Dr. Alfred Blalock, Baltimore; Dr. Seale Harris, Birmingham, Ala., and Dr. Shields Warren, Boston. Dr. Henderson, on request, read to the House information concerning Drs. Blalock, Harris and Warren.

The tellers spread the ballot and the Secretary announced that one hundred and sixty-eight votes had been cast, of which Dr. Blalock received fifty-two, Dr. Harris, sixty-nine and Dr. Warren forty-seven.

The Speaker announced that since no one had received a majority of the votes cast, a second ballot would be taken with the elimination of the name of Dr. Warren.

Dr. James R. Reuling, Vice Speaker, assumed the chair.

Compliments to Miss Jewel F. Whelan

While the tellers spread the ballot, the Speaker called the attention of the House to the absence of one face at the desk, stating that Miss Jewel F. Whelan had been taken ill but is now recovering.

It was moved by Dr. George W. Kosmak, New York, seconded by Dr. Walter E. Vest, West Virginia, and carried unanimously that the House expresses its compliments to Miss Whelan and wishes her a speedy recovery.

Orchid to Miss Hattie A. Niehoff

The Speaker announced that one person was celebrating her silver anniversary because of services rendered to the House for the last twenty-five years and presented to Miss Hattie A. Niehoff, who he stated had served the House well and faithfully, an orchid as a token of the appreciation of the House.

Distinguished Service Award, Continued

The Vice Speaker declared the ballot closed and the Secretary announced that one hundred and sixty-five votes had been cast, of which Dr. Harris received ninety-seven and Dr. Blalock sixty-eight. The Speaker declared that the House had selected Dr. Seale Harris, Birmingham, Ala., as the recipient of the Distinguished Service Award for 1949.

Adoption of Proceedings of St. Louis Interim Session

The Secretary presented the proceedings of the St. Louis Interim Session Nov. 30-Dec. 3, 1948, which were adopted on motion of Dr. Mather Pfeiffenberger, Illinois, seconded by Dr. Walter E. Vest, West Virginia, and carried.

Address of Speaker, Dr. F. F. Borzell

With the Vice Speaker, Dr. James R. Reuling, in the chair, the Speaker presented the following address, which was referred to the Reference Committee on Reports of Officers:

Gentlemen:—Since the Interim Session at St. Louis last December, the American Medical Association has been the pivotal point of many charges and discussions. Its officers have been attacked both from within and without. We have been accused of holding our membership behind an "Iron Curtain." The officers and Board of Trustees have been called a hierarchy made up of reactionaries committed only to the maintenance of a "status quo." It has become necessary for our officers to make public denial and even direct refutation of these charges even to the membership of Congress.

It is because of the events of the last six months that this session of the House of Delegates of the American Medical Association assumes proportions of great significance, not only to the medical profession but to the entire nation as well.

This House of Delegates, constituting for the most part the elected representatives of the membership of the constituent state associations, took deliberate and unanimous action on several matters of vital consequence to the American people. We were accused of having set up a "slush fund." This charge was made with implications of intent to apply pressures corruptly on our legislators for our own selfish ends. If there is one responsibility that is outstanding on this session of the House of Delegates, it is that its deliberations must show the American public once and for all that the American medical profession, constituting the American Medical Association, is a completely democratic body and that when the House of Delegates speaks it speaks for the vast majority of American physicians. It must further demonstrate more clearly than ever that its motivations spring solely from a sense of primary responsibility to insure for our people the maintenance of a quality of medical service equaled nowhere else in the world.

As an answer to criticisms of adverse publicity arising from the St. Louis session, your Speaker respectfully requests this House of Delegates to authorize the appointment for this session of a special committee of five members of the House to be known as the Committee on Publicity whose function will be to cooper-

ate with the Department of Press Relations of the American Medical Association to the end that releases may be made expeditiously and authoritatively. The Speaker has discussed the mechanics of operation of this proposed committee with Mr. John Bach, Director of the Department of Press Relations, and believes that such committee offers a practical solution to the problem.

A better understanding of the democratic functioning of this House might perhaps be stimulated if the delegates would invite selected members from their state societies who are in attendance at the scientific sessions to observe at least one meeting of the House.

The Speaker wishes to take this opportunity to thank the many delegates who have by letter and personal communication shown a keen desire to fulfil their important duties.

It is apparent that this House is faced with a continuing necessity of giving extended consideration to social and political problems dealing with the nation's health. On the other hand, it is noteworthy that while so much emphasis has of necessity been placed on these problems, our scientific activities have been carried on without relaxation through THE JOURNAL, other publications of the Association and the various councils and bureaus. We must, therefore, continue to look to the delegates from the various scientific sections to keep the House alerted to scientific matters requiring action.

At the St. Louis session several resolutions were presented with multiple endorsements. The Speaker is of the opinion that the intent of such resolutions would be better served if they were presented by a single endorsement and the supporters appeared before the proper reference committee in support. This not only will save time and be more democratic but also will more effectively record approval. Your responsibilities are such that your deliberations must be accurately reported and be given correct interpretation to the public. You therefore must continue to assume full responsibility, individually and collectively for your actions. This responsibility demands that we guard every move we make lest we fail in upholding our proud traditions and the lofty position we have attained.

In periods of great stress, in the heat of battle, human reactions are intensified and irritations magnified. It is difficult to retain the calmness necessary for good generalship. Righteous indignation may easily be transmuted into blind hatred. The former is a source of strength, the latter an evidence of weakness. The eyes of the country are on us. Our comrades in arms, the great medical profession, are looking to us of the House of Delegates for leadership. We, then, must lead and not be led. Pressures stimulated by vindictiveness, base emotions or self interest dare not activate our conduct.

He whom the Gods would destroy, they first make mad. There are those who would gladly destroy the American Medical Association, but as long as we hold to a course of dignity, singleness of purpose and unwavering solidarity, we can win. Gentlemen, your responsibility is great and in your hands rests the health of this nation.

REFERENCE COMMITTEES

In accordance with the By-Laws, the following reference committees are appointed. A few changes have been necessary since publication in THE JOURNAL and the Handbook:

SECTIONS AND SECTION WORK

Edward L. Compere, Chairman, Section on Orthopedic Surgery.	Charles H. Phifer, Illinois
Jacob W. Bird, Maryland.	John M. Porter, Kansas.
	Charles T. Stone, Section on Internal Medicine.

RULES AND ORDER OF BUSINESS

Albert F. R. Andresen, Chairman, New York.	James Stevenson, Oklahoma.
L. Howard Schriver, Ohio.	John F. Conway, New Mexico.
	E. Roger Samuel, Pennsylvania.

REPORTS OF BOARD OF TRUSTEES AND SECRETARY

Thomas A. Foster, Chairman, Maine.	Allen H. Bunce, Georgia.
Warren L. Allee, Missouri.	William F. Costello, New Jersey.
	William M. Skipp, Ohio.

MEDICAL EDUCATION

B. R. Kirklin, Chairman, Section on Radiology.	Lowell S. Goin, California.
W. P. Anderton, New York.	H. G. Hamer, Indiana.
	Charles L. Shafer, Pennsylvania.

LEGISLATION AND PUBLIC RELATIONS

William Bates, Chairman, Pennsylvania.	Leo G. Christian, Michigan.
F. J. L. Blasingame, Texas.	Walter G. Phippen, Massachusetts.
	H. Gordon MacLean, California.

HYGIENE AND PUBLIC HEALTH

Deering G. Smith, Chairman, New Hampshire.	Stephen E. Gavin, Wisconsin.
W. Palmer Dearing, Public Health Service.	Scott Lord Smith, New York.
	Felix J. Underwood, Mississippi.

AMENDMENTS TO CONSTITUTION AND BY-LAWS

William D. Stovall, Chairman, Wisconsin.	Paul K. French, Vermont.
Ivan Fawcett, West Virginia.	William A. Hyland, Michigan.
	B. E. Pickett Sr., Texas.

REPORTS OF OFFICERS

F. J. Pinkerton, Chairman, Hawaii.	J. Stanley Kenney, New York.
J. B. Lukins, Kentucky.	Charles J. Kickham, Massachusetts.
George E. Earl, Minnesota.	

CREDENTIALS

H. B. Everett, Chairman, Tennessee.	Raymond F. Peterson, Montana.
E. P. Flood, New York.	Charles F. Strosnider, North Carolina.
Carl A. Lincke, Ohio.	

INDUSTRIAL HEALTH

William L. Estes Jr., Chairman, Pennsylvania.	Warren W. Furey, Illinois.
Wyman D. Barrett, Michigan.	Edward H. McLean, Oregon.
	Carl A. Grote, Alabama.

EXECUTIVE SESSION

John W. Cline, Chairman, California.	Thomas P. Murdock, Connecticut.
Robert H. Hayes, Illinois.	Howard K. Petry, Pennsylvania.
	Hugh P. Smith, South Carolina.

MISCELLANEOUS BUSINESS

Mather Pfeiffenberger, Chairman, Illinois.	William R. Brooksher, Arkansas.
George Braunlich, Iowa.	Andrew A. Eggston, New York.
	Hoyt B. Woolley, Idaho.

TELLERS

Ernest E. Shaw, Chairman, Iowa.	Leonard W. Larson, Section on Pathology and Physiology.
Clarence G. Bandler, New York.	Roscoe H. Reeve, Wyoming.
H. Russell Brown, South Dakota.	George A. Woodhouse, Ohio.
Jesse D. Hamer, Arizona.	

SERGEANTS-AT-ARMS

Joseph F. Londrigan, Chairman, New Jersey.	John J. Masterson, New York.
	John J. Curley, Massachusetts.

On motion of Dr. Walter E. Vest, West Virginia, seconded by Dr. George W. Kosmal, New York, and carried, the nominations for membership on reference committees made by the Speaker were confirmed.

The Speaker requests authorization for the appointment of two special reference committees, as follows:

INSURANCE PLANS AND MEDICAL SERVICE

E. Vincent Askey, Chairman, California.	William H. Halley, Colorado.
Paul A. Davis, Section on General Practice.	Louis M. Orr II, Florida.
James Q. Graves, Louisiana.	Herbert P. Ramsey, District of Columbia.

EMERGENCY MEDICAL SERVICE

Leland S. McKittrick, Chairman, Massachusetts.	Robertson Ward, California.
Karl S. J. Hohlen, Nebraska.	Consultants
George S. Klump, Pennsylvania.	George E. Armstrong, U. S. Army.
Roland W. Stahr, Nevada.	Joel T. Boone, U. S. Navy.
	Edward H. Cushing, Veterans Administration.

It was moved by the Speaker, seconded by Dr. Charles H. Phifer, Illinois, and carried, that these special reference committees be authorized and their membership confirmed.

COMMITTEE ON PUBLICITY OF HOUSE ACTIVITIES

I also request at this time in accordance with my opening remarks, authorization from the House of Delegates to appoint the following Committee on Publicity to serve for this session, to confer with the Speaker or Vice Speaker, the Chairman of the Board of Trustees, the Secretary and the publicity staff of the American Medical Association, to authorize releases or to return to the House if in doubt for House action, and to be prepared to act at any time:

Thomas K. Lewis, Chairman, New Jersey.	Louis A. Baie, Section on Gastro-Enterology and Proctology.
Creighton Barker, Connecticut.	Raymond L. Zech, Washington.
Henry B. Mulholland, Virginia.	Floyd S. Winslow, New York.

Dr. Borzell moved approval of the recommendation and the motion was seconded by Dr. Walter E. Vest, West Virginia, and carried.

IN MEMORIAM

The Speaker read the names of those who have departed from this life since the last annual session as follows (the dates following the names indicate years of service in the House):

William F. Bowen, Kansas, 1934-1935.
William H. Breuer, Missouri, 1934-1937.
Frank L. Brown, Illinois, 1931.
Robert S. Cathcart, South Carolina, 1908-1909.
William T. Corlett, Cleveland, Section on Dermatology, 1902.
Gilbert G. Cottam, South Dakota, 1924.
Crum Epler, Colorado, 1908; 1932-1934.
William A. Evans, Chicago, Section on Pathology, 1902; Section on Preventive Medicine and Public Health, 1912.
Albert A. Gartner, New York, 1943-1948.
John Green, Missouri, 1907.
Arthur H. Gross, Pennsylvania, 1928.
Edward L. Keyes, New York City, Section on Genito-Urinary Diseases, 1917.
Charles E. Kiely, Ohio, 1930-1932; 1934-1941.
James C. E. King, Utah, 1902.
Jennings C. Litzenberg, Minnesota, 1924-1925; 1927-1929.
William E. Lower, Ohio, 1909.
John B. McAlister, Pennsylvania, 1909; 1914; 1928; 1931.
Ross S. McElwee, North Carolina, 1941-1945.
Stuart McGuire, Virginia, 1903-1904; 1906-1908.
Oliver W. H. Mitchell, New York, 1943-1948.
John James Moren, Kentucky, 1917.
A. P. Nachtwey, North Dakota, 1936-1947.
N. J. Nessa, South Dakota, 1943-1945.
Howard T. Phillips, West Virginia, 1933; 1936-1937.
B. S. Pollak, New Jersey, 1928; 1931-1933.
Alfred C. Prentice, New York, 1920.
Joseph Scattergood Jr., Pennsylvania, 1942-1944.
Solomon Solis-Cohen, Philadelphia, Section on Therapeutics, 1907.
J. Walter Vaughan, Detroit, Section on Pathology, 1913.
Olin H. Weaver, Georgia, 1930-1947.
John E. Weeks, New York, 1910-1911.
Guy W. Wells, Rhode Island, 1934-1937; 1939-1940; 1946-1947.
Kasimir A. Zurawski, Illinois, 1913.

The Speaker announced that since this list had been prepared Dr. Roy B. Henline, Section on Urology, had died.

At the request of the Speaker, the audience arose to stand for a moment in silent tribute to the memory of these absentees.

Address of President R. L. Sensenich

The Speaker resumed the chair and called on President R. L. Sensenich for his address and the audience arose in tribute to Dr. Sensenich.

Dr. R. L. Sensenich, President, presented the following address, which was referred to the Reference Committee on Reports of Officers:

That is a very wonderful gesture which rather embarrasses me because I do not know whether it is all coming to me.

During the past year, and, for that matter, throughout the past two years, there have been an almost unprecedented number of things which needed attention and which fell on the President to do. I have been happy to do them. I admit at times they were a bit rugged and the time demanded probably exceeded what usually has been given over to this service, but I am happy to have done them and I hope I have helped some.

Among the myriad things that have come up for consideration during that time, I selected four that I thought might well be discussed here this morning, and I shall give you a brief survey, so far as I am able to in the brief time I have, of the status of these various subjects. They have all been selected because I thought they were important.

One of them is medical education. I think that is one of the most important subjects that you will have to deal with, and no doubt some report from the Council will come to you during this session. As you well know, the medical schools and medical colleges were greatly disturbed during the war as a result of the accelerated courses, the change in students and the diminished number of students, except those that were supported by the military establishment.

The postwar situation was not relieved to any great extent—the G. I. pressure, the number of students and, again, the teacher shortage. By the way, this comes up frequently in Washington. It came up less than two weeks ago, and representatives of the Council on Medical Education and Hospitals are there today. There is perhaps less attraction to teachers with respect to

university positions. There is, of course, government pressure on the other hand because of the alleged shortage of physicians. That shortage is not as it is represented but nevertheless it is made a reason for a great deal of argument for compulsory health insurance which carries with it provisions for funds to be used in medical education. Some of the endowed schools are having great financial trouble, and there is always a temptation to accept government money, and the temptation comes from government. The government socializers have been rather active in this respect.

The university hospitals have been a source of considerable complaint in many areas because they engage in the practice of medicine. That is not news. Some of our very good hospitals for many years have accepted patients and taken the payments for their services and applied those payments to the cost of the maintenance of their medical schools and their teaching staffs, but in some areas that has been a subject of violent discussion and unfavorable reaction.

Then, there has been the matter of the study of medical courses as they are now operated. There has been much criticism in connection with some of the specialist courses, that the persons so trained have had an insufficiently broad base, and it has been suggested that the courses should be studied, and that there should be a reevaluation of courses and of the proportion of time spent and of the methods of teaching. There are many other angles that are being given consideration in the various schools.

Lack of funds has led to an effort to stimulate the donor interest. How far that will go toward meeting the need is not known. In fact, at the moment we have no way of knowing how many schools there are that need substantial financial help. It would seem improbable that federal funds would be necessary for the support of state schools when the states in turn must contribute the funds to the federal government which will later be reappropriated to them. State schools in some instances, apparently, have not had the support of the profession or have not been sufficiently active in their efforts to obtain additional funds. On the other hand, nonstate schools, those that have not received financial support from the states, probably will be in serious need also. This will all come before you in this meeting, no doubt.

A committee from the Council on Medical Education and Hospitals and the Association of American Medical Colleges, the chairman of that committee being a prominent editor, not a physician, is now in the process of making a study of our educational institutions and the things to which I have just referred.

With regard to the second of these four important subjects, I think that preferred attention should be given to the work of the Council on National Emergency Medical Service. The Council will report to you today. That, however, has been the subject of a great deal of discussion and communication, and much has been done in an effort to stimulate interest, especially among those young men who received a part of their medical education at the expense of the government and had no military medical service. The Council was set up for the purpose of conferring with government authorities and units of the American Medical Association concerning possible national emergencies, medical emergencies and consideration of the military and civilian medical needs. Along with that was the training and organization to meet those needs.

There was much complaint at the conclusion of World War II, as after World War I, that medical men had not been well utilized, and one of the chief pressures that developed as a result of the survey made of discharged medical men at the conclusion of the war was the fact that they felt we must insist on the best possible utilization of the special training and skills of medical officers in the armed forces.

We request especially the establishment of a pattern of administration that will prevent assignment of well qualified physicians to minor medical or nonmedical duties or wastage in inactivity. If the medical departments of the armed forces are to be maintained at a high level, the services must provide attractive opportunities to well qualified physicians to progress in medical science. The Army and Navy medical organizations

must have capable medical administrators. However, there must be opportunities to progress in clinical medicine with comparable rewards for physicians detached from major administrative duties.

This may require a concept of military medical reward broader than that presently measured by the breadth of command and proportionate administrative functions, so that the individual may progress and may be rewarded for his superior medical services and continued in medicine rather than, of necessity, being diverted to administrative positions or positions having a great deal of administrative work in order that he may be advanced in proportion to his contribution to the work of the forces.

Additionally, the number whom it is possible to advance under the present medical promotion through administrative positions is limited, and the men become discouraged, and many of them are not interested in accepting service for that reason. The medical officer spends more years than in most other fields in preparation in the highly scientific field of study, and he must continue that study if in medicine he is going to progress and continue to serve as he should in his particular assignment.

I have had complaints, and, by the way, the mail that comes to the President's office is very voluminous. I have been written to a number of times and the definite statement has been made that much of our trouble lies with the fact that the Surgeons General of the services are not given proportionate rank and position. There is probably something to that. That would be reflected down across the board to all of the officers, the younger men, who come back and complain because they were unable to attain their majorities while much younger and less experienced men in the line became colonels. I have had a multitude of communications of that kind.

The armed forces at this time need medical officers. Legislation to draft physicians has been proposed with opportunities being given for voluntary commissions, every effort being made by the medical departments of the armed forces to provide opportunity for good medical work where there are facilities and qualified medical officers with whom superior medical training may be continued. I think that is important.

Some young medical men have been hesitant because of present hospital connections but have accepted commissions when they were assured that they would be given consideration as to appropriate hospital service on completion of their military service. I have had that information from a number of different sources. We rather encouraged and pressed physicians to encourage the young men in the hospitals to accept commissions, and, almost universally, the complaint was, "Well, I am committed here, and I want to go on to a residency; I want to do this or that, and that will be interrupted," but when they were given assurance that they will be given special consideration on their return from military service, many of them accepted that service. Others apparently have assumed that they would not be drafted, and so have chosen to disregard the appeals for young medical officers who have not had military service. This matter will, no doubt, come to you in discussion and will be up for your judgment.

Just a brief report on the present state of legislation as the third subject. The Washington administration has promoted so-called compulsory health insurance, using arguments that by direct statement and implication have been misleading and not factual. The public has indicated its wishes and does not desire this attack on its freedom by government control of personal medical services.

I think it is apparent from the large number of organizations that have supported the opposition to compulsory health insurance, which should be called compulsory sickness taxation, that the public has indicated that it does not wish it, will oppose it, has no interest in it. For that reason, I think it will certainly be impossible to secure that kind of legislation at present.

However, no doubt this drive for government political invasion of the life of the individual will continue as the first step in socialization of America after the pattern of the European nations which are now socialized. The debasement of the individual is the initial step in the concentration of power in the state, or, let's be factual and say in the hands of the bureaucrats whom the political organization will place in control of the personal affairs of the individual.

Felix Morley in his recent book says, "It has been said that freedom is not an abstraction like liberty but an underlying condition of life that cannot be fragmentized." Neither the patient nor the physician can be free to deal with his personal problems of illness and problems of living when the conditions of that service are controlled by a political employee in a distant office. It cannot be fragmentized; you cannot break it down and say that you will be restricted in this and this, and in this you may do so and so. It is just impossible. It is necessary that we distinguish then between what belongs to the individual and what is a proper function of the political commonwealth.

I was greatly interested in, and I want to say how much I appreciated, the talk of Senator McClellan at the "Grass Roots" Conference last night. It was in complete harmony with our views. One cannot quarrel with this issue on the little problem of the doctor alone or in any way so that it becomes distorted as if it were a purely personal interest. It is basic, and Senator McClellan brought that out in beautiful fashion, and his earnestness in the matter was very comforting. Personal service and medical care belong to the individual, and this freedom is not attained by giving everything to the state.

However, this is unfortunate, because in an ever expanding bureaucracy the personal interest of the great army of job holders in the political fortunes of the group managing the state becomes such that it is ghastly; it never stops; it is a continuing pressure.

I heard the head of one of the departments in Washington say yesterday—and I am sorry that I cannot give his name although I do not think he would object particularly—that this pressure is unending; it never ceases. Every man in the department is working for himself, and his own fortunes lie only in proportion as the political organization and his own inside departmental organization progress and grow bigger and stronger.

Last is the matter of cooperation, and this is brief. I do think that we should be careful to cooperate, and endeavor to cooperate in anything that we can do in the fields in which we may come to agreement. By cooperation in those fields in which we agree, we reduce the area of struggle, we reduce the argument which is constantly directed against us, rightly or wrongly. We remove this one angle from our field of battle.

On the other hand, it is equally important that we be not led into thinking that we are cooperating or, by pressure, into asking for cooperation when what they really seek is compromise or an acceptance of and compliance with something which is definitely objectionable to and destructive of those things which we fight for; we have a moral obligation to the public to prevent those things.

I do think it is important, however, that we be not placed in a position where we can be accused of being continuously obstructing, unwilling to participate or to cooperate in those things which might help in the improvement of conditions in general but, on the contrary, to draw the line definitely when that cooperation is made and say, "This is the line. This is why. With this other we will have nothing to do, because what you are asking is not cooperation; you are asking compliance, compromise in things which we recognize as very important."

We must insist that, after all, psychologically and spiritually and physically, it cannot be said that we are detached from any of these things on the material and physical side; we are interested in the men, the women and the children and in those things that are best for them, and, if they are to have that which is best, then it is important that we strive to continue to maintain for them that freedom which will not only make it possible to do better for them but will, from a purely national interest, prevent the deterioration of our governmental structure into something similar to the totalitarian government which we see everywhere else.

Introduction of President-Elect, Vice President and Past Officers of Association

The Speaker introduced Dr. Ernest E. Irons, President-Elect of the Association, Dr. Olin West, Retired Secretary and General Manager, Past President Nathan B. Van Etten and Vice President Roy W. Fouts, each of whom arose as his name was called.

REPORT OF THE BOARD OF TRUSTEES

Dr. E. L. Henderson, chairman, presented the following report of the Board of Trustees as printed in the Handbook, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

To the Members of the House of Delegates of the American Medical Association:

The following report of the Board of Trustees is respectfully submitted:

The official reports of the Treasurer and the Association's Auditors are appended as a part of this report.

Financial Statement

The following sources of revenue produced a total of \$5,166,107.08 in the fiscal year ending December 31, 1948.

Fellowship dues	\$ 73,185.00	
Income from investments	138,912.11	
Miscellaneous receipts and other income	17,700.74	
		\$ 229,797.85
Periodical subscriptions	\$2,339,309.34	
Periodical advertising	2,519,306.84	
		\$4,858,616.18
Books, pamphlets and reprints sold	77,693.05	
Total revenue from all sources		<u>\$5,166,107.08</u>

Costs incident to the production of these revenues together with the expenditures of the Councils, Bureaus and Committees aggregated \$4,767,137.09. The excess of revenues over costs, which amounted to \$398,969.99, was carried to the capital account of the Association, increasing it to \$4,133,380.25 as of Dec. 31, 1948.

Advertising revenue from all periodicals in 1948 totaled \$2,519,306.84, as compared with 1947 revenue of \$2,342,605.39, or an increase of \$176,701.45.

Investment income in 1948 amounted to \$138,912.11 and in 1947 \$133,998.80, an average annual return of 2.25 per cent. The Association's investment counsel advises a conservative investment policy.

An increase of \$783,211.23 in subscription revenues, including Fellowship dues, to \$2,412,494.34 in 1948 from \$1,629,283.11 in 1947 reflects:

- The increase in annual Fellowship dues and the subscription price of THE JOURNAL effective Jan. 1, 1948.
- An increase in the subscription price of other periodicals published by the Association effective the same date.
- An increase in the circulation of Association periodicals.

Publication costs continued to rise, and in 1948 this item amounted to \$3,309,453.42 compared to \$2,840,344.46 in 1947, or an increase of 16 per cent over the previous year.

Printing of Association periodicals was interrupted early in 1948 by a work stoppage in the plant due to a wage dispute affecting certain workers in the Chicago jurisdiction, and for approximately four months the plant was not in normal production. During this period substitute processes were employed and some of the monthly periodicals were printed in other cities. This situation and the fact that expired labor contracts were renewed at advanced hourly rates contributed to higher costs.

It has been the Association's policy to supply to the medical profession books and pamphlets, as well as reprinted articles which are ordered by authors at production cost. In 1948 a loss of \$11,535.52 was sustained in this service because much of the reprinting of articles was performed outside of the plant at high costs. In 1947, when the printing was performed in the Association's plant, an income of \$6,105.06 was derived from this source.

Although the Councils, Bureaus and Committees of the Association were increasingly active in 1948, expenditures were restricted to \$1,169,165.62, which compares with \$1,128,427.65 expended in 1947. Comparison of some other major expense classifications follows:

	1948	1947	Increase
Legal and investigation	\$ 20,027.18	\$ 1,000.00	\$ 19,027.18
Employees' group annuities	146,115.02	141,159.01	4,956.01
State unemployment tax	9,461.46	6,543.37	2,918.09
Federal social security taxes	23,685.92	21,744.22	1,941.70

Wages and salaries paid in 1948 totaled \$2,405,239.15, an increase from \$2,347,671.00 in 1947. These figures are not comparable in measuring labor costs for the period because some printing was performed by outside contractors during the work stoppage.

Paper costs for periodicals increased to \$580,791.28 in 1948 from \$554,972.18 in 1947; engraving and illustrations to \$97,423.94 from \$68,554.35; first class postage to \$112,152.22 from \$94,468.72; second class postage to \$97,066.40 from \$95,315.04; building maintenance to \$89,201.00 from \$79,924.52. Practically all other expenses increased considerably over 1947.

In 1948 the Association added to its investment in printing equipment, and office and laboratory equipment to the extent of \$79,651.61 and paid \$252,663.20 on the contract for construction of a five story addition to its headquarters building which is scheduled for completion in June of 1949. The total cost of the addition will approximate \$600,000 without furnishings or expenses incident to a relocation of many departments.

The balance sheet of the Association as of Dec. 31, 1948 indicated total assets of \$8,949,504.29 and liabilities of \$1,145,561.54. The residual amount of \$7,803,942.75 consisted of the American Medical Association Research Fund Reserve of \$1,495,562.50, additional specified reserves totaling \$2,175,000 and the capital account of \$4,133,380.25.

Included in the assets of land, buildings, equipment, inventories, accounts receivable, etc., were marketable securities totaling \$6,158,587.64. Of this total, specific securities in the amount of \$1,484,637.50 were held in the American Medical Association Research Fund. Other securities represented investments of the:

General Fund	\$1,268,950.14
Depreciation Reserve Fund	1,230,000.00
Association Reserve Fund	350,000.00
Building Reserve Fund	450,000.00
Retirement Reserve Fund	675,000.00
Equipment Modernization Reserve Fund	<u>700,000.00</u>

Through these investments the various funds are assured the financial stability to accomplish the purposes for which they were created.

Aside from the specific reserves, only \$1,268,950.14 in securities was in the General Fund. This is not a relatively large amount, considering that in 1948 Association expenditures amounted to almost \$5,000,000.

Report of Bureau of Medical Economic Research

At the June 1948 meeting of the House of Delegates a resolution was introduced by Dr. William F. Costello, delegate from New Jersey, recommending that the Board of Trustees negotiate with representatives of the life insurance industry with the view of obtaining a nationwide upward adjustment in the level of fees paid by life insurance companies to physicians for medical examinations and attending physicians' statements. This resolution was referred to the Reference Committee on Legislation and Public Relations, which recommended, and the recommendation was approved by the House, that the matter be referred to the Bureau of Medical Economic Research for study. The Director of the Bureau has interpreted the resolution to mean that the Bureau was directed to study the question of life insurance examination fees rather than to make any formal recommendation for action by the House of Delegates.

A few weeks after the House of Delegates' meeting it was learned that the life insurance companies were making a survey of this question of fees. It seemed inadvisable for the Bureau to make a separate study, and most of this report is, therefore, based on the results of the four questionnaires sent out by the Committee for the Promotion of Life Insurance Medical Education of the Association of Life Insurance Medical Directors, hereinafter referred to as Doctor Frost's Committee, Dr. Harold M. Frost, Medical Director of the New England Mutual Life Insurance Company of Boston, being chairman.

The following medical societies have passed resolutions recommending some upward adjustment in life insurance fees. They are:

Rhode Island Medical Society
Tennessee State Medical Association
Oregon State Medical Society
Medical Society of New Jersey
Colorado State Medical Society
Greene County, Pa., Medical Society
Jasper County, Iowa, Medical Society
Oakland County, Mich., Medical Society
Aroostook County, Maine, Medical Society
California Society of Internal Medicine
Chicago Medical Society
Honolulu County, Hawaii, Medical Society
Sonoma County, Calif., Medical Society

Apparently action is contemplated in the near future by the state medical associations of Idaho and Utah. A table showing comparisons of these resolutions and a detailed summary of the replies to the four questionnaires have been prepared by the Bureau for possible use by the reference committee to which the present report will be referred. A number of the medical societies have requested an increase in fees from \$5 to \$10. Others have requested that the fee be raised to \$7.50. Some societies propose that the fee for attending physicians' statements be raised from \$2 to \$3, while others desire the fee to be \$5. None of these societies which have passed resolutions report any adjustment in fees as a result of the resolutions.

The four questionnaires were mailed to the 240 life insurance companies which currently have more than 95 per cent of the life insurance business in the United States. The replies to the questionnaires were recorded by four groups of companies classified according to the amount of business in force:

Group	No. of Companies	Amount (in Millions)
I	144	\$200 or less
II	39	\$201-\$500
III	29	\$501-\$1,000
IV	28	Over \$1,000

One hundred and fifty-three companies or more replied to each of the four questionnaires. These replies come from the companies doing 92 per cent or more of the life insurance business in the United States. It is felt that the failure of some companies to reply does not distort the results of the questionnaire.

An analysis of questionnaire IV, which is devoted entirely to fee schedules, reveals that 95 per cent of the replying companies in group I pay the medical examiner a fee of \$5 for the long form examination. A fee of \$5 is paid by 81 per cent of the replying companies in group II, 84 per cent in group III and 60 per cent in group IV. Eighty-five per cent of all the companies replying to questionnaire IV report that they pay a \$5 fee for the long form examination; 1 per cent pay \$4 and the remaining 14 per cent use a sliding fee schedule. Questionnaire IV clearly indicates that with few exceptions \$5 is almost a universal fee for the life insurance examination. Dr. Frost did not identify the companies which are currently paying more than \$5 under sliding fee schedules. Furthermore, this \$5 fee has been in effect for roughly three fourths of a century.

Questionnaire III furnished information regarding attending physicians' statements, and the results show that 85 per cent of the replying companies pay regular fees for such statements. A fee of \$2 is paid the attending physician by 68 per cent of the replying companies in group I, 58 per cent in group II, 88 per cent in group III, 63 per cent in group IV and 69 per cent of all companies replying to questionnaire III.

Dr. Frost estimated on the basis of limited data that more than 95 per cent of the \$13,000,000 paid by life insurance companies to all practicing physicians was for the life insurance examination fees. He stated further that company practices vary considerably in the matter of the attending physicians' statements, and that in his opinion considerable flexibility was desirable because of differences in the types of statements.

Dr. Frost summarized in a letter dated April 4, 1949, the general position of his committee as a result of the survey.

1. That the life insurance companies through their payments to policyholders and beneficiaries indirectly aid the medical profession in providing funds out of which medical care expenses can be met.
2. That more and more life insurance is being written without a medical examination and that probably this trend would be accentuated if a sharp increase in examination fees materialized.
3. That the life insurance companies as a group "would not feel free to negotiate with the Board of Trustees of the American Medical Association for a nationwide upward revision of the examination fee schedule because of the danger that such action would be construed as a violation of the Sherman Antitrust Act."
4. That individual companies will feel that they should continue to negotiate in the future as they have in the past with individual physicians regarding stipulated fees.

The Director of the Bureau considers Dr. Frost's first point to be somewhat irrelevant. His second point, so far as it refers to trends, is correct, but is probably an overstatement because it would seem very unlikely that the life insurance companies would ever write most of their business on the nonmedical basis. The Director has conferred with the Bureau of Legal Medicine and Legislation regarding the third point, and the Director of that Bureau has commented as follows:

There would be no violation of the federal law if representatives of the insurance companies confer with designated representatives of the Board of Trustees concerning the raising of examination fees, nor would there be any violation if the representative group of the companies recommended that medical examiners be paid according to the value of the services they rendered. If the representative group of the companies, on the other hand, undertook to make it mandatory or to compel individual companies to pay the suggested increase in fees, there might then possibly arise some question as to a violation of the antitrust act. It does not seem to me, however, that Dr. Frost is entirely frank in his statement about this matter and I rather doubt that his statement is based on impartial legal advice.

Dr. Frost's fourth point implies that the present \$5 fee has been developed over many years through the process of negotiation between individual companies and individual physicians. Some might question the notion about the "process of negotiation" actually being responsible for the present \$5 fee.

The laws regulating the life insurance companies in the various states do present some difficulties for the companies in providing a sharp increase in examination fees because it would increase first year expense. The problem is much less if the policy is a large policy. This has led some of the companies to experiment with the sliding fee schedule ranging from \$5 to \$10 or \$15 according to the size of the policy. It has already been noted that 40 per cent of the replying companies in group IV—the largest companies—use the sliding fee schedule; these are the companies which write the highest average policy. Although this sliding fee schedule arrangement does have merit from the standpoint of the insurance companies, it raises certain questions about the quality of the medical examination's depending on the size of the policy; these are questions on which the Director of the Bureau of Medical Economic Research does not feel competent to comment.

According to the sample studies of fee schedules of practicing physicians for patients generally the average fee in the United States was 36 per cent higher in 1947 than in the base period 1935 to 1939. The whole cost of living index had risen 71 per cent. As an economist, the Director of the Bureau would suggest that any standard fee, such as that paid by life insurance companies, should neither rise as high nor fall as low as the extremes of fluctuations in the general price level, the cost of living or the general fee schedules of physicians.

Report of Committee on Rural Health

The Committee on Rural Health at its annual meeting in February 1949 adopted an eleven point program. This program envisions coordination and utilization of successful efforts now in operation by the medical profession, lay groups, agricultural extension organizations and government to insure better rural health. All of the elements needed to bring high standards of health to rural communities are now functioning. What is

required is that these be channeled through community organizations such as health councils with medical guidance. The program outlined below provides for such channeling:

1. State and public health services for general community hygiene and communicable disease control, public health nursing, well-baby conferences and clinics.
2. The Hill-Burton Hospital Construction Act operating where the people of a community demonstrate sufficient desire for such facilities.
3. Scholarships provided by medical associations, farm organizations and through legislative appropriations to be given to deserving boys and girls, without discrimination, for medical education where the recipients agree to practice for a time in rural areas, and for nurses particularly from rural areas.
4. Agricultural school extension services where they utilize their home demonstration courses, 4-H clubs, health specialists whose special duty it is to organize health councils in the counties for the purpose of health education and where appropriate to apply for Hill-Burton facilities; the teaching of better farm methods, better soil conservation and soil building practices, better grain and productive livestock methods such as calf and pig clubs, five acre club lots, better cost accounting and business methods.
5. Parent-Teacher Associations where they encourage examination of school children for hearing, sight, heart, hernia, immunization, school hygiene, as well as physical education.
6. Voluntary health agencies such as tuberculosis, poliomyelitis, cancer, and heart, which do considerable educating within narrow limits.
7. Application of voluntary prepaid medical and hospital care plans to rural communities, taking into consideration that several of the large farm groups have their own indemnity prepaid medical and hospital plans.
8. Promotion of state and county health councils, the medical profession acting cooperatively with organized farm groups and other civic, church, and school organizations and special health groups for the purpose of health education and health activities of local character.
9. Creation of a plan to bring the medically indigent or low income farmer into voluntary prepaid medical plans.
10. Use of health education programs for rural groups.
11. Encouragement of civilian population to help itself.

Respectfully submitted,

F. S. CROCKETT, Chairman.

Report of Committee on Liaison with Red Cross Blood Bank Program

The Committee on Liaison with the American Red Cross National Blood Bank Program met jointly in Washington, D. C., on Feb. 13, 1949, with the Executive Committee and the Committee on Blood and Blood Derivatives of the Advisory Board on Health Services of the American Red Cross.

At this meeting it was disclosed that there would be thirty-four Red Cross Blood Centers in operation by July 1, 1949. Officials of the Red Cross reaffirmed their determination to abide by the policies established by the American Medical Association House of Delegates.

The committee developed a plan to survey the private blood bank situation throughout the country. Accordingly, a questionnaire has been sent to each of the 6,400 registered hospitals in the United States to learn where the blood banks are located; 5,600 replies have been received. A second questionnaire is being prepared to determine such points as the capacity, type of organization, material used and charges made.

The American Hospital Association, the American Protestant and Catholic Hospital Associations, the American College of Surgeons, the College of American Pathologists, the American Society of Clinical Pathologists, the American Association of Blood Banks, the American Red Cross and the National Research Council are cooperating with the Association's committee in this study.

Respectfully submitted,

LEONARD W. LARSON, Chairman.
HERBERT P. RAMSAY.
JOHN W. GREEN.
JAMES R. REULING.
WILLIAM D. STOVALL.
DEERING G. SMITH.
WILLIAM A. COVENTRY.
JAMES Q. GRAVES.
JAMES STEVENSON.

Report of Committee on Nursing Problems

This is the final report of the committee of the American Medical Association to study the nursing problem in the United States. At the same time it is the annual report to the Board of Trustees of the representatives of the American Medical Association on the Commission for the Improvement of the Care of the Patient.

When the Commission for the Improvement of the Care of the Patient was being formed, the Board of Trustees designated its Committee on Nursing Problems to represent the American Medical Association. At the annual session of the Association in June 1948 the House of Delegates endorsed the recommendation of a reference committee that the Committee on Nursing Problems be continued. The members of the Committee on Nursing Problems feel that this committee should now be discharged for the following reasons: (1) The major part of its work has been accomplished; (2) the "follow through" will be carried on by the Commission for the Improvement of the Care of the Patient, and (3) the confusion will be cleared up by this action.

In order that the purpose of the Commission for the Care of the Patient may be understood, a copy of its By-Laws is appended to this report.

At a meeting of the commission in March 1949 Dr. Howard K. Gray was elected chairman to take office in March 1950.

ADMINISTRATIVE REGULATIONS (BY-LAWS) OF THE JOINT COMMISSION FOR THE IMPROVEMENT OF THE CARE OF THE PATIENT

I. *Name*.—The name of this organization shall be "The Joint Commission for the Improvement of the Care of the Patient."

II. *Purposes and Objectives*.—The major purpose of this commission is to stimulate, implement, assist in and conduct activities which will contribute to the improvement of the care of the patient as may be mutually satisfactory to the appointing organizations.

To achieve this objective, the commission performs as a service agency to the parent organizations. It shall be the intention of the commission to obtain a better understanding of the problems and programs of all represented groups; to serve as a source of information on trends within the programs of the participating organizations; to facilitate the development of a more unified public relations approach by the participating organizations; to explore the needs for and stimulate studies in areas of patient care in which the organizations participate; and to perform such functions and carry on such activities contributing to the major objectives as may be mutually satisfactory to the appointing organizations and to the commission.

III. *Membership*.—A. "The Appointing Organizations shall consist of the American Medical Association, American Hospital Association, American Nurses' Association, and National League of Nursing Education."

B. The Appointed Membership shall consist of six representatives of professional nursing, six representatives of the American Medical Association, and six representatives of the American Hospital Association.

The six representatives from professional nursing are to be three from the American Nurses' Association to include representatives actively concerned with the problems of the practical nurse, and three from the National League of Nursing Education to include representatives actively concerned with the problems of public health nursing and the collegiate schools of nursing.

The six representatives of the American Medical Association are to include representatives actively concerned with the problems of the American College of Surgeons, the American College of Physicians and the American Academy of General Practice.

The six representatives of the American Hospital Association are to include representatives actively concerned with the problems of the American Protestant Hospital Association and the Catholic Hospital Association of the United States and Canada.

C. *Ex-Officio Membership* shall be:

(a) The presidents of the American Hospital Association, the American Medical Association, American Nurses' Association and National League of Nursing Education.

(b) The editors of the official journals of the American Medical Association, the American Nurses' Association and the American Hospital Association.

(c) The executive secretaries of the National League of Nursing Education, the American Nurses' Association, the American Medical Association and the American Hospital Association.

IV. *Authority for Appointment*.—Each of the parent organizations shall have authority to appoint representatives in accordance with Sections 3 and 5. The 4 organizations shall be known as the Appointing Organizations.

V. *Terms of Appointment*.—Each appointment shall be for three years so staggered that two of the American Medical Association members, two of the American Hospital Association members and one each of the National League of Nursing Education and American Nurses' Association members shall terminate their appointments each year, with two of the initial appointments from nursing, medicine, hospitals to be for one year, two for two years and two for three years.

A person having served one regular three year term shall not be eligible for immediate reappointment. Vacancies shall be filled by the respective appointing organization.

VI. Voting Privileges and Quorum.—Only appointed members present shall have a vote, except that in the absence of an appointed member a designated ex officio member of the appointing group shall have the power to vote.

A quorum shall consist of ten voting members providing all of the appointing organizations shall be represented.

VII. Officers.—There shall be a chairman, vice chairman and secretary. The first two shall not be from the same major group (nursing, medicine and hospitals). The chairman shall be elected for a one year term at the annual meeting and may be reelected for one additional term. He shall take office the following January 1.

The vice chairman shall be elected in the same manner and at the same meeting as the chairman and may be reelected for one term.

The secretary may be an employee of the commission, a member of the commission, or a member of the staff of an appointing organization. He shall be elected for a two year term.

The chairman shall preside at meetings and perform the usual functions of presidents of similar organizations. The vice chairman shall have the duties generally ascribed to vice chairmen. The secretary shall perform the functions customary for that position in similar organizations.

VIII. Meetings.—There shall be two regular meetings annually. The first regular meeting of the calendar year will be the annual meeting. Special meetings may be called by the chairman.

Attendance at meetings shall be limited to appointed members, ex officio members and other individuals who may be invited by the chairman to participate in the program, or whose presence may be requested by one of the appointing organizations.

IX. Committees.—There shall be an Executive Committee of four members consisting of the chairman, vice chairman, and one other elected annually at the annual meeting to represent the third group, and the secretary ex officio. Vacancies may be filled by the chairman.

The Executive Committee shall carry on the activities of the commission between commission meetings. Other committees may be appointed by the chairman.

X. Financing.—The expenses of representatives shall be a responsibility of the respective appointing organization.

Other organizational expenses such as those for clerical service, meeting space, and office work shall be divided equally between the three major groups (medicine, hospitals and nursing).

XI. Relationship of the Commission to Appointing Organizations.—The commission shall be a service group to the organizations represented. It shall be a sounding board for a constructive exchange of opinions. Actions of the commission are advisory to and not mandatory on the appointing organizations. The commission may originate actions for consideration by, or may receive actions for consideration from the appointing organizations.

The work and conclusions of the commission when approved in principle by all appointing organizations may be transmitted by the commission to state commissions for the improvement of the care of patients where they exist, and otherwise to state constituent organizations of the appointing organizations. The failure of an appointing organization to approve or disapprove a commission conclusion within a period of three months shall be accepted as approval in principle.

Such items as are unanimously approved by the commission and deemed suitable for publication by all four executive directors of the appointing organizations may be released by the commission to the public through professional and other media.

XII. Amendments.—These rules may be amended without previous notice by unanimous vote, or by a two thirds' vote if the amendment has been presented to the membership of the commission at least two weeks in advance of the meeting at which the vote is taken.

XIII. These rules and/or amendments shall become effective when approved by the commission and appointing organizations.

XIV. Deliberations of all meetings of the commission shall be governed by Robert's Rules of Order, Revised.

The by-laws of the commission provide that six representatives be appointed from each of the parent organizations (the American Medical Association, the American Hospital Association, the American Nurses' Association and the National League of Nursing Education). These appointments are to be staggered and are to include men from the special societies, who are, of course, members of the American Medical Association. For the representatives of the American Medical Association, the Committee on Nursing Problems recommends the following appointments: For one year, beginning in January 1950, Drs. Leland S. McKittrick and Thomas P. Murdock; for two years, beginning in January 1950, Drs. Howard K. Gray and Donald Smelzer; for three years, beginning in January 1950, Dr. Howard C. Naffziger and a general practitioner.

The by-laws further provide that the presidents, editors and executive secretaries of the parent organizations are ex officio members of the commission. This is important, as will be seen from certain sections of the by-laws. It is felt that the ex officio members should attend the meetings if possible.

The present representatives of the American Medical Association feel that this commission has potentialities for great good. It is the first time that these large groups representing the healing arts have had a forum to discuss and attempt to solve problems common to all.

Respectfully submitted,

THOMAS P. MURDOCK, Chairman.
HOWARD K. GRAY.
EDGAR P. MCNAMEE.
LELAND S. MCKITTRICK.
DONALD SMELZER.

Recommendation Regarding Advisory Board for Medical Specialties

At the St. Louis Interim Session the House of Delegates adopted a recommendation of the Reference Committee on Medical Education which provided that two members of the Council on Medical Education and Hospitals should be appointed to membership on the Advisory Board for Medical Specialties. This recommendation was brought to the attention of the Council, which has reported to the Board of Trustees as follows:

The action of the House of Delegates was reviewed at length by the Council on Medical Education and Hospitals at its meeting on February 8 and 9. The Council concluded that it would be preferable to maintain the present relationship of the Council to the Advisory Board. During the past two years the Council has developed an increasingly close liaison with the Advisory Board to the point where members of the Council are now invited to sit with the Board at its business meetings and to participate freely in the discussion of all matters which are of interest to the Council. It is the Council's feeling that through this liaison it can accomplish even more than it could through membership on the Advisory Board. The Council would appreciate knowing whether the Board of Trustees approves the Council's desire to maintain the present relationship with the Advisory Board.

The Executive Committee of the Board of Trustees, after consideration of the Council's statement, voted to refer the matter back to the House of Delegates for decision.

Respectfully submitted,

ELMER L. HENDERSON, Chairman.
EDWIN S. HAMILTON, Secretary.
LOUIS H. BAUER.
JOHN H. FITZGIBBON.
JAMES R. MILLER.
WALTER B. MARTIN.
DWIGHT H. MURRAY.
EDWARD J. MCCORMICK.
GUNNAR GUNDERSEN.

ADDENDA TO REPORT OF BOARD OF TRUSTEES

JOSIAH J. MOORE, Treasurer.

AUDITOR'S REPORT

To the Board of Trustees,

American Medical Association,
Chicago, Illinois.

Dear Sirs:

We have examined the balance sheet of the American Medical Association, as of December 31, 1948, and the related statement of income for the year then ended. Our examination was made in accordance with generally accepted auditing standards and included such tests of the accounting records and such other auditing procedures as we considered necessary in the circumstances, except as hereinafter stated regarding confirmation of receivables.

The cash and bank balances have been confirmed by count or by certificates from the depositories. The United States Government and other marketable securities were confirmed by an acknowledgment from the Continental Illinois National Bank and Trust Company of Chicago where the securities are held for safekeeping.

We did not independently confirm the accounts receivable by communication with debtors. The accounts receivable were reviewed as to age and collectibility and, in our opinion, the balances are fully realizable.

Materials, supplies, work in progress, and publications on hand are stated in accordance with physical inventories taken and valued by employees under the direction of the management, and certified by officials of the Association as to description, quantities, condition and valuation. We made tests of the physical existence of the quantities of certain items selected by us, thereby satisfying ourselves that the recording of the quantities was carried out effectively. We tested the prices and computations and satisfied ourselves as to the general basis of valuation.

Expenditures charged to property and equipment accounts during the year, in our opinion, were properly capitalized as representing additions or improvements. The provision for depreciation for the year appears to be reasonable.

All liabilities of which we obtained knowledge in the course of our examination have received appropriate recognition. Attorneys for the Association state that the only litigation pending against the Association is a libel suit, which names the Association among others, and which in the opinion of the attorneys will be defeated.

In our opinion, subject to the exception indicated in paragraph three, the accompanying balance sheet and statement of income present fairly the position of American Medical Association on December 31, 1948, and the results of its operations for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Fidelity insurance is carried on all officers and employees under a comprehensive form policy covering loss through dishonesty, forgery, etc., in amounts ranging from \$2,500.00 to \$50,000.00 (depending upon nature of loss) for each individual.

We have pleasure in reporting that the books are well maintained and that every facility was afforded us for proper conduct of the examination.

Yours truly,

PEAT, MARWICK, MITCHELL & Co.

Total.....	\$1,169,165.52

NOTE.—The above expenses are spread over the following Councils, Bureaus, and Committees as indicated: Association, \$229,273.61; Bureau of Health Education, \$119,153.31; Council on Pharmacy and Chemistry, \$114,012.24; American Medical Association Laboratory, \$42,576.69; Council on Physical Medicine, \$41,831.48; Council on Foods and Nutrition, \$26,214.77; Committee on Therapeutic Research, \$6,416.20; Council on Medical Education and Hospitals, \$136,807.19; Bureau of Legal Medicine and Legislation, \$41,501.47; Bureau of Investigation, \$13,761.18; Bureau of Medical Economic Research, \$97,573.76; Council on Industrial Health, \$49,990.20; Association and Bureau of Exhibits, \$34,973.67; Council on Medical Service, \$129,082.06; Council on National Emergency Medical Services, \$19,616.70; Department of Press and Public Relations, \$66,380.99.

SUPPLEMENTARY REPORT OF
BOARD OF TRUSTEESReport of Committee on Hospitals and the
Practice of Medicine

Dr. Henderson also presented the following report which was referred to the Reference Committee on Legislation and Public Relations but was later taken from that committee and referred to the Reference Committee on Reports of Board of Trustees and Secretary:

Appended as a part of this Report of the Committee on Hospitals and the Practice of Medicine is a Summary of a Study Relating to the Corporate Practice of Medicine in the United States. This study was made and the summary prepared by Mr. E. J. Holman of the Bureau of Legal Medicine and Legislation.

The corporate practice of medicine is distinctly illegal in all of the states in the Union with some minor exceptions. There has been statutory legislation in several states permitting certain modifications of these general laws. These differences are noted in the appended summary.

It is stated in the Principles of Medical Ethics of the American Medical Association, Chapter I, Section 2:

The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual doctors, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession.

Other sections of the Principles which have distinct bearing on the matters considered by this Committee are as follows:

CHAPTER III, ARTICLE V, SECTION 1.—Whenever there arises between physicians a grave difference of opinion which can not be promptly adjusted, the dispute should be referred for arbitration to a committee of impartial physicians, preferably the Board of Censors of a component county society of the American Medical Association.

CHAPTER III, ARTICLE VI, SECTION 2.—It is unprofessional for a physician to dispose of his services under conditions that make it impossible to render adequate services to his patient or which interfere with reasonable competition among the physicians of a community. To do this is detrimental to the public and to the individual physician, and lowers the dignity of the profession.

CHAPTER III, ARTICLE VI, SECTION 3.—By the term "contract practice" as applied to medicine is meant the carrying out of an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, to furnish partial or full medical services to a group or class of individuals on the basis of a fee schedule, or for a salary or a fixed rate per capita.

Contract practice per se is not unethical. However, certain features or conditions if present make a contract unethical, among which are: 1. When there is solicitation of patients, directly or indirectly. 2. When there is underbidding to secure the contract. 3. When the compensation is inadequate to assure good medical service. 4. When there is interference with reasonable competition in a community. 5. When free choice of a physician is prevented. 6. When the conditions of employment make it impossible to render adequate service to the patients. 7. When the contract because of any of its provisions or practical results is contrary to sound public policy. The phrase "free choice of physician," as applied to contract practice, is defined to mean that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patient and physician when no third party has a valid interest or intervenes. The interjection of a third party who has a valid interest or who intervenes does not per se cause a contract to be unethical. A "valid interest" is one where, by law or necessity, a third party is legally responsible either for cost of care or for indemnity. "Intervention" is the voluntary assumption of partial or full financial responsibility for medical care. Intervention shall not prescribe endeavor by component or constituent medical societies to maintain high quality of service rendered by members serving under approved sickness service agreements between such societies and governmental boards or bureaus and approved by the respective societies.

Each contract should be considered on its own merits and in the light of surrounding conditions. Judgment should not be obscured by immediate, temporary, or local results. The decision as to its ethical or unethical nature must be based on the ultimate effect for good or ill on the people as a whole.

CHAPTER III, ARTICLE VI, SECTION 5.—It is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary, or compensation received to accrue to the lay body or individual employing him. Such a procedure is beneath the dignity of professional practice, is unfair competition with the profession at large, is harmful alike to the profession of medicine and the welfare of the people, and is against sound public policy.

CONCLUSION.—While the foregoing statements express in a general way the duty of the physician to his patients, to other members of the profession and to the profession at large, as well as of the profession to the public, it is not to be supposed that they cover the whole field of medical ethics, or that the physician is not under many duties and obligations besides these herein set forth. In a word, it is incumbent on the physician that under all conditions, his bearing toward patients, the public and fellow practitioners should be characterized by a gentlemanly deportment and that he constantly should behave toward others as he desires them to deal with him. Finally, these principles are primarily for the good of the public, and their enforcement should be conducted in such a manner as shall deserve and receive the endorsement of the community.

After consideration of these principles and of the summary, it must be concluded that the over-all policy of the American Medical Association shall be that it is illegal, with the exceptions noted, and unethical for any lay corporation to practice medicine and to furnish medical services for a professional fee which shall be so divided as to produce profit for a lay employer, either individual or institutional (hospitals and medical schools).

Explanation: Therefore, hospitals and medical schools cannot charge patients fees for medical services rendered by physicians even though the physicians are full time employees of an individual or of an institution. However, there can be no objection to the physicians so employed setting the fees for their individual services. These fees may be collected by any agency, the expenses incident to management and development of any physicians' department or of any other departments in the institution may be deducted, but the balance must be paid to the physician. If the physician for any reason wishes to refund to the individual employer, the hospital or the medical school all excess professional fees over and above his salary and the expenses of his department, or any part thereof for the improvement of the facilities for the public benefit of the institution employing him, that is his privilege and no one can object.

Clinics connected with hospitals or medical schools should have identical rights and privileges.

In insurance programs the hospitals that furnish medical services by full time professional employees must work under the identical ethical standards as do independent practitioners working under the fee system in voluntary institutions; namely, Blue Cross should provide only hospital services; Blue Shield should supply all the medical services including pathologic, roentgenologic, anesthesiologic and physiotherapeutic services as well as all other medical services rendered in the hospital or by those hospitals controlled by medical schools. The licensed physician is the only person legally qualified at present to render medical services to any individual.

If this be so, then the medical profession should be dominant in the physician-hospital relationship in all circumstances, but

since the physician and the hospital are completely dependent on each other, it is incumbent on both to be completely interested in all phases of their scientific and financial relationships. This means that the professional staff of the hospital has definite responsibilities not only toward other members of the professional staff, whether active or courtesy, but also toward hospital management. The finances of the institution in which a physician does his professional work are definitely of importance to him and to the professional staff, and the proper consideration must be given to these finances if the hospital is to work efficiently and remain the work shop of the physicians. We must recognize in a general way the two types of hospitals (not government controlled), the so-called closed and the open staff institutions. The situation in the "closed staff" hospital is slightly different from the situation in hospitals with the so-called open staff. However, in practice the results are about the same except that in the open hospital the appointed staff is usually given a preferential rating for private beds. Physicians appointed to active staff duty and given courtesy staff privileges are usually selected by the staff of the institution from legally eligible physicians who have been more or less carefully selected for their ability and ethical conduct. The recommendations of the staff are usually accepted by the management of the hospital through its boards of managers or trustees. It must also be remembered that to be approved by the boards of medical licensure, the American Medical Association and the American College of Surgeons, certain requirements are mandatory to the institution; namely, that it have a full time pathologist and a full time roentgenologist. As a rule, the staff of a hospital elects an executive committee, or works under an appointed executive committee, to advise the lay officers of the institution on purely professional matters and recommends who may or who may not use the institution for their professional work. Unfortunately, in many instances, the financial matters of the lay hospital management have been no affair of the staff or of its professional executive committees. This is wrong and probably the cause of most of the differences of opinion.

Every professional man on the appointed staff should have a voice in the professional management of the institution. The pathologist, roentgenologist, anesthesiologist and the physical therapist, if physicians, as well as the other professional staff members, should have equal standing as active members of the staff, and the executive committee of the general staff should have some say as to who should head any department in the hospital where they work, even if some are salaried employees of the organization in charge of departments. The finances of the hospital are of grave importance to the staff. Without proper facilities the services rendered to the public are in jeopardy and these public services are the all important function of both hospital and staff.

It is therefore the opinion of the committee that most controversies between management and the professional staff, either individually or collectively, should be settled at the local level and the professional opinion should be the deciding factor. If management and staff cannot honestly settle their differences satisfactorily at the institutional level, machinery should be set up by the county medical society to study the problem and an attempt made to settle the dispute. If no results are possible then the matter should be referred and all parties heard by a committee at the state medical association level, and if agreement cannot then be reached between the disputing parties, the matter should be relayed to the Judicial Council of the American Medical Association either as charges by a staff member against the staff or the staff against the hospital or the hospital against the staff, and a decision rendered. This might call for some cooperation between the Judicial Council of the American Medical Association and the American Hospital Association.

Every constituent state and territorial medical association has agreed to help in all of these matters in the foregoing outline of action.

There can be no exploitation of the doctor or of the hospital if all persons concerned in management and on the professional staff will work together to supply the greatest possible good quality medical and hospital service to the public.

Most of these matters can be settled at the hospital or county level. Therefore it is suggested that when resolutions concerning these matters come before the House of Delegates of the

American Medical Association they should be ruled out of order as they consume the valuable time of the House and because the machinery already exists in the Association whereby charges of unethical conduct may be directly referred to the Judicial Council for direct action. It is therefore recommended that after all efforts at the local and state levels have been exhausted, the charges of unethical conduct by either members of the profession or by hospital management should be brought to the Judicial Council for examination. If the Judicial Council, working with a similar committee of the American Hospital Association, cannot adjudicate the specific matter and finds ethical and legal compromise impossible, then suitable action should be taken against the professional men found guilty. The authority for this is found in the Constitution and By-Laws of the American Medical Association as follows:

CHAPTER III—DISCIPLINARY ACTION.—In all controversies between a member and his component society or constituent association, an appeal may be made to the Judicial Council on questions of law and procedure only, but not of fact. The appeal shall be perfected within six months following the date of decision by the constituted authority of the constituent association in question. In addition to such disciplinary action as may be taken under the constitution and by-laws of the component society and constituent association to which the member belongs, the House of Delegates on the recommendation of the Judicial Council and after due notice and hearing may censure, suspend or expel any member for an infraction of the Constitution or these By-Laws or for a violation of the Principles of Medical Ethics. The hearing may be held by the House or by a committee appointed by it for that purpose.

CHAPTER X, SECTION 4—STANDING COMMITTEES.—1. Duties. 2. The Judicial Council.—The judicial power of the Association shall be vested in the Judicial Council, whose decision shall be final.

The Council shall have original jurisdiction in (a) all questions involving Fellowship in the Scientific Assembly or the obligations, rights and privileges of Fellowship; (b) all controversies arising under this Constitution and By-Laws and under the Principles of Medical Ethics to which the American Medical Association is a party, and (c) controversies between two or more constituent associations or their members; between a constituent association and a component society or societies of another constituent association or associations or their members.

The Council shall have appellate jurisdiction in questions of law and procedure but not of fact in all cases which arise between a constituent association and one or more of its component societies, between component societies of the same constituent association, between a member or members and the component society to which said member or members belong or between members of different component societies of the same constituent association. The period of time within which appeal to the Council may be taken shall be limited to the six months immediately following the date of decision by the constituted authority of a constituent association.

The Council shall have jurisdiction on all questions of medical ethics and the interpretation of the laws of the Association.

The Council at its discretion may investigate general professional conditions and all matters pertaining to the relations of physicians to one another and to the public, and may make such recommendations to the House of Delegates or the constituent associations as it deems necessary.

The Council shall have authority to request the President to appoint investigating juries to which it may refer complaints or evidence of unethical conduct which in its judgment are of greater than local concern. Such investigating juries, if probable cause for action be shown, shall submit formal charges to the President, who shall appoint a prosecutor to prosecute such charges against the accused before the Judicial Council in the name and on behalf of the American Medical Association. The Council may acquit, admonish, suspend or expel the accused.

If a hospital or other lay group is found guilty and will not cooperate within ethical and legal limits, it is recommended that the Judicial Council shall order the withdrawal of the Association's approval of that institution. This authority has been given by the By-Laws to the Judicial Council.

This Committee can find no better recommendations to establish principles governing the proper relations between physicians and hospitals than those adopted by the Massachusetts Medical Society, normally called "The McKittrick Report":

1. That the medical costs of hospital care be separated from the non-medical costs, as can be done by existing and accepted methods of cost accounting, and that they appear thus separated on the statement submitted to the patient.

2. That a basic principle in the establishment of charges should be that each department be self supporting. This principle should be so applied that neither the hospital nor the physician rendering the service shall exploit the patient or each other.

3. That fees for medical services which are collected by the hospital be established by joint action of a representative committee of the staff, to include the head of the department, and the administrator and the governing body of the hospital.

4. That the basis of financial arrangement between hospital and physician may be salary, commission, fees, or such other method as will best meet the local situation, with due regard to the needs of the patient, the community, the hospital and the physician.

5. That bills for all medical services be rendered in the name of the physician or physicians performing the services.

It is the opinion of the Committee that acceptance and practice of these principles will clarify the confusion which now exists regarding responsibility for the payment of medical hospital services and non-medical hospital services as defined above, by prepayment and other insurance plans and should be adopted.

Respectfully submitted,

ELMER HESS, Chairman.
WALTER G. PHIPPEN.
JOHN CLINE.

SUMMARY OF A STUDY RELATING TO THE CORPORATE PRACTICE OF MEDICINE IN THE UNITED STATES

The House of Delegates of the American Medical Association at its annual session held in Chicago, on June 24, 1948, adopted a Report of the Committee on Hospitals and the Practice of Medicine which contained the following section:

Because of the difference in the laws of the various states, your Committee recommends that the Bureau of Legal Medicine and Legislation of the American Medical Association be instructed immediately to make a study of the various state laws defining the legal status of corporations attempting to practice medicine in the various states, defining in each instance the differences in the various state laws concerned with this problem, and that, if necessary, legislation be prepared by the Bureau of Legal Medicine and Legislation which will define all of these matters so that uniform legislation to simplify legal interpretations may be prepared and supported by the American Medical Association to insure the legality of the action taken.

Pursuant to this request, the Bureau of Legal Medicine and Legislation has made a survey which has included a study of (1) the provisions contained in state medical practice acts and in the state laws under which incorporation can be effected, (2) pertinent court decisions and (3) opinions rendered by state attorneys general.

While consideration has been given to enabling acts under which medical and hospital prepayment plans may be inaugurated, it has been concluded that the inclusion in this study of anything approximating an analysis of such provisions of these acts as may relate, directly or indirectly, to the corporate practice of medicine would unduly extend the report of the survey without supplying any essential data requested in the action taken by the House of Delegates as indicated.

Furthermore, a determination of whether a particular medical or hospital plan does or does not contemplate the corporate practice of medicine or whether particular acts committed by corporations constitute the practice of medicine are questions possibly related to the subject of the study, but answers to which are not essential to the objective of the study as described in the Report of the Committee on Hospitals and the Practice of Medicine; namely, a determination of "the legal status of corporations attempting to practice medicine in the various states."

GENERAL RULE

The general rule with respect to the legality of the corporate practice of medicine is succinctly stated in 13 American Jurisprudence, under the section relating to Corporations, as follows:

Section 837. While a corporation is in some sense a person and for many purposes is so considered, yet, as regards the learned professions which can only be practiced by persons who have received a license to do so after an examination as to their knowledge of the subject, it is recognized that a corporation cannot be licensed to practice such a profession.

A corporation cannot be licensed to carry on the practice of medicine. Nor, as a general rule, can it engage in the practice of medicine, surgery, or dentistry through licensed employees.

Section 739. It is well settled that a corporation has only such powers as are expressly granted in its charter or in the statute under which it is created or such powers as are necessary for the purpose of carrying out its expressed powers and the object of its incorporation.

And again, in 41 American Jurisprudence, under the section dealing with Physicians and Surgeons, the general rule is stated as follows:

Section 20. It is the majority rule that a corporation cannot engage in the practice of medicine, and that neither a corporation nor any other unlicensed person or entity may engage, through licensed employees, in the practice of medicine or surgery, dentistry, or any of the limited healing arts, although, as appears later, some of the courts qualify or disregard the rule in favor of the practice of optometry. A statute permitting corporations for profit to be organized for any lawful purpose does not authorize the organization of corporations to engage in the

practice of medicine where a statute regulating such practice contemplates only the licensing of individuals.

A medical practice act, in so far as it precludes a corporation from practicing medicine through its licensed employees, is not an unreasonable exercise of the police power violative of the constitutional guaranty of due process.

In Volume 1, Fletcher's *Cyclopedia on Corporations*, a recognized authority on corporation law, it is said, on page 339:

A statute authorizing the formation of corporations to carry on any lawful business does not include the work of the learned professions. Such an innovation with the evil results that might follow would require the use of specific language clearly indicating that intention. The reasons lie deeper than lack of statutory sanction for it. Human personal qualifications for such professions cannot be possessed by a corporation. They would inhere in the members as distinct from the corporation, and it could not have the power to do illegally an act requiring a license which only they could obtain. Neither the practice of law nor the practice of medicine or dentistry is a permissible corporate object. This has also been extended to other professions of the healing art which have been given a legal recognition and license.

MEDICAL PRACTICE ACTS GENERALLY

As a general rule, the medical practice acts of the several states contain no provision expressly prescribing the corporate practice of medicine. All of such acts, however, do set up requirements for licensure, such as a preprofessional requirement, a citizenship and a basic science requirement in some states, an age requirement, a requirement of good character, graduation from an accredited medical school, an internship in most states, and the passing of an examination. None of these requirements can be met by a corporation, which is a legal entity, except possibly the age requirement. These medical practice acts, then, by indirection prohibit the corporate practice of medicine in the absence of exceptions that may be contained in them or possibly in the absence of statutory authorization contained in other enactments.

COURT DECISIONS IN GENERAL

In five states (California, Colorado, Illinois, Indiana and South Dakota) and in the District of Columbia, the courts have said that the corporate practice of medicine is illegal, under the facts involved in the particular cases. In Minnesota and Washington the courts have held that the operation of clinics by laymen through the agency of duly licensed doctors of medicine is unlawful and in the Minnesota case the court said that "neither a corporation or lay person can practice medicine by employing a licensed physician."

Additionally, in sixteen states, court decisions have been rendered declaring illegal the corporate practice of allied groups in the field of the healing art (Arizona, Arkansas, Connecticut, Florida, Iowa, Kansas, Kentucky, Massachusetts, Michigan, New Jersey, New York, Ohio, Pennsylvania, South Carolina, Washington and West Virginia). The reasoning pursued by the courts in reaching these decisions may be applied with equal force to the corporate practice of medicine.

In seventeen states, no court decisions have been rendered applicable either specifically to the corporate practice of medicine or to the corporate practice of allied groups of professions (Alabama, Delaware, Idaho, Louisiana, Maine, Mississippi, Montana, North Carolina, Nevada, New Hampshire, New Mexico, North Dakota, Oklahoma, Rhode Island, Tennessee, Vermont and Wyoming). In some of these states, however, as indicated hereinafter, either formal or informal opinions have been rendered by state attorneys general relative to the corporate practice of medicine, including the following states: Louisiana, Oklahoma and Tennessee.

In four states (Missouri, Nebraska, Oregon and Texas) court decisions have been rendered which apparently are in conflict with the general rule, holding either that the corporate practice of medicine generally is lawful or that the particular acts involved in the case, although constituting the practice of medicine as that term is generally understood, do not involve the corporation in the illegal practice of medicine.

A Virginia court decision construing an exemption pertaining to hospitals in the state medical practice act holds that the exemption does not permit a hospital to engage in the practice of medicine within the intent of the broad statutory meaning of that term but only authorizes it to render to its patients such medical care and attention as is customarily engaged in by hospitals in the proper conduct of their businesses.

OPINIONS OF STATE ATTORNEYS GENERAL

Formal opinions of state attorneys general have been rendered in ten states. Eight of these opinions declare the corporate practice of medicine or of allied groups in the field of the healing arts to be contrary to law (California, New York, Ohio, Oklahoma, Pennsylvania, Tennessee, Utah and Washington). Opinions in Nebraska and Texas are to the contrary. A recent New York ruling holds that certain specialties, though the practice of medicine, may be furnished by a hospital service corporation.

In three other states (Florida, Louisiana and Washington), the offices of the attorneys general have declared informally the corporate practice of medicine to be illegal.

A RÉSUMÉ STATE BY STATE

Alabama.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

Arizona.—While there is no court decision or opinion from the office of the attorney general dealing specifically with the right of a corporation to practice medicine, there is a court decision declaring illegal the corporate practice of optometry and the reasons advanced by the court in that case are equally applicable to a question involving the corporate practice of medicine.

Arkansas.—There have been no court decisions in Arkansas nor any opinions rendered by the office of the attorney general dealing specifically with the legality of the corporate practice of medicine. A decision of the supreme court of the state, however, has held that under the provisions of the state optometry act, a corporation may not engage in the practice of optometry by hiring optometrists lawfully authorized in their own right to practice.

California.—There is a provision in the medical practice act of California which in effect provides that corporations and other legal entities have no professional rights, privileges or powers under the act.

There have been a number of decisions by the Supreme Court of California involving either directly or indirectly the legality of the corporate practice of medicine. In two cases, the court held specifically that the corporate practice of medicine was illegal. In a third, it was held that the corporate practice of dentistry was illegal and in a fourth, that the corporate practice of chiropractic was illegal.

In a fifth, the court had under consideration the prepayment medical care plan sponsored by the California Medical Association and operated under specific legislative authority. The court in that case, while not referring definitely to the legality of the corporate aspect of the plan, upheld the plan.

An opinion rendered by the office of attorney general of California holds (1) that a hospital organized not for profit may not lawfully engage in the practice of medicine, and (2) that such a hospital that hires physicians on a salary basis and bills the patients for the services of such physicians, the fees being unrelated to the compensation paid to the physician by the hospital, is unlawfully engaged in the practice of medicine.

Colorado.—The medical practice act of this state contains a provision specifically prohibiting the practice of medicine by any person as an employee or agent of a corporation except where such physician renders medical care to employees of that corporation.

There have been seven decisions by the Supreme Court of Colorado holding that the corporate practice of dentistry is illegal. The reasoning, in general, used by the court in reaching its decision in these cases would seem to be applicable to the corporate practice of medicine.

Another decision of the supreme court held that a physician licensed to practice medicine could associate himself with a layman but only to the extent that his activities were covered by the laws regulating the practice of optometry.

Another decision by the supreme court, involving a suit for damages against a hospital and a surgeon who was employed by the hospital, held that the suit against the hospital should be dismissed on the ground that "a hospital, a corporation as here, cannot be licensed to and cannot practice medicine."

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

Connecticut.—This state has a law which proscribes the practice of radiology by any person other than a person holding a license to practice medicine, osteopathy or dentistry or unless such practice is carried on under the prescription, direction or supervision of such practitioners. This law, however, provides that its provisions shall not apply to the use of x-rays for diagnostic purposes. The office of attorney general has rendered no opinion concerning the corporate practice of medicine.

A decision by the Supreme Court of Errors holds that an optometrist may not lawfully engage in the practice as an employee of a corporation which bills the patient for services rendered by the optometrist and where the optometrist is paid a regular salary plus commission by the corporation.

Delaware.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

District of Columbia.—The healing arts practice act exempts from its provisions certain clinical and radiographical laboratories in operation at the time of its effective date, Jan. 1, 1928.

A decision by the District Court of the United States for the District of Columbia held that the operation of a prepayment medical care program by a corporation did not constitute the corporate practice of medicine. In the opinion of the court a group of individuals may incorporate themselves for their own mutual benefit and contract with a physician or a group of physicians for a stipulated period at a fixed compensation without violating the healing arts practice act.

Another court decision in the District of Columbia held that the corporate practice of optometry is not illegal for the reason that optometry is not a learned profession as are law and medicine.

Florida.—There are no decisions in this state relating specifically to the corporate practice of medicine. There is a court decision holding that the corporate practice of optometry is illegal.

The office of the attorney general has rendered an informal opinion to the effect that the corporate practice of medicine is not lawful under the laws of the state, that the privilege of practicing medicine is confined to individuals.

Georgia.—A decision of the supreme court holds that the corporate practice of optometry is lawful because such practice is not prohibited by the optometry practice act. Another decision declares unlawful the practice of law by corporations for the reason that such a legal entity as a corporation may not comply with the requirements imposed on applicants for licenses to practice law. The office of attorney general has rendered no opinion bearing on the question of the corporate practice of medicine.

Idaho.—The corporation code specifically provides that no corporation shall be organized to practice any profession with the exception that corporations may be created to erect, own and conduct hospitals and sanatoriums for receiving and caring for patients, their medical, surgical and hygienic treatment.

There are no court decisions or opinions of the office of attorney general bearing directly or indirectly on the legality of the corporate practice of medicine.

Illinois.—The state supreme court has held that a corporation may not be organized to engage in the practice of medicine.

In three other cases, the courts have held that the corporate practice of dentistry constitutes a violation of the dental practice act.

A request for information concerning any opinions rendered by the office of attorney general brought no response.

Indiana.—The supreme court has held that a hospital may not lawfully engage in the practice of medicine nor can physicians practice as agents of such institutions. The office of attorney general has rendered no opinion concerning the legality of the corporate practice of medicine.

In another case, the supreme court held that a corporation all of whose directors were licensed to practice medicine could not lawfully make a contract in its own name purporting to bind it to treat disease because such a contract would be ultra vires unlawful and contrary to public policy.

Iowa.—There are no court decisions relating specifically to the corporate practice of medicine.

One decision by the supreme court holds that the corporate practice of dentistry is illegal for reasons that are equally applicable to the corporate practice of medicine. In two other cases, the corporate practice of optometry was declared to be unlawful.

A request for information concerning any opinions rendered by the office of attorney general brought no response.

Kansas.—The state corporation code provides that corporations may not be formed for purposes of engaging in a learned profession.

The corporate practice of optometry has been declared unlawful by the supreme court for reasons that are equally applicable to the corporate practice of medicine.

No court decisions have been rendered involving specifically the corporate practice of medicine, and a request for information concerning any opinions rendered by the office of attorney general brought no response.

Kentucky.—The medical practice act of Kentucky specifically includes the practice of anesthesiology as including the practice of medicine.

There have been no court decisions concerning the legality of the corporate practice of medicine. Neither has there been any formal opinion from the office of the attorney general.

In a case involving the corporate practice of optometry, the court held that while the word "person" may include a corporation, the latter cannot be licensed to practice a learned profession, which can only be done by an individual who has received a license to do so after proving his qualifications and knowledge of the subject.

Louisiana.—The medical practice act specifically includes, as the practice of medicine, the examination of any material from a person for the purpose of diagnosing, treating or curing disease.

There have been no court decisions or any opinions from the office of the attorney general relating to the corporate practice of medicine either directly or indirectly. It has been reported, however, that the office of the attorney general believes that when the question is presented either to him or to the courts the general rule will be followed.

Maine.—There have been no court decisions bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of attorney general brought no response.

Maryland.—There have been no decisions of the courts or opinions rendered by the office of the attorney general relating definitely to the practice of medicine by corporations.

A court decision does hold that the corporate practice of optometry is not unlawful because of the fact that optometry is not a learned profession.

Massachusetts.—There are no court decisions or opinions rendered by the office of the attorney general relating specifically to the legality of the corporate practice of medicine.

A decision of the Supreme Judicial Court holds that the corporate practice of optometry is unlawful for reasons that are equally applicable to the corporate practice of medicine. Another court decision declares unlawful the corporate practice of law for reasons similar to those advanced in the optometry case.

Michigan.—There are no court decisions or opinions of the office of the attorney general relating to the legality of the corporate practice of medicine.

A decision holds that the optometry practice act does not preclude the operation of an optometric department by a corporation. Another decision holds that one not licensed to practice dentistry cannot operate a dental parlor through the agency of a licensed employee.

Minnesota.—A court decision holds that the science of diagnosing human disease is the practice of medicine and that it is improper and contrary to statute and public policy for a corporation or lay person to practice medicine by employing a licensed physician.

A request for information as to any opinion rendered by the office of the attorney general has brought no response.

Mississippi.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine and these requirements cannot be possessed by a corporate entity.

Missouri.—A court decision holds that a corporation whose purpose was described as "furnishing treatment for hernia and medical and surgical treatment for all other diseases" may not be restrained from entering into contracts with persons to supply medical treatment or from entering into contracts with physicians to render that medical treatment.

In a more recent decision concerning optometry the aforementioned case was cited with approval by the supreme court when it held in the latter case that a corporation advertising the availability of optical services in its department store and receiving the receipts from the optical department was not unlawfully practicing optometry within the meaning of the optometry practice act.

A request for information as to whether or not any opinion has been rendered by the office of the attorney general brought no response.

Montana.—There have been no court decisions bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of attorney general brought no response.

Nebraska.—Court decisions have held that while individuals who actually practice medicine must be licensed, nothing in the state medical practice act can be held to prevent licensed practitioners or others from forming a corporation and from contracting with patients in the corporation's name to furnish them medical attention.

A formal opinion of the attorney general follows the ruling of the cases referred to and held that a corporation may lawfully engage in the practice of dentistry.

Nevada.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

New Hampshire.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

New Jersey.—There are no decisions in this state relating specifically to the corporate practice of medicine. There is a court decision holding that the corporate practice of optometry is illegal because statutory provisions in this state provide for

the issuance of a license to practice optometry only to those who have met certain qualifications and corporations cannot possess those qualifications.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

New Mexico.—There have been neither court decisions nor opinions from the office of the attorney general bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine and these requirements cannot be possessed by a corporate entity.

New York.—The medical practice act contains a section which provides that the act shall not be construed to prevent a corporation organized under section 9c of the insurance law (authorizing medical service plans) from employing duly licensed physicians or from entering into contracts with duly licensed physicians or with groups or partnerships of duly licensed physicians to practice medicine on its behalf for persons insured under its contracts.

Three court decisions have said respectively (1) that under a section of the state membership corporation law enacted in 1895 (subsequently modified) hospitals may lawfully practice medicine through a staff of licensed physicians; (2) that a tax supported, municipally operated public hospital by virtue of the city code of ordinances may include in its bill for hospital services charges for medical services performed by members of its staff and, by virtue of the city code, does not violate the law by practicing medicine through the agency of natural persons who are licensed, and (3) that a proprietary hospital is a place where the sick or infirm may be treated by physicians expressly or impliedly employed by them and that such a hospital, on the contrary, not having the benefit of legislative exemption, may not collect from patients for medical or surgical services performed therein.

In other court decisions relating to the corporate practice of allied groups in the field of the healing art it has been held respectively (1) that a corporation cannot lawfully practice dentistry in the state by employing a licensed dentist to do the work; (2) that the Secretary of State correctly refused to issue a certificate of incorporation to a group whose proposed purpose among others was to "transact and carry on the optical business . . . provided it employed only licensed optometrists to do the work," and (3) that a corporation may lawfully employ a licensed chiropodist because between him and those whom he treats there is no confidential and trust relationship such as exists between physician and patient.

There are three opinions that have been rendered by the office of the attorney general relating to the corporate practice of medicine. One, rendered in 1929, held that a corporation may not be permitted under the provisions of the medical practice act to employ specialists to make physical examinations of persons as such acts would amount to the practice of medicine. The second, rendered in 1935, holds that a business corporation may not be organized to contract with individuals to obtain medical service for them and to contract with physicians to treat and care for such individuals. An opinion of the attorney general dated Sept. 14, 1948, holds that a hospital service corporation organized and operating under Article 9c of the insurance law may furnish to subscribers radiology, pathology, anesthesiology and physical therapy as a part of hospital service and for the purpose of the opinion it is accepted that radiology, pathology, anesthesiology and physical therapy are medical services and the practice of medicine.

North Carolina.—The medical practice act provides specifically that the practice of radiology constitutes the practice of medicine. There are no court decisions relating to the corporate practice of medicine.

The medical practice act sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

North Dakota.—There have been no court decisions bearing directly or indirectly on the legality of the corporate practice of

medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

Ohio.—The supreme court has held in one case that the Secretary of State rightly refused to accept the application for a charter of a group desiring to incorporate to practice optometry, and in another case that a corporation may not directly or indirectly engage in the practice of optometry.

The attorney general has ruled that the corporate practice of dentistry is unlawful.

Oklahoma.—There are no court decisions relating specifically to the corporate practice of medicine. The medical practice act contains a section which sets out certain duties of "all firms, associations or corporations engaged in the practice of medicine" with the clause that "nothing in this section shall operate or be construed to waive the requirements that each and every member of such firm, association or corporation so practicing medicine or surgery thereunder shall be duly licensed to practice medicine and surgery in this state."

An opinion of the attorney general holds that a doctor of medicine employed to have charge of and to perform optometric services in the optometric department of a corporation is guilty of a misdemeanor and the optical company is unlawfully engaged in the practice of optometry "and probably constitutes the unlawful practice thereby of a branch or phase of medicine."

Oregon.—The medical practice act exempts from its provisions the practice of electrotherapy carried on by or under the direction of duly licensed practitioners of medicine.

The Supreme Court of Oregon has held that in view of the exception of the practice of electrotherapy from the state medical practice act it is competent for parties (duly licensed doctors of medicine in this case) to incorporate and for the corporation to carry on the business of using x-ray or electrotherapy or roentgenology. In another case the supreme court held that a corporation, furnishing medical service under a provision of the insurance code, through the agency of licensed physicians employed by it on a salary basis was liable for the negligence of the employed physicians under the doctrine of respondeat superior.

In a case holding the corporate practice of optometry unlawful, decided in 1947, the supreme court said that the optometry practice act, which imposes on optometrists standards of qualifications similar to those required of physicians, would be rendered ineffective if corporations were permitted to furnish optometric services through salaried employees who are licensed optometrists. The reasoning advanced by the court in this case seems equally applicable to a question involving the corporate practice of medicine not specifically permitted by statute.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

Pennsylvania.—There are no decisions in this state relating specifically to the corporate practice of medicine. There is a court decision holding that the corporate practice of optometry is illegal because a corporation cannot obtain a license to practice optometry and may not engage in such practice through licensed agents.

The office of the attorney general has rendered formal opinions holding respectively (1) that there is no statutory authority for granting a charter to a corporation for the practice of medicine; (2) that no one whether acting for himself or under employment by a corporation can practice medicine without full compliance with the medical practice act, and (3) that an application for a certificate of incorporation for the purpose of establishing and maintaining a clinic for the diagnosis and treatment of disease where medical and surgical treatment would be provided would include the practice of medicine by the corporation and the application should be disapproved.

Rhode Island.—There have neither been court decisions nor opinions from the office of the attorney general bearing directly

or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

South Carolina.—There are no court decisions dealing specifically with the legality of the corporate practice of medicine. A decision of the supreme court of the state, however, has held that a corporation may not engage in the practice of optometry by hiring optometrists lawfully authorized in their own right to practice.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

South Dakota.—The supreme court has stated that it is convinced that the practice of learned professions by a profit corporation tends to the commercialization and debasement of those professions and held that such a mode of conducting the practice of medicine is in contravention of the public interest, is against public policy and is unlawful. There have been no opinions rendered by the office of attorney general concerning this question.

Tennessee.—There are no decisions in this state relating specifically to the corporate practice of medicine.

The office of the attorney general rendered an opinion, in 1931, to the effect that the Secretary of State should not issue articles of incorporation to a group whose proposed purpose was "to conduct, carry on and manage the business of procuring for and rendering to natural persons, with whom the corporation may enter into contract for that purpose, certain limited professional medical benefits, attention and service to be administered by a licensed doctor or doctors."

The attorney for the regulatory boards of the state advised the executive office of the licensing board for the healing arts, in 1948, that "private laboratories operating under the direction of lay individuals, who hold themselves out as pathologists and who make diagnoses of cancer" do so in violation of the law.

Texas.—The corporation code of the state authorizes the formation of corporations for the "erection and maintenance of sanatoria."

The supreme court of the state has held that the aforementioned statute reasonably implies authority in such a corporation to provide medical treatment for its patients and to employ for that purpose persons duly licensed to practice medicine.

In a more recent case the supreme court said: "It may be said that the general rule is that a corporation organized for profit cannot practice medicine. Obviously under the medical practice act . . . a license to practice medicine can be issued only to a natural person. . . ." The court continued, citing with approval the above decision, to the effect that the corporation law had implied authorization, as part of a corporate function, on the part of a corporation organized under that law to furnish medical treatment.

The attorney general has advised the secretary of the state board of medical examiners that a corporation operating a private or nonprofit hospital does not violate the medical practice act of the state by entering into a contract with a physician under which the physician will perform professional services in the hospital on a percentage basis for the hospital corporation and the corporation in turn billing the patient for the professional services rendered by the physician. In a formal opinion previously rendered the attorney general said, "We find nothing in the medical practice act which prevents a hospital from hiring one or more physicians to perform professional services for its patients."

Utah.—There are no court decisions in this state relating specifically to the corporate practice of medicine. A decision of the supreme court held that the corporate practice of optometry is lawful because such practice is not prohibited by the optometry practice act.

An opinion rendered by the office of attorney general subsequent to the aforementioned case holds that the word "person" as used in the dental practice act does not include "corporation"

and that a licensed dentist may not be employed by and practice dentistry for a corporation which may not be licensed. The attorney general in his opinion stated that he believed that the court decision referred to is limited to an interpretation of the statute defining the practice of optometry.

Vermont.—There have been no court decisions bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of the attorney general brought no response.

Virginia.—The medical practice act defines practice of medicine and concludes its definition with the statement: "This section shall also apply to corporations." Another section of the medical practice act states, "This chapter shall not affect any person while engaged in conducting a hospital now established, if there be a licensed practitioner resident or practicing therein." The office of attorney general has rendered no opinion bearing on the corporate practice of medicine.

The Supreme Court of Appeals in construing the exemption referred to held that such exemption does not permit a hospital to engage in the practice of medicine within the intent of the broad statutory meaning of that term but only authorizes it to render to its patients such medical care and attention as is customarily engaged in by hospitals in the proper conduct of their businesses.

Washington.—A decision of the supreme court holds that a contract between a medical institute, owned, operated and managed by an unlicensed individual, and a person desiring medical treatment was void as against public policy. In a case involving the corporate practice of optometry the supreme court stated that the case mentioned follows the rule that an unlicensed person may not engage in the practice of medicine by employing a licensed agent and held that the practice of optometry by a corporation employing registered optometrists is unlawful as being against public policy.

A formal opinion of the attorney general holds that a corporation cannot practice optometry through the agency of licensed employees. An informal opinion of the attorney general holds that the corporate practice of medicine would be unlawful.

West Virginia.—There are no decisions in this state relating specifically to the corporate practice of medicine. There is a court decision holding that the corporate practice of optometry through licensed optometrists is unlawful. The reasons advanced by the court in reaching its decision seems applicable to a question pertaining to the legality of the corporate practice of medicine.

There have been on opinions rendered by the office of the attorney general concerning the corporate practice of medicine.

Wisconsin.—The supreme court has held that optometry is a skilled calling, not a profession, and may lawfully be practiced by a corporation employing licensed optometrists. In another case, the supreme court has held that the method of operating a dental corporation is a proper subject of regulation by the state, but did not decide whether or not a corporation could practice dentistry, that question not being at issue.

A request for information concerning any opinions rendered by the office of the attorney general brought no direct response.

Wyoming.—There have been no court decisions bearing directly or indirectly on the legality of the corporate practice of medicine. The medical practice act of the state sets up the customary qualifications to be possessed by those engaging in the practice of medicine, and these requirements cannot be possessed by a corporate entity.

A request for information concerning any opinions rendered by the office of the attorney general brought no direct response.

CONCLUSION

Because the majority of court decisions concerning the corporate practice of medicine, dentistry, optometry and law support the general rule that a corporation may not practice such profession directly, or indirectly through the employment

of licensed personnel; because medical practice acts seem definitely to preclude the licensing of any other than a natural person to practice medicine, and because court decisions seemingly opposed to the general rule actually find real or fancied exceptions to the general rule rather than deny it, it is not believed that legislation to simplify legal interpretations is necessary at the present time.

Proposed Code of Ethics of World Medical Association

There was presented to the House by Dr. Henderson the following proposed Code of Ethics of the World Medical Association, which was referred to the Reference Committee on Legislation and Public Relations:

In every country of the civilized world doctors constitute, not a class, still less a caste, but rather a social body distinct from the other professions. There is in this statement, no idea of precedence, hierarchy or aristocracy. It is a simple observation, explained naturally by the very special nature of the profession.

The doctor is called on to enter intimately into various situations of which he scrutinizes the physical, transient or chronic defects. The confidence which is necessarily placed in him in the ordinary course of his professional life makes him, often—very often—a moral confidant, and many opinions and counsels are daily demanded of him which have only distant bearing or no bearing at all on disease and its treatment.

A true physician, whatever may be his particular field in medicine, must have a refined sense of psychology, exceptional tact, indispensable moral qualities and, in practice, some general directing rules, the most necessary of which are recognized in all countries.

So, there are several national professional associations which have recognized the necessity of codifying these general rules, and the national codes of ethics are numerous. Some include developments of a secondary nature connected with certain special customs of the specific country.

Just as a number of national associations have done, our World Association ought to attempt to condense in a brief and concise text the general rules, the observation of which are desirable or necessary in every country, deliberately omitting the question of, on the one hand, secondary matters, and, on the other hand, discipline for infractions which can be carried out only by a national organization on a national basis.

The idea of drafting in a code, rules for medical ethics on a world scale is not new. The A. P. I. M. developed an International Code in November 1935. (*Rev. internat. de méd. profess. et sociale* 8:32-47 [Nov.] 1935). The work of the A. P. I. M. ought to represent for us who are studying the question, a rough draft from which we can embroider clearly the principles on which agreement should be obtained for a world plan.

Already our World Medical Association has accomplished one single and important thing. This is the Declaration of Geneva, on which discussions in the Council and in the General Assembly at Geneva permitted all ideas to be expressed, discussed and understood.

In an international association, the difficulty is in understanding one another, because words do not always have the same emphasis or the same meaning when they are literally translated into another language.

At Geneva we have, with general good will and an acute sense of our responsibilities, conquered all obstacles, and our theme, which has already gone around the world, includes the most incontestable principles, which ought to record the conscience of the doctor in all areas of the world.

We hope that in a very short time this text will become the solemn promise given by all doctors of the world at the start of their careers.

This declaration has already been adopted by Le Conseil National de l'Ordre des Médecins Français, the Alpha Omega Alpha Fraternity of the United States and the Canadian Medical Association.

No preface to a study on medical ethics would be as pertinent as the text of the Declaration of Geneva, which is given here:

DECLARATION OF GENEVA

Adopted by the General Assembly of The World Medical Association at Geneva, Switzerland, September 1948.

At the time of being admitted as Member of the Medical Profession I solemnly pledge myself to consecrate my life to the service of humanity.

I will give to my teachers the respect and gratitude which is their due;
I will practice my profession with conscience and dignity;
The health of my patient will be my first consideration;
I will respect the secrets which are confided in me;
I will maintain by all the means in my power, the honor and the noble traditions of the medical profession;
My colleagues will be my brothers;
I will not permit considerations of religion, nationality, race, party politics or social standing to intervene between my duty and my patient;
I will maintain the utmost respect for human life, from the time of conception; even under threat, I will not use my medical knowledge contrary to the laws of humanity.
I make these promises solemnly, freely and upon my honor.

In this very concise résumé and of which the Medical Code will be for the most part only an amplification, a development or explanation, we wish to add the short introduction of the Code of Ethics of the Canadian Medical Association.

Our Canadian confreres have, in a few very high sounding and dignified phrases, defined what a code of ethics should contain and what it should only contain.

INTRODUCTORY

"As ye would that men should do to you, do ye even so to them" is a Golden Rule for all men. A code of ethics for physicians can only amplify or focus this and other golden rules and precepts to the special relations of practice. As a stream cannot rise above its source, so a code cannot change a low grade man into a high grade doctor, but it can help a good man to be a better man and a more enlightened doctor. It can quicken and inform a conscience, but not create one. Only in a few things can it decree "thou shalt" or "thou shalt not," but in many things it can urge "thou shouldst" or "thou shouldst not." While the highest service they can give to humanity is the only worth while aim for those of any profession, it is so in a special sense for physicians, since their services concern immediately and directly the health of the bodies and minds of men.

Here is the text proposed for your study, subject to such changes and additions as may be made by the committee, and which will be studied by the Council at Madrid. The text decided at Madrid will be that submitted to the General Assembly at London in October.

The General Assembly at Geneva in September 1948 adopted a general classification of the work which should be presented to you: (a) duties of doctors in general; (b) duties of doctors to the sick, and (c) duties of doctors to one another.

DUTIES OF DOCTORS IN GENERAL

A doctor must always maintain the highest standards of professional conduct.

A doctor must not allow himself to be influenced merely by motives of profit.

The following practices are deemed unethical: (a) any self advertisement except such as is expressly authorized by the national code of medical ethics; (b) taking part in any plan of medical care in which the doctor does not have complete professional independence; (c) to receive any money in connection with services rendered to a patient other than the acceptance of a proper professional fee, or to pay any money in the same circumstances without the knowledge of the patient.

Under no circumstances is a doctor permitted to do anything that would weaken the physical or mental resistance of a human being except from strictly professional reasons in the interest of his patient.

A doctor is advised to use great caution in publishing discoveries. The same applies to methods of treatment whose value is not recognized by the profession.

When a doctor is called on to give evidence or a certificate he should only state that which he can verify.

DUTIES OF DOCTORS TO THE SICK

A doctor must always bear in mind the importance of preserving human life from conception. Therapeutic abortion may

be performed only if the conscience of the doctor and the national laws permit.

A doctor owes to his patient complete loyalty and all the resources of his science. Whenever an examination or treatment is beyond his capacity he should summon another doctor who has the necessary ability.

A doctor owes to his patient absolute secrecy on all which has been confided to him or which he knows because of the confidence entrusted to him.

A doctor must give the necessary treatment in emergency, unless he is assured that it can and will be given by others.

DUTIES OF DOCTORS TO ONE ANOTHER

A doctor ought to behave to his colleagues as he would have them behave to him.

A doctor must not entice patients from his colleagues.

A doctor must observe the principles of "The Declaration of Geneva" approved by The World Medical Association.

Report of Council on Industrial Health

Dr. Henderson also presented the following report, which was referred to the Reference Committee on Industrial Health, after a motion had been made by Dr. Mather Pfeifferberger, Illinois, seconded by Dr. Charles H. Phifer, Illinois, and carried, to have it mimeographed:

The eleventh plank in the American Medical Association's platform for the advancement of medicine and public health calls for greater emphasis on the program of industrial medicine with increased safeguards against industrial hazards and prevention of accidents occurring on the highway, in the home and on the farm. The Council on Industrial Health has long felt that a constructive program, placing primary emphasis on preventive medicine and positive health promotion, would represent a greater contribution to the health of working people than a sickness insurance program alone. The Ninth Annual Congress on Industrial Health, held in January 1949, was designed to discover additional acceptable ways of extending the usefulness and influence of industrial physicians and hygienists as important factors in the developing patterns of community health and medical service. This supplementary report summarizes briefly the major recommendations arising out of that Congress in a form that may serve as a practical implementation of the industrial medical segment of the American Medical Association's broad program.

Public Relations.—Progress in industrial medicine and hygiene depends fundamentally on good understanding of objectives by all concerned. The Council on Industrial Health, after consultation with other affected departments in the American Medical Association, has taken steps to set up a permanent conference group with labor and management. This is intended to replace previous informal and irregular contacts with periodic meetings (1) to discuss ways and means for the extension of industrial medicine, industrial hygiene, accident prevention and health education of workers, (2) to clarify the status of physicians and medical organizations in relation to the entire range of industrial health activity and (3) to provide a method for the consideration of other aspects of medical service having industrial application. Recommendations of the conference will be subject to ratification by the participating organizations. It is anticipated that similar conference arrangements can be set up in the major industrial states and communities.

Professional Relations.—Progress also depends on effective professional teamwork expressed in several major directions:

1. Between private physicians, industrial physicians and public health agencies, based on a broadening concept of function, tempered by ethical considerations and local needs. This desirable relationship can best be stimulated by a revitalization of the committees on industrial health in the principal industrial state and local medical societies and in the organizations of specialists.

2. Between medicine and the other professional groups involved—nurses, engineers, hygienists, dentists, specialists in accident prevention and others, through a formalized liaison committee intended to promote integration and cooperation.

Professional Education.—As industrial medicine expands, so must facilities for professional training keep pace in the form of introductory or refresher postgraduate courses, as residencies and fellowships, and as a certifying program or appropriate modification thereof. Industrial medicine, to compete on reasonably equal terms for medical talent, must become attractive as a rewarding career, professionally and financially.

Scientific Development.—Panels of experts set up during the last Congress on Industrial Health, dealing with atmospheric pollution, toxic chemicals, hazardous physical agents, harmful biologic exposures and the medical aspects of human relations in business and industry, have requested some official status and an opportunity for continued growth and development. If agreeable to the Board of Trustees and the House of Delegates, and as rapidly as time, personnel and the budget permit, these groups will be invited to act as regularly appointed consulting committees to the Council on Industrial Health, capable of organized programs of professional education, research and administration.

Workmen's Compensation, Unemployment Compensation and Rehabilitation.—These closely related social developments have extraordinary significance in the relations of medicine to management and to working people. The Council on Medical Service has paid particular attention to compensation for unemployment due to sickness of nonindustrial origin. Since medicine is of basic importance in the administration of workmen's compensation and the employment phases of rehabilitation, the Council on Industrial Health has appointed advisers representing legal, administrative and technical points of view to assist it in the consideration of pertinent aspects of these related activities.

All constituent medical societies and industrial commissions have been notified of these expanded services and have been invited to use them. As policies are formulated they will be submitted as special reports through regular channels for consideration and adoption.

Industrial Medicine and Medical Care Plans.—Many existing medical care plans are industrial in origin. Physicians in industry are frequently in excellent position to evaluate the health needs of employed groups and to determine ways of meeting them. Conferences with the Council on Medical Service have confirmed this view to mutual advantage. Industrial medicine, with its primary interest in the promotion of individual effectiveness through preventive medicine and health conservation and with its roots deep in clinical medicine, performs its best function by narrowing the gap between the two. Certainly as good medical standards and resources in industry improve they can be of great service in maintaining independence and self determination and in counteracting tendencies toward centralization and control.

The American Medical Association Program

Dr. Henderson submitted the following program of the American Medical Association, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

The American Medical Association in February, 1949, issued a revised 12 Point Program for the Advancement of Medicine and Public Health. This program was a statement of principles only. Considerable study has been given to this program. The Board of Trustees feels that these 12 points cover all the essential principles necessary for a satisfactory program. It believes, however, that these 12 points need further elaboration as to detail so that the implementation of them may be more clearly understood. Hence, the Board submits to the House of Delegates, for its consideration, the following statement consisting of an elaboration of the 12 points, together with a brief statement of the Board's stand on certain legislative proposals:

1. A FEDERAL DEPARTMENT OF HEALTH: Creation of a Federal Department of Health of Cabinet Status with a Secretary Who Is a Doctor of Medicine, and the Coordination and Integration of All Federal Health Activities Under This Department, Except for the Military Activities of the Medical Services of the Armed Forces.

Since 1884, the American Medical Association has demanded a Federal Department of Health with a Secretary who is a physician in charge.

At present the various agencies concerned with health are distributed in various government departments. It would be in the interest of efficiency and economy to have them under one head to avoid duplication of effort and diversion of activity.

Various suggestions have been made to establish a Department of Welfare, a Department of Education, Health and Welfare and an Independent Health Agency. The health of the people is certainly important enough to warrant an independent agency, in accordance with the recommendations of the Hoover Commission. The argument has been made that it is not the policy of our government to have an expert in charge of a department, but that the experts should be subservient to the chief of the department. In answer to this, the American Medical Association feels that no other government department is so closely concerned with the individual as would be a Department of Health. Other departments deal as a rule with the population as a group. Matters of health are often individual and no one could be better qualified to superintend matters of individual health than a physician. At this time we urge support of the report of the Hoover Commission on this subject, which recommends an Independent Health Agency under which will be assembled all activities concerned with health except those of the armed forces and Veterans Administration.

2. MEDICAL RESEARCH: Promotion of Medical Research Through a National Science Foundation with Grants to Private Institutions Which Have Facilities and Personnel Sufficient to Carry on Qualified Research.

The Steelman Report states that \$110,000,000 is now spent for medical research; \$55,000,000 of this comes from industry and the balance from the government and from private foundations. These funds are not adequate and further funds for research are difficult to obtain. Bills are now in Congress to establish a National Science Foundation, to facilitate coordination of research and make available funds for research in medical and other sciences. The American Medical Association recognizes that research is the basis of medical progress. We urge the establishment of a National Science Foundation with appropriate federal support.

3. VOLUNTARY INSURANCE: Further Development and Wider Coverage by Voluntary Hospital and Medical Care Plans to Meet the Costs of Illness, with Extension as Rapidly as Possible into Rural Areas. Aid Through the States to the Indigent and Medically Indigent by the Utilization of Voluntary Hospital and Medical Care Plans with Local Administration and Local Determination of Needs.

The voluntary hospital and medical care insurance development in the United States has been the most rapidly growing insurance project in the history of the country. The movement started slowly. At the end of the first seven years of voluntary hospital insurance under the Blue Cross, only 2,870,000 subscribers were enrolled. Now after about sixteen years there are 32,500,000 enrolled in the Blue Cross and over 20,000,000 enrolled in industrial and commercial types of plans and all three types are continuing their rapid growth. Medical care insurance developed about five years after the Blue Cross hospital insurance began. After the first seven years, there were only 2,845,000 enrolled in nonprofit plans. Now six years later, there are over 11,000,000 enrolled in these plans and 26,000,000 others enrolled in commercial and industrial plans. These plans likewise are growing at a rapid rate. Besides these plans there are cooperative and special health plans of labor. For the protection of the public the American Medical Association has aided in the development of standards for voluntary insurance plans. The association is conducting a campaign to educate both the public and the profession on the value of voluntary medical care plans, recognizing that serious illness is a financial handicap to millions of Americans. It is making every effort to assist in extending the coverage and distribution of these plans, particularly in those rural areas now lacking them. The association has recognized the desirability of a

National Voluntary Enrolment agency for the nonprofit plans to facilitate interchange and enrolment of companies with national payrolls. It is believed that at least 80,000,000 will be enrolled within a reasonable time in voluntary hospital and medical care plans. When we add this number to the 24,000,000 now receiving their medical care in whole or in part from the government, the industrial workers covered by established health plans and the approximately 5,000,000 indigent, it will be seen that a greater portion of the population will be provided for than by any other means suggested.

4. MEDICAL CARE AUTHORITY WITH CONSUMER REPRESENTATION: Establishment in Each State of a Medical Care Authority to Receive and Administer Funds with Proper Representation of Medical and Consumer Interest.

It would be advisable to have in each state an authority to receive, administer and distribute funds from government sources to prevent duplication of effort and to insure that all needs will be met. Such an authority should have representation of all groups concerned including both the distributors and the consumers of medical care.

5. NEW FACILITIES: Encouragement of Prompt Development of Diagnostic Facilities, Health Centers and Hospital Services, Locally Originated, for Rural and Other Areas in Which the Need Can Be Shown and with Local Administration and Control as Provided by the National Hospital Survey and Construction Act or by Suitable Private Agencies.

The American Medical Association supported the passage of the National Hospital Survey and Construction Act (Hill-Burton bill). Bills are now in Congress to extend the life of this act and to double the funds available. The American Medical Association supports such legislation with proper controls to insure local origination of demands and demonstration of need. Extension of hospital and diagnostic facilities in areas now lacking them will help solve the problem of a better distribution of physicians.

6. PUBLIC HEALTH: Establishment of Local Public Health Units and Services and Incorporation in Health Centers and Local Public Health Units of Such Services as Communicable Disease Control, Vital Statistics, Environmental Sanitation, Control of Venereal Diseases, Maternal and Child Hygiene and Public Health Laboratory Services. Remuneration of Health Officials Commensurate with Their Responsibility.

The American Medical Association regards this item in its program as highly important. Large areas of the country are without proper public health service and many of these areas cannot afford such service. Prevention of disease at the source will decrease the need for medical care. There are bills now in Congress to extend federal aid to communities needing it for this purpose. We support legislation which will permit aid to local communities where suitable organizations have been developed for the administration as suggested in item 4 (Medical Care Authority) and where public health agencies are limited to the field of public health. There is a shortage of qualified public health officials, and the public health schools are graduating too few students. The reasons for this are largely monetary and political. Public health officials are often not paid in accordance with the scale of pay of other government officials with like or even less responsibility. Often public health officials are subject to political control, making their tenure of office uncertain and efficient service impossible.

7. MENTAL HYGIENE: The Development of a Program of Mental Hygiene with Aid to Mental Hygiene Clinics in Suitable Areas.

Mental hygiene is becoming increasingly important. This field is being invaded by charlatans, and the public is being done a disservice. More adequate state controls are needed to protect the public against unqualified practitioners. State medical societies should sponsor the development of suitable mental hygiene clinics where they are needed. The American Medical Association stands ready to assist state societies and other recognized scientific bodies in developing a suitable program of mental hygiene. Although bills have been introduced into Congress on this subject far more consideration and study must be given before any program is enacted.

8. HEALTH EDUCATION: Health Education Programs Administered Through Suitable State and Local Health and Medical Agencies to Inform the People of the Available Facilities and of Their Own Responsibilities in Health Care.

The success of any medical care program in the United States depends on public cooperation and keeping the people informed. Through its Bureau of Health Education the American Medical Association sponsors radio broadcasts, prepares pamphlets for distribution, exhibits on health and arranges for lectures. This is insufficient and each state and county society is urged to develop a Bureau of Health Education for the public, so that the latter may be kept informed not only of facilities available, but of progress in medicine.

9. CHRONIC DISEASES AND THE AGED: Provision of Facilities for Care and Rehabilitation of the Aged and Those with Chronic Disease and Various Other Groups Not Covered by Existing Proposals.

The care of the aged and the chronic invalid will henceforth be an increasing problem. This is because the increased span of life brought about by the decrease in infant mortality and decrease in mortality from infectious disease has resulted in more persons living to the age at which they are subject to the degenerative diseases of middle and old age. Since 1900 the population of the country has doubled, but the number of people over 64 has quadrupled. Paradoxical as it may sound, the reason we have an increasing number of chronic invalids is because these people have received good medical care in youth. The American people need greater provision for the care of chronic illness, but the buildings required need not be on as expensive a scale as those necessary for the care of acute illness. The American Medical Association, the American Public Health Association, the American Hospital Association and the American Public Welfare Association have jointly created a Commission on Chronic Illness which hopes to stimulate the establishment of a program in each state so that the status of the chronically ill may be improved and the continued loss to society because of chronic illness may be prevented.

10. VETERANS' MEDICAL CARE: Maintenance of Existing High Standards of Medical Care for Veterans Including Extension of Facilities Where Need Can Be Shown Where Practical, Care of the Veteran Should Be in His Own Community by a Physician of His Own Choice.

The American Medical Association desires that every citizen receive the highest quality of medical care and recognizes the special consideration owed to the veteran. The American Medical Association is concerned that the veteran receive the highest quality of medical care and believes that he can usually be taken care of to his satisfaction in his own community by a physician of his choice.

11. INDUSTRIAL MEDICINE: Greater Emphasis on the Program of Industrial Medicine, with Increased Safeguards Against Industrial Hazards and Prevention of Accidents Occurring on the Highways, at Home and on the Farm.

The American Medical Association approves the expansion of service in the field of industrial medicine. It invites attention to the fact that accidents are fourth in the list of the causes of death and that automobile accidents are fourth in the list of accidental deaths. It is ready to cooperate with the National Safety Council and other organizations to find means of reducing deaths from accidents.

The Council on Industrial Health of the American Medical Association has set up a permanent conference group with labor and management, to discuss ways and means of extending industrial medicine, accident prevention and health education of workers; to clarify the status of physicians and medical organizations in relation to the entire range of industrial health activity, and to provide a method for the consideration of other aspects of medical service having industrial application.

Professional relations have been established with all the various professional groups involved in accident prevention.

Expanded service has been developed with workmen's compensation, unemployment compensation and rehabilitation.

Industrial medical care plans are increasing; as good medical standards and resources in industry improve they can be of great service in maintaining independence and self determination and in counteracting tendencies toward centralization and control.

12. MEDICAL EDUCATION AND PERSONNEL: Adequate Support with Funds Free from Political Control and Regulation of the Medical and Allied Professional Schools.

Some medical schools are finding it difficult to secure sufficient funds to maintain their standards of training. The American Medical Association would prefer to see medical schools receive the support they require from private philanthropy or local public funds. Unless and until such support is provided, it may be necessary for some medical schools to accept financial aid from the federal government. Such aid, however, must carry with it the assurance of freedom from political control and regulation.

To preserve the freedom and independence of the medical schools it is important that the responsibility for determining which schools may qualify for federal aid should reside in the states. This can be satisfactorily accomplished if the legislation provides that any medical school shall be eligible for financial aid if three fourths of the states through their medical licensing authorities judge the school to be conducting an educational program of sufficiently high quality to warrant the admission of its graduates to their state examinations for medical licensure.

To encourage continued local support of medical education from public and private funds, the formula for allocating federal aid should provide only a limited portion of a school's total budget.

Since medical schools are already increasing enrolments as rapidly as they can expand their facilities, the provision of a relatively large financial premium which might induce certain schools to enroll more students than they could properly accommodate should be avoided.

The formulas for the allocation of all funds should be simple in principle and written into the law. The responsibility and authority of the officials administering the program should be limited to an audit to determine that the funds are employed for the general purposes for which they were granted.

Any federal scholarship program should leave the medical schools entirely free in the selection of their students and should avoid the regimentation of the future careers of the recipients.

It is not the function of the federal government to build and operate medical schools.

The American Medical Association is firmly opposed to the medical care section of S. 1679 and certain other sections of the bill, the reasons for opposition to which have been cited, and to any other bill which lodges primary initiative and control of medical care in a federal bureaucracy or which contains uniform and compulsory features to be established nationally and imposes a direct federal tax on every worker to finance the program. Such plans concentrate further power in the central government. They absorb functions which are much better retained at the local level, and they greatly increase the over-all cost of providing health services. Most important, existing evidence establishes the fact that such plans lead to a widespread and serious deterioration of the quality of medical care.

Government is unable to deliver the services that are promised and which would be paid by the plan set forth in S. 1679; the proposal constitutes an extreme example of compulsory paternalism, impossible of practical operation, and contrary to the principles of American democracy.

The Council on Medical Service of the American Medical Association is holding conferences with cooperatives and various other farm and labor groups. As a result of these conferences progress is definitely being made.

The American Medical Association, through its Board of Trustees, has taken steps toward a conference of representatives of interested groups to consider this program and such elaboration as may seem indicated in the public interest.

To summarize, the American Medical Association supports:

1. The establishment of an independent national health agency with a physician in charge.

2. The establishment of a National Science Foundation.

3. Rapid extension of voluntary hospital and medical care insurance.

4. The establishment of a medical care authority in each state to administer and distribute government funds with adequate representation of interested groups.

5. Extension of hospital and diagnostic facilities under suitable control.

6. Provision for establishment of complete public health coverage for the country with federal aid where the need can be shown with proper remuneration of public health officers and insuring them freedom from political control.

7. Increased safeguards for the public against charlatans in the field of mental hygiene and establishment of necessary mental hygiene clinics.

8. Continued and expanded public health education by the American Medical Association, state and county societies.

9. Furtherance of the care of the chronically ill through support of the Commission on Chronic Illness.

10. Protection of the veteran in his rights to medical care of the highest quality.

11. Continuation of the activities of the Council on Industrial Health and cooperation with the National Safety Council and other organizations in an effort to reduce accidents.

12. Encouragement of local and private support of medical education and use of government aid only if shown absolutely essential and then under suitable controls to protect the independence of medical education.

Finally, opposition to any plan of government controlled medical care compulsory in nature and supported by payroll taxation, with inevitable deterioration of the quality of medical care.

Activities of the Editor

Dr. Henderson presented the following report, which was referred to the Reference Committee on Reports of Board of Trustees and Secretary:

The Board of Trustees is aware of the criticism of the Editor coming from within and from without the profession. The Board recognizes that the public has come to believe that the Editor is spokesman of the Association. The membership undoubtedly wishes the elected officials to speak authoritatively on all matters of medical policy.

Against the time when the Editor retires Dr. Austin Smith has for some months been in training as the Assistant Editor and the talent of the Editor will be retained for the present under the control of the Board of Trustees.

In view of the increasing responsibility of the Editor and reorganization of the department, the Board of Trustees has decided on the following points:

1. The Editor will completely eliminate speaking on all controversial subjects both by platform and by radio. Approval of all speaking engagements will be made by the Executive Committee.

2. Elimination of all interviews, including press conferences, and statements by Dr. Fishbein except on scientific subjects.

3. Editorials on controversial subjects will be supervised by the Executive Committee.

4. Complete information as to these activities will be reported to the members of the House of Delegates.

5. There will be permanent elimination of the diary in Tonics and Sedatives.

6. Plans for the training of a new Editor in an orderly manner, including the retirement of the present Editor, will be formulated.

The Board of Trustees of the American Medical Association announces that plans have been formulated for the retirement of Dr. Morris Fishbein as Editor of THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION at an appropriate time. For thirty-seven years Dr. Fishbein has served the American Medical Association well and faithfully. THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION is an enduring monument to his genius and devotion. His activities have extended far beyond his immediate duties as an editor, and the Board desires to pay tribute to his many accomplishments in other fields.

The Board finds that serious dislocation would result from any sudden replacement. With this in mind a reorganization of the editorial staff is under way so that his retirement, when consummated, will not result unfavorably for ventures of the Association.

Respectfully submitted,

ELMER L. HENDERSON, Chairman.
EDWIN S. HAMILTON, Secretary.
LOUIS H. BAUER.
JOHN H. FITZGIBBON.
JAMES R. MILLER.
WALTER B. MARTIN.
DWIGHT H. MURRAY.
EDWARD J. MCCORMICK.
GUNNAR GUNDERSEN.

(To be continued)

Commission on Chronic Illness

FIRST MEETING HELD IN CHICAGO

The groundwork for a concentrated attack for the first time on all aspects of the problem of chronic illness was laid with the creation in Chicago of a national Commission on Chronic Illness. Organized in the course of a series of meetings and conferences on May 19-20 in the Hotel Sheraton in that city, the new body represents the culmination of a year's work on the part of four national voluntary associations in the medical, public health, hospital and welfare fields to carry out one of the major recommendations made by the National Health Assembly, held in Washington, D. C., in May 1948.

Officers of the new commission are: Leonard W. Mayo, vice president of Western Reserve University in Cleveland, who will serve as chairman; Dr. James R. Miller, a practicing physician in Hartford, Conn., and a member of the Board of Trustees of the American Medical Association, vice chairman, and J. Douglas Colman, executive director of the Maryland Hospital Service in Baltimore, secretary-treasurer.

The work of the group will be guided, between sessions of the full commission, by an executive committee of five members. Members of this committee include, in addition to the officers of the Commission, Dr. Thomas Parran, dean of the School of Public Health of the University of Pittsburgh, and Mrs. Joseph T. Ryerson, who has been an active participant in civic affairs in Chicago for many years.

When its membership is complete, the Commission on Chronic Illness will consist of thirty persons. Up to the present time, twenty-six persons have been designated as members of the group. All of them are prominent citizens, representing broad fields of interest, experience and knowledge, as well as the major geographic sections of the nation.

Included on the present membership roster of the commission, besides Mr. Mayo, Dr. Miller, Mr. Colman, Dr. Parran and Mrs. Ryerson, are: Dr. Creighton Barker, executive secretary, Connecticut State Medical Society, New Haven, Conn.; S. Bruce Black, president of the Liberty Mutual Insurance Company, Boston; Miss Sarah Blanding, president of Vassar College, Poughkeepsie, N. Y.; S. DeWitt Clough, chairman of the Board of Governors, Chicago Heart Association; Dr. Ward Darley, dean of the School of Medicine of the University of Colorado, Denver; Joseph W. Fichter, master of the Ohio State Grange, Columbus; Charles H. Houston, Washington, D. C.; Mrs. R. L. Ireland, former president of the Board of Directors of the Benjamin Rose Institute, Cleveland; Dr. Andrew C. Ivy, vice president of the Chicago Professional Colleges, University of Illinois, Chicago; Dr. Theodore G. Klumpp, president, Winthrop-Stearns, Inc., New York City; Samuel L. Latimer Jr., editor, *Columbia Record* and *Columbia State*, Columbia, S. C.; Dr. Thomas A. McGoldrick, Brooklyn; Karl P. Meister, executive secretary, Board of Hospitals and Homes of the Methodist Church, Chicago; Peter Odegard, chairman of the Department of Political Science of the University of California, Berkeley; Dr. Ellen C. Potter, Deputy Commissioner for Welfare, State Department of Institutions and

Agencies, Trenton, N. J.; Walter Reuther, president, United Automobile Workers of America (C. I. O.), Detroit; Dr. Dean W. Roberts, chief, Bureau of Medical Services, Maryland State Health Department, Baltimore; Dr. Edward S. Rogers, dean of the School of Public Health of the University of California, Berkeley; Mrs. Lucille M. Smith, United States Public Health Service, Washington, D. C.; Dr. Albert W. Snoke, director, Grace-New Haven Community Hospital, New Haven, Conn., and Judge Thomas S. Waxter, director, Department of Public Welfare, Baltimore.

The objectives of the new commission have not been fully formulated. An outline of objectives which had been suggested by the Interim Commission was discussed, and in the light of advice by the technical experts a prospectus of the commission will be issued and will be ready in the near future. A report of the deliberations of the expert advisers and of the commission at its meeting will also be available.

Most of this material will probably be provided by the organization's technical advisors—a group of thirty-two experts selected on the basis of their experience and achievements in fields related to the care of the chronically ill. It will be the function of these persons to advise the commission on professional and technical matters.

On May 19 these technicians assembled in Chicago to engage in preparatory discussions on the commission's aims and activities. They were divided into five groups which met simultaneously throughout the day and explored the areas of activity considered most pertinent to the commission's future work. These areas are: clinical problems (including prevention and research), institutional care (including hospitals and nursing homes), noninstitutional care, rehabilitation and convalescence, and community problems (including organization and administration, provision of services and conducting of studies and investigations).

Discussions of the five technical committees were led, respectively, by Dr. Ernst Boas, specialist in internal medicine, New York; Dr. Jack Masur, director of the projected Clinical Center of the National Institutes of Health, Bethesda, Md.; Dr. Martin Cherkasky, director of the Home Care Program, Montefiore Hospital for Chronic Diseases, New York; Dr. Howard A. Rusk, director of the New York University and Bellevue Hospital rehabilitation centers in New York and associate editor of the *New York Times*, and Dr. Lester Breslow, chief of the Chronic Disease Division, California State Department of Health.

After their committee meetings, the technical advisors met in joint session to consolidate their findings. On May 20, the reports of the technical committees were delivered to the organizing conference by the respective chairmen, after which they were submitted to the commission for consideration. It is on the basis of these reports that the acting executive secretary of the commission will prepare a report on the group's projected activities.

It is expected that, when finally published, the goals of the commission will be broadly similar to the tentative ones listed by the interim group, representing the American Hospital Association, the American Medical Association, the American Public Health Association, and the American Public Welfare Association, that planned and organized the Commission on Chronic Illness.

Briefly stated, these goals are as follows: (1) to modify the prevailing attitude of society that chronic illness is hopeless; to substitute for the prevailing overconcentration on the provision of institutional care, a dynamic program designed as far as possible to prevent chronic illness, to minimize its disabling effects and to restore its victims to a socially useful and economically productive place in the community; (2) to define the problems arising from chronic illness among all age groups, with full realization of its social as well as medical aspects; (3) to coordinate separate programs for specific diseases with a general program designed to meet more effectively the needs common to all chronically ill persons; (4) to clarify relationships among professional groups and agencies working in the field of chronic illness, and (5) to stimulate adoption in every state and community of a well rounded plan for prevention and

control of chronic illness and for the care and rehabilitation of the chronically ill.

Organized as a nonprofit corporation under the laws of Illinois, the Commission on Chronic Illness is appealing to foundations, professional societies and other voluntary national organizations and individuals for funds with which to carry on its work. It has already received donations amounting to \$25,000 in cash—\$20,000 from the American Medical Association and \$2,500 each from the National Society for Crippled Children and Adults and the New York Foundation. Of the other groups which have already been approached for contributions, eight have referred the question to their boards of directors and four have as yet taken no action on the matter.

Besides making a cash contribution to the commission, the American Medical Association has agreed to furnish it with office space in the Association's Chicago headquarters, as well as furniture and equipment, for five years. The National Society for Crippled Children and Adults has offered certain staff services to the commission.

The United States Public Health Service, which has no official connection with the commission, has shown its interest in the work of the body by assigning a member of its staff to serve in the capacity of executive secretary of the commission until such time as the permanent staff director assumes office.

Dr. Leonard A. Scheele, Surgeon General of the Public Health Service, was the featured speaker at a luncheon which took place during the conference on May 20. Pointing out that "everyone has a stake" in the commission's program, he maintained that the federal government's interest in the new organization was a particularly keen one.

He stressed, however, the "voluntary origin" and "democratic structure" of the commission, declaring that the attitude of the Public Health Service toward it could best be expressed in the phrase: "What can we do to help?"

Chronic illness is the nation's "daily disaster," he asserted, and its magnitude, complexity and universal scope make it a problem requiring solution on a public as well as an individual basis.

Society has, up to now, "failed to take enough responsibility for this problem," he declared, adding that implementation of future programs proposed by the commission "undoubtedly will require greater governmental participation." But he emphasized that it will be the commission's function to advise government at all levels "how and to what extent" it should deal with chronic illness.

Earlier in the day on May 20, the conference heard representatives of the four national associations that had been instrumental in organizing the commission describe the stake of their respective organizations in its program. These organizations—the American Hospital Association, the American Medical Association, the American Public Health Association and the American Public Welfare Association—first undertook the steps that eventually led to formation of the commission when they cooperated in setting up a Joint Committee on Chronic Disease late in 1946.

With Dr. Ellen C. Potter, representing the American Public Welfare Association, as chairman, the joint committee did much to stimulate both professional and public interests in the chronic disease problem by publishing, in October 1947, a statement on this subject entitled "Planning for the Chronically Ill." The Committee was staffed, during its two year period of existence, by the American Public Health Association.

Subsequently, at the National Health Assembly in May 1948, the recommendation was made that the joint committee be expanded in membership and geographic representation and that it explore the possibilities of constituting itself a national Commission on Chronic Illness.

In the fall of 1948, the joint committee became an Interim Commission on Chronic Illness, although its membership remained limited to representatives of the four sponsoring organizations. Under the chairmanship of Dr. James R. Miller, the interim commission formulated the plans which led to the conference in Chicago and to creation of the permanent Commission on Chronic Illness.

Besides Dr. Miller, who described the American Medical Association's reasons for welcoming establishment of the com-

mission, the other speakers at the Friday morning session were Dr. Ellen C. Potter, representing the American Public Welfare Association, Dr. Edward S. Rogers, representing the American Public Health Association, and Dr. Albert W. Snoke, representing the American Hospital Association. All four had also been members of the interim commission, and all but Dr. Snoke had represented their organizations on the original Joint Committee on Chronic Disease.

After Dr. Scheele's address at the luncheon meeting on May 20 and the formal installation of Mr. Mayo as chairman of the commission, members of the body and its technical advisors held a closed business meeting, after which the conference adjourned.

At this session, the executive committee of the organization was elected and the budget for the first year's operations approved. Other matters discussed included selection of additional commission members, fund raising, staff needs and plans, and proposed objectives and activities. Deliberations on this last point revolved around the recommendations submitted by the technical advisory groups.

The following persons have been appointed as technical advisors to the Commission on Chronic Illness: Dr. Donald B. Armstrong, second vice president, Health and Welfare, Metropolitan Life Insurance Company, New York; Dr. Daniel G. Blain, medical director, American Psychiatric Association, Washington, D. C.; Dr. E. M. Bluestone, director, Montefiore Hospital for Chronic Diseases, New York; Dr. Boas; Dr. Breslow; Dr. Charles Cameron, medical and scientific director, American Cancer Society, Inc., New York; Dr. Cherkasky; Miss Eleanor Cockerill, associate professor of social case work, School of Applied Social Sciences, University of Pittsburgh; Dr. Nila Covalt, State Veterans Home and Hospital, Rocky Hill, Connecticut; Dr. Thomas D. Dublin, executive director, National Health Council, New York; Miss Ruth Freeman, administrator of nursing, American National Red Cross, Washington, D. C.; Dr. Vlado A. Getting, Massachusetts Commissioner of Health, Boston; Eli Ginzberg, Columbia University, New York; Miss Bell Greve, executive secretary, Cleveland Rehabilitation Center; Miss Ruth Hubbard, president, National Organization for Public Health Nursing, Inc., Philadelphia; Miss Mary Jarrett, New York; Dr. T. Duckett Jones, medical director, Helen Hay Whitney Foundation, New York; Dr. Albert Kaiser, health officer, Department of Public Safety, Health Bureau, Rochester, N. Y.; Dr. Frode Jensen, assistant professor of medicine, University of Colorado Medical School, Denver; Dr. A. B. C. Knudson, chief, Physical Medicine, Rehabilitation Division, Veterans Administration, Washington, D. C.; Dr. Marcus D. Kogel, Commissioner of Hospitals, New York; Dr. William B. Kountz, Division of Gerontology, School of Medicine, Washington University, St. Louis; Dr. Masur; Dr. H. B. Mulholland, Department of Internal Medicine, University of Virginia Hospital, Charlottesville, Va.; Miss Edna Nicholson, director, Central Service for the Chronically Ill, Chicago; Dr. James E. Perkins, managing director, National Tuberculosis Association, New York; George St. J. Perrott, chief, Division of Public Health Methods, United States Public Health Service, Washington, D. C.; Miss Marian Randall, executive director, Visiting Nurse Service of New York; Miss Ollie Randall, consultant on services for the aged, Community Service Society, New York; Dr. Rusk; Dr. Edward S. Stieglitz, Washington, D. C., and Dr. Hart E. Van Riper, medical director, National Foundation for Infantile Paralysis, Inc., New York.

Coming Medical Meetings

- American Association of Railway Surgeons, Chicago, Drake Hotel, June 30-July 2. Dr. Chester C. Guy, 5800 Stony Island Ave., Chicago 37, Secretary.
- Idaho State Medical Association, Sun Valley, June 20-23. Dr. Alfred M. Popma, 220 N. First St., Boise, Secretary.
- Maine Medical Association, Poland Spring, Poland Spring House, June 19-21. Dr. Frederick R. Carter, 142 High St., Portland 3, Secretary.
- Montana State Medical Association, Butte, Aug. 1-4. Dr. Herbert T. Caraway, 115 N. 28th St., Billings, Secretary.
- West Virginia State Medical Association, White Sulphur Springs, The Greenbrier, Aug. 4-6. Mr. Charles Lively, 1031 Quarrier St., Charleston, Executive Secretary.

Washington Letter

(From a Special Correspondent)

June 13, 1949.

Aid to Medical Education Conditionally Approved

During the week ended June 11, public hearings before both the House and Senate subcommittees on health legislation were devoted mainly to testimony by spokesmen for education in medicine and the allied sciences. Among the witnesses were Drs. Joseph C. Hinsy, Herman G. Weiskotten, Harvey B. Stone, James S. Simmons, Gaylord Anderson, Donald G. Anderson, Dean F. Smiley, William Harvey Perkins, Carlyle Jacobsen, Ira Hiscock, Ward Darley, George P. Berry, Victor Johnson and Walter A. Bloedorn.

The gist of their presentations was that, while federal financial aid to professional education is not something to be desired, the worsening economic plight of training institutions leaves little choice; hence such assistance would be acceptable provided that academic freedom and other safeguards are guaranteed by legislation.

"There is a definite need now for federal aid to medical education provided that the educational and administrative policies can continue to rest in the hands of the medical colleges without political inference and with the maintenance of academic freedom," said Dr. Hinsy, testifying as chairman of the executive council, Association of American Medical Colleges.

Points stressed by Drs. Weiskotten and Donald G. Anderson, representing the American Medical Association Council on Medical Education and Hospitals, were: Insufficiency of present production of physicians has been exaggerated in many quarters; medical colleges need additional funds to expand faculties, raise salaries of their members and improve physical facilities; outside interference must be guarded against. "While additional funds could be put to good use by all medical schools and are urgently needed by some, all medical educators are agreed that the sacrifice of academic freedom would be too high a price to pay for such funds. Although many improvements are possible in medical education, the standards of medical education in the United States today are high. Furthermore, medical education is in safe hands. No other professional group has assumed responsibility more effectively in the education of its members than have the physicians of our nation. Medical educators have emphatically indicated that they do not wish federal support, if federal officials are to be empowered to regulate, directly or indirectly, the curriculum, the administration or the admission policies of the medical schools."

New Bill on Federal Chiropractors

The chiropractic lobby always sees to it that in every session of Congress there is at least one bill furthering their interests introduced in both Senate and House. The latest to be filed is S. 2025, sponsored by Senator Pepper of Florida. It would authorize appointment of chiropractors in the Veterans Administration. It was introduced June 8 and referred to the Labor and Public Welfare Committee for consideration by the health subcommittee headed by Senator Murray. That it will be pigeonholed may be regarded as virtually certain. A similar measure, sponsored by Representative Huber, of Ohio, has been sidetracked by the House Veterans Committee.

Keefe Describes Socialistic Pattern of Health Insurance

The floor of the House of Representatives was the scene on June 2 of a fervent address by Representative Keefe of Wisconsin in which he quoted from writings by J. Donald Kingsley, Assistant Federal Security Administrator, to show the socialistic influence on the campaign for national compulsory health insurance. Representative Keefe said that Mr. Kingsley, in his book "Strategy for Democracy," published in 1942 with David W. Petegorsky as co-author, wrote:

"We can therefore do little more now than to take effective steps to recruit and train a sufficient number (of doctors and nurses) and to assure them through socialized medicine a career."

"Is it not perfectly clear," the Wisconsin Republican stated on the House floor, "therefore, that in line with the whole grad-

ualist policy of social revolution expounded by the authors in this book that they seek not to prevent ultimate socialization of medicine, and nationalization of hospital facilities, but in reality seek by this first step to achieve their ultimate goal. It therefore seems to me to be quite important in view of the past record and background of those who are behind the scenes in developing these various and sundry programs that we make thorough inquiry into their past advocacy and relationships in order to determine whether or not this first step is in reality another movement in the direction of a pure socialist state."

Socialized Medicine Fiercely Debated on House Floor

A heated debate, strongly along partisan lines, on the subject of President Truman's proposed compulsory health insurance program took place on the House floor on May 27. Principal participants were House Majority Leader McCormack and Representative Biemiller, Democrats, and Representatives Keefe and Hoffman (Michigan), Republicans. The debate was precipitated by a speech by Representative Biemiller in which he cited testimony presented at the health bill hearings as evidence that the President does not intend to socialize American medicine.

When Representative Keefe voiced exception, the majority leader observed that the late Senator Robert M. La Follette was branded as a sinister figure because of the social reforms he advocated. Representative Hoffman, a strong opponent of most Truman policies, interjected the opinion that if there are so many Americans who cannot afford adequate medical care it is because of the "Democratic-New Deal Party."

Keefe's implication that the Administration seeks nationalization of hospitals and socialization of medicine brought a retort by McCormack that "these are coined phrases for the purpose of deceiving the people and creating an impression that something sinister, something inimical to the best interests of the people is involved in the recommendations made by President Truman." The Democratic leader said he respects the position taken by opponents of compulsory health insurance, adding: "But when they try to impugn the motives of those who honestly are endeavoring to seek a solution . . . there is no contribution being made."

Antivivisectionists Oppose Experimentation Bill

National attention was focused on public hearings conducted May 24 and 25 before a special Senate committee on S. 1703, which would authorize transfer of unclaimed animals from the District of Columbia dog pound to medical schools and other institutions. Among those appearing to support passage of the bill were Dr. Alfred Blalock, of Baltimore; Dr. George C. Ruhland, District of Columbia health officer; Representative A. L. Miller (Republican, Nebraska), who is a doctor of medicine; Dr. Charles F. Morgan, of Georgetown University School of Medicine, and Dr. Norman H. Topping, assistant director of the National Institutes of Health. Individuals and representatives of various societies urged defeat of the bill on the ground that it condones cruelty to animals.

National Science Foundation Bill Advances

The Priest subcommittee of the House has favorably reported a slightly revised National Science Foundation bill, which is expected to be approved by the House Interstate and Foreign Commerce Committee early in June and then forwarded to the floor for final action. The new measure, formally introduced May 24 as H. R. 4846, differs only in minor details from the bill that has already passed the Senate. It provides for establishment of four divisions within the foundation: Medical Research; Mathematical, Physical and Engineering Sciences; Biological Sciences, and Scientific Personnel and Education. Establishment of special commissions, as for poliomyelitis, is left to the discretion and judgment of the foundation.

Bill Authorizes Medical Aid for Veterans' Children

Children—regardless of age—of World War II veterans who died of service-connected injury or disease would be made eligible for government medical, dental, hospital and domiciliary care under provisions of a bill that has been introduced in the House by Representative Hagen of Minnesota. The measure was referred to the Veterans Committee.

GOVERNMENT SERVICES

SECRETARY OF DEFENSE

APPOINTMENT OF DRS. RAYMOND ALLEN AND RICHARD MEILING

Secretary of Defense Johnson has announced the appointment of Dr. Raymond B. Allen, President of the University of Washington, Seattle, as Director of Medical Services for the National Military Establishment, and of Dr. Richard L. Meiling of Columbus, Ohio, as Deputy Director. They will assume their duties in the Office of the Secretary of Defense about July 1. In announcing the appointments, Secretary Johnson said, "I am confident that with a Director and Deputy Director of such high caliber and with the aid and counsel of the Armed Forces Medical Advisory Committee, great progress will be made toward the objectives of a more unified and effective medical service for the Armed Forces."

Dr. Allen will continue as Director of Medical Services for three months to initiate organization of the recently formed National Military Establishment Medical Services Division, which will coordinate operation of the medical services of the three military departments and related National Military Establishment agencies. On October 1 he will return to the University of Washington, and Dr. Meiling will be appointed Director of Medical Services.

Dr. Allen was one of the original members of the Armed Forces Medical Advisory Committee when it was formed last December. He also was a member of the National Security Organization of the Commission on Organization of the Executive Branch of the Government (Hoover Commission), which made an intensive study of the military medical services and recommended establishment of a Medical Advisory Board in the Office of the Secretary of Defense. In addition, he is Chairman of the Special Committee on Civil Defense of the Research and Development Board.

He was born in North Dakota and from 1928 to 1930 was in general medical practice in Minot. He was a fellow of the

Mayo Foundation, 1930-1933; associate dean in charge of graduate studies, College of Physicians and Surgeons, Columbia University, 1934-1936; associate director, New York Post-Graduate Medical School and Hospital, Columbia University, 1933-1936; dean, Wayne University College of Medicine, 1936-1939; executive dean, Chicago Colleges of the University of Illinois (medicine, dentistry and pharmacy), September 1930-1946; dean, College of Medicine, University of Illinois, September 1943-1946.

Dr. Meiling was the Air Evacuation Officer, Headquarters, Army Air Force, in 1942. He then had charge of planning, organization and administration for air evacuation of patients from battlefields and stations to hospitals in the United States. He was born in Springfield, Ohio, and has been assistant professor, Department of Obstetrics and Gynecology, College of Medicine, Ohio State University, Columbus. He was graduated from the Army-Air Force School of Aviation Medicine and from the Command and General Staff School in 1942. He is a specialist certified by the American Board of Obstetrics and Gynecology and a member of the Aero Medical Association, the Royal Society of Medicine, London, England, the Association for Study of Internal Secretion, the American Medical Association, the Columbus Surgical Society, and the Columbus Obstetric and Gynecologic Society.

The duties of the Director of Medical Services are: 1. Establishment and control of general policies, standards and programs for the medical services of the three military departments and appropriate agencies of the National Military Establishment. 2. Exercise general direction, authority, and control over administration and utilization of personnel and facilities of the medical services of such departments and agencies through the heads thereof. 3. Such other duties with respect to the medical services of the National Military Establishment as the Secretary of Defense may direct.

ARMY

AVAILABILITY OF MEDICAL RESERVES BEING DETERMINED

Reserve officers of the Army Medical Corps have been asked by Major General R. W. Bliss, the Surgeon General of the Army, to signify their availability for short periods of service ranging from one to twenty-nine days a month, in order to help relieve the critical shortages of professional personnel.

If response to the questionnaires is sufficiently encouraging, reserve officers may volunteer for such short terms of service and perform professional duties at hospitals and medical installations located in their geographic areas.

"The Army Medical Department is faced with an unparalleled peacetime emergency in carrying out our medical requirements satisfactorily," General Bliss stated. "In time of military emergency, it is the reserve officer upon whom the great burden of effort and sacrifice has fallen. Today, we are again turning to reserve officers of the Medical Department for help."

INVITATIONS TO MEDICAL STUDENTS

The Surgeon General has sent letters to about 6,000 junior medical students telling them of the opportunities for internships in the Army Medical Department and inviting them to visit Army general hospitals this summer in anticipation of applying for internships for training beginning July 1, 1950.

Each year the Army Medical Department offers internships to about three hundred graduates of approved medical schools. The selected candidates are commissioned in the Medical Reserve Corps, called to active duty and assigned to Army general hospitals for a one year rotating internship commencing each July 1. Each applicant must be a man not less than 21 nor more than 32 years of age, must meet the physical require-

ments and be a citizen of the United States. Applications must be received October 18-25, 1949, in order to receive consideration, and must be forwarded through the dean of the applicant's medical school. Selections will be announced by telegram, Nov. 15, 1949. Complete information may be secured from the medical professor of military science and tactics at the nearest medical school having a Medical Reserve Officers Training Corps unit, or by writing direct to the Surgeon General, Washington, D. C.

SURVEY OF RESERVE OFFICERS

The Surgeon General has sent a questionnaire to reserve Army medical officers to determine their availability for short periods of duty ranging from one to twenty-nine days a month and for longer duty tours. Their response to the questionnaires will determine the number of physicians available for short or longer periods of duty to relieve the Army's critical shortage occasioned by the imminent separation of medical officers trained under the Army Specialized Training Program. The Surgeon General stated, "The Army Medical Department is faced with an unparalleled peacetime emergency in carrying out medical requirements satisfactorily. We are again turning to Reserve Officers of the Medical Department for help."

PERSONAL

Majors Walton M. Edwards and Loren F. Parmley Jr. and Capt. John W. Sumner of the Medical Corps have been selected for advanced training at the University of Colorado (problems of newborn infants), University of Wisconsin (internal medicine) and University of Illinois, Chicago (electroencephalography), respectively.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ALABAMA

Hospital News.—Ground breaking ceremonies were held June 4 for the new 80 bed annex of St. Vincent's Hospital in Birmingham, which will be constructed under the Hill-Burton Act. St. Jude's Hospital, a 152 bed general hospital for Negroes in Montgomery; a 50 bed general facility, DeKalb County Hospital at Ft. Payne; Etowah County Health Center at Gadsden, and the 24 bed general Perry County Hospital in Marion are expected to get under way in June.

University Retirements.—The Medical College of Alabama will lose three of its faculty members because they have reached the retirement age. Following June graduation exercises, Drs. James S. McLester and James M. Mason, professors of medicine and surgery, respectively, both of Birmingham, and Dr. Stuart Graves, Tuscaloosa, dean emeritus and director of admissions for the school will retire. Dr. McLester has served as professor since 1920. Dr. Mason was named professor of surgery in 1945. Dr. Graves was dean of the two year school at Tuscaloosa for six years; when the school was moved to Birmingham in 1945 and offered a four year curriculum, he became director of admissions.

FLORIDA

State Medical Election.—Officers of the Florida Medical Association for the coming year are: Drs. Walter C. Payne, Pensacola, president; Herbert E. White, St. Augustine, president elect, and Robert B. McIver, Jacksonville, secretary-treasurer.

County Society Establishes Registry.—Physicians of the Hillsborough County Medical Society have established a registry to enable callers to locate physicians for emergency duty or to find their own doctors when they are not available at usual places. It will give twenty-four hour service.

ILLINOIS

Dr. Steffen to Lecture in Europe.—Dr. Curt Steffen, Rockford, has accepted invitations to give a series of lectures on American medicine at the University of Cologne and the University of Hamburg in the British zone of Germany. He will also speak on "The Health Policy in the United States" at the annual assembly of medical sociologists and professors from German universities in Cologne the first part of July. Dr. Steffen formerly was connected with the university in Hamburg.

Illinois Association of Medical Health Officers.—The full time medical health officers in Illinois, at the April meeting of the Illinois Public Health Association, reactivated the Illinois Association of Medical Health Officers, which had been discontinued some years ago after it merged with the Illinois Public Health Association. The association makes eligible for membership all full time medical health officers, school health physicians, professors of public health and preventive medicine, and other medical men with public health occupation. The following officers were elected: Drs. Winston H. Tucker, Evanston, president; Samuel N. Mallison, Champaign, vice president, and Norman J. Rose, Highland, secretary-treasurer. Drs. Arlington Ailes, LaSalle; Albert C. Baxter, Springfield, and Pierre A. Steele, Decatur, were elected to the executive committee.

Chicago

St. Luke's, Alumni Day.—The annual Staff and Intern Alumni Day of St. Luke's Hospital medical staff will be held June 22 at the Lake Geneva Country Club. Golf, tennis and boating will be enjoyed. For reservations, telephone Dr. Willis G. Diefenbaugh, secretary of the alumni association, at Harrison 7-5000 or Harrison 7-1500.

Borden Undergraduate Award.—Edward H. Lanphier of Dixon, a senior at the University of Illinois College of Medicine, has been named winner of the Borden Undergraduate Research Award for 1949. The award represents a gift of \$500. Originality and thoroughness of research are of primary consideration in selecting the winner for the award established by the Borden Company Foundation, Inc. Mr. Lanphier, who will receive his Doctor of Medicine degree from the University of Illinois this month, has been doing research in the department of pharmacology since 1946.

Grant for Virus Studies.—The board of directors of the Hektoen Institute for Medical Research of the Cook County Hospital has announced the receipt of a grant of \$13,800 from the Dr. Leonard H. and Louis Weissman Medical Research Foundation on June 1, to be used for special virus studies, conducted under the supervision of Dr. Oscar Felsenfeld, director of bacteriology and virology.

KENTUCKY

Mental Hospital Building Campaign.—Solicitation of additional funds amounting to \$1,000,000 for Our Lady of Peace Hospital, Louisville, has been started. The bed capacity of the hospital for mental and nervous diseases has been increased from 108 to 150. The total cost of the hospital now under construction will be about \$2,100,000, \$682,734 of which has been allocated by the federal government.

Poliomyelitis Hospital Committee.—A subcommittee to the Permanent Planning Poliomyelitis Committee has been appointed to work out a plan to take care of the hospital facilities for any possible epidemic of poliomyelitis. Dr. Charles F. Wood, Louisville, director of poliomyelitis clinics in the state, heads this subcommittee. Hospital space will be allotted according to areas, and the committee will decide which hospitals should receive the overflow after certain ones have reached their capacities. Other members of the committee are Dr. Alexander J. Alexander, Lexington, representing pediatricians, and Dr. Tracy Jones, Harlan, representing the state health department.

LOUISIANA

Society News.—The New Orleans Graduate Medical Assembly installed Dr. Curtis H. Tyrone as president and chose Drs. Edwin H. Lawson president elect, Woodard D. Beacham secretary and H. Ashton Thomas treasurer. The 1950 meeting will be held March 6-9 at the Municipal Auditorium.

State Medical Election.—Louisiana State Medical Society officers for the coming year, selected at the annual meeting May 5-7 are: Drs. Edwin H. Lawson, New Orleans, president, and George W. Wright, Monroe, president elect. Dr. James Q. Graves, Monroe, was selected delegate to the American Medical Association, 1950-1951, with Dr. Arthur A. Herold, Shreveport, as alternate. Baton Rouge was chosen as the 1950 meeting place.

NEW JERSEY

Society News.—The New Jersey Proctologic Society has chosen the following officers: Dr. Julius E. Gerendasy, Elizabeth, president; Dr. Urban R. Finnerty, Montclair, secretary, and Dr. Saul Zager, Newark, treasurer.

State Medical Election.—The Medical Society of New Jersey at its annual meeting in April installed Dr. James F. Norton, Jersey City, as president, Drs. Aldrich C. Crowe, Ocean City, president elect, Earl L. Wood, Newark, secretary, and George J. Young, Morristown, treasurer.

Foundation Honors 50 Year Practitioner.—The associates and friends of Dr. Max Danzis, Newark, have established the Max Danzis Medical Education Foundation in honor of his fiftieth year of practice. The foundation will create scholarships to enable deserving persons to further their medical knowledge and skill, establish residencies and provide for research problems and related projects. The officers of the foundation are Drs. Charles M. Robbins, Newark, president; Julius Newman, Newark, secretary, and Herman S. Nash, Newark, treasurer.

NEW YORK

Conference on Public Health.—Lake Placid has been chosen by the state department of health and the State Health Officers Association as the location for the Annual Conference of Health Officers and Public Health Nurses, June 20-23. The Association of School Physicians will hold its annual meeting on the opening day, in conjunction with the general conference of public health administrators.

Child Guidance Clinic Teams.—Two new child guidance clinic teams will be set up by the New York State Department of Mental Hygiene. The team operating in Suffolk County was scheduled to begin work June 1 under the direction of Dr. Joseph W. Haley, formerly supervising psychiatrist at Kings Park State Hospital. The Nassau County team, to begin operation September 1, will be under the supervision of Dr. Paul G. Edgar, senior psychiatrist at Manhattan State Hospital. The state department at present has eight traveling child guidance clinic teams, each consisting of a psychiatrist, a psychologist and a psychiatric social worker. The clinic teams, operating

under the department's Division of Prevention, maintain regular schedules in designated cities and towns. During the past year more than 7,000 children were served through over 1,000 child guidance clinics held in 132 communities. The Suffolk County child guidance team has established headquarters at Riverhead in a suite of rooms furnished by the Suffolk County Health Department. Clinics will be held every Tuesday. Clinics will be held each Monday at Toaz Junior High School in Huntington, each Wednesday at Our Lady of Perpetual Help School at Lindenhurst. On the first and third Thursday of each month a clinic will be conducted in rooms furnished by the County Department of Health at Islip, and on the second and fourth Thursday at the River Avenue School in Patchogue. The department is currently engaged in a survey which aims to locate and evaluate these services on a statewide basis.

Community Nutrition Institute.—The third Community Nutrition Institute sponsored by the New York State Department of Health and the College of Home Economics, Syracuse University, will be held on the University Campus, July 5-16. It is open to physicians, nutritionists, public health nurses and college teachers of nutrition. The subjects for discussions are What a Community Expects of the Nutritionist, Services of the Nutritionist to the Community, Nutrition Surveys, Role of Emotions in the Maintenance of Health, Method of Teaching Nutrition to Children, Advances in the Role of Fat and Carbohydrate and Protein in Nutrition, and Diabetes and Care of the Diabetic Patient. Total cost of the institute including board and room will be \$100. Address inquiries to Dr. Anne Bourquin, College of Home Economics, Syracuse University, Syracuse, N. Y.

New York City

Kings County Hospital.—Cornerstone ceremonies for the ten story 570 bed Kings County Tuberculosis and Chronic Disease Hospital in Brooklyn, a part of the Kings County Hospital Medical Center, were held June 10 with Mayor William O'Dwyer as principal speaker. The hospital, estimated to cost \$7,300,000 and scheduled for completion in the summer of 1950, is one of the several municipal hospital projects now under construction. The others are the Francis Delafield Hospital, the James Ewing Hospital and the Bird S. Coler Chronic Disease Hospital and Home.

Cardiac Clinic for Industry.—The cardiac clinic of the New York University-Bellevue Medical Center has set up a work classification unit to determine the type of occupation persons with heart disease may safely hold in business and industry. The survey, which will take more than a year, will be conducted among the outpatients attending the Bellevue Hospital Thursday Night Cardiac Clinic. The unit is under the direction of Dr. Leonard J. Goldwater, and the work is being underwritten by the New York Heart Association. Physicians representing two leading business firms are contributing their time: Drs. John H. Iselin Jr., of Consolidated Edison and the Chase National Bank, and Sigmund Falk, New York, of the Emerson Radio Corporation.

Increase in New Tuberculosis Cases.—According to the statistician for the New York Tuberculosis and Health Association, health department figures for the first three months of 1949 show a 26 per cent increase in the number of new cases of tuberculosis reported over the same three periods of 1948. There were 2,476 new cases reported this year up to April 1 as compared with 1,959 for the first three months last year. There was, however, for the first quarter of this year, a decrease in the number of deaths from tuberculosis. In Manhattan, the most crowded borough, the rise in tuberculosis was at a greater rate than for the city as a whole, more than half of the new cases being reported from that borough. On April 1 of this year there were 6,165 patients in the city's tuberculosis hospitals compared with 5,236 on the same day a year ago, an increase of 18 per cent. Tuberculosis clinics likewise report a 12 per cent increase in the number of patients treated.

NORTH CAROLINA

State Medical Election.—The Medical Society of the State of North Carolina at its annual meeting installed Dr. G. Westbrook Murphy, Asheville, as president, and elected Drs. Roscoe D. McMillan, Red Springs, president elect and Millard D. Hill, Raleigh, secretary-treasurer.

State Heart Association.—Dr. Robert L. McMillan, associate professor of clinical medicine, Bowman Gray School of Medicine of Wake Forest College, Winston-Salem, was elected president of the North Carolina Heart Association at a recent organizational meeting in Pinehurst. Dr. George T. Harrell Jr., head of the department of internal medicine, was named secretary. The association will sponsor a symposium on heart disease for doctors and laymen at the school in the fall.

Funds for Local Health Work.—The North Carolina State Board of Health has allocated the \$800,000 annual fund to aid local health work as follows: \$3,000 a year to each of the state's 100 counties; \$500 in addition for each county conducting a twenty week oral hygiene program; \$250 for each county conducting a ten week oral hygiene program and 40 cents for each school child, based on average daily attendance in each health unit. It was decided that the \$175,000 venereal diseases fund will be apportioned as in the past, but an additional fund will be allocated on the basis of population. This will amount to about 5 to 8 cents per capita.

OHIO

Personals.—Dr. Allyn B. Choate of Charlotte recently became president of the North Carolina Mental Hygiene Society for a two year term.—Dr. Everett F. Conlogue, superintendent since 1943 of the Stillwater Sanatorium, Dayton, is the newly elected president of the Ohio Tuberculosis Hospital Association.

Gift to Western Reserve.—The Louis D. Beaumont Foundation, Cleveland, has made a gift of \$100,000 to Western Reserve University School of Medicine, Cleveland, with no restriction on its use. According to Dr. Joseph T. Wearn, dean, the money will be used to pay better salaries to faculty members.

PENNSYLVANIA

Joint Meeting.—The Reading Eye, Ear, Nose and Throat Society held a joint meeting with the Reading Dental Society May 18. Dr. S. Gordon Castigliano, Philadelphia, spoke on the "Oral Cavity—the Physician and the Dentist," and Dr. Benjamin F. Souders, Reading, on "Ocular Manifestations of Tropical Diseases and Their Treatment."

Honor Secretary for Long Service.—The Bradford County Medical Society presented Dr. Stanley D. Conklin, Sayre, Pa., with a gold watch and chain properly inscribed in appreciation of twenty-five years of service as society secretary. The Medical Society of the State of Pennsylvania sent congratulations.

Philadelphia

Assistance for Tuberculosis Patients.—The William B. Lake Foundation has been established to provide assistance to citizens of Philadelphia and its environs who are suffering from pulmonary tuberculosis. Applicants must be deserving members of the "upper middle class" of society who do not normally receive aid and who are not able to pay the cost of proper hospitalization and care. Physicians should make application for their patients to the William B. Lake Foundation, Ralph D. Strong, secretary, 135 B. Broad Street, Philadelphia 9.

Alumni Seminar.—The annual Alumni Postgraduate Seminar of the Hahnemann Medical College and Hospital will be held June 22-23. On Wednesday morning the discussions will be limited to obstetrics and gynecology; in the afternoon to pediatrics. In the evening the main address will be given by Dr. Pascal F. Lucchesi, medical director of the Philadelphia General Hospital. On Thursday the morning sessions will be devoted to problems of general surgery and the afternoon sessions to those of internal medicine. The Alumni Banquet will be held that evening at 7 p. m. in the Benjamin Franklin Hotel.

Personals.—Carl D. Anderson, Ph.D., scientist and president of the Society of Sigma Xi, and Dr. William T. Taltafiero of the University of Chicago, will be the recipients of the honorary degree of Doctor of Laws at ceremonies attending the installation of the hundred and second chapter of Sigma Xi at Temple University on April 28.—Dr. John Yeatts Howson of Wayne is the recipient of the first annual citation given by the Philadelphia Division of the American Cancer Society for outstanding work in cancer control. The citation was "for outstanding leadership in organizing and conducting the Committee on Diagnostic Delay in Pelvic Cancer," which was established by the Obstetrical Society of Philadelphia and the Philadelphia County Medical Society in 1945.

New Heart Clinic.—A gift of \$250,000 for the construction of a new heart clinic and an additional \$25,000 to extend for two years an original grant made in 1940 for cancer research have been presented to the University of Pennsylvania by the Penn Mutual Life Insurance Company. The new clinic, to be known as the Penn Mutual Heart Clinic for the Study and Treatment of Cardiovascular Diseases, will be part of the outpatient building of the Thomas Sovereign Gates Memorial Pavilion in the university's proposed new medical center. The late Dr. Gates served as president of the university and was a trustee of Penn Mutual for more than twenty-two years before his death in 1948. The clinic will consist of one half floor in the center, a total of twenty-nine rooms which will provide enlarged facilities for both treatment and research.

Pittsburgh

New Graduate School Appointments.—The Graduate School of Public Health, University of Pittsburgh, has announced the following faculty appointments:

Dr. James A. Crabtree, a member of the U. S. Public Health Service since 1938, has been named head of the department of public health practice. He was in public health work in Tennessee from 1926 to 1934, when he became associate director of health, Tennessee Valley Authority. He served with the U. S. Public Health Service initially as epidemiologist in the National Cancer Institute; subsequently as executive assistant to the Surgeon General, executive secretary of the Health and Medical Committee of the Council of National Defense, consultant to the War Production Board and to the Office of Lend-Lease Administration, acting director of health for the United Nations Relief and Rehabilitation Association, Deputy Surgeon General and director of the Medical Division, National Security Resources Board.

Antonio Ciocco, D.Sc., also of the U. S. Public Health Service, has been appointed head of the department of biostatistics. Dr. Ciocco, a graduate of the University of Naples and of Johns Hopkins University, Baltimore, was associate in otology, Johns Hopkins School of Medicine 1930-1936, and associate in biology at the school of Hygiene and Public Health 1937-1939. Since then he has been biometrician, public health administrator and deputy chief of the Division of Public Health Methods, U. S. Public Health Service.

Other appointments include Theodore F. Hatch, research director, Industrial Hygiene Foundation, Pittsburgh, professor of industrial health engineering, and Paul M. Densen, D.Sc., chief of medical research statistics Division, Department of Medicine and Surgery, Veterans Administration, associate professor of biostatistics.

TENNESSEE

Fifty Year Practitioners.—Certificates and fifty year buttons for a half century of service were presented last month to 13 physicians at a meeting of the Nashville Academy of Medicine. Presentations were made by Dr. Nathaniel S. Shofner, president of the Tennessee State Medical Association.

Cancer Finding Program.—The State Public Health Council on May 12 appointed a committee to work out details of a new cancer finding program of the Tennessee Department of Public Health. The state legislature has appropriated \$50,000 a year for the program; \$56,000 of additional federal funds are reported available also. The committee will recommend a method of paying for services for the cancer detection program and recommend the location of clinics. Drs. Robert N. Buchanan Jr., Nashville; Cecil B. Tucker, Nashville, and Robert H. Hutcheson, Nashville, state department commissioner, were named to the committee which will work with the Tennessee Division of the American Cancer Society. Plans will deal with the establishment of a cancer service within the Division of Preventable Diseases on July 1.

TEXAS

University Appointment.—Dr. Joe C. Rude, of the Veterans Administration Hospital, Oklahoma City, has accepted appointment as professor of radiology at the University of Texas Medical Branch, Galveston.

Gorgas Memorial Plaque.—A memorial plaque honoring Major General William C. Gorgas, pioneer fighter against yellow fever, was unveiled recently in Brownsville by the general's granddaughter, Mrs. P. A. Hofheinz, Houston. The plaque, presented by the Brownsville Historical Association, will be installed in the Brownsville Junior College Administration Building, which was formerly the hospital for Fort Brown, where Gorgas was an Army physician in 1880.

Industry Builds a Hospital.—A million dollar general hospital built by a nonprofit corporation founded by local industries was opened May 7 in Lufkin. More than \$1,000,000 was contributed by fourteen business firms and industries. The 102 bed hospital will serve 4,000 employees of the sponsoring companies for whom it is primarily intended, although it can accommodate the citizens of Angelina County during normal times. Only unusual circumstances will necessitate giving preference to employees of the companies. Governor Beauford Jester gave the dedicatory address. Dr. U. Gail Medford, Lufkin, will be chief of staff.

Ashbel Smith, M.D.—1805-1886.—A feature of the Graduation Exercises of the University of Texas Medical Branch, Galveston, June 10, was the unveiling of a bronze head of Ashbel Smith, M.D. (1805-1886), Surgeon General of the Republic of Texas and first chairman of the Board of

Regents of the University of Texas. Dr. Smith received his M.D. degree from Yale in 1825 and studied in Paris. He rendered heroic service in the yellow fever epidemic in Galveston in 1839, established the first hospital in Houston in Texas during the war for independence, and was the first Minister of the Republic of Texas to England and France. During the Civil War Dr. Smith raised the Second Texas Infantry and was its commander. He was a member of the state legislature and arranged for the establishment of the University of Texas and served as dean of Texas Medical College in Galveston before the establishment of the Medical Branch.

VERMONT

Medical History Club.—A history club has been organized by students and faculty of the University of Vermont College of Medicine at Burlington. Two meetings have been held this year. The name adopted was "Surgeons of the Short and Long Robe." Four meetings are planned for the academic year 1949-1950. There is a backlog of available papers and an apparent enthusiasm on the part of both students and faculty.

VIRGINIA

County Health Service Endowed.—A privately endowed county health service was launched at Victoria May 21. Governor Tuck and Colgate W. Darden Jr., president of the University of Virginia, were the principal speakers. The two story colonial brick building which will house the Lunenburg Health Service, Inc., is financed by a \$250,000 trust fund created by Robert Miles Williams, owner of the Victoria Supply Company and a victim of infantile paralysis. The nonprofit corporation will complement the work of the state public health unit to be established in Lunenburg County July 1. The structure includes clinic rooms, laboratory and rooms for emergency patients furnished by private citizens in the county and given to the foundation. The clinics will have services of three physicians and two dentists.

WASHINGTON

Community Observes Dr. Hood Day.—The town of Ferndale paid its respects to Dr. Charles S. Hood May 10. The observance took the form of an open house at his home in the afternoon and a dinner sponsored by the Lions Club in the evening. The high school band serenaded Dr. Hood, who has been Ferndale's physician for forty-seven years.

Dr. Ripley Heads Psychiatric Department.—First head of the new psychiatric department of the University of Washington School of Medicine, Seattle, is Dr. Herbert S. Ripley. He has been an assistant professor of psychiatry at Cornell University Medical College, New York. A graduate of Harvard Medical School, Boston, 1933, Dr. Ripley has taught at Cornell University since 1935 except for the war years, when he was a consulting psychiatrist in the South Pacific with the rank of lieutenant colonel.

HAWAII

Returns as Chief of Tuberculosis Control.—Dr. Robert H. Marks has returned to his position as head of the Bureau of Tuberculosis Control of the Territorial Department of Health after a year's absence. He has been serving as director of the Jefferson Tuberculosis Sanatorium in Birmingham, Ala. Dr. Maurice L. Brodsky, acting chief of the bureau, who was on loan to the territory from the U. S. Public Health Service, returned to the mainland April 21.

Hawaii Proposed as Clearing House on Epidemiology.—A formal proposal to make Honolulu the "intelligence center" for epidemiologic information for the Pacific area has been advanced by Karl F. Meyer, Ph.D., director of the Hooper Foundation of San Francisco, affiliated with the University of California. Dr. Meyer offered a resolution to this effect at the Pacific Science Congress at Auckland, New Zealand, earlier this year. It was approved and has been referred to the Pacific Science Board for consideration. In a stop-off at Honolulu Dr. Meyer discussed the idea with officials of the Territorial Health Department. "With existing fast transportation," he said, "the disease of one area in the Pacific can become the epidemic of another area within a few days. Hawaii, strategically located, should be the clearing house for information on epidemiology, as Singapore was before the war under the League of Nations." He suggested, however, that the present proposal be strictly a Pacific matter, not affiliated with the United Nations. Among the outstanding problems cited by Dr. Meyer as requiring attention were tuberculosis among all the natives, filarial infections in Samoa and the Fijis, leprosy in New Caledonia and widespread tooth decay. He suggested as one project for the center the standardization of leprosy treatment.

GENERAL

International Meeting on Ophthalmology.—The Pan-American Association of Ophthalmology and the National Society for the Prevention of Blindness will hold a joint meeting at the Floridian Hotel, Miami Beach, Fla., March 26-30, 1950. It will be the annual meeting of the national society and an interim meeting for the Pan-American association.

Diabetes Detection Drive.—The American Diabetes Association reports that the diabetes detection drive, inaugurated by the association during Diabetes Week, December 6-12, 1948, covered 145,960 patients including 37,243 children. The program is continuing. Local committees of doctors from county medical societies provided for free testing of urine of patients either in the doctors' offices or in the detection centers.

American Board Meeting.—The American Board of Obstetrics and Gynecology at its annual session in Chicago May 8-14 elected Drs. Walter T. Dannreuther, New York, president; Paul Titus, Pittsburgh, secretary-treasurer, and Robert L. Faulkner, Cleveland, assistant secretary. At this examination meeting 236 candidates were certified. The next annual examination meeting will be held at the Hotel Shelburne in Atlantic City, N. J., May 21-28, 1950, immediately following the International Congress on Obstetrics and Gynecology in New York.

Journal on Fertility and Sterility.—The American Society for the Study of Sterility will publish a new journal, *Fertility and Sterility*, to be devoted to original articles, reviews and abstracts. Dr. Pendleton Tompkins, San Francisco, is editor, and Dr. Abner I. Weisman, New York, managing editor. The advisory board comprises twenty distinguished authorities. Original papers on relevant topics should be addressed to Dr. Tompkins, 450 Sutter Street, San Francisco 8. Subscriptions will be \$7.50 a year and should be sent to Paul B. Hoeber, Inc., 49 East 33 Street, New York 16.

German Medical and Dental Periodicals.—An Interim Checklist of Holdings of 168 German Medical and Dental Periodicals, 1939-1948, in 38 libraries of the United States and Canada, has been compiled by the Committee on Periodicals and Serial Publications of the Medical Library Association. The number of copies to be published will be based on the number of orders received by July 15, 1949. To assure receipt of a copy, an order accompanied by remittance of \$1 should be sent before that date to Mrs. Edith Denehl, Marquette University Medical Library, 561 North 15th Street, Milwaukee 3, Wis.

Hoffeimer Research Award.—At the 1949 convention of the American Psychiatric Association Dr. Benjamin Pasamanick, in charge of the Children's Service of the Division of Psychiatry, Kings County Hospital, Brooklyn, and associate in psychiatry at the Long Island College of Medicine, Brooklyn, received the first Lester N. Hoffeimer Research Award of \$1,500. The award is offered to the psychiatrist under 40 who has published the best research in the preceding three years. The work for his paper, "A Comparative Study of the Behavioral Development of Negro Infants" was done at the Yale Clinic of Child Development and appeared in the *Journal of Genetic Psychology* (69: 3-44, 1946).

Study of Visits to Family Physicians.—A study completed by Columbia University's School of Public Health, reveals that in two comparable industrial plants in New York City the plant which maintains an industrial physician had more than twice as many of its employees visiting family physicians during a year's time as did the plant which does not keep a doctor on its rolls. Conducted by a group of investigators headed by Drs. Leonard J. Goldwater, New York, and Meyer Rosenblum, Brooklyn, the study shows that the plant with a physician in attendance referred to family doctors 17 per cent of the plant personnel, as contrasted with the non-medical-service factory, in which only 7.3 per cent of its employees visited their doctors. The employees numbered about 1,000 at each plant.

Polio myelitis Report.—According to the U. S. Public Health Service, 155 cases of polio myelitis were reported during the week ending May 28 as compared with 101 the previous week, 138 for the corresponding week last year and a five year median of 44 cases for the week. The current increase was accounted for almost entirely by the increase in Texas (from 42 to 72), California (from 11 to 18), Arkansas (from 2 to 9), Oklahoma (from 3 to 7) and Florida (from 3 to 7). No other state reported more than 5 cases currently. The cumulative total to date is 1,619 cases, as compared with 1,077 last year and a five year median of 888 for the same period. Of the current total California has reported 378 cases and Texas 291. The total since the average seasonal low point of the disease is 696, as compared with 729 last year and a five year median of 343 for the corresponding period.

First Medical Exchange Students Arrive.—The first two foreign medical students coming here under the Medical Student Exchange Program of the Association of Internes and Medical Students arrived May 24 from Denmark. They will be followed by medical student representatives from France, England, Czechoslovakia and Norway. Exchange facilities for clinical clerkships have been prepared by the association at Yale University School of Medicine, New Haven, Conn., and the University of Pennsylvania School of Medicine and Woman's Medical College in Philadelphia. The Medical Student Exchange program has been arranged by the Association of Internes and Medical Students and the Medical Student Unions in various countries through the facilities of the International Union of Students. Thirty American medical students will travel to Europe this summer to study at medical centers in Denmark, France, Czechoslovakia and England.

Tuberculosis Culture Bank Affiliates with International Group.—An invitation to the Culture Bank of Tubercle Bacilli, Trudeau, N. Y., to affiliate with the International Federation of Culture Collections of Micro-Organisms at Lausanne, Switzerland, has been accepted by the National Tuberculosis Association, which maintains the Trudeau bank. The invitation to become a member of the International Federation is recognition of the value of the service the culture bank has performed and offers an opportunity for more extensive service, said Dr. Esmond R. Long, Philadelphia, director of the association's medical research. About eighty laboratories with culture collections of various types of micro-organisms are members of the International Federation under the direction of Professor Paul Hauduroy. Member laboratories, on request, can obtain cultures of any micro-organisms grown by other member laboratories.

Northwestern Medical Association.—A group of 45 skiing physicians from all parts of the United States have formed the Northwestern Medical Association, primarily to study winter sports from the medical point of view. They will meet each year at Sun Valley to discuss skiing safety, snow blindness, frost bite, treatment of fractures, high altitude and winter diseases. At their first meeting the physicians and dentists, who are associate members, elected Dr. L. Henry Garland, San Francisco, as their first president and Dr. Vernon D. Smith, St. Paul, secretary-treasurer. The physicians adopted a constitution that names the purposes of their new organization as the "advancement of the science and art of medicine and the betterment of public health especially as it relates to winter climates." The major function of the group will be that of an advisory counsel, and recommendations will be made in connection with all safety aspects of skiing.

Society Elections.—The American Orthopedic Association at its recent annual meeting in Colorado Springs installed Dr. Robert W. Johnson Jr., Baltimore, as president, and J. Spencer Speed, Memphis, Tenn., president elect. The American Proctologic Society at its meeting May 31 to June 4 in Columbus, Ohio, installed Dr. Louis E. Moon, Omaha, Neb., as president, and elected Drs. Hoyt R. Allen, Little Rock, Ark., president elect; Wendell W. Green, Toledo, Ohio, secretary and Rufus Alley, Lexington, Ky., treasurer. The North Pacific Society of Neurology and Psychiatry at its annual meeting in Portland, April 7-9 installed Drs. H. Ryle Lewis of Spokane, Wash., president, and chose Charles P. Larson, Tacoma, Wash., president elect. Gerhard B. Haugen, Portland, Ore., was reelected secretary-treasurer. The next annual meeting will be held in Spokane in 1950.

Marriages

JOHN C. SOUDERS JR., Rock Island, Ill., to Miss Louise Aileen Padburg of Oklahoma City in Evanston, Ill., February 26.

GLENN CLAIRE HALL, Pulaski, Va., to Miss Frances Elizabeth Palmer of South Boston, at Charlottesville, May 21.

LAWRENCE LEE WASHBURN, Louisville, Ky., to Miss Alice Howison Brown in Greeneville, Tenn., May 21.

ROBERT DELL HAYS, Brady, Texas, to Miss Mary Lou Holland of Van Buren, Ark., in New Orleans, May 15.

MEYER IRVING KRISCHER, Norfolk, Va., to Miss Helen Virginia Green in Ingleside, May 20.

JIM C. BARNETT JR., Dallas, Texas, to Miss Ann Fairly Wilson of Hazlehurst, Miss., June 14.

JOHN EDGAR CAMPBELL JR., Knoxville, Tenn., to Miss Bobbie Jean Darby of Atlanta, May 21.

Deaths

Howard Canning Taylor * New York; born in Green's Farms, Conn., in 1868; Columbia University College of Physicians and Surgeons, New York, 1891; formerly on the faculty of his alma mater; an Associate Fellow of the American Medical Association; specialist certified by the American Board of Obstetrics and Gynecology; past president of the American Society for the Control of Cancer; member of the American Gynecological Society, of which he had been president, and the Association for the Study of Internal Secretions; fellow of the American College of Surgeons; affiliated with the Tarrytown (N. Y.) Hospital, Elizabeth A. Horton Memorial Hospital in Middletown, N. Y., Greenwich (Conn.) Hospital, Sharon (Conn.) Hospital, Stamford (Conn.) Hospital, Roosevelt Hospital and the Sloane Hospital for Women; died March 26, aged 80.

Frederick Robert Driesbach, Dansville, N. Y.; born in South Dansville, N. Y., May 31, 1865; College of Physicians and Surgeons, medical department of Columbia College, New York, 1889; member of the American Medical Association; for many years county coroner; formerly member and president of the board of pension examiners; served as director and president of the Merchants and Farmers National Bank; formerly surgeon for the Lackawanna Railroad; a founder, from 1927 to 1946 president, president emeritus from 1946 to 1948, when he became honorary president and formerly chief of staff, Dansville General Hospital, now known as the Dansville Memorial Hospital, where he died April 25, aged 83, of pneumonia.

Harry Monroe Hendershott * Portland, Ore.; born in 1879; University of Oregon Medical School, Portland, 1908; associate professor emeritus of ophthalmology at his alma mater; specialist certified by the American Board of Ophthalmology and American Board of Otolaryngology; member of the Pacific Coast Oto-Ophthalmological Society; served during World War I; in recognition of his services during World War II received a medal and citation for his work in the selective service system; affiliated with Shriners Hospital for Crippled Children and the Physicians and Surgeons Hospital, where he died March 26, aged 69, of cerebral sclerosis.

Edward Pennington Allen, Oklahoma City; University of Texas School of Medicine, Galveston, 1911; emeritus professor of obstetrics at the University of Oklahoma School of Medicine; member of the American Medical Association; member and formerly vice president of the Central Association of Obstetricians and Gynecologists; served during World War I; affiliated with St. Anthony and University hospitals; died March 25, aged 65, of coronary occlusion.

Solomon Ben-Asher * Jersey City, N. J.; University and Bellevue Hospital Medical College, New York, 1923; specialist certified by the American Board of Internal Medicine; member of the National Gastroenterological Association; served during World War I; on the staffs of the Jersey City Medical Center, Fairmount Hospital and the Greenville Hospital; died April 27, aged 54, of coronary occlusion with myocardial infarction.

William John Bingham, Denver; Colorado School of Medicine, Boulder, 1904; member of the American Medical Association; also a minister; formerly a missionary; at one time in charge of the Hospital Americano-Latino, Pueblo, Mexico; died April 25, aged 76, of cerebral vascular accident and cardiovascular renal disease.

Jonas Borak * New York; Medizinische Fakultät der Universität, Wien, Austria, 1921; specialist certified by the American Board of Radiology, Inc.; on the staff of the City Hospital; died April 4, aged 56, of coronary thrombosis.

Alexander Moultrie Brailsford * Major, U. S. Army, retired, Camden, S. C.; Medical College of the State of South Carolina, Charleston, 1897; formerly member of the state board of medical examiners; served in France during World War I; entered the medical corps of the U. S. Army in 1920 and retired June 30, 1934 for disability in line of duty; died April 6, aged 77, of coronary thrombosis.

Paul Albert Brehm, Madison, Wis.; University of Nebraska College of Medicine, Omaha, 1925; member of the American Medical Association; director of the industrial hygiene division of the state board of health; formerly chairman of the National Conference of Governmental Industrial Hygienists; affiliated with Columbia and Johnston Emergency hospitals; died April 29, aged 48, of acute coronary occlusion.

Jephth Latamore Brock, Franklinton, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1903; served as parish coroner and sheriff; died April 7, aged 69, of cerebral hemorrhage and uremia.

George Clay Campbell, Anadarko, Okla.; Kansas City (Mo.) Medical College, 1899; served during World War I; died April 18, aged 73, of carcinoma.

Charles F. Childs, Quincy, Ill.; Kentucky School of Medicine, Louisville, 1892; served during World War I; died April 1, aged 76.

George C. Clisby, Kinsman, Ohio; Western Reserve University Medical Department, Cleveland, 1900; served during the Spanish-American War; died April 19, aged 76, of chronic myocarditis and cerebral hemorrhage.

Oliver Warren Cobb * Florence, Mass.; University of Virginia Department of Medicine, Charlottesville, 1897; an Associate Fellow of the American Medical Association; died in Northampton, April 6, aged 90, of arteriosclerosis.

David Young Cohill, Marblehead, Mass.; Boston University School of Medicine, 1896; died April 9, aged 84.

Jesse F. Conrad, Magnetic Springs, Ohio; Eclectic Medical Institute, Cincinnati, 1901; died April 21, aged 76, of cerebral hemorrhage.

Matthias W. Conrow, Springfield, Mass.; New York Homeopathic Medical College and Hospital, New York, 1905; fellow of the American College of Surgeons; on the staff of Wesson Memorial Hospital; died April 14, aged 70, of coronary thrombosis.

Floyd Harrison Cook, Akron, Ohio; Syracuse University College of Medicine, 1907; on the staff of City Hospital; for many years eye surgeon for the Erie Railroad; died April 12, aged 67, of subarachnoid hemorrhage.

Emelyn Lincoln Coolidge, New York; Cornell University Medical College, New York, 1900; formerly affiliated with the Babies Hospital and the Lying-In Hospital; author of numerous books; died April 14, aged 75, of arteriosclerosis and hypertension.

Charles Elihue Copeland * Charleston, W. Va.; College of Physicians and Surgeons, Baltimore, 1893; an Associate Fellow of the American Medical Association; past president of the Kanawha Medical Society; served during World War I; on the staff of Mountain State Memorial Hospital; died April 20, aged 81.

Hiram Thomas Coulter, Rockdale, Texas; Bellevue Hospital Medical College, New York, 1898; member of the American Medical Association; served during World War I; on the school board; died in a hospital at Temple recently, aged 75, of cerebral hemorrhage.

Thomas E. Craig, Charlotte, N. C.; Knoxville (Tenn.) Medical College, 1904; died April 12, aged 79, of uremia.

Howard Cone Curtis * Moorestown, N. J.; Columbia University College of Physicians and Surgeons, New York, 1922; formerly secretary of the Burlington County Medical Society; affiliated with the Burlington County Hospital, Mount Holly, where he died April 7, aged 56, of rupture of the aorta.

Hugh Alexander Cuthbertson * St. Petersburg, Fla.; University of Toronto Faculty of Medicine, 1894; an Associate Fellow of the American Medical Association; died April 21, aged 79, of myocardial infarction.

William Minor Dabney * Ruxton, Md.; University of Virginia Department of Medicine, Charlottesville, 1896; died April 20, aged 75.

Eric Jacob Danek, Chicago; Dearborn Medical College, Chicago, 1906; died April 16, aged 68, of diabetes mellitus and chronic interstitial nephritis.

Frederick Bond Dart, Niantic, Conn.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1923; member of the American Medical Association; medical examiner at East Lyme for many years; served during World War I; at one time health officer at large with the state department of health in Baltimore; died April 24, aged 57.

Virginia M. Davies, Congers, N. Y.; Woman's Medical College of the New York Infirmary for Women and Children, New York, 1886; died April 21, aged 87, of thrombosis.

Robert Jerome Day, Imperial, Neb.; University of Nebraska College of Medicine, Omaha, 1940; member of the American Medical Association; served during World War II; died April 14, aged 32, of carcinoma of the colon.

Michael Patrick DeVito, Washington, D. C.; Georgetown University School of Medicine, Washington, 1932; member of the American Medical Association; assistant professor of surgery in plastic and reconstructive surgery at his alma mater; served during World War II; affiliated with Georgetown, Emergency, Children's, Gallinger and Providence hospitals; died in Pinehurst, N. C., April 18, aged 43, of coronary occlusion.

Polychemotherapy

By the administration of several sulfonamide compounds in a mixture, untoward effects are less frequent than when treatment is undertaken with a single sulfonamide drug. The size of the dose for the mixture is the same as that for the single product. S. Lewi (in charge of consultation at the Rothschild Hospital), who in 75 cases in which this method of treatment was used observed no accident, has been trying since 1948 to apply the polychemotherapy method to the arsenical treatment of syphilis. He has used a mixture (0.075 Gm. neoarsphenamine, 0.03 Gm. sulfarsphenamine and 0.02 Gm. dichlorophenarsine hydrochloride) freshly prepared in distilled water in the same syringe; the solution is injected slowly into the vein. The injections are repeated for twenty consecutive days. So far, this intensive treatment has not produced any reaction except for some nausea, more rarely vomiting. There have been no transient cephalgia, medicamentous fever, rashes or serious accidents. In his communication of Feb. 18, 1949, to the Society of the Paris Hospitals, the author did not discuss the therapeutic value of this method, as the limited number of cases in which the treatment was used consisted almost entirely of old cases with irreducible serologic reaction. However, in 1 case of previously untreated syphilis, of one year's duration, he noted the development of an almost completely negative serologic reaction (the only Kolmer reaction being dubious) after a single treatment of twenty injections. In another case of secondary syphilis, six injections of polyarsenotherapy caused all lesions to disappear. The author at present is trying this treatment on a larger scale for recently acquired syphilis and, to diminish the dose of the various arsenicals, has added a small dose of oxophenarsine hydrochloride. He has also drawn attention, in *Le Médecin Français* of April 10, to his first trials of anti-thyroidic polychemotherapy consisting in a mixture, at equal doses, of aminothiazole, thiouracil and methylthiouracil. After an initial treatment of a daily dose of 0.20 Gm. for the average case, signs of hyperthyroidism rapidly retrogressed and the daily doses could be progressively lessened until the patients were given minimum doses as a maintenance treatment. In 1 patient excellent therapeutic results were obtained with the administration of a mixture of aminothiazole, thiouracil and its methyl and propyl derivatives. Up to the present no accident with this method has been observed. The patients receive weekly hematologic examinations. Dr. Lewi also has stressed that polychemotherapy may permit the studying of other drug modifications; for instance, sulfones (interesting in experimental tuberculosis), the toxicity of which has not yet allowed their use at therapeutic doses on more than an experimental scale in human beings.

Increase of Antibiotic Pot

on

Exchange of Dialyzable Substances by Crossed Circulation

Bessis's ingenious exchange transfusion technic is being used more widely; for example, in serious intoxications with uremia. In collaboration with P. Freixa, the author has just perfected a new technic of crossed circulation between two organisms. This technic, the use of which is limited to known or unknown dialyzable products, is intended to rid an organism of an excess of dialyzable products or to introduce into it those that are missing. In their experiments on dogs and goats, the authors have noted the innocuity of such an intervention, even between two different species. They now are considering the possibility of applying this method to human therapy; for example, in cases of acute uremia.

THE NETHERLANDS

(From Our Regular Correspondent)

AMSTERDAM, May 23, 1949.

Influenza Research

The Netherlands Government is engaged in making plans for the fight against influenza. Four laboratories are acting as working units, three of which belong to the University of Leyden, the fourth being in the Institute of Preventive Medicine, also at Leyden. A special government commission has been set up to organize the plan of campaign against the disease. A biologic concern has also been incorporated to manufacture vaccine.

At present the collective Leyden laboratories form at the same time the regional laboratory for the Netherlands under Prof. J. Mulder, who for many years, formerly at Groningen, during the last few years at Leyden, has been doing outstanding research work on influenza in this country. They act in the service of the London Influenza Centre of the World Health Organization under Dr. C. H. Andrewes. The organization comprises: (1) a reporting service of clinical influenza and influenzal pneumonia, distributed over the country, but chiefly localized in the towns near the frontiers and in harbor towns; (2) the equipment of a team to collect material on the spot; (3) the evolving of a rapid virologic diagnosis and the determination of the serologic strain type; (4) a unit for studying the fight against influenzal pneumonia by means of antibiotics, especially penicillin; (5) a unit for the study of vaccination problems; (6) the development of knowledge about the statistics of influenzal morbidity and mortality in Holland, the figures being obtained from the Netherlands Central Institute of Statistics (The Hague), which possesses accurate data from the year 1902 onward.

The greatest anxiety for Holland is caused by the necessity to build up an adequate stock of penicillin which must be present in case of a severe influenza epidemic, so that every patient with influenzal pneumonia can be treated. It is expected that export from America would be suspended if such an epidemic should make its appearance. At present Holland produces more penicillin than the quantity necessary for normal use. The of an adequate stock is estimated to take two years

Myron Robinson Jackson, Oyster Bay, N. Y.; Cornell University Medical College, New York, 1923; member of the American Medical Association; fellow of the American College of Surgeons; member of the school board; affiliated with North Country Community Hospital in Glen Cove and Meadowbrook Hospital in Hempstead; died April 15, aged 54, of coronary occlusion.

George Abraham Jett, Chicago; Rush Medical College, Chicago, 1893; died April 9, aged 77, of carcinoma of the colon.

Joseph Henry Shaver Johnson, Chicago; College of Physicians and Surgeons, Homeopathic, Buffalo, 1883; the Hahnemann Medical College and Hospital, Chicago, 1884; died April 5, aged 92, of cerebral hemorrhage.

James Alba Johnston, Byron, Ill.; Omaha Medical College, 1894; member of the American Medical Association; died April 6, aged 89, of coronary heart disease.

Thomas Henry Johnston, Alhambra, Calif.; Queen's University Faculty of Medicine, Kingston, Ontario, Canada, 1900; at one time practiced in Spencer, Iowa; past president of the Clay County (Ia.) Medical Society; served on Selective Service Examining Board for World Wars I and II; died April 10, aged 77, of Parkinson's disease.

Percival Milton Kerr Ⓢ Wilkes-Barre, Pa.; Temple University School of Medicine, Philadelphia, 1906; on the staff of Nesbitt Memorial Hospital, Kingston, where he died April 11, aged 63, of cerebral thrombosis and arteriosclerosis.

Phyllis Schuyler Kerr Ⓢ White Plains, N. Y.; Rush Medical College, Chicago, 1928; specialist certified by the American Board of Dermatology and Syphilology; affiliated with the Tarrytown (N. Y.) Hospital, Lawrence Hospital in Bronxville, White Plains (N. Y.) Hospital and Westchester Division-New York Hospital; died in the Doctors Hospital, New York, April 12, aged 54, of carcinoma.

Louis Kimmelman, Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1910; affiliated with the Temple University Hospital; died March 20, aged 62, of thrombosis.

Edgar Coote Lee, San Diego, Calif.; Rush Medical College, Chicago, 1904; specialist certified by the American Board of Urology; served on the staffs of Scripps Memorial Hospital, La Jolla and Mercy Hospital; died April 11, aged 67, of hemorrhage and duodenal ulcer.

Leslie Clifford Love, Montclair, N. J.; Columbia University College of Physicians and Surgeons, New York, 1900; served as a member of the board of health, board of education and medical milk commission; formerly on the staff of Mountainside Hospital, where he died April 3, aged 75, of carcinoma.

Frank Allemang Lupton, Birmingham, Ala.; Johns Hopkins University School of Medicine, Baltimore, 1899; member of the American Medical Association and the Southern Surgical Association; died April 14, aged 76.

Harmar Hendrix McConkey, Canton, Ohio; Jefferson Medical College of Philadelphia, 1934; member of the American Medical Association; served during World War II; on the staff of Aultman Hospital; died April 14, aged 39, of coronary occlusion.

Carleton Buel McCulloch Ⓢ Indianapolis; Chicago Homeopathic Medical College, 1895; an Associate Fellow of the American Medical Association; fellow of the American College of Surgeons; vice president and medical director of the State Life Insurance Company; received the French Croix de Guerre for his bravery during World War I; died in Methodist Hospital April 5, aged 77, of coronary heart disease.

John Joseph McMahon Ⓢ New York; Trinity Medical College, Toronto, Canada, 1899; specialist certified by the American Board of Obstetrics and Gynecology; fellow of the American College of Surgeons; served on the staffs of the St. John's Long Island City Hospital in Long Island City, Misericordia Hospital and St. Clare's Hospital, where he died April 13, aged 71, of acute coronary occlusion.

Francis Aloysius Mahoney, Brookline, Mass.; Tufts College Medical School, Boston, 1906; affiliated with Brooks Hospital; died April 6, aged 67, of coronary thrombosis.

Edward Allan Mednick, New York; New York University College of Medicine, 1938; specialist certified by the American Board of Radiology; member of the Radiological Society of North America and the American College of Radiology; affiliated with the Veterans Administration Hospital; died April 6, aged 34, of coronary heart disease.

Christian Nysewander, Des Moines; Starling Medical College, Columbus, 1879; member of the American Medical Association; died April 8, aged 94, of carcinoma of the rectum.

Richard Michael Raymond, Framingham, Mass.; Bellevue Hospital Medical College, New York, 1891; died recently, aged 78, of carcinoma.

Edward Combs Redmon, Louisville, Ky.; University of Louisville (Ky.) Medical Department, 1905; on the staff of Samaritan Hospital, where he died March 24, aged 63.

Henry James Reynolds, Chicago; Bellevue Hospital Medical College, New York, 1875; died in the Illinois Masonic Hospital April 13, aged 96, of chronic myocarditis and arteriosclerosis.

Dutch Kilgo Robison, Rocksprings, Texas; Memphis (Tenn.) Hospital Medical College, 1899; member of the American Medical Association; served during World War I; received the Selective Service Medal for his work during World War II; died in Del Rio February 20, aged 71, of diabetes mellitus.

John Clayton Rogers, Louisville, Ky.; Kentucky University Medical Department, Louisville, 1903; served during the Spanish-American War and World War I; on the medical advisory board, state selective service during World War II; formerly clinical director of the U. S. Veterans Hospital in Waukesha, Wis.; on the staff of Western State Hospital; died in the Nichols Hospital March 25, aged 69, of arteriosclerotic heart disease.

Edward Harry Rosenzweig Ⓢ Chicago; Loyola University School of Medicine, Chicago, 1922; died March 17, aged 52.

Emanuel Salwen Ⓢ Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1917; specialist certified by the American Board of Urology; member of the American Urological Association; fellow of the American College of Surgeons; served during World War I; at one time instructor in anatomy at the Long Island College of Medicine; on the staffs of the Maimonides and the Coney Island hospitals; died April 4, aged 55, of hypertensive vascular disease and cerebral hemorrhage.

Allen Sather, Fosston, Minn.; State University of Iowa College of Medicine, Iowa City, 1908; member of the American Medical Association; served as mayor of Fosston; director and past president of the Farmers State Bank; died February 14, aged 67, of femoral thrombosis, arteriosclerosis and hypertension.

Herbert Philander Sawyer, Goodhue, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1895; died in Red Wing March 10, aged 78, of coronary heart disease.

Ethan Allen Sherrill Sr., Houston, Texas; University of Tennessee Medical Department, Nashville, 1899; member of the American Medical Association; died recently, aged 71, of ruptured esophageal varices.

Charles M. Spicer Ⓢ Denver; University Medical College of Kansas City, Mo., 1905; affiliated with Denver General Hospital, Mercy Hospital and St. Anthony's Hospital, where he died February 13, aged 66, following an operation for carcinoma.

Samuel Page Stubbs, Fort Smith, Ark.; Kansas City (Mo.) College of Medicine and Surgery, 1918; past president of the county board of health; member of the American Medical Association; died March 23, aged 68, of brain tumor.

Ellis Hall Tade, Bicknell, Ind.; Medical College of Indiana, Indianapolis, 1905; died February 24, aged 70, of heart disease.

Herbert Ellery Thompson Ⓢ Bangor, Me.; Medical School of Maine, Portland, 1909; past president of the Penobscot County Medical Association; fellow of the American Society of Clinical Pathologists; formerly pathologist for the state board of health; served on the staffs of State Hospital, Worcester (Mass.) State Hospital and the Eastern Maine General Hospital; died March 29, aged 71.

Walter Earnest White, Ipswich, S. D.; Northwestern University Medical School, Chicago, 1914; member of the American Medical Association; superintendent of county board of health; died recently, aged 64, of heart disease.

Daniel Dodson Willcox, Petersburg, Va.; University College of Medicine, Richmond, 1901; member of the American Medical Association; on the staff of Petersburg Hospital, where he died April 18, aged 71.

Homer Holsinger Wolfe Ⓢ Fort Bragg, Calif.; Cooper Medical College, San Francisco, 1909; died March 3, aged 64.

Amos Monroe Wooten, Pinetops, N. C.; University of North Carolina School of Medicine, Chapel Hill, 1910; member of the American Medical Association; a member of the county board of health; president of the Pinetops Building and Loan Association; died in the Edgecombe General Hospital, Tarboro, April 15, aged 64, of pneumonia.

L. James Dixon, Denver; St. Louis College of Physicians and Surgeons, 1922; died in the Mercy Hospital April 20, aged 54.

Joseph Murray Doyle, Chicago; Victoria University Medical Department, Coburg, Ontario, Canada, 1893; died April 28, aged 83, of cerebral hemorrhage and carcinoma.

Richard Alvin Drake, Medford, Mass.; Harvard Medical School, Boston, 1902; member of the American Medical Association; formerly city physician and member of the local board of health; on the staff of the Lawrence Memorial Hospital; died April 8, aged 70.

Floyd Ernest Duncan © Rushville, Ill.; St. Louis College of Physicians and Surgeons, 1922; affiliated with Schmitt Memorial Hospital in Beardstown; died in Green Bay, Wis., April 10, aged 48.

Robert Wirt Dunham, Elkins, W. Va.; College of Physicians and Surgeons, Baltimore, 1908; died April 23, aged 67.

Thomas Martin Egan, Chicago; Bennett Medical College, Chicago, 1915; member of the American Medical Association; on the staff of Illinois Central Hospital, where he died April 10, aged 62, of cerebral hemorrhage and hemiplegia.

James Claude Elsom, Madison, Wis.; Medical College of Virginia, Richmond, 1886; member of the American Medical Association; emeritus professor of physical therapy at the University of Wisconsin Medical School; professor of physical culture and director of gymnasium at the University of Wisconsin from 1894 to 1936; served during World War I; formerly on the staffs of the University and Wisconsin General hospitals; died April 11, aged 82, of heart disease.

James Ernest Fox © Hopkinsville, Ky.; Hospital College of Medicine, Louisville, 1904; member of the Southern Psychiatric Association and the American Psychiatric Association; formerly health officer of Paducah; at one time superintendent of Central State Hospital in Lakeland; served on the staff of the Western State Hospital; died in the Riverside Hospital, Louisville, April 7, aged 71, of diabetes mellitus.

George W. Fredendall, Lexington, Mo.; Chicago Medical College, 1886; died March 29, aged 85.

Karl Friedbacher, West Allis, Wis.; University of Pennsylvania School of Medicine, Philadelphia, 1925; member of the American Medical Association; fellow of the College of Surgeons; died in Naples, Fla., May 10, aged 48, of bronchogenic carcinoma.

John Henry Frost, Stanton, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1894; died April 7, aged 82, of intestinal hemorrhage and gangrene of the left foot.

Silvies S. Fuller, La Mesa, Calif.; Kansas City Hahnemann Medical College, Kansas City, Mo., 1903; died April 12, aged 74.

James John Galman © Sheldon, Iowa; Detroit College of Medicine, 1897; affiliated with St. Joseph Hospital; died in Sioux City April 1, aged 76, of uremia.

Ralph English Garnhart, Milan, Ohio; Ohio Medical University, Columbus, 1904; also a registered pharmacist; member of the American Medical Association; died April 7, aged 73, of coronary occlusion.

Shaul George © Pittsburgh; Northwestern University Medical School, Chicago, 1904; fellow of the American College of Physicians; served during World War I; for many years affiliated with Pittsburgh Hospital, where he died April 14, aged 75, of carcinoma of the bladder.

Michael Gradess, Philadelphia; Temple University School of Medicine, Philadelphia, 1906; died April 2, aged 73, of heart disease.

John Bagg Griggs, New York; Yale University School of Medicine, New Haven, 1897; served during World War I; at one time practiced in Hartford, Conn., where he was on the staff of the Hartford Hospital; died in St. Clare's Hospital April 7, aged 79.

Charles Lee Harding, Bellevue, Ohio; Eclectic Medical Institute, Cincinnati, 1896; served during World War I; on the school and library boards; died April 1, aged 74, of Hodgkin's disease.

Harry B. Harris, Dayton, Ohio; University of Pennsylvania Department of Medicine, Philadelphia, 1894; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; served on the staff of Miami Valley Hospital, where he died February 16, aged 82, of leukemia.

Agnes Barlow Harrison, Eastsound, Wash.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1881; died April 24, aged 89, of coronary thrombosis.

Alma Fife Heath © George Washington University School of Medicine, 1931; associate in medicine and member of the board of directors of the National Homeopathic Hospital, where he died April 13, aged 46, of gastric ulcer with hemorrhage.

David Aloysius Heffernan © Boston; Harvard Medical School, Boston, 1902; served during World War I; formerly an officer in the regular navy; member of the staffs of the Massachusetts Eye and Ear Infirmary in Boston and the Brooks Hospital, Brookline, where he died April 18, aged 68.

Harold Heller, Galveston, Texas; Emory University School of Medicine, Atlanta, 1934; served during World War II; chief of the eye, ear, nose and throat service at the U. S. Marine Hospital; died March 20, aged 41, of coronary thrombosis.

William Thornton Henshaw, Charleston, W. Va.; University of the City of New York Medical Department, New York, 1889; medical director of the Workmen's Compensation Fund; served during the Spanish-American War; for many years state health commissioner; formerly mayor and member of the house of delegates; died in St. Francis Hospital April 13, aged 80.

Charles Edgar Hill, Belleville, Ill.; Marion-Sims-Beaumont Medical College, St. Louis, 1902; member of the American Medical Association; died April 21, aged 72, of arteriosclerotic cardiovascular renal disease.

Whittaker R. Hill, Toledo, Ohio; University of Louisville (Ky.) School of Medicine, 1925; member of the American Medical Association; affiliated with Flower Hospital; accidentally drowned in an undertow at Sarasota, Fla., April 13, aged 52.

Willard Kenneth Hills © Colorado Springs, Colo.; University of Colorado School of Medicine, Denver, 1911; served during World War I; died April 13, aged 62, of carcinoma of the stomach.

Edward Horgan, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1893; member of the American Medical Association; died April 10, aged 79.

John Horni © Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1896; fellow of the American College of Surgeons; on the staffs of the Wyckoff Heights, Bethany Deaconess and Beth Moses hospitals; died April 17, aged 75.

Harry L. Houston, Portland, Ore.; University of Oregon Medical School, Portland, 1904; died in the Portland General Hospital April 14, aged 73.

Theodore Gilman Howe, Berkeley, Calif.; Georgetown University School of Medicine, Washington, D. C., 1903; served during World War I; formerly associated with the Veterans Administration; died in Oakland, April 7, aged 70.

Clinton Luman Hoy © Major, U. S. Army, retired, San Francisco; Rush Medical College, Chicago, 1906; served overseas during World War I; entered the medical corps of the U. S. Army on Sept. 9, 1920 as a major; retired Oct. 31, 1930 for disability in line of duty; died April 14, aged 72, of coronary thrombosis.

Oscar Wilhelm Hubbard, Batavia, Ill.; Illinois Medical College, Chicago, 1898; for many years served on the school board; died April 8, aged 84, of pulmonary tuberculosis and chronic nephritis.

Otis Talmage Hudson © Mounds, Ill.; Barnes Medical College, St. Louis, 1909; chief of staff, St. Mary's Hospital in Cairo; president of the First State Bank; died April 12, aged 61, of coronary occlusion.

William E. Hurley, New York City; Long Island College Hospital, Brooklyn, 1920; died in St. Vincent's Hospital April 4, aged 52, of gangrene of the intestine and acute peritonitis.

John M. Hutchings, Clifton Heights, Pa.; Hahnemann Medical College and Hospital, Philadelphia, 1911; member of the American Medical Association; died in the Delaware County Hospital, Drexel Hill, April 26, aged 63, of coronary thrombosis.

Abraham Hymanson © New York; University of the City of New York Medical Department, 1892; consultant at Beth David Hospital and Beth Israel Hospital, where he died April 24, aged 80, of arteriosclerosis.

Oliver Kingsley Isham, Hartford, Conn.; University of the City of New York Medical Department, New York, 1889; died in Hartford Hospital March 21, aged 83, of cerebral hemorrhage.

Richard Michael Raymond, Framingham, Mass.; Bellevue Hospital Medical College, New York, 1891; died recently, aged 78, of carcinoma.

Edward Combs Redmon, Louisville, Ky.; University of Louisville (Ky.) Medical Department, 1905; on the staff of Samaritan Hospital, where he died March 24, aged 63.

Henry James Reynolds, Chicago; Bellevue Hospital Medical College, New York, 1875; died in the Illinois Masonic Hospital April 13, aged 96, of chronic myocarditis and arteriosclerosis.

Dutch Kilgo Robison, Rocksprings, Texas; Memphis (Tenn.) Hospital Medical College, 1899; member of the American Medical Association; served during World War I; received the Selective Service Medal for his work during World War II; died in Del Rio February 20, aged 71, of diabetes mellitus.

John Clayton Rogers, Louisville, Ky.; Kentucky University Medical Department, Louisville, 1903; served during the Spanish-American War and World War I; on the medical advisory board, state selective service during World War II; formerly clinical director of the U. S. Veterans Hospital in Waukesha, Wis.; on the staff of Western State Hospital; died in the Nichols Hospital March 25, aged 69, of arteriosclerotic heart disease.

Edward Harry Rosenzweig * Chicago; Loyola University School of Medicine, Chicago, 1922; died March 17, aged 52.

Emanuel Salwen * Brooklyn; Columbia University College of Physicians and Surgeons, New York, 1917; specialist certified by the American Board of Urology; member of the American Urological Association; fellow of the American College of Surgeons; served during World War I; at one time instructor in anatomy at the Long Island College of Medicine; on the staffs of the Maimonides and the Coney Island hospitals; died April 4, aged 55, of hypertensive vascular disease and cerebral hemorrhage.

Allen Sather, Fosston, Minn.; State University of Iowa College of Medicine, Iowa City, 1908; member of the American Medical Association; served as mayor of Fosston; director and past president of the Farmers State Bank; died February 14, aged 67, of femoral thrombosis, arteriosclerosis and hypertension.

Herbert Philander Sawyer, Goodhue, Minn.; University of Minnesota College of Medicine and Surgery, Minneapolis, 1895; died in Red Wing March 10, aged 78, of coronary heart disease.

Ethan Allen Sherrill Sr., Houston, Texas; University of Tennessee Medical Department, Nashville, 1899; member of the American Medical Association; died recently, aged 71, of ruptured esophageal varices.

Charles M. Spicer * Denver; University Medical College of Kansas City, Mo., 1905; affiliated with Denver General Hospital, Mercy Hospital and St. Anthony's Hospital, where he died February 13, aged 66, following an operation for carcinoma.

Samuel Page Stubbs, Fort Smith, Ark.; Kansas City (Mo.) College of Medicine and Surgery, 1918; past president of the county board of health; member of the American Medical Association; died March 23, aged 68, of brain tumor.

Ellis Hall Tade, Bicknell, Ind.; Medical College of Indiana, Indianapolis, 1905; died February 24, aged 70, of heart disease.

Herbert Ellery Thompson * Bangor, Me.; Medical School of Maine, Portland, 1909; past president of the Penobscot County Medical Association; fellow of the American Society of Clinical Pathologists; formerly pathologist for the state board of health; served on the staffs of State Hospital, Worcester (Mass.) State Hospital and the Eastern Maine General Hospital; died March 29, aged 71.

Walter Earnest White, Ipswich, S. D.; Northwestern University Medical School, Chicago, 1914; member of the American Medical Association; superintendent of county board of health; died recently, aged 64, of heart disease.

Daniel Dodson Willcox, Petersburg, Va.; University College of Medicine, Richmond, 1901; member of the American Medical Association; on the staff of Petersburg Hospital, where he died April 18, aged 71.

Homer Holsinger Wolfe * Fort Bragg, Calif.; Cooper Medical College, San Francisco, 1909; died March 3, aged 64.

Amos Monroe Wooten, Pinetops, N. C.; University of North Carolina School of Medicine, Chapel Hill, 1910; member of the American Medical Association; a member of the county board of health; president of the Pinetops Building and Loan Association; died in the Edgecombe General Hospital, Tarboro, April 15, aged 64, of pneumonia.

Polychemotherapy

By the administration of several sulfonamide compounds in a mixture, untoward effects are less frequent than when treatment is undertaken with a single sulfonamide drug. The size of the dose for the mixture is the same as that for the single product. S. Lewi (in charge of consultation at the Rothschild Hospital), who in 75 cases in which this method of treatment was used observed no accident, has been trying since 1948 to apply the polychemotherapy method to the arsenical treatment of syphilis. He has used a mixture (0.075 Gm. neoarsphenamine, 0.03 Gm. sulfarsphenamine and 0.02 Gm. dichlorophenarsine hydrochloride) freshly prepared in distilled water in the same syringe; the solution is injected slowly into the vein. The injections are repeated for twenty consecutive days. So far, this intensive treatment has not produced any reaction except for some nausea, more rarely vomiting. There have been no transient cephalaea, medicamentous fever, rashes or serious accidents. In his communication of Feb. 18, 1949, to the Society of the Paris Hospitals, the author did not discuss the therapeutic value of this method, as the limited number of cases in which the treatment was used consisted almost entirely of old cases with irreducible serologic reaction. However, in 1 case of previously untreated syphilis, of one year's duration, he noted the development of an almost completely negative serologic reaction (the only Kolmer reaction being dubious) after a single treatment of twenty injections. In another case of secondary syphilis, six injections of polyarsenotherapy caused all lesions to disappear. The author at present is trying this treatment on a larger scale for recently acquired syphilis and, to diminish the dose of the various arsenicals, has added a small dose of oxophenarsine hydrochloride. He has also drawn attention, in *Le Médecin Français* of April 10, to his first trials of antithyroidic polychemotherapy consisting in a mixture, at equal doses, of aminothiazole, thiouracil and methylthiouracil. After an initial treatment of a daily dose of 0.20 Gm. for the average case, signs of hyperthyroidism rapidly retrogressed and the daily doses could be progressively lessened until the patients were given minimum doses as a maintenance treatment. In 1 patient excellent therapeutic results were obtained with the administration of a mixture of aminothiazole, thiouracil and its methyl and propyl derivatives. Up to the present no accident with this method has been observed. The patients receive weekly hematologic examinations. Dr. Lewi also has stressed that polychemotherapy may permit the studying of other drug modifications; for instance, sulfones (interesting in experimental tuberculosis), the toxicity of which has not yet allowed their use at therapeutic doses on more than an experimental scale in human beings.

Increase of Antibiotic Potency by Distillation or Concentration

J. Solomides (Paris Pasteur Institute), after noting the remarkable effect of cod liver oil distillate on burns, eczema and certain dermatoses of microbiologic origin, has studied the bactericidal properties of distillates of other oils. The first results show that completely disacroleined castor oil distillate possesses potent bactericidal properties against the tubercle bacillus, non-acid-resisting gram-positive and gram-negative germs and fungi. Distilled peanut oil is much less active. The author believes that oils, and especially the glycerides they contain, are, through a still unknown mechanism, submitted during their distillation to modifications which are responsible for the antibiotic potency of these distillates.

Exchange of Dialyzable Substances by Crossed Circulation

Bessis's ingenious exchange transfusion technic is being used more widely; for example, in serious intoxications with uremia. In collaboration with P. Freixa, the author has just perfected a new technic of crossed circulation between two organisms. This technic, the use of which is limited to known or unknown dialyzable products, is intended to rid an organism of an excess of dialyzable products or to introduce into it those that are missing. In their experiments on dogs and goats, the authors have noted the innocuity of such an intervention, even between two different species. They now are considering the possibility of applying this method to human therapy; for example, in cases of acute uremia.

THE NETHERLANDS

(From Our Regular Correspondent)

AMSTERDAM, May 23, 1949.

Influenza Research

The Netherlands Government is engaged in making plans for the fight against influenza. Four laboratories are acting as working units, three of which belong to the University of Leyden, the fourth being in the Institute of Preventive Medicine, also at Leyden. A special government commission has been set up to organize the plan of campaign against the disease. A biologic concern has also been incorporated to manufacture vaccine.

At present the collective Leyden laboratories form at the same time the regional laboratory for the Netherlands under Prof. J. Mulder, who for many years, formerly at Groningen, during the last few years at Leyden, has been doing outstanding research work on influenza in this country. They act in the service of the London Influenza Centre of the World Health Organization under Dr. C. H. Andrewes. The organization comprises: (1) a reporting service of clinical influenza and influenzal pneumonia, distributed over the country, but chiefly localized in the towns near the frontiers and in harbor towns; (2) the equipment of a team to collect material on the spot; (3) the evolving of a rapid virologic diagnosis and the determination of the serologic strain type; (4) a unit for studying the fight against influenzal pneumonia by means of antibiotics, especially penicillin; (5) a unit for the study of vaccination problems; (6) the development of knowledge about the statistics of influenzal morbidity and mortality in Holland, the figures being obtained from the Netherlands Central Institute of Statistics (The Hague), which possesses accurate data from the year 1902 onward.

The greatest anxiety for Holland is caused by the necessity to build up an adequate stock of penicillin which must be present in case of a severe influenza epidemic, so that every patient with influenzal pneumonia can be treated. It is expected that export from America would be suspended if such an epidemic should make its appearance. At present Holland produces more penicillin than the quantity necessary for normal use. The building up of an adequate stock is estimated to take two years of production.

The 1949 influenza epidemic on the Continent, starting in Italy early in December 1948, reached Holland (via Belgium) between Dec. 25, 1948 and Jan. 1, 1949. The attack rate was about 7 per cent of the population. At present the mortality is estimated at about 2,000 persons (i. e., approximately 0.3 per cent). The age distribution is not yet known, but it was chiefly the older persons who died.

In this epidemic, too, *Staphylococcus aureus* made the largest number of victims. To combat the fulminating *Staphylococcus tracheobronchopneumonia* it was considered necessary to administer 4 to 6 $\times 10^6$ units of penicillin every twenty-four hours.

(irrespective of the sensitivity of the infecting strains), on account of the extensive necrosis and hemorrhage in the air passages and lungs, and on account of the early and serious toxemia. A rapid virologic diagnosis of the isolated virus strains was developed by Prof. J. Mulder in the virus laboratory of the Clinic of Internal Medicine of Leyden University. Use was made of ferret serums against the strains WS (England, 1933), PR8 (United States, 1934), A (Holland, 1941), Rhodes (United States, 1947) and Barratt (England, 1947), the non-specific inhibition having been eliminated with cholera enzyme. In this way the positive amniotic fluids from the first egg passages could serve in the serum neutralization experiments according to Hirst, and the diagnosis of influenza A with the subgroup could usually be made three days after the inoculation of the first eggs. Serums of ferrets inoculated with sputum or throat garglings could be used after eight days, and indicated the serologic pattern more clearly than the strains themselves. All the isolated strains were closely related to the A¹ group, which was already found in Holland in 1947, probably as an offshoot of the then prevailing large epidemic in Sweden. A large proportion of the patients' serums in the acute stage showed no basic immunity against the new strain, in contrast to the strain PR8; the latter could be ascertained by applying cholera enzyme to the patients' serums. The pneumotropic properties of the strain seem to have been slight for human beings, although four virus strains were isolated from ground lung tissue from patients dying of staphylococcic tracheobronchopneumonia. A rapid diagnosis of influenzal pneumonia at autopsy, in the Pathological Institute of Leyden University, was obtained from the cytologic picture in slide preparations of the epithelium of the trachea; there was necrosis of ciliated and goblet cell epithelium, which had sometimes entirely disappeared; the basal cells were normal.

Vaccination experiments were carried out on a small scale, the results of which are not yet available.

BUENOS AIRES

May 5, 1949.

Treatment of Some Forms of Retinitis with Melanophorous Hormone

In 1937 Prof. Dr. J. C. Mussio Fournier, director of the Institute of Endocrinology, Hospital Pasteur, in Montevideo, and the chemist O. Conti studied the effect of the melanophorous hormone in the treatment of vitiligo and albinism (Mussio Fournier and others: *Bull. Acad. de Méd.*, Paris 120: 770, 1938; *Endocrinology* 28: 513, 1941; *J. Clin. Endocrinol.* 3: 353, 1943). The extract of the melanophorous hormone, as prepared by chemist O. Conti, is made from the posterior and intermediate lobes of the hypophysis of cattle. It is standardized in frog units (*Leptodactylus ocellatus* L.) and may be administered by injection. Later the ophthalmologists F. González Vanrell and P. Carriguiry treated patients with retinitis pigmentosa with injections of the melanophorous hormone, with favorable results (*Día méd. d. Uruguay* 15: 982, 1948). The most significant case was of a patient, 55 years old, whose vision was reduced to perceiving movements of fingers at 30 cm.; ten weeks after starting the treatment the visual acuity increased to 0.2, being actually 0.5. Recently the four authors mentioned published new cases of retinitis pigmentosa treated with good results (*Bull. et mém. Soc. méd. d. hôp. de Paris* 65: 12, 1949). In another recent paper Mussio Fournier and collaborators review the good results obtained by instilling the melanophorous hormone in the conjunctiva of patients with retinitis pigmentosa and also the favorable effects obtained on the photophobia of five albinos and on the visual capacity of

three of them. Furthermore, they claim (J. G. Mussio Fournier, O. Conti, F. González Vanrell and P. Carriguiry, *Día méd. d. Uruguay* 16: 257, 1949) favorable effects on patients with diabetic retinosis, hypertensive retinopathy and grave myopia with alterations of the eye grounds. The most significant case is of a diabetic man, 78 years old, in whom the eye ground could not be observed, the corpus vitreum being so turbid that his vision was reduced to counting fingers at a distance of some 20 cm. Six hours after instillation the patient could leave his guide; three days afterward, the visual capacity was 0.1. In most cases improvement has been observed within thirty to sixty minutes after the instillation. The authors believe that the hormone has a stimulant action on the function of the retina, but that it provides only symptomatic treatment, there being no effect on the course of pathologic changes. The Institute of Endocrinology has sent the extract of melanophorous hormone to different scientific centers to carry out controlled investigations. According to a personal communication from Dr. Mussio Fournier, some ophthalmologists of Buenos Aires already have confirmed the results described in some cases.

Diabetes and Thiouracil

Drs. B. A. Houssay and C. Martínez have found that pre-treatment with thiouracil, thiothymine or cysteine causes a delay and lessened incidence of the appearance of diabetes in rats with subtotal extirpation of the pancreas (95 per cent). BAL and methionine do not show such a preventive action. Thiouracil produces remission of the hyperglycemia of some rats with light diabetes and improves, temporarily, severe diabetes of other rats. In animals thus protected, besides return of the glycemia to normal, the beta cells are found normal or only slightly altered, while the test animals show serious lesions. Further studies on rats with subtotal pancreatectomy showed that a diet which contains much pig's fat had an unfavorable effect on the diabetes, while coconut oil seemed to protect some of the animals. However, the undesirable influence of pig's fat could be corrected by treatment with thiouracil, but not with coconut oil or methionine. Thiouracil treatment of rats fed large amounts of pig's fat distinctly augmented the sulfhydryl radical of the liver.

Intraspinal Injection of Epinephrine

Dr. M. P. Collado Storni reported to the subsection of anesthesiology of the Argentine Society of Surgeons his study of anesthetized dogs which received intraspinally relatively large amounts of epinephrine (0.25 to 0.35 mg. per kilogram). The dose necessary for elevating the blood pressure is larger than when it is administered intravenously, but the effect is of greater duration, probably because of the relatively slow rhythm of destruction of epinephrine in the spinal canal. Lesions of the medulla have not been observed. The minimum dose for provoking a pharmacologic effect has been studied by the effect on glycemia, which provides a more reliable test than blood pressure. Suprarenalectomy does not modify the results found in the normal animal.

Congress of Neurosurgery

The third South American Congress on Neurosurgery was held in Buenos Aires, under the auspices of the Argentine Government and the chairmanship of Prof. Dr. Ramón Carrillo, Argentine Minister of Health and professor of neurosurgery at the Medical Faculty of Buenos Aires. The first congress was held in Montevideo (Uruguay) in 1945 and the second in Santiago de Chile in 1947. Besides numerous delegates from many Latin American countries and the United States (Earl Walter, James Poppen, Tracy Putnam, Charles Burlingame), there were many representatives from European countries. The

official subjects included surgical treatment of epilepsy, hemostasis in neurosurgery, and lobotomy. Eighty-five of the other one hundred and fifty-five papers presented were read to subcommittees. Many neurosurgical operations were carried out, some by foreign surgeons. The fourth congress will be held in 1951, in Rio de Janeiro.

Brief Items

The first Argentine Congress of Medico-Social Assistance to the neuropsychiatric patient will be held during the latter part of September in Buenos Aires. It is organized by the Ministry of Health, but specialists of different countries will participate. This congress will study modern ways of care for neuropsychiatric patients and the necessary organization to undertake it.

The Mariano R. Castex prize for Internal Medicine of the National Academy of Medicine in Buenos Aires has been given to Drs. E. S. Mazzei, D. Taylor Gorostiaga and Elyeser Magalhaes for their work on pulmonary embolism.

Prof. Dr. Pedro de Eliza'de, well known Argentine pediatricist, died suddenly in Buenos Aires.

Prof. Dr. Pedro L. Balaña, for many years professor of Dermatology and Venereal Diseases, known through his investigations on leprosy, has died.

Correspondence

ARMED FORCES' NEED FOR PHYSICIANS

To the Editor:—Until recently we, the undersigned civilian doctors, had our doubts about the need of the Army for additional Medical Corps officers at the present time. We wondered whether perhaps the Army had not overestimated its needs as a peacetime organization and set its quota on the basis of wartime conditions. We felt that the pre-World War II idea of more than six medical officers to one thousand troop personnel was absurd overstaffing for actual medical needs of a peacetime army—even as an occupation force. We had heard that there were nearly four doctors per thousand soldiers in the European Command, and to us this seemed an excessive number for healthy men when some parts of the United States had less than one doctor per thousand population. Indeed we hardly saw the need for former A.S.T.P. students or other doctors to volunteer now for military service.

Within the past month, however, we have had the opportunity, in the capacity of civilian medical consultants, to visit all the general, station and field hospitals maintained by the United States in the American zones of Germany and Austria. What we have observed as civilian doctors convinces us that the serious lack of trained personnel for medical care is an injustice to the armed forces, their dependents and other American civilians on duty in this command. We feel that the present situation and the predictable future outlook here for medical care should be called to the attention of the members of the American Medical Association in the hopes of stimulating more younger doctors to volunteer at this time for military service.

At the moment, the situation is particularly acute, since so many medical officers have completed their tour of duty and are going home within the next three months. The number of replacements is only about one half of those leaving. We have seen evidence of overstaffing with the present setup and what we have observed was due merely to replacements arriving a few weeks in advance of the departure of the group going back to the states. Many installations are understaffed already for an average census of patients.

What has distressed us most is the fact that German and Austrian civilian doctors are necessarily being called on to fill the places left by inadequate replacements. Nearly every hospital is endeavoring to indoctrinate these foreign physicians in American methods of the practice of medicine, and although a few are well trained or are learning our ways quickly, the vast majority do not seem to us to be up to the American standards, aside from language difficulties. Furthermore, these men naturally do not inspire the confidence in their American patients that American doctors do. Since there is no alternative, they must be employed until American doctors volunteer adequately to do the job.

Doctors who have been in the armed services during the recent war will obviously ask whether the medical officers are being used in a professional capacity only. We can speak authoritatively only of those we have seen in the hospitals, and our observations do not apply to the dispensaries and field units, but at least so far as the hospitals are concerned we have seen little waste or misuse of medical talent. Perhaps some professional time might be saved by limiting medical officers to purely professional activities, but a large part of the former administrative duties of medical officers have been taken over by the Medical Service Corps officers. In the hospitals, doctors are usually made responsible for "property"—but other than this we have heard few complaints along this line from those in the hospitals. Probably the situation is different in field units, but a certain amount of administrative and inspection duties cannot be avoided under field conditions. It should be pointed out that of 220 medical officers for Army, dependents and civilian personnel, only 60 are actually on duty with troops. About 90 medical officers are available for this field duty, so these are rotated through field and fixed installations. Thus, none remain more than two thirds of their duty on field assignment.

Line officers expect a doctor to be a jack of all trades, but, given time, they may yet learn that people with eight or more years of higher education can be more profitably used in a professional capacity than in inspection and administrative duties which could be more effectively done by an intelligent noncommissioned officer with three months' special training. On the other hand, and in justice to the line officers, one must admit that they have a point when they ask, "Why can't we get enough doctors to adequately look after our own men abroad?" We believe the present situation here is a challenge to the medical profession of America.

S. H. BARON, M.D., San Francisco.

E. M. WILLIAMSON, M.D., Kalamazoo, Mich.

S. D. BLACKFORD, M.D., Charlottesville, Va.

PRURITUS ANI ET VULVAE DUE TO ALLERGY

To the Editor:—My experience corroborates the statement of Dr. H. Hailey (Pruritus Ani et Vulvae, THE JOURNAL, March 26, p. 837) that eczema due to allergy is the common cause of pruritus ani et vulvae. Favoring atopic allergy in many cases is the associated eczema in other areas of the skin and of other manifestations of allergy in a varying number of these sufferers. The familial predisposition to eczema even in the vulval and anal tissues and to other allergic manifestations as noted by Dr. Hailey is confirmed.

I and many experienced allergists, however, disagree with the statement that "cutaneous tests for allergy have no legitimate place in the diagnosis and treatment of eczema and the practice will probably be discontinued in the near future." It is true that I have long reported the fallibility of the skin test with

regard to both positive and negative reactions, both by the scratch and intradermal methods in the determination of clinical food allergy. But testing, especially with the scratch test, is advisable because of the occasional large reactions which indicate possible immediate severe allergy in contrast to the cumulative allergy which may be indicated by lesser and often by negative reactions. It is because of this fallibility of the skin reaction in the diagnosis of food allergy that my standardized elimination diets have found increasingly successful use for over twenty years. But the modification of such diets always has been advised by the consideration of large skin reactions by the scratch method and by a definite history of dislikes or disagreements for specific foods.

In contrast to food allergy, skin testing is of much greater importance in the diagnosis of inhalant allergy to pollens, dusts, fungi and miscellaneous inhalants. Here again positive reactions may indicate past or potential allergy and in a small percentage of cases no reactions may occur, which justifies at times the conjunctival tests. Thus for diagnosis of inhalant allergy skin testing is most necessary.

No mention, moreover, is made by Dr. Hailey of the important use of patch tests with drugs, cosmetics, including nail polish, and other recognized causes of contact dermatitis for the study of the allergenic contact causes of pruritus ani et vulvae.

Thus, far from discontinuing skin testing, its well recognized values with its limitations should encourage its proper use and interpretation. Without skin testing the recognition and control of the causes of eczema would be seriously impaired.

ALBERT H. ROWE, M.D., Oakland, Calif.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers. June 20-22, Sept. 12-14. *Part III*. June, various centers. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written*. Various Centers. July 15. *Oral*. Oct. 16-20. Sec., Dr. Curtiss B. Hickox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*. Oct. 17. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC. *Part I*. Various Centers. Feb. 3. Final date for filing application is Nov. 5. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part II*. New York City, Jan. 1950. Final date for filing application for Part II is Aug. 15. Address: Sec.-Treas., Dr. Harold A. Sofield, Room 1856, 122 S. Michigan Ave., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY: Chicago, Oct. 7-8. Final date for filing application is Sept. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

AMERICAN BOARD OF PEDIATRICS: *Written*. Under local monitors, June 24. *Oral*. Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec., Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: *Parts I and II*. New York, Oct. 22-24. Final date for filing application is July 22. Sec., Dr. Ernest L. Stebbins, 615 N. Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. *Special Examination*, October. Place to be announced. Final date for filing application is July 15. December, New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*, Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*. Montgomery, June 28-30. Sec., Dr. D. C. Gill, 519 Dexter Ave., Montgomery.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACT

Medical Practice Acts: Sanipractor's Right to Practice Obstetrics.—The defendant was charged by information with practicing obstetrics and administering a hypodermic injection without having an unrevoked certificate to practice medicine but only a license from the state as a "drugless healer" permitted to practice "full sanipractic." The trial court sustained the defendant's demurrer and dismissed the case, so the State appealed to the Supreme Court of Washington.

Was it the intention of the legislature, asked the Supreme Court, to make the practice of obstetrics outside the scope of practice given to drugless healers?

In construing a statute and ascertaining the legislative intent, certain rules are observed by the courts. Statutes in *pari materia* must be construed together. Statutes in *pari materia* are those which relate to the same person or thing, or the same class of persons or things; and in construing a statute, or statutes, all acts relating to the same subject matter or having the same purpose, should be read in connection therewith as together constituting one law. The object of this rule is to ascertain and carry into effect the intent of the legislature, and it proceeds on the supposition that the several statutes having to do with related subject matters were governed by one spirit or policy, and were intended to be consistent and harmonious in their several parts and provisions. From this general rule it follows, said the Supreme Court, that our attention should first be directed to the determination of whether the drugless healing act gave the defendant the right to practice obstetrics. In our opinion, that conclusion cannot be drawn from the provisions of the statute. Section 4 of the act relating to drugless practitioners provides for the issuance of five different certificates, mechanotherapy, suggestive therapeutics, food science, physcultopathy and ". . . for any other separate and coordinate system of drugless practice. . . . Practitioners hereunder shall confine their practice to the subjects and system or systems represented by their certificate. . . ." Section 7 of the act provides that all persons granted licenses or certificates thereunder shall be subject to state and municipal regulations relating to the control of contagious diseases, the reporting and certifying of births and deaths, and all matters pertaining to public health; and all such reports shall be accepted as legal. The act further provides that in order to acquire a certificate to practice drugless therapeutics, a person must prove a residence course of three entire sessions of thirty-six weeks each at a chartered drugless school and be compelled to pass an examination in "obstetrics." It was argued by the defendant that the provision requiring an examination concerning obstetrics, coupled with the direction that persons receiving the benefits of the act must certify births, indicated the intention of the legislature to allow holders of certificates under the act to practice obstetrics.

The provisions of the indefinitely worded statute do not indicate the extent of the practice of drugless healers, said the Supreme Court, so it is necessary to examine all of the pertinent acts passed by the legislature. The court then discussed the practice acts relating to medicine, osteopathy, osteopathy and surgery, midwifery, and chiropractic, all of which, including the drugless healer statute, were originally passed in 1919. In the drugless healers act the term "drugless therapeutics" is defined

as consisting of "hydrotherapy, dietetics, electro-therapy, radiography, sanitation, suggestion, mechanical and manual manipulation for the stimulation of physiological and psychological action to establish a normal condition of mind and body, but shall in no way include the giving, prescribing or recommending of pharmacetic drugs and poisons for internal use, the purpose of this act being to confine practitioners hereunder to drugless therapeutics." The legislature did not define any of the terms used in the other practice acts, except "practicing midwifery." By these enactments, the court indicated, the 1919 legislature determined that practitioners of all types of healing arts, except physicians and surgeons, should be "restricted to their own particular methods of healing." "It was the manifest intention of the Legislature to prohibit the holders of restricted licenses from practicing branches of the art of healing not embraced within the subjects on which the licensee had been examined, and which by his certificate he was authorized to practice." (*State ex rel. Walker v. Dean*, 155 Wash. 383, 284 P. 756.) In the acts relating to physicians and surgeons, and the act relating to osteopathy and surgery, and the act having to do with midwifery, the legislature was careful to require definite knowledge and practical experience before a certificate could issue which would entitle the holder to practice obstetrics. The title to the drugless healers act, when liberally construed in connection with the other statutes relating to the care of the sick and afflicted, proves conclusively that the legislature intended to treat drugless healing as it did the other schools of practice—that is, that drugless healers should be allowed to do only those acts included within the definition.

Other reasons which reinforce the logic of the foregoing conclusions, added the Supreme Court, are found in the requirements for admission to, and the courses of study required by, the various schools of the healing arts. These requirements indicate the desire of the legislature to measure the extent of practice by knowledge and experience acquired by study and practice. Medical schools, for example, are accredited and approved by the Association of American Medical Colleges and the Council on Medical Education and Hospitals of the American Medical Association, which require that applicants for admission to schools of medicine must have a bachelor's degree and a good college record, or have completed three years of college work with a superior record, or have completed two years of college work in which they have demonstrated outstanding ability. An osteopath must have, before he can take the state examination for a license, a diploma issued by some chartered school of osteopathy approved by the Association of Osteopathic Colleges. The requirements of the association for school admission are that the applicant for admission must have had a four year high school course and a minimum of two years' collegiate work. The educational requirements of a drugless healer, on the other hand, are a high school education and a residence course of three entire sessions of thirty-six weeks each at a chartered drugless school. It will be noted that the act does not require proof of practical experience in a hospital, nor does it indicate in any way that it was intended to extend the privilege of taking care of women prior to, at and after childbirth to drugless healers. The act makes no reference to the character of the school, as do the acts relating to physicians, surgeons and osteopathy.

What we have said about the right to practice obstetrics, the Supreme Court concluded, applies with equal force to the administration of ether and the administration of a drug by hypodermic injection. The giving of a drug, either orally or by injection, is limited to those practitioners especially designated by statute. In this connection it will be noted that physicians and surgeons are authorized "to use drugs" and "to sever or penetrate the tissues of human beings." The osteopathic act compels "sufficient experience in and a practical working knowledge of pathology, and the administering of anesthetics" by one desiring a certificate to practice surgery. In addition, the osteopathic act states, ". . . nothing in this act shall be construed to prohibit . . . the practice of midwifery. . . ." That the administering of drugs or anesthetic and the cutting of an umbilical cord are part of a surgical operation cannot be doubted. The judgment in favor of the sanipractor was therefore reversed.—*State v. Houck*, 203 P. (2d) 693 (Wash., 1949).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Wartime Reduction of Dental Caries in Europe.—

According to Sognnaes an attempt has been made to assemble and analyze (1) the over-all incidence of dental caries in children from different European countries in the period between the beginning of World War I and the termination of World War II and (2) certain dietary factors in operation during the war years of possible significance in connection with the observed fluctuations in the frequency of caries. It was found that the teeth of European children in all of the occupied and war-torn countries show (1) a definite tendency to decrease in caries in the latter part of, and following, the recent wars. This is (2) most significant in young children and (3) in those teeth of older ones which have developed or matured during the war years. The most important general principle evolved from this analysis is (4) that there seems to be several years' delay in the initial effect of wartime conditions on the teeth and, following the first World War, even a greater delay in the return to the prewar dental status. In summing up the dietary analysis the author has failed (1) to establish a uniform increase in any specific food or food factor which can satisfactorily explain the reduction in caries and (2) to demonstrate the expected concurrent reduction in caries and sugar during the two wars. He has succeeded in showing that in several countries there has been a reduction in refined carbohydrates and of caries after certain time intervals. The author sets forth the hypothesis that in wartime children and their individual teeth during their development and maturation indirectly have benefited by the replacement of the refined caloric food sources by natural ones, and thereby have received certain caries-preventing qualities. That concept is compatible with the time relationship between the reduction in caries and war rationing, and in agreement with observations on experimental animals.

Complications of Typhoid.—Lozoya reports on the experience gained at the Hospital Infantil of México, D. F., in dealing with intestinal perforations and rupture of the gallbladder in typhoid. Among the 457 cases of typhoid observed in three years, there were 29 cases of intestinal perforation and 4 ruptured gallbladders. Of these patients 21 were operated on, with a survival of 9; of the 8 who were not operated on, 7 died. All 4 with rupture of the gallbladder were operated on, 1 patient surviving. Lozoya feels that in patients with

typhoid who have perforation of the intestine or rupture of the gallbladder operation is necessary. Good preoperative and postoperative care is essential, along with expert surgical technic, which must provide drainage of the peritoneum and avoidance of its reinfection and of abdominal distention. A good prognosis depends largely on early operation, but when there are malnutrition, intense toxicity and infection with marked leukopenia, combined with intestinal perforation or rupture of the gallbladder, death usually results.

- Studies in Human Malaria. W. C. Cooper, D. S. Ruhe, G. R. Coatney and others.—p. 25.
- Studies on Q Fever in Panama. E. C. de Rodaniche and A. Rodaniche.—p. 67.
- *Q Fever in Laundry Workers, Presumably Transmitted from Contaminated Clothing. J. W. Oliphant, D. A. Gordon, A. Meis and R. R. Parker.—p. 76.
- Relationship Between Certain Populations of Culex Pipiens Linnaeus and Culex Quinquefasciatus Say in the United States. M. A. Farid.—p. 83.

Q Fever in Laundry Workers.—According to Oliphant and his co-workers 3 cases of Q fever and 3 cases of apparently subclinical infection recently occurred in employees of a laundry handling soiled laundry from the Rocky Mountain Laboratory in circumstances suggesting that infection may have been transmitted to them by contaminated clothing and linens. There was no history of recent tick bite, exposure to contaminated air in experimental laboratories, contact with slaughterhouses or cattle pens among these workers to account for infection arising outside their place of employment. It is of interest that only those employees of the laundry who actually handled soiled laundry contracted Q fever infection. The intervals between the dates of onset are within the limits of variation of the established incubation period of Q fever, which is fourteen to twenty-six days. It is significant that infection apparently can be transmitted indirectly by contact with contaminated materials such as clothing and linens. All soiled laundry from the Rocky Mountain Laboratory is now routinely sterilized with steam under pressure before delivery to the laundry. Treatment with penicillin, streptomycin and sulfadiazine had no apparent effect on the clinical course of the disease.

- Mechanism of Heart Failure: Résumé of Present Knowledge of the Cardiovascular Failure. R. P. Bailey and J. W. Leider.—p. 60.
- Aureomycin in Primary Atypical Pneumonia.**—The authors and his co-workers present the results of their study of these highly atypical ("virus") pneumoniae. The authors now utilize agglutinins. The authors have found that in some cases after the use of aureomycin, the patients were performed in 25 months to 12 years of age. The iliac crest puncture was done. The iliac crest puncture had both sternal and spinous punctures; 2 had iliac crest and spinous punctures; 1 had a tibial puncture in addition to the iliac crest and of a spinous process. The authors have used of alternative sites for bone marrow puncture of definite value. In children, the spinous process of the iliac crest are often the preferred sites for puncture.

drug was first administered, with corresponding improvement in their general condition. In 2 of these treatment was discontinued at this time, and what appeared to be a recrudescence took place. In the other 7 cases treatment was maintained and uneventful recovery ensued. No important toxic side effects resulted from aureomycin.

Addison's Disease Complicated by Toxemia of Pregnancy: Review of Literature. M. Cohen.—p. 879.

Penicillin and Bacteremia Following Extraction of Teeth.—According to Hirsch and his associates it has been demonstrated that bacteremia following the extraction of teeth is of importance in the development of bacterial endocarditis. The desirability of eliminating, or even diminishing, the frequency of one of the causes of bacterial endocarditis is obvious. The effect of sulfonamide prophylaxis on the incidence and persistence of bacteremia following the extraction of teeth

having been inconclusive, the authors decided to try penicillin prophylaxis. Sixty-five patients requiring dental extractions were each given 600,000 units of penicillin in wax and peanut oil contained in 2 cc. of the mixture three to four hours before extraction, while 65 patients were not given penicillin and served as controls. Blood cultures in duplicate were obtained immediately and ten and thirty minutes after extraction, incubated both aerobically and anaerobically and studied for the presence of bacteria. When all the organisms isolated were considered, 46 per cent of the patients in the control group and 37 per cent of the patients in the penicillin-treated group were found to have bacteremia. When alpha and gamma streptococci alone were considered, a statistically significant reduction in the incidence of bacteremia, from 34 to 15 per cent, was observed with the use of penicillin. The incidence of bacteremia could not be correlated with age, sex, race, state of oral hygiene or number of teeth extracted. The number of positive cultures was greater, however, the more extensive the surgical procedure. Penicillin prophylaxis was employed in eleven tooth extractions on 7 patients with healed rheumatic or bacterial endocarditis. Transient bacteremia occurred in 4 patients. The authors suggest a plan of prophylaxis preceding dental extraction in patients with rheumatic and congenital heart disease.

Effect of Sodium Chloride Deprivation on Growing Rat. J. T. Cuttino and M. H. Rosenthal.—p. 260.
Interrelationship of Diseases of Liver and Brain. A. B. Baker.—p. 268.

Intracranial Lesions in Rheumatic Heart Disease.—Dent and Neubuerger found in a series of 688 necropsies 45 in which rheumatic heart disease was noted in patients older than 25 years, excluding those in whom it was complicated by subacute bacterial endocarditis. The brain was adequately examined in 14 of these cases, and in 9 it showed significant vascular changes. It was found that lesions of intracranial vessels occur with unexpected frequency in late stages of rheumatic heart disease. The larger and smaller arteries and veins, mainly in the leptomeninges, show a great variety of pathologic features. The principal lesions are: various forms of thrombosis, endarteritic proliferation, alteration of the elastic membranes and fibrosis of media and adventitia. The histologic picture, as a rule, is sufficiently characteristic to permit differentiation from other vascular diseases that occur in the same location. Parenchymal changes in the brain secondary to the vascular processes are identical with those produced by other vascular diseases. Focal neurologic signs may occur, but there is little evidence to show that the lesions described form the anatomic basis for psychotic syndromes.

Thymus in Myasthenia and Goiter.—In recent years, thymectomy had been resorted to with gratifying results in many of the cases of myasthenia gravis. Bryan and his associates made a histopathologic study of the thymus in this disorder. Since thymic hyperplasia occurs also in other endocrine disorders, a comparison was made with thymic hyperplasia of hyperthyroidism. Among 23 cases of myasthenia gravis, exclusive of thymoma, in which thymectomy was done, there were 4 in which extreme lymphoid hyperplasia, and 2 in which moderate lymphoid hyperplasia of the thymus, was observed on microscopic examination. In the remainder of the cases the gland either was normal or had been replaced by fat. Twelve of the 17 normal glands in the myasthenia series showed areas of hyperplasia, but the percentage of glandular tissue was too low to permit their being considered hyperplastic, the average content of thymic parenchyma being only 29 per cent. In none of the 20 cases of hyperthyroidism did extreme hyperplasia of the thymus occur, and in only 1 case did moderate lymphoid hyperplasia occur. Small areas of epithelial

clustering occurred in 2 cases of the myasthenia series and in 3 cases of the hyperthyroidism series, but the glands were essentially normal. When the amounts of the glandular tissue of the thymuses were determined, percentages of thymic tissue, the weight of the parenchyma of 2 of 13 glands in the myasthenia series significantly exceeded the upper limit of normal, while the weight of the parenchyma of 7 to 9 glands in the hyperthyroidism series exceeded the upper limit of normal. There was apparently no correlation between the extent of hyperplasia determined microscopically and that which was observed when the weight of essential thymic elements exceeded significantly the expected upper limit of normal.

Mechanism of Petechial Hemorrhage Formation. J. G. Humble.—p. 69.

Exchange Transfusion in Erythroblastosis.—In their technic of exchange transfusion Wiener and Wexler introduce citrated blood into the saphenous vein at the ankle and withdraw the infant's blood simultaneously from the radial artery at the wrist, coagulation being prevented by the administration of small amounts of heparin. The procedure, besides being simple, is safe, there having been no operative mortality in more than forty transfusions. The authors present the results obtained with exchange transfusion in their first 28 cases. In 16 of these, erythroblastosis was severe and almost certainly would have been fatal if left untreated; in 6 it was of moderate severity, and in 6 it was mild. Only 7 of the infants died. The available data indicate that the mortality would have been at least twice as high had the usual treatment with simple transfusions been given. Fresh blood should be used instead of bank blood because of its greater survival time and smaller likelihood of introducing infection. All infants who have survived have developed normally both physically and mentally and have shown no sequelae of damage to liver or brain. The most reliable index of the severity of the disease in the erythroblastic infant is provided by antenatal titrations of the maternal univalent Rh antibodies, as well as by tests for the presence of univalent antibodies in the infant's blood.

Oxygen in Commercial Aviation.—According to Carlson and his associates routine transcontinental and intercontinental flights are now made in unpressurized aircraft at altitudes which require oxygen for crew and passengers. A much larger number of flights are made at altitudes which are borderline so far as oxygen requirements are concerned, the need for oxygen being accentuated by such conditions as night flying and passengers with chronic or acute illnesses which limit their oxygen utilization. The oxygen systems in commercial airline aircraft have been the result of each company's meeting a need according to the information at their disposal concerning oxygen requirements from the physiologic standpoint, as well as the

engineering factors related to specific installation problems. The authors present data for use in the design of commercial aircraft oxygen systems from the point of view of requirements from a physiologic, a medical and a practical and engineering basis and the standardization possible in utilizing these factors. They feel that increasing the flow of oxygen above normal, especially at low altitudes, would protect passengers suffering from such diseases as pulmonary fibrosis, emphysema, anemia and cardiac disease. Present data indicate that the administration of as little as 50 per cent oxygen is of value in certain clinical cases.

Multiple Sites for Bone Marrow Puncture.—Rheingold and his associates say that although the sternum is the usual site for puncture in the study of the bone marrow, other sites have been used in recent years. The authors used bone marrow punctures on multiple sites in 31 adults. Comparison of the results obtained with multiple punctures showed surprisingly similar findings. Occasionally, marrow was obtained from one site, when another yielded a dry tap. Because of these highly comparable results in different areas, the authors now utilize the various sites interchangeably when multiple punctures are performed. Spinous process punctures were performed in 25 infants and children ranging from 2 months to 12 years of age. In 5 children two punctures were done. The iliac crest puncture was performed in 8. Ten patients had both sternal and spinous process and iliac crest punctures; 2 had iliac crest and spinous process punctures, and 1 had a tibial puncture in addition to punctures of the sternum and of a spinous process. The authors conclude that the use of alternative sites for bone marrow puncture is of definite value. In children, the spinous process and iliac crest are often the preferred sites for puncture.

Emotional Factors and Tuberculosis.—A critical review of the literature presented by Berle indicates that current as well as ancient notions concerning tuberculosis and genius, tuberculosis and mental disease, the psychopathology of tuberculosis and the possible influence of emotional factors on the course of this disease need to be reevaluated. As a result of this study, two recommendations suggest themselves: (1) training young phthisiologists to an awareness of the psychologic problems of patients with a chronic disease; and (2) clinical investigation of the possible role of bodily reactions and life situations in the development of tuberculosis. Although many physicians treating tuberculosis in private practice have long been aware of their patients' psychologic problems and have met these effectively, there is no systematic program for the training of young phthisiologists along these lines. Therefore it is suggested that the Trudeau Society or other similar organization plan an effective program for the development of an understanding of the personal and social problems of their patients. The second recommendation relates to the problem of the resistance of the host in infectious diseases. Clinical observations on the parallel course of a patient's emotional life and the course of his tuberculous disease should be carried on. Investigators could determine, for instance, whether any fluctuation occurred in the concentration of a known bacteriolytic enzyme in certain persons under conditions of emotional stress. No progress can be made in the understanding of the relation of emotional factors and tuberculosis unless the physiologic accompaniments of emotional stress are included in the detailed study of the problem of virulence.

Epidemiologic Studies on Patients with Q Fever.—Three hundred cases of Q fever, with 3 deaths, have been investigated in Los Angeles and vicinity since September 1947. The cases occurred throughout the area at all seasons and over several years. They were predominantly in males in the industrial age groups, their occupations being extremely diversified. The epidemiologic findings suggested three general hypotheses as to the modes of spread of the disease in this endemic area—occupation in the dairy or livestock industries, residence in close approximation to a dairy or livestock yards, and household use of raw milk. No one of these possible modes of spread would account for more than one half of the cases. Specific epidemiologic studies have been arranged to determine the worth of each of these hypotheses.

Transvaginal Roentgen Therapy.—Caulk applied transvaginal roentgen treatment alone or combined with other conventional methods in 346 cases of carcinoma of the cervix during the decade of October 1936 to December 1946. Two hundred and two patients were treated prior to 1943, and definite data for analysis in terms of five to ten year survivals were available for 192. One hundred and eighteen patients were dead, 104 having died prior to five years of observation. Two of these 104 died without clinical evidence of the disease; at least 67 patients died of or with cancer. The cause of death in the remaining cases is not known. Fourteen deaths occurred after five years, 5 from causes other than cancer, 6 from causes unknown and 3 from cancer. By combining a short anode-cervix distance with a large speculum and large master cone aperture, the maximum divergence of the beam at the level of the cervix was obtained. Daily doses of 800 r were given. The total dose varied over the years from 5,000 to 8,000 r, but at present a total dose of 6,400 r is given if intracervical and intrauterine radium is to be added, and 7,200 r if supplementary radium therapy is not to be given. All patients had some degree of diarrhea as an immediate result of the transvaginal therapy. The percentage of late complications was relatively low, with 2 cases of severe bowel reaction and only 6 cases of a recto-vaginal fistula directly attributable to radiation. Only transvaginal roentgen therapy was applied to all obese patients in

stage 1 except those with endocervical cancer. The survival in this group—21 of 28 cases—was gratifying. Only 1 of 9 selected patients in clinical stage II to whom transvaginal roentgen therapy was applied survived. This group demonstrated satisfactory control of the local disease in the fornices, but paracervical and parametrial disease spread. Transvaginal roentgen therapy can be utilized to advantage in the treatment of cervical cancer. It is an ideal substitute for local cervical radium application in all cases in which it can be practicably applied. In carcinoma of the cervical stump it can supplant radium entirely. Results may be improved by the delivery of larger doses to the parametria with higher voltage apparatus and the routine addition of intracavitary radium therapy.

Irradiation of Carcinoma of Cervix Uteri.—Ernst devised a new single unit type of cervical uterine radium applicator for the treatment of carcinoma of the cervix the technical advantage of which is due to the mechanically controlled expansion features and to the accurate distribution of seven to nine cross fire radium sources within the pelvis. The expanding feature of the lateral capsules and auxiliary colpostats of this instrument assures a much broader and more uniform distribution of radium intensities, thereby minimizing the danger of over-irradiation of certain areas within the vaginal vault. With the aid of external pressure, the more direct and indirect irradiation of the parametrial fields at close range is facilitated. Since all the radiation sources are incorporated within a single applicator, complete fixation of the individual multiple radium sources is assured. Another advantage is the decentralization feature for correcting, or at least modifying, the position of the displaced cervical canal to a more central position, thereby increasing the vulnerability of both the primary lesion and the parametrium to the radiation sources. Injury to the bladder and the rectum is minimized by the design and mechanical features of the lead-filled ends of the vertical radium capsules. Studies of the intensity of the irradiation on slow photographic films revealed that this method of application compares favorably with the Manchester method. From a clinical research standpoint the author's method facilitates the more accurate comparison and clinical evaluation of the relative effectiveness of various methods of radium application in relation to the time and intensity factors of the total radium dose. This method of applying radium is ideal for the fractional dosage type of irradiation.

Aureomycin in Rocky Mountain Spotted Fever.—Harrell and his associates suggest that aureomycin gives promise of usefulness in rickettsial disease. It is a new antibiotic produced by a species of *Actinomyces* which is effective when administered orally or parenterally against a wide variety of bacteria, against most rickettsias and against a few viruses. The authors present the histories of 3 patients with Rocky

Mountain spotted fever who were treated with aureomycin. The drug was supplied in capsules of 50 mg. for oral administration and in ampules containing 20 mg. of the lyophilized drug as the hydrochloride. Parenteral injections were used in only 1 of the 3 cases. The parenteral dose of aureomycin should probably be in the range of 5 to 10 mg. per kilogram per day in this disease. At present the daily oral dose for human beings seems to be 50 to 100 mg. per kilogram (3 to 6 Gm. daily for an adult) on a four to six hour schedule. The temperature in severe cases responds in about three days. Aureomycin was as effective in inducing clinical remission as any other drug yet tried. It apparently has the property of penetrating cell membranes and attacking rickettsias within cells, suppressing their growth and reproduction and allowing a lower level of immunity to be effective in reducing toxicity, lowering temperature and producing a clinical remission. Since the antibiotic acts primarily on the rickettsias, the importance of supportive therapy to the patient must not be forgotten. Since rickettsial spotted fever varies widely from year to year and from patient to patient, many more cases must be studied before final conclusions can be drawn. It may prove that a combination of aureomycin and para-aminobenzoic acid will be even more effective than either drug alone. An addendum to this paper cites a report by other investigators on the use of aureomycin in Rocky Mountain spotted fever. The favorable response of these 25 additional cases confirms the impression that "aureomycin" is a very effective drug in the treatment of Rocky Mountain spotted fever.

The Changing Picture of Tularemia Transmission.—A study of 704 case histories of tularemia convinced Washburn and Tuohy that in Arkansas the name "rabbit fever" applied to tularemia is, in part, a misnomer. Only 31 per cent of cases were traceable to this source, while ticks were implicated in 56 per cent. Seasonal occurrence and site of lesion coincide with this conclusion. There is also reason to believe that the incidence of the disease is increasing and this may be in part due to the greater number of infected tick vectors. Many of the recently reported cases indicate satisfactory response to streptomycin with greatly lowered morbidity. The disease appears as a definite occupational hazard to those whose work requires them to remain in a tick-infested environment.

Glycerin Osmotic Drainage in Peritonitis.—The Smiths present an evaluation of glycerin osmotherapy after using it in the treatment of peritonitis for over ten years. With localized soiling, as from a gangrenous gallbladder or appendix, a glycerin swabbing of the contaminated area and the insertion of a Kehrner cigaret drain, the gauze of which has been saturated with glycerin, is all that is needed. In diffuse peritonitis, with agglutination of intestinal loops and pocketing of pus, the loops of intestines are gently separated to permit aspiration of pus collections and free lavage with glycerin. As much as 8 ounces of autoclaved glycerin U. S. P. is poured over the inflamed intestines and at least one osmotic drain is placed in the crater of the infection. Unlike normal peritoneum, an edematous wound is not irritated by full strength glycerin since fluids extracted from the tissues seem to dilute the glycerin. The authors present case reports to illustrate the possibilities of osmotherapy in patients with diffuse peritonitis. They stress that glycerin has several useful properties which make it suitable for intraperitoneal use in the treatment of acute diffuse secondary peritonitis. Glycerin induces drainage from infected tissues. It has antiseptic and bactericidal action on the etiologic bacteria of peritonitis. It tends to restrict the formation of residual adhesions. Glycerin absorbed from the peritoneum has a protein-sparing action, reduces hypoglycemia and prevents formation of acetone bodies.

It causes an increase in leukocytes. Used in conjunction with a mechanical drain, it prevents the latter from adhering within the abdomen and avoids skin maceration and superficial infection usually associated with prolonged pus drainage.

Pregnancy and Cancer of Breast.—Brooks and Proffitt believe that although pregnancy exerts a decided influence on existing cancer in the mammary gland, it is not influential in the production of cancer in the gland. They investigated this problem on women who were operated on for cancer of the breast when they were less than 46 years old. They found no evidence that pregnancy plays a part in originating a cancer of the mammary gland, but there seems to be no doubt that pregnancy exerts a strong influence on a coexisting cancer of the breast. It increases the rapidity of its growth. The mechanism of this influence seems to be the same as that which causes the well known anatomic changes in the normal mammary gland during pregnancy. The advisability of the removal of the other breast simultaneously with or subsequent to radical operation for cancer of the breast depends on the likelihood that cancer may have already extended to the normal breast. It should be removed for the same reason that the contents of the axilla should be removed. This is of particular importance in instances in which a cancer arises in the medial hemisphere of the mammary gland, in some of which the primary neoplasm is nearer the other breast than to the axilla of the one diseased. Whether or not a patient during the childbearing age, operated on for cancer of the breast, is to be advised against pregnancy depends on the probability of the complete removal of all the neoplasm and the patient's ability to understand and choose the amount of risk involved for diminishing an already short life expectancy if all the tumor is not removed. With residual cancer the life expectancy, already short, would be further shortened by pregnancy.

Tissue Reaction to Talc and Starch Powder.—Postlethwait and his co-workers point out that talc, when used as a lubricant for surgical gloves, is frequently implanted in the wound during operation and has been known to result in the development of adhesions and granulomas. Efforts have therefore been made to find a substitute for talc. The authors describe animal experiments, which they carried out in order to compare tissue reactions to talc and to a starch powder that had been suggested by other investigators as a substitute for talc. Both materials were placed into the peritoneal, pleural, and pericardial cavities, and within muscles, tendons, joints,

and nerves of dogs. Whereas talc was found to produce granulomatous reactions, the starch powder when placed in the same tissues by similar technics is absorbed with little or no reaction. The authors suggest the starch powder as a satisfactory substitute for talc.

New Method for Roentgenologic Study of Rectum.—Levene describes a new method for the roentgenologic study of the rectum. It consists of spraying a thin mist of barium sulfate suspension on the rectal mucosa. This technic is made possible by the development of new apparatus which allows spraying without building up internal pressure. The procedure is safe and is attended by no discomfort. This method of examination has revealed lesions of various types which were not demonstrated by routine barium enema.

Use of Hyaluronidase with Local Anesthetic Agents.—According to Kirby and his co-workers the use of regional anesthesia has been limited because of the difficulty of depositing anesthetic solutions consistently along nerve trunks. Hyaluronidase, a mucolytic enzyme, is now generally conceded to be a spreading factor. The authors found that addition of hyaluronidase to local anesthetic agents injected subcutaneously increased the area of skin anesthesia but decreased the duration of anesthesia, apparently because of accelerated absorption. When epinephrine was added to local anesthetic agents the duration of anesthesia was approximately the same with and without hyaluronidase. In most instances epinephrine increased the spreading effect of hyaluronidase, probably by delaying absorption. Hyaluronidase may prove helpful in producing regional and infiltration anesthesia in surgical and dental patients.

Boxing and Intracranial Injuries.—Romino says that with the present increase in ring accidents closer study of participants must be made in order to determine the fitness factor. He suggests that boxers should be licensed. Before a license is granted, he should undergo a physical examination. This license should be renewed each year. A boxer should have a medical record of each fight and present this to the commissioner at the time of renewal of his license. The license should be shown to the doctor and a physical examination must be made before each fight. A fighter who has been knocked out should not be permitted to fight for three months. No fighter whose blood pressure is more than twenty points above normal for his age group should be permitted to fight because, in addition to the danger of serious intracranial injuries, it is likely that fighters whose blood pressures are elevated receive, in the course of a bout, numerous petechial hemorrhages which sooner or later result in a "punch drunk has-been." Each fighter should present the doctor with a signed affidavit from his manager, stating that he has undergone sufficient training. The managers should see that their boxers are evenly matched.

Book Notices

The Modern Management of Gastric and Duodenal Ulcer. Edited by F. Croxon Deller, M.D., M.R.C.P. Cloth. Price, \$5.50. Pp. 227, with 57 illustrations. Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

As stated in the prologue, this book gives the points of view of the various contributors on the modern management of gastric and duodenal ulcer, in an attempt to present to general practitioners and surgeons a balanced, educative account of the modern trends in diagnosis and treatment of these two extremely common diseases. The work is practical and based on clinical experience rather than on scientific argument for the reasoning and advice. Important phases of anatomy, physiology, pathology and pathogenesis are adequately discussed. Each section dealing with these fundamental phases of any study of organic disease, the methods of the sections on clinical and laboratory examinations, and the operative procedures are well written and contain the essential features which every doctor dealing with such patients should know thoroughly. The material presented is up to date, and, although much of the material presented is not unknown, it is sound and the advice and inferences given are sound. The book can be recommended for medical students, general practitioners and surgeons alike.

How to Live Longer. By Justus J. Schifferes. With a foreword by Ralph F. Sikes, M.D. Cloth. Price, \$3. Pp. 253. E. P. Dutton & Co., 300 Fourth Ave., New York 10, 1949.

This book for the layman places emphasis on the individual's responsibility for his own health and consequently for the health of the nation. It attempts to replace ignorance, neglect and indifference, termed the elements of involuntary suicide, with sound knowledge and sensible attitudes. Gains made in the last fifty years by medicine and public health are used to indicate the further strides that could be made in prolonging life if the facts of preventive and therapeutic medicine could be put to work through health education of the public.

The ten leading causes of death are analyzed and methods of outwitting these killers are suggested. The usual course of the various diseases is discussed and "danger signals" noted. Principal attention is given to stressing the importance of early medical treatment and advice when such signs manifest themselves.

The author avoids overemphasis on fear and altogether presents a hopeful picture, in fact one which some may consider overoptimistic, for those who intelligently use available health resources. The style is stimulating, and the text informative. A bibliography and a list of agencies concerned with specific health problems provide extensive fields of exploration for those with a special interest in health education.

The National Formulary 1949. [Compiled by the Joint Formulary Committee of the British Medical Association and the Pharmaceutical Society of Great Britain.] Boards. Price, 2s.6d. Pp. 128. The British Medical Association, Tavistock Sq., London, W.C.1; The Pharmaceutical Press, 17 Bloomsbury Sq., London, W.C.1, [1949].

This booklet is prepared by the Joint Formulary Committee, which represents the medical and pharmaceutical professions in England, and is intended to provide "a volume of convenient size which may be carried in the pocket or kept ready at hand by the practitioner and pharmacist. Information which may more appropriately be obtained from textbooks or works of reference is omitted." The committee's objective to provide a volume of convenient size has been achieved. Unfortunately, brevity has caused a sacrifice of information that might be desirable to many physicians. On the other hand, the book provides for the Britisher useful information on characteristic properties of some commonly used drugs, preparations subject to the requirements of the Dangerous Drugs Act and Regulations and the composition of many substances used by the medical profession in England. The book will have little value to the American physician except when the physician may wish to learn the identity of a proprietary remedy used in England; the booklet contains an appendix listing proprietary or trade names and the drugs or preparations which are substantially identical.

Your Coughs, Colds and Wheezes. By Joseph D. Wassersug, M.D. Cloth. Price, \$2.95. Pp. 277. Wilfred Funk, Inc., 227 E. 44th St., New York 17, 1949.

Here is a refreshingly frank approach to these widespread health problems, and at the same time a realistic acceptance of the fact that medicine is still far from their solution. The book conducts the reader through the territory of practical realities, pausing at each signpost to weigh new theories or developments with complete impartiality, accepting only those measures that have been found truly helpful and explaining in practical language the faults or omissions of certain procedures that may have received exaggerated recommendations temporarily. At the same time a completely hopeless or defeatist attitude is avoided.

Specific respiratory afflictions, including colds, influenza, pneumonia, tuberculosis, lung cysts and other growths, are considered in individual chapters, with emphasis in each on prevention and treatment. Of great practical value is a special chapter titled "Your Job May Be Dangerous," presenting data that many physicians will find helpful when discussing specific problems with patients. In addition to consideration of harmful effects from various types of dusts, subjects such as dampness, chilling and practical measures for control of dust are included. Two chapters on asthma serve to rationalize thinking of the average person on this frequently misunderstood medical problem.

In the final chapter is considered the much discussed but rarely identified "cigaret cough," followed by presentation of several case histories of persons whose casually dismissed cigarette cough was found to be caused by something far more serious.

Reader interest is further stimulated by the inclusion at the end of each chapter of a brief test in which one checks statements as true or false or selects the correct answer from three suggested.

Blood Clotting and Allied Problems. Edited by Joseph E. Flynn. Transactions of the First Conference, February 16-17, 1948, New York. Loose-leaf. Paper. Price, \$3.25. Pp. 179, with 26 illustrations. Josiah Macy, Jr. Foundation, 565 Park Ave., New York 21, [n. d.].

On Feb. 16-17, 1948, sixteen workers in coagulation under the sponsorship of the Josiah Macy Jr. Foundation gathered in New York to discuss blood clotting. One of their members read the well known poem, "The Blind Men and the Elephant." It is likely that, like the six men of Indostan, sixteen coagulationists returned to their homes still firmly adhering to their own fixed concepts of the coagulation elephant.

Although the book, as is to be expected, fails to furnish a coordinated picture of coagulation integrated with problems of hemostasis, several presentations, notably Jaques' paper, "Blood Clotting and Hemostasis," and Brinkhous' "Initiation and Acceleration Factors in Thrombosis," include much pertinent information drawn from past and present researches.

The chemists dominated the conference. A scholarly essay on the chemistry and physical chemistry of fibrinogen is given by Dr. Edsall. Many of his data are drawn from work done in his own laboratory. Drs. Seegers and Ware discuss the activation of prothrombin. By an interesting bit of scientific juggling they attempt to reconcile the former claim of Mertz, Seegers and Smith that the reaction between thromboplastin and prothrombin is stoichiometric with their present theory that thromboplastin acts catalytically. They discuss their Ac-Globulin in detail without, however, making much effort to correlate their work with that of other investigators who studied this factor at a time when they still vehemently denied its existence. The paper of Dr. Tage Astrup on "Fibrinolytic Enzymes" stresses the present confusion concerning nomenclature and prompted the appointment of a committee to decide on names. They agreed that both plasmin and fibrinolysin are proper terms for the fibrin-lytic enzyme.

Under the heading of "Value of Prothrombin Determinations," Drs. Wright, Brambel, Olwin, Quick and Smith discussed various phases of the problem. Dr. Olwin presents the relative advantages and disadvantages of the one and two stage methods applied to dicumarol[®] hypoprothrombinemia. Dr. Quick described his studies of congenital hypoprothrombinemias. Dr. Link in a rambling discussion on dicumarol[®] aims frequent darts

at Dr. Quick, but appears to have difficulty justifying his claim that methyl xanthines cause hyperprothrombinemia. An appendix giving the prothrombin determination technic as done in various laboratories is included.

Allergy to Cottonseed and Other Oil-Seeds and Their Edible Derivatives. Excerpts from Testimony before the Administrator, Federal Security Agency in the Matter of Fixing and Establishing Definitions and Standards of Identity for Mayonnaise, French Dressing, and Related Salad Dressings (Docket FDC-51). Public Hearings Held at Washington, D. C., November 18, 1947, and January 6 to 8, 1948. Cloth. Pp. 275. National Cottonseed Products Association, Inc., Sterick Bldg., Memphis 3, Tenn., 1948.

The title for this book describes it briefly and well. As stated in the preface, it was published for the limited distribution to the "medical, scientific and scholarly libraries of the United States." It is an excellent contribution whose value is restricted to allergists who are interested in the subject of sensitivity to edible oils. The testimony was taken from six well known allergists and two technicians in the edible oil industry. The evidence given is not limited to the experience and opinions of the six specialists regarding the frequency and likelihood of allergy symptoms resulting from ingestion of edible oils. In addition, a critical evaluation of the literature on the subject is brought out through the answers to various questions. Two of the six allergists stated that allergy symptoms resulting from ingestion of edible oils were not uncommon, while the other four stated that their active search for patients was fruitless.

The detailed evidence submitted by these latter four specialists indicates that allergy to cottonseed oil is unlikely even in patients who are proved to be sensitive to cottonseed protein. In addition, the evidence of the two technicians engaged in the field of edible oils indicates that under present conditions of oil extraction, oil shipment in tank cars and the use of the same pumps and pipes for various types of edible oils in refining, there is no practical way of preventing admixture of small amounts of other edible oils in cottonseed oil.

An Introduction to Gastro-Enterology. By Walter C. Alvarez, Professor of Medicine, University of Minnesota, Rochester, Minnesota. Fourth edition. Cloth. Price, \$12.50. Pp. 903, with 269 illustrations. Paul B. Hoeber, Inc., Medical Book Department of Harper & Brothers, 49 E. 33rd St., New York 16, 1948.

The fourth edition of "An Introduction to Gastro-Enterology" is actually the fourth revision of Doctor Alvarez's book initially published as "The Mechanics of the Digestive Tract," over twenty-five years ago.

As indicated by the title, this splendid work presents the dynamics of gastrointestinal function, normal and pathologic, written in the stimulating Alvarez style—clear, interesting and readable. The value to the reader lies in the fact that the elucidation of gastrointestinal symptomatology begins with a description of the basic physiology of gastrointestinal function, and from this point the reader is led in logical manner through the development of the pathologic physiology to an explanation of the clinical picture based on previously described facts.

The discussion of gastrointestinal motility and its relation to gastrointestinal symptoms such as nausea, vomiting, hunger, pain and constipation, found in this text, is the most detailed and complete account available on the subject.

In essence, the entire book concerns itself with normal and abnormal dynamics. There is no classified discussion of gastrointestinal disease as such, nor any but a cursory discussion of secretory activity. The bibliography is excellent and valuable in itself.

American Standard Practice for School Lighting. Sponsors: Illuminating Engineering Society, American Institute of Architects. Approved September 20, 1948, American Standards Association, Incorporated. Paper. Price, 50 cents. Pp. 79, with illustrations. Illuminating Engineering Society, 51 Madison Ave., New York 10, 1948.

This is a monograph on school lighting, giving complete details from the engineering point of view. It should be of interest not only to school architects and engineers but to physicians having to do with the eyes of school children or being called in an advisory capacity to school boards or school health services.

Selected Works of Henry Clapp Sherman, Mitchell Professor Emeritus of Chemistry, Columbia University, New York. [Reprints.] Cloth. Price, \$5. Pp. 1056, with illustrations. The Macmillan Company, 60 Fifth Ave., New York 11, 1948.

This book is a tribute to a great and inspiring teacher and to a great research worker who continues to contribute importantly to the world's knowledge of nutrition. It consists of over one hundred reprintings of original articles by Dr. Sherman published from 1895 to the present. Most of the papers included are reports of original research, while a few are addresses and reviews. Also included are biographic notes and a complete list of Dr. Sherman's papers and books. All this material was assembled by a committee of students and co-workers from Columbia University, who express their appreciation of Dr. Sherman as a teacher and associate in a foreword.

In a section entitled "Looking Forward in Nutrition," which was written especially for this volume, Dr. Sherman states that even though further research will add much to our knowledge of nutrition the application of our present knowledge could result in a vast nutritional improvement of man.

This book is an excellent résumé of the progress in nutrition during the first half of the twentieth century—the period of greatest advance in nutrition knowledge in the world's recorded history. It will probably appeal more to the nutrition specialist and research worker than to the student or dietitian.

Histologie und mikroskopische Anatomie des Menschen mit Berücksichtigung der Histophysiologie und der mikroskopischen Diagnostik. Von Prof. Dr. Med. Otto Bucher, Leiter des Laboratoriums für experimentelle Histologie und Erster Prosektor am Anatomischen Institut der Universität Zürich. Band V. Sammlung medizinischer Lehr- und Handbücher für Ärzte und Studierende. Boards. Price, 59.50 Swiss francs. Pp. 467, with 376 illustrations. Hans Huber, Marktgasse 9, Bern 16; distributed by Grune & Stratton, Inc., 381 4th Ave., New York 16, 1948.

This new textbook of histology from Switzerland is in German. Its avowed purpose is to help medical students pass their examinations and to prepare them for their work in pathology and the clinics. To these ends the subject is presented in simple, didactic form embellished with numerous tables and graphs. As the title promises, considerable emphasis is placed on the sections dealing with the differential diagnosis of the various tissues and organs. In this essentially simple morphologic presentation, discussions of most of the unsettled problems of histology and histophysiology receive scant attention. The three pages devoted to the submicroscopic organization of the cell do not contribute much to an understanding of the complex problems touched on. The illustrations are almost entirely original ones prepared by the author and a number of students and artists. On the whole, the black and white ones are not particularly good with regard to cellular detail. There are, however, a number of excellent colored figures.

According to the preface the lack of histology texts in German motivated the writing of this one. It seems that the present contribution falls below the level set in former years by the Stöhr-von Möllendorff, the Schaffer and the Petersen textbooks. As it is taught in American medical schools, histology is concerning itself progressively with functional and chemical interpretations of structure. This point of view is conspicuously absent in the present text. Those students who prefer ready-made outlines and summaries might relish parts of this book if it were in English.

Food Products. By Henry C. Sherman, Ph.D., Sc.D. Fourth edition. Cloth. Price, \$4.80. Pp. 428, with 20 illustrations. The Macmillan Company, 60 Fifth Ave., New York 11, 1948.

The present edition is the first revision of this well known text since 1933. As in the previous edition, food products are discussed from the standpoint of (1) production and marketing; (2) sanitation, inspection and standards of purity or of conventional market grade; (3) general composition, mineral content and vitamin values, and (4) special characteristics, digestibility, nutritive value and place in the diet.

Special attention has been given to a carefully studied revision of the tabulations of the amounts of individual amino acids in the different food proteins and to the lists of suggested readings

at the end of each chapter. While rather elementary for the physician, this book has long been a college textbook and a valuable reference for beginning studies of foods and nutrition.

Engineering the New Age. By John J. O'Neill. Cloth. Price, \$3.50. Pp. 320. Ives Washburn, Inc., 29 West 57th St., New York 19, 1949.

Science and engineering, twin giant forces, are lacking in social consciousness, at least in their organized aspects, O'Neill believes, and development of that is vital to cultural progress. It is vital because only through such a new attitude can reconstruction of "man's terrestrial homestead" to harmonize with changed needs and ideals be accomplished. With that premise, the author proceeds to orient the reader on Nature's basic design and how Nature actually has always proved to be an ultra-scientific engineer. Chapters on "The Master Designer" and "The Pulsing Ball We Call the Earth" present this graphically.

Man's fumbling attempts to take over are described in a section devoted to consideration of primitive civilizations, the phenomena of rivers and their rise and fall, and the construction of early cities after the brick, the "module of the structural art," was developed. After sections on the "personality" of the modern world, in which a design for life is suggested, and re-creation of our cities, which O'Neill translates as "curing urban ulcers," there is presented a program by which the engineers can elevate their social as well as professional aims. There is reproduced a credo, headed "Faith of the Engineer," which O'Neill considers as perhaps as basic as the Hippocratic oath. The book is both stimulating and encouraging. It shows that even though civilization slips and falters the net is always a little more on the plus side. O'Neill believes this progress will be accelerated if engineers will accept their responsibilities as world builders.

A Program for the Nursing Profession. By the Committee on the Function of Nursing (Division of Nursing Education, Teachers College, Columbia University). Chairman: Eli Ginzberg, Ph.D., Associate Professor of Economics, School of Business, Columbia University. Cloth. Price, \$2. Pp. 108. The Macmillan Company, 60 Fifth Ave., New York 11, 1948.

In 1948 three major studies were completed in relation to the nursing field, one by the Committee on Nursing of the American Medical Association, one under the sponsorship of the National Nursing Council and one by the Committee on the Function of Nursing. As all of these make valuable contributions to future planning, they should be carefully analyzed and correlated by all who are interested in the continued advancement of the nursing profession along such lines as will insure an adequate supply of nursing service in accordance with total needs.

The report of the Committee on the Function of Nursing is presented in seven chapters describing the plan of study, estimated requirements and recruitment factors, specialization of functions, educational methods, the integration of nursing personnel in the health team, economic aspects and incentives and, finally, a summary of findings, conclusions and recommendations. There has also been appended a selective bibliography which gives to the reader convenient access to the reference material freely utilized by the committee.

The recommendations of the committee are related chiefly to the classification of nursing personnel, the clarification of the duties of the health team, methods of education of the proposed professional and practical nursing groups, the estimated needs of nursing personnel, economic factors and research in clinical, administrative and educational fields. It is also of interest to note that in the opinion of the committee the major difficulties which now confront the nursing field can only be solved by "a radical break with the past."

Hasidism. By Martin Buber. Cloth. Price \$3.75. Pp. 208. Philosophical Library, Inc., 15 E. 40th St., New York 16, 1948.

Hasidism is a religious philosophy which originated among the Jews of Russia. The author, a distinguished Hebrew historian, presents in this volume the results of a lifetime of study on this colorful religious movement which centered about the common man who sought a way of life. The author believes that the philosophy of Hasidism should be of interest not only to its followers but to the rest of the world.

Sex and You. By LeMon Clark, M.S., M.D. Cloth. Price, \$2.75. Pp. 203. Bobbs-Merrill Company, 734 N. Meridian St., Indianapolis 7; 468 4th Ave., New York 16, 1949.

Many books are being written on the subject of sex. Some of them are excellent, others are worthless and some are definitely vicious. This book is one of the very best. It does not get lost in giving a great many of the details regarding sex and the sex act, but strikes boldly toward the goal of an underlying philosophy of life and sex. In the interpretation of these complex phenomena the author has done a good job, indeed. Too many persons simply cannot see the woods for the trees. They know a great many facts, and their information is authentic point for point, but they do not have a wholesome philosophy to tie the whole matter together. Dr. Clark has given us an excellent opportunity to develop a sound attitude toward sex and life and therefore has made an extremely important contribution to a subject which is in great need of being understood as a whole. This book can be strongly recommended to persons contemplating marriage and to those who are already married and yet may feel that they are not succeeding to the fullest possible extent. As indeed, who has? It will give a new slant to the whole subject for many persons and should be widely circulated. It is beautifully written, thoroughly balanced and correct in the views expressed.

You and Others. By Helen Shacter, Ph.D., and W. W. Bauer, M.D. Illustrated by Guy Parker, Felix Traugott, and Clara Ernst. Health and Personal Development Series. Cloth. Price, \$1.56. Pp. 288, with illustrations. Scott, Foresman and Co., 433 E. Erie St., Chicago 11, 1948.

This is the sixth grade book of the new health, safety and personal development series. The book presents basic information about the body and how it works and grows, the essentials of good nutrition and good posture, and the effect of emotions on the body's functioning. Methods of promoting sound health and safe living are considered in detail and common problems faced by preadolescents in learning how to understand themselves and others are given substantial attention.

A group of child characters, their parents and their teachers are used throughout the book to point up the variance in health problems and needs among children at this age level. Incidents and anecdotes developed around the experiences of these fictional characters should closely touch the life of the pupils who use the book. The titles of the four units, "You and Your Friends," "You and Your Family," "You and Your School" and "You and Your Community," are indicative of how the health implications of daily living are tied in with the interests of the child. An additional factor in motivation will be found in the appealing cartoons interspersed among line drawings and colored pictures. "Things to Do" or suggested activities in connection with each of the units should serve as a springboard for the development of projects in personal, school and community health.

Physicians need not hesitate to recommend this book as a resource in the development of a functional health education program in the schools.

Cytologie sanguine: Normale et pathologique. Par M. Bessis, directeur du Laboratoire de recherches du Centre national de transfusion sanguine. Préface de A. Tzanck. Paper. Price, 1500 francs. Pp. 298, with 247 illustrations. Masson & Cie, 120 Boulevard Saint-Germain, Paris 6^e, 1948.

This is an excellent book on the cells of the blood and hemopoietic organs. Of the modern textbooks of hematology there are but few covering this field exclusively, the outstanding predecessor being the four volume Handbook of Downey. There is a chapter on technic, followed by nine chapters on each type of blood cell or its precursor. A minute description of the appearance of each cell in the fresh or stained preparations is given. The black and white drawings and photographs are unusually good, bringing out points that one has often wished to find in pictures. The colored plates, representing cells stained with May-Grünwald-Giemsa stain, while beautifully clear, differ enough from the colors which American technicians are used to, after the Wright technic, to make the recognition and classification of some of the cells somewhat difficult. A table of contents and a glossary are given, but no index. This book is a valuable and desirable addition to the books on hematology and should be very useful in clarifying nomenclature.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

STATISTICS ON POLIOMYELITIS

To the Editor:—1. What percentage of the population of the United States at one time or another suffer from poliomyelitis in any degree of severity? 2. What percentage of these cases are of such severity as to require medical attention? 3. What percentage of cases of poliomyelitis actually require an iron lung? 4. What percentage of the patients in these cases which require treatment in an iron lung actually survive? 5. What is the consensus regarding value of an iron lung as compared with its estimated value eight or ten years ago?

M.D., Indiana.

ANSWER:—1. In the Communicable Disease Study, a house to house canvass which was made in twenty-eight cities in 1936, attacks of infantile paralysis at any time since birth were recorded for all persons under 25 years at the time of the survey. It was found that of 174,850 persons covered by the survey 897 had had attacks of poliomyelitis, or 5.1 per thousand persons, and 2.4 per thousand under 25 had suffered attacks from which there were residual effects.

2. It can be assumed today that all cases of poliomyelitis reported as such to state health departments are seen at least once by a physician. It can also be assumed that there still remain a number of cases of mild paralytic poliomyelitis that are not recognized during the acute stage, are not reported to state health departments and deformities from which are subsequently discovered on preschool or school examination.

3. The percentage of cases of poliomyelitis requiring use of the respirator will vary from epidemic year to epidemic year and will also vary in the same epidemic year in different areas. This may be due to variations in the virulence of the strain of the virus causing the disease, as well as the degree of immunity of the patient at the time of contact with the virus. During 1948 respiratory paralysis was unusually high in the epidemics occurring in North Carolina and California.

4. Comprehensive surveys have not been made of the mortality rates of respirator cases probably because of the vagueness of the term "respirator cases." The difficulty seems to be in determining what a respirator case is. Does it depend on the type of involvement, or does it depend on the length of time the patient is placed in a respirator, which may vary?

In the 1946 Minnesota epidemic, the Minneapolis General Hospital submitted figures which showed that it had handled a total of 35 respirator cases. Included in those 35 cases were 13 of the spinal, 12 of the bulbospinal and 10 of the bulbar type. In these 35 respirator cases there was a 62.8 per cent mortality rate.

University Hospitals reported total respirator cases 31, of which 17 were spinal, 9 bulbospinal and 5 bulbar in type. Of this group of 31 cases, they reported a mortality of 35.5 per cent. But it is difficult to say how statistically accurate these figures are, for both institutions also reported a series of cases termed respirator plus tracheotomy, in which the mortality rates were much higher. Just how to determine which were true respirator cases and those which were not is difficult to say. Evidently the respirator plus tracheotomy series represented cases which were actually not true respirator cases, but in which the respirator was used perhaps as a last resort. It seems to be difficult to determine on the basis of studies available the exact mortality rate in "respirator cases."

5. During the Minnesota epidemic of 1946 and the California epidemic of 1948 (Los Angeles) there was opportunity for intensive study of respiratory and bulbar poliomyelitis. These studies have resulted in a better understanding of the value of the respirator in treatment of these types of poliomyelitis. We recognize today that the use of the respirator in certain types of bulbar poliomyelitis is actually contraindicated. Finally, the respirator is being used much more effectively than it was eight or ten years ago. Better indications for its use, improvements in the respirator and the development of new therapeutic technics have, during the last decade, resulted in a lower mortality in bulborespiratory paralysis.

TREATMENT OF DUODENAL ULCER

To the Editor:—1. What is the latest accepted treatment for uncomplicated duodenal ulcer; bleeding ulcer? 2. In what way does roughage such as vegetable pulp affect the ulcer? Why should one puree foods? 3. In what way does the eating of meats affect ulcer? Should they be scraped before eating? 4. What foods are low acid producing? 5. What are the chances of complete cure? 6. How does alcohol affect an ulcer? 7. Should a patient with ulcer be on a high protein diet?

P. Lancione, M.D., Bellaire, Ohio.

ANSWER.—1. (a) many methods have been accepted as logical approach for duodenal ulcer. If peptic ulcer is the result of abnormal function in the stomach or duodenum, or both, attempts at restoration to normal would be important.

The reports on simple vagotomy, with or without other operative procedures on the stomach, are convincing. A pharmacologic method can be instituted which would simulate this surgical approach.

Long before this specific surgical approach appeared it was known that partial paralysis of the vagus nerves could be accomplished with atropine sulfate. The vagus nerves must be so paralyzed twenty-four hours of the day. This can be accomplished by giving this drug three times a day at meals and at bedtime. One can block out emotional stimuli over the vagus nerves by this method almost as completely as with a section of the vagi. In some patients with peptic ulcer, if the emotional stimuli are overwhelming, it may be impossible to paralyze these nerves to a degree consistent with normalization of function.

If inhibitory influences of the cortex on the hypothalamic region of the brain prevent emotional stimuli from being exteriorized, then attempts should be made to break down this so-called physiologic block. This can be accomplished with barbiturates in patients who seem to respond. However, there are some in whom barbiturates do not produce emotional quiescence. This is particularly true in many who have free-flowing "anxiety" and are always voluble. In this small group, chloral hydrate, which will quiet not only the cortex, but also the hypothalamus—should be substituted for the barbiturates. For therapeutic purposes, the chloral hydrate can be masked in a convenient vehicle. Whether it be barbiturates or chloral hydrate, the drug should be given around the clock.

There is increasing clinical evidence that the pain which starts one to three hours after eating frequently appears in the early morning hours and may be related to a lowering of the blood sugar level. This relative hypoglycemia may produce increased stimulation of the vagus nerves, which in turn aggravate and magnify the abnormal function in stomach and duodenum. While there are not any adequate reports on blood sugar in patients at the height of the pain, the conclusion is justifiable if one is to interpret the Hollander (intravenous crystalline insulin) test and its influence on blood sugar, and increased acidity in the stomach. Therefore patients who have an uncomplicated duodenal ulcer should be fed at least six times a day. The following diet is given as a logical approach to this phase of the problem (ambulatory ulcer):

Avoid:

Coffee, tea, alcohol in all forms, tobacco.
Fried foods, greasy canned fish, i. e., sardines, smoked fish.
Raw fruits and vegetables.
Whole grain cereals and breads.
Spices and condiments—i. e., pepper, mustard, chili sauce, etc.
Meat, including poultry; meat stock soups.
Sugar, pie, cake, candy, jelly, honey, syrup, ice cream.

Take (take only things listed below—nothing else):

Butter as desired.
Enriched cream of wheat, farina, corn meal, cream of rice; strained oatmeal and Pettijohn's; puffed rice, rice Krispies; rice, noodles, macaroni, spaghetti; all plainly cooked without spice sauces.
Enriched white bread, toasted; white crackers, melba toast, holland rusk, zwieback.
Vegetable milk soups, made with puréed vegetables. No meat stock soups.
Lean fresh water fish, broiled, boiled, or baked; whitefish, perch, pike, trout or bass.
Cottage or cream cheese in moderate portions.
One or two eggs daily, soft boiled, poached, shirred or scrambled over water.
• All vegetables are to be thoroughly strained as baby foods; use no vegetables with seeds or tough fibers.
All fruits to be thoroughly strained as baby foods, except canned peach and pear which may be taken whole; fresh strained orange juice daily; use no berries or syrup of the canned fruit.
Mashed, baked, boiled potatoes, without skins, are permissible.
Baked custard, simple puddings and jello.
Milk, buttermilk (if desired), breakfast cocoa, Ovaltine, cream.
Regular, not iodized salt.
Sugarless sweetener or saccharine instead of sugar.
Bedtime nourishment is important.

Free sugar is omitted from this diet because the rapid absorption of sugar has a tendency to produce a secondary hypoglycemic reaction in susceptible patients. This negates the high level of blood sugar that one attempts to produce.

Peptic ulcer is relatively uncommon in diabetic patients under 40 years of age. This evidence adds weight to the hypoglycemic phase of ulcer distress.

1. (b) The treatment of bleeding ulcer—unless a patient is vomiting—begins with milk and cream every two hours, from 8 a. m. to 8 p. m. The same pharmacologic approach as written under 1. (a) is utilized except that the medication, as far as atropine and barbiturates are concerned, may have to be temporarily given hypodermically.

The intestinal phase of gastric secretion can be buffered again by the aluminum salts one-half hour and one hour after eating. As the clinical picture improves, additions to the diet, with adequate attention to the vitamin intake, can be instituted. The blood picture should be carefully and repeatedly studied to note the improvement of the patient. The prothrombin, bleeding and coagulation time should be frequently checked, because deviations from normal would prolong bleeding. One can readily institute measures to bring these back within normal range.

The question concerns uncomplicated bleeding ulcer and the patient is not vomiting. Blood transfusions have time-honored indications. Toward the end of the first week the patient should be fairly well able to approach the diet and the medical management previously described.

2. Roughage such as vegetable pulp affects the peptic ulcer patient by removing the mucous protection in the ulcer bed and allows peptic digestion to go unhampered. When adequate amounts of mucus cover the duodenal or gastric mucosa, and not too much lysozyme is present, digestion of this mucosa cannot take place. For these reasons puréed foods are definitely indicated.

3. A patient with peptic ulcer has a hyperirritable parietal cell which will secrete acid on the least provocation—from nerve impulse, secretagogues or hormones—which will produce an increased acid response. Since the digestion of meat produces secretagogues, these in turn will more easily stimulate a hyperirritable parietal cell and produce increased acid. Scraped meats are preferable to masticated meats in that scraped meats are more easily buffered by acidity and will leave the stomach much earlier than the lumps of meat which the patient usually swallows. When the meat leaves the stomach sooner, there is less chance for secretagogues to remain in the gastric juice.

The recent so-called cures for peptic ulcer, be they hog's duodenum by mouth or injection of enterogastrone, do not justify optimism at present. The best clinical experimental evidence for therapy is found in the reports of the work on vagotomy.

4. Fruits—except cranberries, plums and prunes—vegetables and milk are low acid producing.

5. A patient with peptic ulcer can be completely cured if the ulcer has not penetrated too deeply into the muscularis and has not produced an accessory pocket with a pseudodiverticulum. Deep-seated emotional factors which will not, by themselves, come to the surface under the influence of diet and drugs will also lessen the possibility for permanent cure. If the latter is true, then there is a definite indication for surgical intervention in some of these patients even though the ulcer itself is uncomplicated. Recurrence of symptoms in a patient with peptic ulcer who is under management as outlined is directly attributable to some emotional upset which produces stimulation that is not blocked by the atropine sulfate.

6. Alcohol affects a patient with peptic ulcer in that (1) it increases the acidity; (2) it prevents the patient from taking an adequate diet; (3) avitaminosis may develop because of the restricted diet; and (4) it may affect the liver, which in turn will disturb the physiology of the body and will prevent a normalizing of the psychologic balance in the individual.

7. A patient with ulcer does not necessarily have to be on a high protein diet. His intake of protein should be adequate to keep him only in nitrogen balance.

LOCALIZATION OF INTRAOCULAR FOREIGN BODY

To the Editor:—Please list the different methods for localizing a radiopaque intraocular foreign body. Which is the most accurate method?

J. C. Galbreath, M.D., Brownwood, Texas.

ANSWER.—Some thirty methods have been described for localizing radiopaque intraocular foreign bodies. All are intrinsically inaccurate, and for best results two or more methods should be used. Stereo roentgenograms in the posteroanterior and lateral views are recommended prior to localization. Small foreign bodies located far anteriorly may be visualized by means of a soft tissue technic with dental film at the inner canthus. Localization usually depends on determination of the relationship of the foreign body to an arbitrarily selected point on the globe

indicated by a radiopaque reference marker. Findings are then interpreted with reference to a normally shaped eye. Reference markers may be small pieces of wire placed under the conjunctiva, a silver ring sutured to the limbus, or a larger ring placed in the fornices, a contact lens containing lead markers or the elaborate device of Sweet. A number of devices have been designed for use with double exposure roentgen studies, but occasionally foreign bodies of low density will not be visualized. The most nearly accurate is Sweet's localization, but this requires the most elaborate equipment. Air injected retrobulbarly may allow precise localization in some cases. Berman's localizer has been of value in magnetic foreign bodies. Occasionally, if the media are clear, the foreign body may be localized with an ophthalmoscope. There are good discussions in Thorpe (The Management of Nonmagnetic Foreign Bodies, *Surg., Gynec. & Obst.* 84: 809, 1947) and Haik (Intra-Ocular Foreign Bodies, *J. A. M. A.* 135: 895-901 [Dec. 6] 1947).

TREATMENT OF CARDIOVASCULAR SYPHILIS

To the Editor:—A male patient, aged 57, has an aortic aneurysm due to previous syphilis. The blood Wassermann reaction in June 1948 was 4 plus. At that time he complained of symptoms of slight cardiac failure, which disappeared on adjustment of his activities and use of digitoxin tablets, 0.2 mg. twice a day for about ten days. His blood pressure is 170 systolic and 50 diastolic. Presently he is having a course of 0.13 Gm. bismuth subsalicylate in oily suspension once to twice a week. What is your opinion as to the advisability of treatment with procaine penicillin injections? I am hesitant because of the risk of Herxheimer reaction. Is the risk less if we have to deal with an aortic incompetence (syphilitic) without an aneurysm? What doses of procaine penicillin do you advise?

M.D., New York.

ANSWER.—Although opinion on the subject has not yet been crystallized, the belief is gaining ground that syphilitic cardiovascular lesions of all types respond well to treatment with penicillin and that the beneficial effects outweigh inherent dangers as from the rare therapeutic paradox and Jarisch-Herxheimer reactions. Some physicians feel that the risk of Herxheimer reaction is lessened if the patient is first prepared by treatment with heavy metals and then small doses of penicillin are begun. Others begin treatment with full doses of penicillin by a number of suitable schedules provided the patient receives a total of 6,000,000 to 9,000,000 units. Aqueous preparations of penicillin may be administered, 20,000 units intramuscularly every three hours around the clock; or a slowly absorbed type of penicillin, 300,000 units twice a week for ten to fifteen weeks. In addition to the specific treatment, there must be treatment directed toward the cardiac condition.

STERILITY INVESTIGATIONS

To the Editor:—I have been asked by several patients to determine ovulatory time with the "rat test" in order that they may more accurately use the Ogino-Knaus method of conception control. The only chemical or bioassay tests which I can find in the literature that could possibly be used are the Venning-Browne method of measuring excretion of pregnandiol and the Allen-Corner demonstration of progesterone. Is either of these tests more reliable or clinically more practicable than biopsy, basal temperature or potentiometric readings?

Leslie T. Hamm, M.D., Lawton, Okla.

ANSWER.—In a study of the comparison of methods used in determining the time of ovulation F. E. D'Amour (*J. Clin. Endocrinol.* 3: 41-48 [Jan.] 1943) studied twenty menstrual cycles of 5 subjects using concurrently four to six of the following methods: gonadotropin assay, estrogen assay, pregnandiol determination, vaginal smears, body temperature and subjective experiences. The purpose was to evaluate the validity of these tests on the basis of uniformity in the occurrence of positive responses and synchrony of their appearance. It was concluded that (1) subjective experiences were valueless as tests for ovulation; (2) body temperature fluctuations were not sufficiently regular or clearcut to be reliable; (3) uniformity of results of hormonal assays and vaginal smears confirmed the validity of each, and a certain sequence of events appears typical of the normal cycle, and (4) because of its sharpness and its apparent close association with ovulation, the gonadotropin peak occurring in the mid interval was considered most indicative of the exact time of ovulation.

The rat test about which inquiry is made is most likely the one described by D. P. Murphy and E. J. Farris (*Am. J. Obst. & Gynec.* 54: 467-474 [Sept.] 1947). To determine the time of the day of ovulation 2 cc. of morning urine is injected subcutaneously into each of 2 immature female white rats of the Wistar strain. At the end of two hours the animal is killed

with illuminating gas. The abdomen is opened and each ovary compared with the reds of the Munsell color chart.

In the presence of normal ovulation, the patient's urine induces hyperemia in the ovaries of the rat on four or five consecutive days. In the absence of ovulation there is no hyperemia. If ovulation is abnormal, hyperemia occurs but usually on less than four consecutive days. The test is performed daily during the middle ten days of the cycle. Intercourse is interdicted during the test month.

After the control month, intercourse is advised or artificial insemination is performed on the last day of each normal ovulation reaction. To provide the maximum sperm, intercourse should not be practiced on the day before the day when the ovum is ready.

The rat ovulation test is useful because it indicates whether or not ovulation is occurring. In addition, it provides information as to when ovulation occurs, thus permitting conservation of sperm until the optimum time for impregnation.

HISTAMINE IN MULTIPLE SCLEROSIS

To the Editor:—A patient has taken daily injections of histamine to arrest the progress of multiple sclerosis for the last three years. Recently he complained of symptoms suggestive of ulcer of the duodenum, which was verified by roentgen examination. The ulcer subsequently perforated. It has been suggested by the neurologist who previously treated him that he resume histamine injections. Is not such treatment an etiologic factor in duodenal ulcer, and would it aggravate his present condition?

Victor Piro, M.D., Chelan, Wash.

ANSWER:—Whether administration of histamine in cases of multiple sclerosis is helpful or not is not by any means clearly decided. Some neurologists report favorable subjective improvement, while many others report the opposite. In either instance there are not any reports of improvement in objective findings in multiple sclerosis. Histamine is a vasodilator and if it has not proved effective in your case in three years there is no reason for continuing it as a therapeutic agent. It is not known whether histamine is a factor in the production of a duodenal ulcer. If a perforated duodenal ulcer developed in your patient during the course of treatment with histamine, it is strongly recommended that you stop giving it. In my personal experience histamine injections have failed in the treatment of multiple sclerosis.

LIVER EXTRACT AND HYPERTENSION

To the Editor:—Kindly discuss the following: (1) the relationship of hypertension (210 systolic and 120 diastolic) and the administration of biweekly liver injections, 15 units intramuscularly, in a man aged 50, proved four and one-half years ago to have pernicious anemia; (2) the relationship, if any, of rheumatic pains in the back of neck, shoulders and arms in a young married woman aged 26 who has been getting weekly or biweekly injections of 10 units liver and 1 cc. vitamin B complex as a "tonic" for one year.

M.D., Canada.

ANSWER:—1. There is no known relationship between hypertension and the administration of liver extract. The incidence of hypertension in patients with pernicious anemia being treated with liver extracts is certainly not higher than is the incidence in other persons of comparable age.

2. The liver extract and vitamin B complex probably are totally unrelated to the rheumatic pains. Chronic myositis or chronic arthralgia have not been described as sensitivity reactions to either preparation.

HYDROFLUORIC ACID POISONING

To the Editor:—A spot remover, produced locally, contains 10 per cent hydrofluoric acid produced by diluting 60 per cent technical hydrofluoric acid. This remover is dispensed in a 2 ounce plastic bottle which will spray a few drops at a time when the bottle is squeezed. How much of this liquid would produce dangerous symptoms if ingested by a child, and how much would you consider a lethal dose?

John J. Shurts, M.D., Eldora, Iowa.

ANSWER:—Hydrofluoric acid is a corrosive poison and extremely dangerous in any concentration. When swallowed it will cause serious and extremely painful burns of the lips, mouth, esophagus and stomach. This is followed by nausea, vomiting, diarrhea, intense thirst and difficulty in swallowing. Systemic effects due to absorption of the acid are manifested by rapid weak pulse, dyspnea, muscular weakness, excitement and tremors, convulsions and collapse. Death is attributed to respiratory paralysis.

The lethal dose of hydrofluoric acid is not easily determined, since large amounts of the acid may be rejected in vomitus. Two drams of the technical grade of acid have caused the death of an adult and much smaller quantities can produce dangerous symp-

toms. The fatal oral dose for mammals is considered to be about 0.5 Gm. per kilogram of body weight.

Treatment must be prompt. Death may occur in a few minutes to several hours after ingestion of hydrofluoric acid. Large amounts of lime water should be given to dilute and neutralize the acid. Raw eggs or milk should be given to protect the mucous surfaces and an intravenous calcium preparation should be available for treatment if tetany occurs. Vomitus, feces and urine should be washed away to prevent external burns.

TRAUMATIC PREPARATION OF GASTRIC ULCER

To the Editor:—What physical stresses are exerted on the normal or diseased stomach when a man seizes a moderately heavy weight at waist level and lifts it a short distance, assuming that the weight does not press on the abdominal wall? Is there a bursting, tearing or stretching force exerted on the stomach? This question has arisen in reference to onset of symptoms of perforated gastric ulcer during work.

M.D., Washington.

ANSWER:—Physical stresses exerted on the normal or diseased stomach should be minimal under the circumstances. It is conceivable that the amount of exertion entailed in a patient harboring a penetrating or perforating gastric ulcer may have played a role, especially if the lifting was done immediately after a hearty meal or if the symptoms of perforation appeared promptly after the exertion described. The condition which may predispose to acute perforation of a chronic peptic ulcer are as follows: a blow to the abdomen, an unusually heavy meal, severe emotional stress, alcoholic debauch, violent exertion, strenuous manipulation of the abdomen during a fluoroscopic examination, vigorous abdominal massage or a fall from a height. Chronic penetration and "protected" perforation of a chronic ulcer is a common complication and is noted in about 1 of every 4 cases in which patients with gastric or duodenal ulcer have been submitted to operation. The fact remains that the rupture of an ulcer is spontaneous in the majority of cases.

VASECTOMY

To the Editor:—In *The Journal*, January 29, page 346, the answer to a question titled "Vasectomy" states: "Vasectomy is indicated and is done for the prevention of epididymitis following prostatic operations and also in some instances to prevent recurrent attacks of epididymitis."

In a recent survey in which I have been engaged, eighteen out of twenty urologists, most of whom are members of the American Board of Urology, have opposed routine vasectomy accompanying prostatic operations as a necessary procedure in preventing epididymitis—in view of the infection-preventing power of present day drugs. This consensus is supported by the experimental results of Dr. Nesbitt, urologist at the University of Michigan Hospital, which were published in the January 1948 issue of *The American Journal of Urology*. Consequently, I was surprised to read the aforementioned quotation.

Apparently, there are still those who favor vasectomy in every case. I for one, and I know there are others—am curious to hear the reasons which proponents of routine vasectomy with prostatectomy would offer for such procedure today.

Reverend James V. Moscow, Chicago.

SPEECH DEFECT

To the Editor:—In *Queries and Minor Notes*, *The Journal*, Dec. 25, 1948, a question is asked about the treatment of an 8 year old boy who has an articulatory disorder. The advice given was to refer the boy to a Child Guidance Clinic for psychotherapy and that speech therapy would be like using a sledge hammer to drive carpet tacks.

When one sees children with articulatory defects one cannot fail to be impressed by the fact that there are children who experience real difficulty in learning to produce certain sounds (Karlin, I. W.; Youtz, A. C., and Kennedy, L.: *Distorted Speech in Young Children*, *Am. J. Dis. Child.* 59:1203 [June] 1940). The causes may be varied, but to label all of them as "baby talk" is reductio ad absurdum.

This boy will benefit best by an intelligent combination of speech therapy and psychotherapy.

Isaac W. Karlin, M.D., Brooklyn.

MYELOGRAMS

To the Editor:—The optimistic response to the query on back pain or increased pain after myelogram (*The Journal*, January 15, p. 194) is not in accord with my experience. After this test, patients sometimes, though not often, do have back pain for many months or even years. Similar pain is encountered after spinal puncture for anesthesia, suggesting that the pain is not an irritation due to the opaque medium but is due to the mechanics of the puncture and injection.

It is important to be conscious of the disadvantages or risks inevitable in our diagnostic procedures.

THERAPEUTIC CRITERIA IN RHEUMATOID ARTHRITIS

OTTO STEINBROCKER, M.D.
CORNELIUS H. TRAEGER, M.D.
and
ROBERT C. BATTERMAN, M.D.
New York

This report summarizes recommendations for uniform therapeutic criteria in rheumatoid arthritis. The need for such criteria arose from the recognition of the confusing language and standards found in the many therapeutic reports on this disease. In an effort to develop common standards for the evaluation of therapy in this condition, the Committee for Therapeutic Criteria of the New York Rheumatism Association was formed in 1945. A number of previous attempts had been made to establish some order in this subject.¹

One of the chief difficulties which confronted us was the varied language used in the body and conclusions of articles on therapy which did not lend themselves to any accurate appraisal. For example, in presenting their conclusions, writers reporting results employed such terms as excellent, good, improved, greatly improved, moderately improved, objectively improved and so on. Even investigators using the same methods of therapy have reported their results in different language, not quite comparable. It becomes obvious that the reader can, in no possible way, intelligently determine what is meant by these many terms, nor can he usefully compare the results so reported.

The Committee soon encountered the manifest difficulty inherent in therapeutic evaluation in any disease of unknown causation with no specific treatment. One of the great problems involved here is the enormous influence of subjective factors in the assaying of results, on the part of investigators as well as patients. Especially confusing are attempts to evaluate the response

The criteria have been adopted by the New York Rheumatism Association and the American Rheumatism Association (Executive Committee). The authors constitute the Special Committee on the Specific Criteria of the New York Rheumatism Association. The committee of the same name of the American Rheumatism Association, both under the chairmanship of the senior author, Dr. Charles Short, Walter Solomon, Dr. Charles Tyson, who have given this report.

apeutic Criteria of the committee of the same both under the chairmen are Drs. Charles Taylor and T. Lloyd in the preparation of

Med.* **235**: 501, 1946. Short, C., and Bauer, W.: Course of Rheumatoid Arthritis in Series of Patients Receiving Simple Medical and Orthopedic Measures, *New England J. Med.* **238**: 142, 1948.

of pain in patients receiving treatment. The psychogenic influence of any new type of therapy, or even the psychologic impact of a change in physicians, accounts for another confounding factor in reporting results. It was decided, therefore, that a common language of therapeutic effectiveness is possible and feasible only in terms of the objective evidence presented by patients during the course of observation. For this reason the fundamental thesis of this work, "therapeutic criteria," is based entirely on objective information.

Early in our efforts, we noted many pitfalls in the evaluation of results. One of them was the inclusion, by many investigators, of patients in whom the diagnosis of rheumatoid arthritis was questionable. To minimize the possibility of confusion in this regard, we have embodied in our recommendations a definition of rheumatoid arthritis. It follows closely the pattern established by the primer on rheumatism published by the American Rheumatism Association.

It should be noted that these therapeutic criteria are intended for application only to patients presenting a clearcut diagnosis of rheumatoid arthritis, although those with juvenile rheumatoid arthritis, or rheumatoid arthritis with valvular heart disease, need not be excluded. Conditions to which the criteria do not apply include ankylosing spondylitis, psoriatic arthropathy, the arthritis of ulcerative colitis, Felty's syndrome, Reiter's syndrome and any cases in which the distinction between atypical rheumatoid arthritis and one of the specific infectious arthritides cannot be made with certainty.

Another problem which confronted us was the fact that many of the investigators did not seem to recognize the natural fluctuations of the disease, which in any period of observation may lead to a spontaneous remission unrelated to therapy. Similarly, exacerbations or relapses are frequent, since the disease is usually progressive. It becomes important, therefore, to have the period of observation for therapeutic evaluation of sufficient length of time to take into account the natural history of the disease. For this purpose the Committee recommends that each method of therapy should have its own arbitrary time limit established for initial therapeutic response to exclude the factor of spontaneous remission. At least a one year follow-up period should be included in any therapeutic study to provide a comparison with the initial response to treatment in this condition. Complete remission is the most significant index to the effectiveness of any specific therapeutic agent. Furthermore, to avoid errors arising from misinterpretation of the natural fluctuations of the disease, the Committee recommends that minor improvement

(grade III), as indicated later, should not be considered significant. Therefore, it should not be included in any statistical summary of a therapeutic agent or procedure. This precaution is necessary to avoid misleading lumping of "favorable" results.

In the reporting of therapeutic results, it is obviously of prime importance to consider the extent of involve-

TABLE 1.—Classification of Rheumatoid Progression

Stage	Roentgenologic Signs	Muscle Atrophy	Extra-Articular Lesions (Nodules Tenovaginitis)	Joint Deformity	Ankylosis
I	Osteoporosis sometimes no destructive changes	0	0	0	0
II	Osteoporosis slight cartilage or subchondral bone destruction may be present	Adjacent	May be present	0	0
III	Osteoporosis cartilage destruction bone destruction	Extensive	May be present	Subluxation ulnar deviation and/or hyperextension	0
IV	Same as III with bony ankylosis	Extensive	May be present	Same as III	Fibrous or bony ankylosis

ment in each case at the beginning of therapy. To facilitate such evaluation we have proposed a classification of patients according to the stage of the disease at the start of treatment.

The classification of patients according to the stage of involvement at the beginning of treatment serves several important functions. It is a useful index to future progression of the disease. In therapeutic studies it enables the individual observer to notice any differences in the response of each group in the various stages. In this way it also offers a logical basis of comparison by various investigators employing the same form of treatment, permitting them to distinguish any possible differences in their results and those of others due to grossly unequal numbers of patients in similar stages in each study.

From a practical point of view, the patient's functional capacity is important. However, the evaluation of therapeutic results has long been confused by the failure to distinguish between the effects of therapy on rheumatoid activity in contradistinction to its influence on functional capacity. Although remission of rheumatoid activity is likely to be accompanied with commensurate improvement in the mobility of affected joints, functional capacity may vary considerably in spite of an unaltered rheumatoid process, or as a result of such different procedures as orthopedic measures, physical therapy, psychotherapy and many others which improve function without altering the activity of the disease. Functional impairment is not necessarily proportionate to the structural damage, although such a relationship is common.

The ideal specific is an agent which will give lasting arrest of rheumatoid activity in all cases. At the moment there is no such remedy. It becomes necessary, therefore, to distinguish between those therapeutic agents which show measurable objective effects and those which only influence subjective and/or functional

features of the disease. For that reason especially, the criteria must be based entirely on objective evidence.

Wherever possible, precision instruments, such as a tape measure and goniometer, should be used in estimating the amount of swelling and motion for the purpose of reporting the progress of the disease being treated.

The Committee believes, however, that any evaluation should be based on the over-all picture and should not be unduly influenced by any laboratory procedure or any one feature of the disease.

In the course of the Committee's efforts to arrive at practical therapeutic criteria, it became increasingly clear that the effective use of such standards requires agreement on other preliminary considerations. These have been designated as supplementary aids to the therapeutic criteria. They consist of a definition of rheumatoid arthritis, a classification of the stages of rheumatoid arthritis and a classification of functional impairment. These now are presented and are followed by the therapeutic criteria for the response of rheumatoid activity. Finally, a brief exposition is included on the application of the therapeutic criteria and supplementary aids as a system of classification and evaluation. They are recommended by us to provide the common language and standards so sorely needed in the therapeutic investigation of rheumatoid arthritis.

DEFINITION OF RHEUMATOID ARTHRITIS

Rheumatoid arthritis is a systemic disease of unknown causation, occurring at all ages. It may be acute, subacute or chronic. It may be reversible, especially in the early stages. It is generally a chronic progressive disease, with joint involvement as the chief manifestation. Ordinarily, it is polyarticular and usually symmetric. The typical joint swelling presents a fusiform appearance. The affected joints are characterized by pain, stiffness, swelling and, many times, other signs of inflammation. Subcutaneous nodules, tenovaginitis and muscular atrophy are frequent concomitants. The rheumatoid process often progresses to deformity, subluxation and/or ankylosis. The significant pathologic changes as a rule consist of proliferation of the synovial tissue, joint effusion and roentgenologic evidence of osteoporosis and destruction

TABLE 2.—Classification of Functional Capacity

Class	
I	Complete Ability to carry on all usual duties without handicaps
II	Adequate for normal activities Despite handicap of discomfort or limited motion at one or more joints
III	Limited Only to little or none of duties of usual occupation or self care
IV	Incapacitated, largely or wholly Bedridden or confined to wheelchair; little or no self care

of cartilage and subchondral bone. Systemically, there is usually an elevation of the erythrocyte sedimentation rate and sometimes leukocytosis, anemia, fever, vasomotor imbalance, loss of weight and anorexia. Although the course of this condition tends to be progressive, with exacerbations, it may be punctuated by spontaneous remission.

In early rheumatoid arthritis joint swelling may be absent. The presence of such swelling, however, is a prerequisite for inclusion of a patient in any thera-

peutic study. Other causes of joint swelling, such as rheumatic fever, gout, osteoarthritis and rheumatoid-like disorders should be excluded. A doubtful case should be omitted from any therapeutic investigation.

CLASSIFICATION OF STAGES OF RHEUMATOID ARTHRITIS

To insure more accurate and reliable classification, certain characteristics of the disease, limited to the joints and adjacent structures, can be employed to distinguish the various stages of progression. These may be divided into four stages according to the clinical signs and roentgenologic changes.

Rheumatoid arthritis may be active or inactive. During activity, regardless of the stage, spontaneous remission may occur. Certain clinical and laboratory features characterize the various degrees of activity and may be present in any stage. These features are: elevation of erythrocyte sedimentation rate, leukocytosis, anemia, fever, vasomotor and trophic disturbances, weakness, joint tenderness, swelling and loss of weight. Some

Stage III, Severe

- *1. Roentgenologic evidence of cartilage and bone destruction, in addition to osteoporosis.
- *2. Joint deformity, such as subluxation, ulnar deviation or hyperextension, without fibrous or bony ankylosis.
3. Extensive muscle atrophy.
4. Extra-articular soft tissue lesions, such as nodules and tenovaginitis, may be present.

Stage IV, Terminal

- *1. Fibrous or bony ankylosis.
2. Criteria of stage III.

Any two or more of these stages may coexist in different joints in the same patient, but usually the process advances to an approximately similar degree in multiple joints. Since it is not practical to appraise the disease according to the stage of each affected joint, it is expedient to classify each case according to the status of the worst joint. It should again be emphasized that in any stage the disease may be considered active or inactive, and, if active, the degree of thera-

TABLE 3.—Response of Rheumatoid Activity to Therapy

Grade	Systemic Signs	Signs of Joint Inflammation	Signs of Extra-Articular Activity	Remaining Impairment of Joint Mobility	Articular Deformity	Erythrocyte Sedimentation Rate	Roentgenologic Signs
I							
Complete remission....	0*	0*	0*	Due only to irreversible changes	Due only to irreversible changes	0*	No progression
II							
Major improvement...	Elevated erythrocyte sedimentation rate and/or vasomotor imbalance permissible	Only minimum* residual joint swelling (no new sites)	Minimum* (no new sites)	Only consistent with minimum residual activity	Due only to irreversible changes	May be elevated	No progression
III							
Minor improvement...	Decreased*	Only partially* resolved (no new sites)	Decreased* (no new sites)	In relation to residual inflammation	May be present	May be elevated	No progression
IV							
Unimprovement	Undiminished*	Same* or worse	Same or new sites or exacerbation*	Same, better or worse	Present or not	Any rate	Changes indicative of progression

* Indicates criteria required to be present.

of these may become more pronounced with advancing and persistent inflammatory changes.

At any stage of the disease certain of the objective features may be present and may be recognized clinically or roentgenologically, such as persistent joint swelling with or without effusion, tenderness, stiffness and limitation of motion.

Certain characteristics in the progression of the disease, chiefly structural changes, may be used to differentiate the various stages. These are embodied in the following outline²:

Stage I, Early

- *1. No destructive changes roentgenologically.
2. Roentgenologic evidence of osteoporosis may be present.

Stage II, Moderate

- *1. Roentgenologic evidence of osteoporosis, with or without slight subchondral bone destruction; slight cartilage destruction may be present.
- *2. No joint deformities, although limitation of joint mobility may be present.
3. Adjacent muscle atrophy.
4. Extra-articular soft tissue lesions, such as nodules and tenovaginitis, may be present.

2. The criteria prefaced by an asterisk are those which must be present to permit classification of a patient in any particular stage or grade.

peutic response is determined according to the criteria to be outlined.

Hypertrophic articular changes occur frequently in the late decades, and they are usually of little importance in rheumatoid arthritis in the clinical, pathologic and functional features and their response to treatment.

CLASSIFICATION OF FUNCTIONAL IMPAIRMENT

The following classification of functional impairment is recommended as an adjunct to the criteria for the stages of rheumatoid arthritis

Class I

Complete functional capacity with ability to carry on all usual duties without handicaps.

Class II

Functional capacity adequate* to conduct normal activities despite handicap of discomfort or limited mobility of one or more joints.

Class III

Functional capacity adequate to perform only little or none of the duties of usual occupation or of self care.

Class IV

Largely or wholly incapacitated with patient bedridden or confined to wheel-chair, permitting little or no self care.

THERAPEUTIC CRITERIA FOR RESPONSE OF
RHEUMATOID ACTIVITY

To provide the most convenient and reliable means of assaying results, four categories of response of rheumatoid activity to treatment are recommended. These range from grades I to IV. Grade I represents maximum improvement; grade IV no improvement, and grades II and III intermediary stages. The criteria² are based entirely on objective evidence, since subjective symptoms are considered unreliable.

Grade I, Complete Remission

- *1. No systemic signs of rheumatoid activity (see definition).
- *2. No signs of joint inflammation.
- *3. No evidence of activity in any extra-articular process, including nodules, tenosynovitis and iritis.
- *4. No remaining impairment of joint mobility, other than that associated with irreversible changes.
- *5. No elevation of erythrocyte sedimentation rate.
- 6. Articular deformity, or extra-articular involvement due to irreversible changes, may be present.

Grade II, Major Improvement

- *1. No systemic signs of rheumatoid activity, with exception of an elevated sedimentation rate and vasomotor imbalance.
- *2. Major signs of inflammation resolved, such as heat, redness of joints and of extra-articular involvement.
- *3. No new rheumatoid process of intra-articular or extra-articular structures.
- 4. Minimum joint swelling may be present.
- 5. Impairment of joint mobility associated with minimum residual activity may be present.
- 6. Articular deformity, or extra-articular involvement due to irreversible changes, may be present.

Grade III, Minor Improvement

Any decrease in signs of rheumatoid activity inadequate to fulfil the criteria of grade II:

- *1. Diminution of systemic signs of rheumatoid activity.
- *2. Signs of joint inflammation only partially resolved.
- *3. No evidence of extension of rheumatoid activity into additional articular or extra-articular structures.
- 4. Decreased but not minimum joint swelling present.
- 5. Impairment of joint mobility due to residual inflammation may be present.
- 6. Articular deformity, or extra-articular involvement due to irreversible changes, may be present.

Grade IV, Unimprovement or Progression

- *1. Undiminished signs of rheumatoid activity, regardless of functional capacity.
- *2. Exacerbation of any previously involved joint or joints, or development of new sites of rheumatoid activity.
- *3. Roentgenologic changes indicative of progression of the rheumatoid process, excepting hypertrophic changes.
- 4. In the presence of one or more of the aforementioned criteria, improvement in other features, including, a normal or lowered erythrocyte sedimentation rate, not significant.

APPLICATION OF THE THERAPEUTIC CRITERIA
AND SUPPLEMENTARY AIDS AS A SYSTEM
OF CLASSIFICATION AND EVALUATION

The first consideration in undertaking the treatment of a patient with rheumatoid arthritis is to determine: (1) the stage of the disease, (2) the presence of rheumatoid activity and (3) the degree (class) of functional impairment. A patient therefore would be classified as having rheumatoid arthritis, active or inactive, stage —, class —.

With treatment the stage of the disease rarely improves. However, either rheumatoid activity or functional impairment, or both, may respond. For the purposes of clinical evaluation of response to treatment, therefore, there are two variables—rheumatoid activity and functional impairment. It is the opinion of the Committee that rheumatoid activity represents the crucial basis for assessment of the effectiveness of any therapeutic agent. For the purposes of evaluation of the response of rheumatoid activity to any treatment, the signs of active disease presented by the patient at the initial examination constitute the maximum evidence of rheumatoid activity in that person, and form the basis for determination of response to therapy by decrease in those signs of activity. For example, a patient at the beginning of treatment may be in stage III, active, class IV, and can, after a suitable period of therapy still be in stage III, yet may show grade II improvement of rheumatoid activity and class II functional capacity. The classification of functional impairment together with the criteria for therapeutic response of rheumatoid activity can give a helpful insight into the usefulness of the whole treatment program, which may include such general procedures as physical therapy, rehabilitation measures, psychotherapy, orthopedic corrections, analgesic and constitutional therapy and many others. For the purpose of evaluating specific therapeutic agents, this Committee recommends that reports of such treatment should be based only on the "Criteria for Therapeutic Response of Rheumatoid Activity."

DIETHYLSTILBESTROL IN MUMPS ORCHITIS

Prophylactic and Therapeutic Use

ARCHIBALD L. HOYNE, M.D.

Chicago

Epidemic parotitis, although primarily a disease of childhood, has been reported in all ages from infancy to senility. The greatest incidence is between 8 and 14 years. The virus of mumps, like that of other virus diseases, involves all the systems of the body at the onset, and, according to the thesis of Philibert, complications are, in reality, exaggerated or latent manifestations of the disease. Therefore, the so-called complications may not seem to follow the initial infection but may be concurrent or precede clinical evidence of parotitis. Because these facts have been demonstrated repeatedly, it would be theoretically ideal to have prophylactic measures instituted at the time infection takes place.

Statistically, approximately 1 out of every 5 men experiences testicular involvement as a result of mumps. This complication most commonly occurs on the fourth to the seventh day of the disease. It is usually ushered in with chills, inguinal pain and pressure sensation over the entire scrotum. There may or may not be an associated difficulty in urination. Early physical examination often reveals a thin, shiny, slightly reddened scrotum, and pressure elicits pain over the entire region. The testicle may be slightly enlarged, and the epididymis is usually shotty. After this initial tran-

sitory period a rapid enlargement of the testes occurs. The swelling may be hydrocele-like or may be stony hard, but in either case it is extremely tender and exquisitely painful to touch. The testicle may reach the size of a large orange, and in 1 out of every 6 cases it may be bilateral. Atrophy occurs in approximately 55 per cent, but there is restoration of function of the undamaged tubules when the inflammatory process subsides. This usually occurs in seven to ten days.

Lack of trauma and strict bed rest in the early phases of the disease seem to have no bearing on the incidence of epididymo-orchitis. This is the severest complication of mumps, but it is almost never seen in children before puberty.

In view of the experimental work done with estrogens on the testes of laboratory animals, as well as human beings, it has been postulated that an inhibition of the normal function might be beneficial in inflammatory conditions of the testicle and that estrogens may be of prophylactic value when these conditions are imminent.

The normal physiologic action of estrogen and the effects produced by large amounts of the substance in the body tissues of both laboratory animals and human beings have been shown both experimentally and clinically to be quite distinct. Zondek,¹ in 1940, demonstrated in human beings as well as in laboratory animals that high concentrations of estrogens in the body tissues inhibit the normal function of the ovaries and testes. Experimentally, the injection of estrogenic substances has produced a definite retardation of development of the testes in immature male subjects, as well as degenerative changes in the testes of adult animals. Also, temporary sterilization in the male human being has been accomplished by injection of estrone.

Diethylstilbestrol differs from the naturally occurring estrogens in that it does not possess a cyclopentenobenzanthracene nucleus. But the structure of diethylstilbestrol is not greatly unlike the derivatives of cyclopentenobenzanthracene. This similarity of structure is in all probability the responsible factor in the almost identical pharmacologic activity of the natural and synthetic estrogenic substances.

The frequency of orchitis in mumps varies in different series and with epidemics. In some years the incidence is low, while in others the virus seems to have a predilection for the testes, and the presence of orchitis is much higher. Radin,² in 1917-1918, reported an incidence of 13.91 per cent, and Bang,³ in 1943, reported 66 per cent. Bailey and Haerum⁴ reported this complication in 19.9 per cent of their series, while Dermon and LeHew⁵ found that in 35 per cent of their patients with mumps orchitis developed. McGuiness and Gall⁶ reported 36.2 per cent orchitis as a complication in their cases, but Worden⁷ reported only

a 16.4 per cent incidence in his series. In Rambar's⁸ patients, orchitis occurred in 28.83 per cent of the controls. For Eagles' series,⁹ the incidence of orchitis for four consecutive years was 21.25 per cent, 24.33 per cent, 27.03 per cent and 24.28 per cent, with an average of 25.12 per cent.

In view of the great frequency of orchitis in the adult, the average being between 18 and 25 per cent, the accompanying loss of additional man-days due to this complication is very important. This is true especially when epidemics strike in institutions, large organizations or military personnel, and has stimulated several investigators to try various methods to prevent this complication.

Measures have been used both prophylactically and therapeutically. Prior to the introduction of prophylactic serum, strict bed rest was often the only treatment instituted. The latter has been shown to be of no value, as it does not lessen the possibility of orchitis.

The use of convalescent mumps serum as a prophylactic agent was first reported by Hess,¹⁰ who found it very dependable. Since then a number of other workers have had equally good results with convalescent serum for passive immunization after exposure to mumps.

Some investigators then tried convalescent serum to prevent orchitis in mumps. Rambar⁸ gave 40 cc. of convalescent serum intravenously to 86 men on the first day of their clinical symptoms. One hundred and sixty-three men constituted his control group. Orchitis occurred in 14, or 16.27 per cent, of the men given serum, and in 47, or 28.83 per cent, of the control group. Bailey and Haerum,⁴ Iverson and de Lavergne and Florentin used convalescent serum with decidedly different degrees of success. It appeared to be of definite value in some series, while in others the results did not vary greatly from those in the control groups.

Candel and his co-workers¹¹ used pooled normal plasma as a prophylactic agent. Seventy-five men served as a control group, and 30 patients received 100 cc. of pooled plasma immediately on admission. The incidence of orchitis in the control group was 22.6 per cent and 20 per cent in the group receiving plasma. Thus it would seem that plasma is of little or no value in that dosage.

Another factor to be considered in the use of serum or plasma is the high incidence of infectious hepatitis as observed following World War II. This is a definite drawback to their administration, regardless of their worth as prophylactic agents. However, ultra-violet irradiation of the serum or plasma may be an aid in prevention of this further complication.

Gellis, McGuiness and Peters¹² selected gamma globulin as a prophylactic agent. In one series gamma globulin prepared from convalescent mumps serum was used, and in the second series the gamma globulin was prepared from normal human pooled plasma. In the first series, 51 patients were treated with 51 controls. The incidence of orchitis in the controls was 27.4 per cent, while in the treated patients it was only 7.8

per cent. Those receiving gamma globulin in the second series (that prepared from pooled plasma) consisted of 67 patients, and there were 67 controls. The incidence of orchitis was 26.8 per cent in the controls and 20.9 per cent in the treated patients. In this series only those patients with clinical symptoms of twenty-four hours or less were included. The results with convalescent serum gamma globulin indicate a high prophylactic efficiency, while the pooled plasma gamma globulin seems to be of little worth. However, the injection of convalescent serum gamma globulin was restricted to patients with parotitis of twenty-four hours' duration or less. Therefore, this procedure may have a somewhat limited value. Gamma globulin, in contrast to results with serum or plasma, has not been shown to cause infectious hepatitis, but it is not always readily available.

In the past, the treatment of mumps orchitis has been primarily symptomatic. Strict bed rest, support of the testes by a scrotal bridge, cold applications to the scrotum and salicylates and codeine to relieve pain have been the measures commonly favored. However, in 1912, Smith¹³ first described incision of the tunica albuginea to relieve the pressure on the testes. Since then Wesselhoeft and Vose¹⁴ have expressed their belief that surgical treatment may be definitely indicated but should be reserved only for patients in whom the severity of the symptoms warrants intervention. Prescribing of heat, cold and/or morphine is incidental, in their opinion, as it would be in any acute condition when operation is required. They express the belief that convalescent serum is ineffective and illogical in treatment of orchitis and debatable as a prophylactic agent. Nixon and Lewis¹⁵ stated that convalescent serum is ineffective when used to prevent orchitis in parotitis. However, they asserted that early surgical treatment is of value in relieving symptoms, shortening the period of disability and preventing subsequent atrophy. Finn and Palmberg¹⁶ reported 3 cases in which surgical treatment gave good results.

In contradistinction to the advocates of surgical treatment, Rambar,¹⁷ while in the navy, reported 2 cases of severe mumps orchitis treated with 1 unit of pooled human plasma each, with dramatic relief of pain, drop in temperature and subsidence of swelling. Smith¹⁸ also used pooled plasma for the treatment of orchitis. In 5 cases (12.5 per cent of his patients with mumps) he administered 1 unit (500 cc.) of pooled plasma intravenously and reported results varying from excellent to dramatic. Rambar⁸ described another series in which he used both convalescent serum and pooled plasma. Of 56 patients, 30 were reserved as controls, 13 each had 1 unit (500 cc.) of pooled normal plasma, 10 received 40 cc. doses of convalescent serum and 3 had both serum and plasma. The results showed the average number of febrile days in the treated group to be 4.5 and in the untreated group 5.5. Thus the value of serum or plasma as a therapeutic agent could not be demonstrated by this study.

The fact that orchitis rarely occurs in the male patient with mumps before puberty suggests that the

virus seldom attacks the inactive testes. This prompted the use of diethylstilbestrol, which is known to decrease the activity of the testes and revert them to the pre-pubertal type of gland. Savran¹⁹ in his series used diethylstilbestrol for 77 patients and had 168 controls. He gave 1 mg. three times daily for five days at first, and orchitis developed in 3 patients. He then increased the dosage to 1 mg. four times daily for seven days, and none of the patients had orchitis. His treatment included bed rest with bathroom privileges for six to seven days, acetylsalicylic acid as needed, soft diet and fluids given freely. In 17 patients who had started treatment, inability to obtain the drug resulted in its discontinuance, and orchitis developed in 5 of them, an incidence of 29.8 per cent. Of those who received the treatment only 3 or 3.9 per cent had orchitis, but among the 168 controls 28, or 16.6 per cent, had orchitis. There were no side effects or toxic symptoms manifested by the treated patients at any time.

CLINICAL STUDY

An attempt was made to determine the efficacy of diethylstilbestrol both as a prophylactic agent and as a therapeutic measure in mumps orchitis. Patients admitted to the contagious disease hospital of a large community do not always suffer from the average course of a disease. Often they constitute the group with the severer type or representing social service problems, so that the accumulation of a great number of cases was difficult. This study was conducted over a six month period.

A total of 39 adult male patients with mumps were hospitalized. Of these, 19 had orchitis of varying severity on admission. With this relatively small number of patients, it was impossible to follow any as controls. Therefore, the 20 admitted without orchitis were treated prophylactically with diethylstilbestrol. The duration of the mumps at the time of admission varied from one to four days.

At the start, 1 mg. of diethylstilbestrol was given on the day of admission and every morning thereafter until the parotitis subsided. Thirteen patients were so treated, and 3 of this number, or 23.08 per cent, had orchitis. For all of these the condition was unilateral; in 2 it was classified as mild and in the third as moderate. The dosage was then increased to 2 mg. every morning, and 7 patients were treated by this method. None of these 7 had orchitis. The percentage affected, therefore, was 23.08 per cent for those receiving 1 mg. of diethylstilbestrol, 0 per cent for those receiving 2 mg. daily and 15 per cent for the total number of patients treated.

The 19 patients admitted with orchitis were given diethylstilbestrol therapy in larger doses, except in those cases with mild involvement. The patients received 5 mg. of diethylstilbestrol immediately on admission and 5 mg. every morning until the orchitis subsided. A smaller dose was used in the cases of milder disease.

Of the 19 patients, the average duration of mumps on admission was 8.26 days and the average duration of orchitis was 2.58 days. The degree of orchitis was classified on admission as unilateral or bilateral, and as mild, moderate or severe, depending on the amount of fever, pain, swelling and tenderness present. The response to the drug by these patients was in some instances dramatic, with decided decrease in pain and tenderness and a lessening of the patients' general

toxicity within twenty-four hours. In every instance the response was good, with an uneventful recovery. The average duration of treatment was 4.73 days, and the average total hospital stay was 5.89 days.

COMMENT

The results in 39 patients with mumps who were treated prophylactically and therapeutically were both dramatic and consistent. Savran, using 1 mg. of diethylstilbestrol three times daily at the beginning of his series, had 3 patients in whom orchitis developed, but when 1 mg. was given four times daily no orchitis occurred. In our series, only 1 mg. daily was used initially, and in 3 cases in a series of 13 mild orchitis developed. The next 7 patients were treated with 2 mg. daily, and no orchitis was seen. The original dose of 1 mg. daily is, in our opinion, an inadequate amount for prophylaxis. However, 2 mg. daily produced excellent results in a limited number.

Therapeutically, 5 mg. of diethylstilbestrol was given daily, and the results in 19 patients were striking. The simplicity of administration, the relatively low cost, the rapidity of response, the decrease of morbidity, the shortening of the hospital stay and the needlessness of surgical intervention make orally administered diethylstilbestrol the treatment of choice.

SUMMARY

1. Epididymo-orchitis, although the severest complication of mumps, is almost never seen in children. The incidence ranges from 18 to 25 per cent in adults.

2. Numerous agents administered prophylactically gave varying results. Diethylstilbestrol, used in a series of 77 cases by Savran, showed a 3.9 per cent incidence when given in adequate dosage. Our results limited to a smaller series disclosed a similar response when the dosage was adequate.

3. Diethylstilbestrol seems to be the ideal drug for mumps after puberty in that the morbidity of orchitis is decidedly decreased and surgical intervention is made unnecessary when orchitis is present.

4. The simplicity of oral administration and the lack of toxic effects, together with the dramatic clinical results, make diethylstilbestrol the treatment of choice as a prophylactic and also as a therapeutic agent for mumps orchitis.

NOTE.—Since this paper was written, we have had 25 additional male adults with mumps. Twenty-one of this number had orchitis when admitted and were treated with diethylstilbestrol. For these 21 the dosage was 5 mg. daily, and the time for recovery varied from three to five days. Three of the 4 patients without orchitis were treated with diethylstilbestrol prophylactically and orchitis developed in 1.

3026 South California Avenue.

The Mammalian Erythrocyte.—The transformation of a reticular cell of the bone marrow—a rather nondescript kind of a cell, relatively small, with a nucleus poor in chromatin—into the mature red cell, is brought about by the little understood processes of nucleic acid metabolism, of protein syntheses and of differentiation. Such processes are not peculiar to the red cell, but the manifestation of these processes is perhaps more readily apparent in this cell than in other cell types. . . . According to Sabin, reticular cells of the bone marrow endothelium, which develop in sinusoids temporarily closed to circulation, give rise to the erythrocytic series. On the other hand, those reticular cells which develop extravascularly give rise to the granulocyte series.—Granick, S., *The Chemistry and Functioning of the Mammalian Erythrocyte*, *Blood*, the *Journal of Hematology*, May 1949.

PRESENT POSITION OF RADIOTHERAPY
IN MEDICAL PRACTICE

B. W. WINDEYER, M.D.
London, England

The development of the art and science of radiotherapy has proceeded with such rapidity that it has been difficult to keep continually abreast of the progress that has been made. This is particularly true in regard to the last ten years, during which time the discoveries have been of such far reaching importance as to open up entirely new fields and new possibilities of methods of treatment by the use of roentgen rays and the radiations from radioactive substances. At the same time, owing to the war, maintenance of close contacts among the workers in this branch of medicine in different countries has not been possible. In consequence the radiotherapy of each country has developed along individual lines to a greater extent than in the prewar period.

It is possible that this tendency to isolation has resulted in excessive attention being paid to certain aspects of the subject and in the relative neglect of others. It is therefore particularly valuable for us from overseas to be able at the present time to attend these meetings, to hear the opinion of our colleagues and to have the opportunity of visiting the various clinics and research centers in this country.

I am honored by your invitation to address the Radiology Section of the American Medical Association and thought that my best contribution would be to describe the way in which radiotherapy has progressed in Britain, how it is being carried out at present and its possible lines of future development.

ESTABLISHMENT OF REGIONAL RADIUM CENTERS

The growth of radiotherapy as an independent specialty in Britain began with the establishment of regional radium centers by the National Radium Commission. This body was set up by statute in 1929 to insure that nationally owned radium was used to best advantage. Regional centers were established throughout England, Scotland and Wales in hospitals attached to medical schools. Supplies of radium were lent to these hospitals and in each case a radium officer was appointed, to cooperate with the members of the staff in the treatment of patients, to organize an adequate system of records and follow-up and to be responsible for the care and custody of the radium. Up till this time the small amount of radium work that was being done was carried out mainly by enthusiastic surgeons and gynecologists who had been influenced by the excellent work seen at the centers in Paris and Stockholm. The roentgen therapy was carried out almost entirely as a subsidiary part of the work of the diagnostic radiologists, and there was little liaison between these two forms of radiation therapy.

The radium officers gradually became of greater importance, and in the majority of centers the radium work was entirely handed over to them. It was soon realized that radium therapy and roentgen therapy involve the same problems and are, in fact, the same

From the Myerson Institute of Radiotherapy, Middlesex Hospital, London, England.

Read before the Section on Radiology at the Ninety-Seventh Annual Session of the American Medical Association, Chicago, June 24, 1948.

method of treatment, that there is every advantage in their being carried out under the control of the same person. Gradually roentgen therapy has been separated from the control of the department of roentgen diagnosis. It has been merged with radium therapy under the single direction of the radiotherapist in an entirely separate department. The ranks of the radiotherapists were filled from the radium officers, from the diagnostic radiologists and from the surgeons and gynecologists who had become interested in this form of therapy.

At the same time there was an increasing realization of the necessity of organizing the radiotherapy of cancer in large and well equipped departments, each treating a considerable number of patients. To attain this end the department must centralize the work of a relatively wide geographic area, and the tendency has been to aggregate small departments of roentgen and radium therapy into large centralized units.

The advantages accruing from such aggregation are many. Such trained men as are available would be used to maximal advantage, a matter of some importance with our shortage of specialists combining a sound knowledge of both roentgen and radium therapy. The training of further therapists could be carried out under conditions in which they would get experience under supervision, and not have to work on their own, with inadequate knowledge. Such specialists would be in a position to see sufficient numbers of each of the many diseases involved, and the presence of colleagues employed in the same work would greatly assist in the achievement of a higher standard. On the grounds of health alone it is desirable in a department to have several therapists, and this would not be possible economically in a small department. The many different types of radium container, which are necessary for satisfactory work, would be available, and all such apparatus would be kept in use, thus insuring the most economical employment of expensive radium supplies. There would be sufficient numbers of roentgen therapy generators to insure that interruption of work by mechanical breakdown was minimized. A full range of equipment would be provided producing roentgen rays of different quality of beam. The center would be large enough to make the best use of such expensive equipment as a 1,000,000 or 2,000,000 volt roentgen ray plant, or a teleradium unit, and to carry out controlled research in their use. Physicists and a physics laboratory in association with the radiotherapy department would be kept fully employed.

The National Radium Commission has adopted this policy of centralization in the organization of its centers, and the continuation of this policy has been accepted in the planning of the Regional Organization of the new National Health Service.

In addition, the radiotherapy departments have been organized as part of a large medical center, as it is realized that the maintenance of clinical progress and the proper conduct of radiotherapy demand the closest cooperation between the radiotherapists and the representatives of other specialties. Where possible the departments have been made a part of a university teaching center, so that research could be facilitated by association with the basic teaching and research departments.

Opinion in Britain has further crystallized toward the idea that radiotherapy is best carried out by full time workers in these departments. The increasing variety, complexity and expensiveness of the equipment necessary to give the optimum treatment to any particular patient have meant that it has become impossible for the private practitioner to make the capital outlay to provide the necessary staff and equipment. The treatment of cancer by radiation has become so expensive that it must be subsidized from public funds. As, however, cancer may and does occur in all classes of the community, provision has had to be made for the treatment of private, as well as public, patients in large well equipped institutions. The majority of full time appointments have been arranged so as to cater to this need.

In this arrangement for the centralization of radiotherapy there are some obvious difficulties, particularly with regard to the radiotherapy in dermatologic diseases. It is realized that the large number of patients requiring radiotherapy cannot be dealt with satisfactorily in the radiotherapy center and that roentgen therapy has become an essential part of dermatologic practice. It is probable that there will be an arrangement whereby roentgen therapy of nonmalignant diseases of the skin will be carried out both in special skin hospitals, provided that these are adequately equipped for the purpose, and in general hospitals with dermatologic departments.

In the general hospitals the roentgen therapy of cutaneous disease may be undertaken either in the dermatologic or in the radiotherapy department, as may be more convenient. In either case there must be active collaboration between the radiotherapist and dermatologist, at least to the extent that in the skin roentgenologic department there should be a visiting radiotherapist to advise on calibration, dose measurement, choice of plant, protection and other technical matters.

Such then is the organization which has been developed. Its full implementation has been delayed and hindered by factors associated with the war, building difficulties and lack of trained personnel. In common with some other specialties which are of little value to military medicine, there could be no recruits to radiotherapy, except for those unfit for military service.

CONTRIBUTION OF PHYSICISTS

Of the work which has been carried out, undoubtedly the greatest and most significant contribution to radiotherapy which Britain has produced in recent years has been the work of the physicists in the fields of estimation of dose received and of dose distribution.

We consider these matters to be of fundamental importance and have developed the physical side to a considerable extent. In fact, every radiotherapy department makes full time use of one or more physicists, specially trained in clinical problems, who have the use of a well equipped physics laboratory. It has been said that we have become too much imbued with the value of the physicist in our day to day practice, so that it may be advantageous to explain what we consider to be the role of the physicist and his significance in radiotherapeutic practice. Essentially we consider the physicist as a member of the team which includes

the pathologist and other clinical specialists and which is necessary for efficient radiotherapy.

The treatment of a patient with roentgen rays or radium involves many problems, among which are: (1) the dose, or amount of energy which should be delivered, (2) the quality of the radiation, (3) the time over which it is delivered, (4) the volume of tissue which should be treated and (5) the fractionation of the total dose. All these factors will have an effect on the biologic response of the lesion treated, and they must be linked up with, and be made dependent on, the even greater problems of the local and general clinical reactions of the patient and the hematologic, cytologic and biochemical changes induced. If any progress at all is to be made in unravelling these biologic problems, it is essential to know accurately the dose which produces any particular effect.

The routine measurement of tumor dose as opposed to dose delivered incident on skin has been a great advance. It is, however, a difficult and complicated procedure in many cases of deep seated lesions and may necessitate much calculation and measurement, especially if several fields are employed in different planes. It is necessary to know whether the dose is delivered to the whole of the volume of tissue which is thought to be the site of the neoplasm and whether the dose is homogeneous throughout this volume of tissue. An accurate estimation is required of the dose delivered to surrounding normal tissues and particularly to any radiosensitive organs which may be in close proximity to the lesion or in the path of one or more of the beams.

If these factors are considered it is obvious that estimation of dose will be closely linked with the planning of the distribution of fields in each patient. We consider that this is now essential in a large proportion of the patients who are given full courses of roentgen or telerradium therapy with curative intent. With these ends in view we make a practice of regularly calling in the physicist in consultation when we are dealing with the technical aspects of the treatment of individual patients. There are, of course, some instances of routine technics which can be standardized and the dose calculated from predetermined measurements of the patient, thus obviating the necessity of individual planning. Also, in the cases of purely palliative treatment, in which smaller doses are given, it is obviously unnecessary.

Isodose charts drawn for every quality of beam, focal skin distance and size and shape of field are indispensable equipment. It is natural, therefore, that a great deal of work should have been done in devising apparatus such as contour projectors and dose finders, to give in some cases a more strictly accurate, in others a simpler, method of plotting the effect of multiple fields. Moreover, the Hospital Physicists Association now provides a service to supply the widest possible range of charts, tables, diagrams and data which may be required for roentgen or radium therapy.

Condenser chambers of the type described by Sievert have been modified and developed so that chambers of suitable size and capacity can be used for taking direct readings during treatment in body cavities, such as the esophagus, to check the calculated values. There has also been a considerable amount of work carried

out in devising methods and apparatus for promoting accuracy of beam direction.

In radiotherapy the work of Paterson and Parker ("Dosage System for Gamma Ray Therapy") has caused a complete alteration in many technics and an entirely different method of approach. Of fundamental importance is the fact that the dose delivered can be estimated with accuracy in place of the older systems of stating the radiation emitted from the radium tubes with all the modifying factors of area, filtration, distribution and distance. Here too the problems of dosage measurement merge with those of dosage distribution, and here too the physicist is constantly employed. For distribution of radium sources on surface applicators or in plane or volume implantations, there are accepted rules which have given constant and satisfactory results where clinical conditions have allowed them to be accurately followed. The help of the physicist is frequently sought to measure, or calculate, the distribution and dose from a difficult implant or an awkwardly shaped applicator and, of course, in the planning of individual telerradium treatments.

Apart from developing what have now become day to day physical measurements, the hospital physics departments have made many contributions which have not yet been fully correlated with clinical observations. Of such is the work of Mayneord on the estimation of volume dosage. This may be of great importance if increased use is made of regional irradiation or if treatment with radioactive isotopes is undertaken to any extent.

The whole of this work carried out by the clinical physicists to the radiotherapy departments is designed to give the radiotherapist more accurate and fuller information about the doses which he is delivering. It is realized by all concerned that the achievement of physical accuracy is not the whole of radiotherapy, but merely the foundation stone on which can be built the investigation of the many biologic and clinical problems which remain unsolved. If the radiotherapist can be assured that he has accurately delivered his prescribed dose to the prescribed volume of tissue, he has eliminated one variable from the many with which he is confronted.

In the field of radiobiology the work of W. M. Dale, J. Wass and the late Douglas Lea on the development of theories of the action of radiations, the cytologic work of Koller and the histologic method of Spear and Glucksmann for assessment of radiosensitivity have all been of fundamental importance. They have profoundly affected the approach of the radiotherapist to problems of optimum dosage levels, but have not yet had any pronounced effect on the technics of treatment commonly employed.

DEVELOPMENT OF APPARATUS

In the development of apparatus for routine radiotherapy, there have not been great advances in Britain since 1939. There was no new manufacture of machinery during the war, when we had to rely for spares and replacements entirely on accumulated stock and on imports from this country. In consequence we have had less experience in the use of supervoltage apparatus than there has been here, and we are

anxious to develop this more fully when we can obtain machinery.

Technical progress in roentgen therapy has been mainly in the development of accessory apparatus, such as beam direction appliances, and improvements in the quality and type of measuring instruments. New types of x-ray apparatus developed since the war are still in the prototype stage and are not ready for routine use.

In radium therapy the use of telerradium has received encouragement from the National Radium Commission. The type of apparatus developed by the Radium Beam Therapy Research and described by Miss Wood, which makes use of pneumatic transference of the radium, has become almost standard equipment for units up to 10 Gm.

In the use of radium needles for implantation therapy the work of Paterson and Parker has led to the introduction of unequally loaded needles in some cases. It has frequently been found difficult or impossible to comply accurately with the Paterson and Parker distribution rules, for example, to insert needles to close the lower end of a planar or cylindric implant, which may be necessary to obtain proper distribution. Needles which have a greater linear density of radium at each end than there is in the center of the shaft are now being used and have greatly simplified such implants.

FUTURE OF RADIOTHERAPY

The place which any, therapeutic method takes in the treatment of disease is subject to variation from time to time, depending on new discoveries and the development of other methods. The place which radiotherapy will hold in the future is a matter for conjecture and may be greatly influenced by the unpredictable possibilities opened up by discoveries in nuclear physics. It may also be influenced by further additions to the knowledge of the cause and methods of treatment of cancer.

Discoveries in nuclear physics may open up new fields of usefulness and entirely new methods of treatment. Additions to our knowledge of cancer may provide an efficient method of hormone administration or chemotherapy whereby malignant disease can be destroyed in its generalized as well as its local stage. Great advances are being made; and the hope that such a discovery is imminent has in some quarters raised the question as to whether radiotherapy will not disappear and whether any young man is wise to take up this work as a career. The future in this matter cannot be foreseen, but the same arguments have been used for many years during which radiotherapy has developed to greatly increased usefulness. They were certainly used to dissuade me when all the eggs of my career were placed in the radiotherapy basket.

PRESENT STATUS OF RADIOTHERAPY

The position which radiotherapy occupies in the treatment of malignant disease in Britain may be judged from a report of the Medical Research Council for 1938 giving details of the numbers of patients treated at nine general hospitals. Of a total of 4,387 patients treated for malignant disease, 32.3 per cent were treated by operation alone, 45.5 per cent by some form of radiotherapy alone and the remaining 22.2 per cent by a combination of surgical treatment and radio-

therapy. That is to say that radiotherapy was used in the treatment of 67 per cent of the patients. At the Middlesex Hospital in 1946, radiotherapy in some form, either alone or in combination with operation, was used for 82 per cent of all patients with malignant disease who received treatment. This figure is a high one, as the hospital has a large department and provides radiotherapy services for several neighboring hospitals. It would be fair to say, however, that in Britain radiotherapy is used for 60 per cent or more of all patients receiving treatment for malignant disease. These statements do not give an altogether correct picture of the relative position of surgical treatment and radiotherapy in malignant disease, as the figures include not only patients treated with curative intent but also those for whom only palliation could be undertaken. Unfortunately, many patients suffering from cancer still come with lesions much too advanced for surgical treatment to be carried out with any hope of success. The only chance of any improvement in the condition of many of them then rests with radiotherapy.

Apart, however, from the cases of advanced disease, radiotherapy is the treatment of choice in certain well established types of cancer. The great majority of the common skin cancers—basal cell and squamous cell carcinoma—and the majority of primary lesions of the lips, buccal cavity, pharynx and larynx have become radiotherapeutic problems in the first instance. Metastatic invasion of glands from these lesions remains, however, in most clinics, to be treated by block dissection if the disease remains unilateral and has not spread widely into periglandular tissues.

The best method of treatment of carcinoma of the cervix uteri has given rise to discussion and argument for many years. There is now a measure of agreement on this subject. It is that in the majority of cases of squamous carcinoma of the cervix, the early as well as the late stages, radiotherapy is the method of choice. There is a place for radical surgical treatment, in cases in which there is local recurrence after radiotherapy if the condition is still operable, in endocervical adenocarcinoma, in cases in which there has been persistent pelvic infection and in cases in which abnormalities or atresia of the vagina would interfere with the proper application of radium. Surgical treatment may also be chosen in those cases in which it is thought that the tumor is likely to be radioresistant after an analysis of the cell counts conducted by Spear and Glucksmann's method of histologic examination.

Many types of primary lymphadenopathy (Hodgkin's disease and lymphosarcoma) are treated by radiotherapy almost exclusively. In carcinoma of the breast it is used mainly as preoperative or postoperative treatment, and by similar association with surgical treatment the results in tumors of the testis have shown a dramatic improvement. In cancer of the bladder it has a definite part to play. In many other less well defined groups radiotherapy is used for the treatment of a patient because of some peculiar situation or condition of the growth.

Palliative treatments must occupy at least 60 per cent of the time of the average hospital radiotherapy department. Their value cannot be estimated in statistical tables, but only by an appreciation of each patient and a knowledge of the life history of untreated malignant disease. Treatment which will heal a bleed-

ing ulcerated surface, stop a foul-smelling discharge or take away the pain of a bony metastasis is of the greatest importance even if the patient's life is prolonged little, if at all. In nonmalignant conditions radiotherapy is used to a considerable and increasing extent. Recent advances in chemotherapy have provided a more satisfactory method of dealing with acute inflammatory conditions, but certain chronic inflammations, including tuberculous adenitis, actinomycosis and some arthritic conditions, in particular ankylosing spondylitis, are being treated in increasing numbers.

COMMENT

With regard to the future and possible developments in radiotherapy, it seems likely that for some years to come roentgen rays in the 200 to 250 kilovolt range will continue to have a considerable field of usefulness. It is probable that with increased accumulated experience of clinical reactions and of biologic experiments, the results obtained with this form of treatment can be still further improved. It seems likely also that radium or some substitute, such as radioactive cobalt, will continue to be used for implantations and intracavitary therapy. We in Britain hope to play a greater part in continuing the investigation into the use of roentgen rays generated at voltages of 1,000,000 or 2,000,000 and higher and in the development of teleradium therapy with units of much greater size, the equivalent of perhaps 50 or 100 Gm. of radium, now that the production of radioactive isotopes has made this a possibility. Plans are in hand for experimental work in the 20,000,000 to 30,000,000 volt roentgen ray range.

With such developments it is obvious that the radiotherapists and their physicist colleagues are going to have much of their time occupied with questions of protection. These difficulties will be increased with the extensive use of radioactive isotopes for therapeutic purposes. The protection problems are, however, of the same type whatever the form of radiation used and should be dealt with by the same team of workers.

The whole question of the control and use of radioactive isotopes is one of great importance. In Britain we have not yet had the opportunity of using them for therapeutic purposes, but have followed the published work with close interest. We feel that their method of action on normal and pathologic tissues, the clinical reactions produced and, in particular, the dangers of severe and permanent damage which may occur from their use make it essential that they should be used by workers who are fully trained in the use of radiations on human tissues. It is obvious that the best results will be obtained, both with regard to rapid accumulation of knowledge and to efficient treatment of patients with the minimum risk, if the therapeutic use of radioactive isotopes is in future entrusted to radiotherapists.

ABSTRACT OF DISCUSSION

DR. ROBERT R. NEWELL, San Francisco: I have long been convinced that radiation therapy and roentgen diagnosis are essentially different, that the nature of the therapeutic specialties is similar to the nature of the other medical specialties, but that diagnostic radiology is quite different. An art is what one does; science is what one thinks. One learns a science by reading, listening and thinking about it. One learns an art by doing, working at it. For our purposes here, there should be a clear distinction between the scientific foundation and the

art of medical practice. The diagnostic radiologist practices little of the medical art. I mean that he is not occupied much with bedside medical care, but he has to serve as scientific consultant to all doctors. Patients generally reveal an understanding of this difference between the diagnostic radiologist and other doctors, looking on his services as technical and impersonal. I can work with a patient for a quarter-hour in the fluoroscopic room and find him afterward not only ignorant of my name, but unaware that I am a doctor. Physicians not infrequently incline to treat diagnostic radiologists as technical servitors rather than professional consultants. Radiologists are very much concerned with keeping themselves doctors. We are not always aware of our purposes and motivations, but I wonder whether in the United States the situation is not this: that radiologists hang onto therapeutic radiology, where they do practice the art of medicine, primarily to keep themselves convinced that they are in fact doctors, both in their own eyes and in the eyes of their patients and fellow practitioners.

DR. F. W. O'BRIEN, Boston: Radium has had a much wider use in England than in this country. Here, apparently, we have been stymied by the ease with which roentgen dosage may be approximated and phased by the calculations necessary for accurate dosage when radium is employed. Few clinicians have the interest to wrestle with the theoretical physics involved in dosage measurement, but welcome data in applicable form. Paterson and Parker among others in England and Quimby in the United States have done just that for radium dosage. They have reduced involved formulas to such simple terms that anyone with a knowledge of arithmetic can apply them. This old objection to the use of radium is no longer valid. Another obstacle to its use has been the fact that in many hospitals in the United States radium is not a part of the radiologic department. More often than not it is controlled by the gynecologic service without any outside supervision of setup and dosage. This situation is being gradually corrected. Sentiment is crystallizing here, as it has in England, as Professor Windeyer pointed out, "... radium therapy and roentgen therapy involve the same problems and are, in fact, the same method of treatment, that there is every advantage in their being carried out under the control of the same person." A person who professes to do radiation therapy without an adequate source and knowledge of radium and roentgen radiation cannot do justice to his patient or himself. Our own late Prof. James Ewing long ago advocated just what has been done in England, viz., the aggregation of small departments of roentgen and radium therapy into large centralized units for the treatment of cancer with the obvious advantages that would accrue to the patient and the therapy trainee, as pointed out by Professor Windeyer. When one reflects that the National Cancer Institute has an appropriation for the fiscal year of 1948 of \$14,000,000, that during the 1947-1948 campaign, the American Cancer Society collected \$12,000,000 (60 per cent of which was returned to the state in which it was collected), that the Atomic Energy Commission has had \$5,000,000 of funds allocated for cancer research in 1948, and that other millions have been collected by or donated to hospitals and universities for cancer study, it seems incredible that we cannot have here an integrated plan of cancer research and applied medicine.

DR. B. W. WINDEYER, London, England: In presenting what we have been doing in England, I certainly am not going to be drawn into a discussion on what should be done in this country. One realizes that, among other factors, problems are different and the distances are different, but I thought that it might be of value for you to know the way in which the matter has been handled in Britain. I am extremely grateful for the opportunity to see what is being done here, and I am sure that it would be of inestimable benefit to our young men if some form of reciprocal studentships could be arranged whereby we could send you men from time to time, and perhaps it may not be time completely lost if your young men were also to come to us.

ESTIMATION OF URINARY SODIUM

A Simple Test for Patients on Low Sodium Diets

J. MARION BRYANT, M.D.

VIVIAN IOB, Ph.D.

GEORGE L. PHILLIPS, B.S. Pharm.

and

ELMIRA E. BLECHA, M.S.

Ann Arbor, Mich.

The difficulties encountered in maintaining patients on strict low sodium diets are numerous and well known. Our experience with several hundred hypertensive and cardiac outpatients treated over a three year period with low sodium diets¹ indicates that some difficulties can be avoided by having each patient perform daily a simple test which gives a fairly reliable estimate of the sodium intake for the preceding twenty-four hours. By performing this test the patient is able to detect errors in his dietary practices. The procedure is simple and inexpensive, requires a minimum of apparatus and is carried out by the patient each day on a specimen of urine collected before breakfast. The necessary materials can be secured from any drug store.

In 1920 Allen² emphasized the necessity for close observation of the output of sodium chloride in the urine of patients maintained on salt-free diets. Dietary errors unrecognized by both patient and physician are probably responsible for many failures to obtain beneficial responses in hypertensive patients on these diets. Sources of relatively large amounts of sodium, usually in the form of salt, are numerous and difficult to identify. In addition, the patient's estimate of the proper amounts of certain allowable foods relatively high in sodium content is frequently responsible for an unsatisfactory response. Experience has shown that even the most intelligent patients who have followed a strict low sodium diet for months or years inadvertently eat foods high in sodium chloride. Such dietary lapses will go undetected unless there are means available to the patient for promptly recognizing increases of salt in the urine.

The test to be described is a modification of that devised by Fantus in 1936³ for estimating sodium chloride excretion in surgical patients receiving intravenous solutions. The usefulness of this procedure for controlling hypertensive patients on low sodium diets was pointed out to us by Dr. Arthur Grollman.

REAGENTS AND APPARATUS

A 10 per cent solution of potassium chromate and a 0.73 per cent solution of silver nitrate are the only reagents required. The two solutions may be conveniently kept in two 1 ounce (30 cc.) medicine bottles with the customary medicine droppers attached. The silver nitrate solution must be kept in a dark bottle to protect it from light. An additional medicine dropper for measuring the urine specimen can be stored conveniently in a third bottle. The medicine droppers for

measuring the urine specimen and the silver nitrate solution should be checked to see that they deliver drops of approximately the same size. A 5 cc. Kahn type test tube completes the apparatus.

PROCEDURE

Urine Test.—Ten drops of the urine specimen are placed in the test tube. One drop of potassium chromate is added and the mixture shaken. The silver nitrate solution is added drop by drop and the mixture shaken between drops until a permanent light brown or brick red color appears. Each drop of silver nitrate used represents approximately 250 mg. of chloride per liter, expressed as sodium chloride, or by inference 100 mg. of sodium per liter. Variations in the pH of the solution tested will cause slight variations in the results of this test.

Water Test.—A modification of the aforementioned procedure may be used for estimating the sodium content of water used for cooking and drinking. The volume of the solution to be tested must be larger, in view of the fact that the sodium chloride content of drinking water is usually much less than that of urine and the sensitivity of the test as employed for urine is not sufficient to be satisfactory. Thus, 40 drops of water to be tested are used rather than 10 drops; otherwise the procedure is the same. If more than 1 drop of the silver nitrate solution is required to reach the end point (a reddish tinge), the water contains more than 63 mg. of chloride per liter, expressed as sodium chloride. This indicates that approximately 25 mg. of sodium per liter is present and, assuming that 3 liters of water are consumed per day as drinking water and in cooked foods, approximately 75 mg. or more sodium are ingested from this source alone. The amount of chloride ion added in the chlorination of water is too small significantly to affect this test.

INTERPRETATION

This test is a practical method for estimating the sodium content of urine based on the volumetric determination of chloride by Mohr's method⁴ and the assumption that under ordinary conditions the urinary excretion of sodium and chloride roughly parallel each other. Daily twenty-four hour determinations of urinary sodium are obviously the ideal in controlling this type of dietary regimen, but such a procedure is expensive and so complicated as to be prohibitive at the present time even in the control of hospitalized patients.

It is recognized that in the absence of unusual fluid loss from extrarenal mechanisms sodium and chloride are almost entirely excreted in the urine.⁵ It has also been shown that approximately the same ratio exists between the amounts of sodium and chloride in the urine of patients on salt-free diets as in the chemical compound sodium chloride.⁶ Foods and drinking waters containing significant amounts of sodium also contain chloride in roughly the same proportion as in common table salt.⁶ Thus the determination of urinary chlorides in the absence of the ingestion of other chloride or halogen compounds is a simple method of checking the sodium intake. Some medicines and "salt substitutes" containing chloride compounds as ammonium chloride, potassium chloride, lithium chloride, iodides

chloride test described herein. The fifth column gives the number of drops of the 0.73 per cent silver nitrate solution needed to reach the end point for the various specimens with the simplified chloride test. The last column gives the urinary potassium content by the flame photometer method. This table shows that, although the measurement of the sodium content of the urine by the simplified chloride test involves a large error, there is a rough correlation between the estimate obtained in this way and the actual sodium content of the urine. There is, however, a better correlation between the data obtained by the more accurate Volhard method of determining chloride and the data obtained by the use of the flame photometer.

Figure 1 is a graph in which the actual sodium content is plotted against the sodium values estimated by the simple chloride test. The heavy diagonal line indicates a theoretically perfect correlation, and the crosses indicate the actual correlation between the true and

Fig. 1.—Graph based on data contained in the table, showing the correlation between actual sodium content (horizontal values) and the content estimated by the simplified chloride test (vertical values) of urine samples from patients on low sodium diets.

estimated sodium content of the urine specimens. With one exception the error was in the direction of overestimating the urinary sodium content.

Fig. 2.—Diagram illustrating the hourly urinary excretion and concentration of urinary sodium over a twenty-four hour period in a normal subject on a regular diet and in a hypertensive outpatient on a low sodium diet. The sodium values were obtained by the simplified chloride test described in the text. The subject on the regular diet excreted an estimated 3.3 Gm. of sodium (8.3 Gm. sodium chloride) with 2.2 liters of urine, and the patient on the low sodium diet excreted an estimated 0.4 Gm. of sodium (1 Gm. sodium chloride) with 2.3 liters of urine. The concentration of the urinary sodium varied inversely with the hourly volume of urine. The estimated sodium excretion recorded at 8:00 a. m. represents the hourly average from 10:00 p. m. to 8:00 a. m. The vertical values are in milligrams of sodium. The broken line indicates milligrams of sodium per hundred cubic centimeters; the unbroken line shows milligrams of sodium per hour.

8. Logan, M. A.: Composition of Cartilage, Bone, Dentin and Enamel, J. Biol. Chem. 110: 375-389 (July) 1935.

This comparison of the chloride methods of estimating sodium with the direct determination of sodium by the flame photometer⁷ establishes the former as sufficiently accurate to be of value as a clinical aid in the management of patients on low sodium diets. The fasting morning specimen of urine is used for convenience because it tends to vary less from day to day than specimens obtained later and is roughly representative of the twenty-four hour specimen in regard to sodium chloride concentration in patients on low sodium diets. Persons eating a normal diet usually show a higher concentration of urinary chlorides later in the day.⁹ Figure 2 shows the distribution of sodium excretion as estimated by the simple chloride test throughout the day in the case of a normotensive subject on a regular diet and in the case of a hypertensive patient on a low sodium diet.

Factors that influence the volume of the daily urinary output, such as variations in fluid intake, fluid loss by extrarenal mechanisms, variations in renal function and other factors, affect the result of this test. When the intake of fluid is maintained at approximately 1 to 3 liters, the urine output varies from about 800 cc. to 2 liters. With the urinary volume in this range and the patient following a diet containing approximately 200 mg. of sodium, the simplified test described requires from 1 to 6 drops of the silver nitrate solution to reach the end point, which indicates the presence of approximately 250 to 1,500 mg. of chloride per liter, expressed as sodium chloride. This amount of urinary chloride corresponds to a daily intake of chloride of 1,500 mg. or less, expressed as sodium chloride, which are the quantities contained in the standard 200 mg. sodium diet.¹ This satisfies, roughly, the criteria set up by Allen¹⁰ for a satisfactory urinary sodium chloride output in patients on salt-free diets.

Experience has established the fact that patients on low sodium diets are able to control their sodium intake satisfactorily by this procedure with a minimum of checks by physician and dietitian. The value of this test is comparable to that of the simplified Benedict test for the control of glycosuria by the diabetic patient, although it is even less complicated than the Benedict test. In our opinion this test has been of sufficient practical value in the management of the majority of hypertensive and cardiac outpatients on low sodium diets to justify the omission of "salt substitutes" and medicines containing halogen compounds.

Finally, it should be pointed out that the presence in the urine of sodium unaccompanied with halogens will not be detected by this procedure; thus, if compounds such as sodium bicarbonate or tartrate are ingested, the test is useless.

SUMMARY AND CONCLUSIONS

A practical and inexpensive test for estimating urinary sodium excretion is described. This test is a simple procedure that enables patients on low sodium diets to estimate the daily urinary excretion of sodium and the sodium content of their drinking water. It has been found by clinical trial to be sufficiently accurate for the control of such patients. The value of this test in the management of hypertensive and cardiac patients on diets low in sodium is comparable to that of the simplified Benedict test in the treatment of diabetes.

SOME EFFECTS OF MYANESIN® IN PSYCHIATRIC PATIENTS

LOUIS S. SCHLAN, M.D.

Manteno, Ill.

and

KLAUS R. UNNA, M.D.

Chicago

The drug 3-ortho-toloxyl-1,2-propanediol (myanesin,® tolserol®)¹ was introduced by Berger and Bradley² as a muscle-relaxing agent; it apparently raises the threshold of internuncial neurons in the spinal cord and brain stem.³ Myanesin® does not affect voluntary muscle power, is not hypnotic and has negligible effects on the electroencephalogram in doses of 0.5 to 2.0 Gm. given by mouth four to five times a day. It has been used to alleviate spasticity and rigidity with variable results.⁴ It has also been tried in cases of intractable pain⁵ and in 3 psychotic patients.^{6b}

Its use in the treatment of anxiety was suggested to us by Dr. Pauline Cooke of Chicago. Sixty-three patients (from Manteno State Hospital) were chosen to test its effects not only in anxiety states but also in acute and chronic psychoses (mixed types of schizophrenia), in alcoholism, in addiction to drugs and as an adjuvant to electroshock (table). All patients had been under previous observation for a long time, and many had been treated with electroshock, insulin shock, carbon dioxide therapy, or a combination of these. The drug was administered in doses of 0.5 to 1.5 Gm. four times a day either in tablets (tolserol,® 0.25 Gm.) or in a syrup of eriodictyon and propylene glycol (1 Gm. per 30 cc.). The present paper represents a preliminary report and will be followed by a more extensive study.

In 3 female patients whose anxiety was the main presenting complaint, myanesin,® within one hour after administration, caused alleviation of the anxiety without concomitant sleepiness. The duration of the effect in 2 patients was about two hours for each dose; in the third a much longer period of normal behavior resulted. All 3 reported in much the same language that they were able "to think things through" during the time of action of the drug. Tremor and startle disappeared, and the patients were able to fall asleep normally at bedtime.

In 8 patients with acute alcoholism, each with the "shakes" after prolonged bouts, myanesin,® decidedly reduced or abolished the gross tremor promptly. This was best seen on their raising a cup of coffee to the lips. Before the administration of the drug, both hands were needed in each case and this heroic effort resulted in spillage. Within thirty to sixty minutes after the

ingestion of the drug, the cup could be lifted with one hand in normal fashion and without spilling. Severe anxiety was as promptly relieved, and the patients reported feeling comfortable with the exception of "hangover" effects, such as headache and gastric distress. All of these patients had been chronically readmitted to the hospital and had previously required paraldehyde and barbiturates for three to four days after each prolonged intoxication. No such sedation was now necessary. Their subjective reports were that the relief experienced with myanesin® was prompter than with either of the other types of sedatives and, in addition, they felt "wide awake" and closer to "normal."

In 2 patients addicted to drugs (morphine and heroin, respectively), the withdrawal symptoms (yawn-

on other disturbed wards. In no case did schizophrenic ideation seem to be affected.

Of 30 patients subjected to electroshock (glissando technic) 10 had consistent postictal apnea lasting from 6 to 16 seconds. In these 10, 2 Gm. of myanesin® in solution administered one-half hour before electroshock abolished the apnea in 9 cases and reduced it from 15 to 5 seconds in the tenth. (Such apnea has been blamed for residual cerebral damage following electroshock therapy). In all 30 cases the tonic and clonic components remained absolutely unchanged in duration or quality by administration of the drug.

No serious toxic effects were observed. The soluble forms of myanesin® occasionally cause dizziness if too large a dose is given. These solutions also anesthetize slightly the mucous membranes of the tongue and pharynx. When single doses of 2 Gm. or more were given in tablet form, slight nausea was experienced by susceptible patients. Some effects were observed suggesting tolerance with prolonged unremitting use of the drug (two to three weeks).

Results of Myanesin® Therapy in Sixty-Three Patients

No. of Patients	Category	Results
1	Psychoneurotic, mixed type, severe, 20 years' hospitalization	Remission of 12 days comparable to results from four electroshock treatments. Startle reactions, a significant feature in this case, abolished. Tolerance with repeated doses.
2	Anxiety states, mixed	Alleviation of anxiety. No soporific effects.
2	Manic depressive psychoses-hypomania	Sedative action without soporific effects. Repeated doses produced tolerance.
8	Chronic alcoholism (in abstinence)	Rapid effect (15-30 minutes). Prompt abolition of severe tremor. No nocturnal sedation necessary. No craving for alcohol or paraldehyde.
2	Drug addiction (morphine and heroin) (in abstinence)	Rapid effect. Abolished somatic symptoms of withdrawal. Did not affect craving for drugs.
17	Schizophrenia (mixed types, disturbed)	No remarkable effect. Sedative action noted only when surroundings were quiet.
1	Schizophrenic patient with lobectomy, unremitting low grade excitement	Sedative action for two weeks. No other remarkable effect.
30	Diverse patients receiving electroshock	No effect on pattern or duration of seizure. In 10 patients exhibiting consistent postictal apnea, the apnea was abolished.

ing, nausea, leg cramps, vomiting) were alleviated without the craving for the drugs being affected.

In 9 disturbed patients, with long histories of psychosis, who were chronic inmates of the hydrotherapy ward, the effects of myanesin® therapy were variable. Two hypomanic patients promptly became calmer, without becoming sleepy, and appeared in better contact, and 1 with agitated depression showed diminished activity and did not require nocturnal sedation. An extremely overactive dissociated patient, who had previously had a bilateral frontal lobectomy, became consistently quiet with myanesin® therapy. She had been refractory to all other medication. In the remaining 5 cases the effects fluctuated. In the patients whose spontaneous activity was reduced, responsiveness to exciting factors in the environment remained unaffected. The sedative action of myanesin® was apparent only when the rest of the ward was quiet. This observation was repeated in 11 more spontaneously excited patients

CONCLUSIONS

In a trial group of 63 cases preliminary to a more exhaustive study the following effects of myanesin® (3-ortho-toloxyl-1,2-propanediol) therapy were noted:

1. Sedation without soporific effect permitting normal sleep in patients with pronounced anxiety when disturbed psychic functions had been causing insomnia.
2. Reduction of spontaneous activity but no effect on responsiveness to external stimulation.
3. Its sedative effects in psychotic persons were most apparent when the environment was not disturbing.
4. No alteration of chronic schizophrenic states.
5. Beneficial effects were obtained in the treatment of prolonged alcoholic intoxication and in anxiety states. In the former its action is preferable to that of paraldehyde and barbiturates. In the latter it is the only drug we have seen that allays anxiety without clouding consciousness. As such it promises to be helpful as an adjunct to psychotherapy.
6. The pattern and duration of seizures from electroshock were not changed by myanesin® given in doses of 2 Gm. On the other hand, postictal apnea, where it existed, was greatly reduced or eliminated.

"Our Patients Should Be Our Friends."—It is so obvious to those of us who have been practicing medicine privately that our patients should be our friends that we do not often stop to ask the question, "Why?" The statement may seem trite to some, but to the beginner and to the skeptic it is well to pause a moment to present some of the answers. The first of all is in establishing more easily an accurate diagnosis. In my own field and in most other fields of medicine the diagnosis is in large part dependent on an adequate history of the present illness, past troubles, family history, and social and business relationships. The sooner one establishes a sympathetic and friendly relationship with one's patient the sooner will one obtain the necessary information from all the story that can be told; any minor portion of the patient's account, sometimes in the form of a confession, may be vastly more important than all the laboratory tests in the world and may save not only time and money, but even misery and death themselves.—Paul D. White, The Shattuck Lecture, *La Médecine du Cœur, The New England Journal of Medicine*, May 26, 1949.

WILL NOISE DAMAGE ONE'S HEARING?

W. E. GROVE, M.D.
Milwaukee

Is noise driving you crazy? This was the subject of a syndicated article in a newspaper Sunday supplement of August 1947. Psychiatrists and psychologists who have studied the problem regard noise as one of the most serious threats to our health. Long-continued noise menaces health and destroys efficiency. It produces fatigue, which impairs efficiency. It encourages inattention and lack of concentration, which is again reflected in lack of efficiency. It promotes absenteeism and again impairs efficiency. The nervous system is not constituted to take this sort of battering. One becomes jumpy, jittery and irritable under the impact of continuous noise. Neurasthenia and psychasthenia develop which are not incomparable to battle fatigue. Podolsky said, "It is not an exaggeration at all to say that often cases of insanity are caused by nervous systems which cannot adjust themselves to the constant bombardment of noise."

Fig. 1.—Distribution of classes of audiograms in different departments (A, B, C, D and E), from MacLaren and Chaney. (The vertical values on the right indicate cumulative percentage.)

Business executives realize that noise causes inattention, lack of concentration and poor efficiency. Their own offices are invariably placed in a quiet sector of the factory and are well sound proofed and insulated against the noisy operations of the plant. But what of the production worker who is constantly bombarded with noise of high intensity day in and day out, for months and years on end? Management has not yet learned, or is unwilling to recognize, that noise is destroying the health of their operatives, nor do they realize that from a purely mercenary business point of view noise is reducing the efficiency of production.

A long-continued high intensity noise impairs nervous and mental health, reduces efficiency as a production tool and damages hearing function; and that is what the otologist in general and the Committee on Conservation of Hearing of the Academy of Ophthalmology and Otolaryngology in particular are interested in.

The condition designated as "occupational deafness" has been recognized for many years.¹ In 1890 Barr²

made a survey of 100 boilermakers who had followed their occupation for more than three or four years and did not find any with normal hearing. For many years the condition was known as "boilermakers' deafness." With the increased industrial production incident to the first world war, interest in this condition was intensified. Since then this has rapidly become the world's greatest industrial nation. There was no need to worry about this problem while we were a small agricultural nation nor is there need for much concern even today in the rural areas, but in the cities it has become a health problem of major importance. Where metal strikes on metal there is bound to be noise.

SOURCES AND INTENSITY OF INJURIOUS NOISE

Certain facts are incontrovertible. Exposure to extremely loud sounds over a long period results in impaired hearing. The louder the sound, the greater is the impairment over a similar period. The longer the period of exposure to the same sound level, the greater is the hearing impairment.³ While all ears are probably susceptible to high intensity level sound, they are probably not equally susceptible. More data are needed on this point. Ears with a preexisting conduction lesion are probably less susceptible than are ears with normal hearing. MacLaren and Chaney,⁴ working in airplane plants on the coast, made an analysis of 5,000 audiograms of persons working in six different departments in which the relative noise level was 70, 100, 105, 110 plus, 110 plus and 105 decibels. They found that persons with a preexisting conduction deafness remained at about the same proportion in each department, indicating that noise exposure does not aggravate the existing condition deafness. More data are needed on this point. The ears of the young are probably more susceptible than those of middle or advanced age. More data are needed on this point also.

Bunch⁵ stated the opinion that noise above an 80 to 90 decibel level was injurious. McCoy⁶ suggested that the practical range for corrective measures should begin at the 100 decibel level, but MacLaren and Chaney⁴ found a sharp reduction in normal audiograms between a department in which the average noise level was 70 decibels, Department A, and one in which it was 100 decibels, Department B, using Beasley's classification. They expressed the belief, therefore, that the dividing line between innocuous and hazardous noise lies somewhere between 70 and 100 decibels. For its effect on the hearing function one can, however, safely disregard noise of less than a 90 decibel level, although Davis⁷ said that there is no rigid proof of permanent impairment of hearing from noise of less than 115 to 120 decibels "... and that concern about noise levels below 100 decibels ... is quite unwarranted." This statement is loose and is subject to confirmation.

MacLaren and Chaney,⁴ in their survey of the general noise level in various departments of an airplane factory, found the sources of noise, in the order of their loudness, listed in the table. In this connection Bunch⁵ pointed out that the noise level of an ordinary office

is about 40 decibels, that of a busy street about 65 decibels and that of heavy traffic about 80 decibels.

It is generally believed that noise of high intensity is more injurious to the hearing when it is of high pitch than when the pitch is lower. Lurie⁸ and his co-workers, working with guinea pigs, showed that intense sound of 500, 1,000 and 2,000 cycles produced changes in the organ of Corti which were comparable to those produced by a tone of 4,000 cycles. They found that the higher the frequency the closer to the round window were the degenerative changes in the organ of Corti. With exposure to a tone of 500 cycles the lesion was in the upper half of the second turn or in the lower half of the third turn of the cochlea. Whether these experimental observations can be used with respect to human beings is not known, but, at any rate, in human beings the basal coil of the cochlea seems to be its most vulnerable spot. Perlman,⁹ experimenting on human listeners, stated, "Sounds of low frequency produced less acoustic trauma than those of high frequency." Others have expressed the belief that sounds of low frequency but high intensity can produce as

much damage to the organ of Corti as those of high frequency. More data are needed on this point also.

However, there are other factors to be considered besides the intensity of the noise. These, according to Perlman,⁹ are (1) the total length of exposure, (2) the length of exposure per period, (3) whether the sound stimulus is continuous or interrupted, (4) the length of the interruptions, (5) the type of space and environment, whether there is reverberation or not, (6) the age of the worker and (7) previous ear or associated disease.

NATURE OF THE HEARING DEFECT

The hearing defect caused by prolonged exposure to loud noise is greater for high tones than for low tones. While the initial effect of exposure to loud noise involves the hearing for high tones only and is therefore not easily discernible by the person exposed, the longer the exposure the more likely is a gradual loss of hearing in the range of frequencies concerned in speech. The development of this noise deafness is slow and insidious, and the worker is apt

to disregard it until he is rather deaf, particularly if he has a well paid job.

McCoy took 100 young persons with normal hearing and no ear, nose or throat disease and placed them in a chipping school. After working for seven hours in the chipping school where they were exposed to a

Fig. 2.—Broken lines show levels of hearing in workers after seven hours in a chipping school. (Taken from the paper by McCoy.)

noise intensity of 110 to 130 decibels, a representative group of the men had a definite hearing loss associated with tinnitus and a feeling of discomfort. This is illustrated in figure 2. On the following day, only a slight loss for high tones was discernible audiometrically and the associated symptoms were gone. This initial effect was probably due to fatigue of the eighth nerve and the spasticity of the intratympanic muscles. However, after a month's exposure to this noise level there was a permanent deficiency in the high frequency range, illustrated in figure 3, and this loss was not materially affected by a short rest. McCoy¹⁰ said that a "repre-

Fig. 3.—Broken lines show the levels of hearing recorded for a man who had worked one month in a chipping school. (Taken from the paper by McCoy.)

sentative group" of the men showed these changes, indicating thereby that not all ears are equally susceptible. However, while all ears are not equally susceptible to an injurious noise of a month's duration, it is fair to suppose from the experience of others that most of the ears would suffer if the exposure lasted long enough.

METHOD OF PROCEDURE

No form of treatment is effective once the lesion in the neuroepithelium of Corti's organ has occurred. Prevention of the lesion is, therefore, the only means of attack. Sounds of injurious intensity must be prevented from reaching the ear. The method of procedure must concern itself with education, propaganda and prevention. Sporadic attempts to solve the problem have already been made, particularly in the airplane factories during the war.

The Subcommittee on Industrial Noise has been busily engaged during the past year in acquainting insurance carriers and independent employers of labor throughout the country with the seriousness of the noise problem and its effects on the general health and the hearing function. It has obtained the active cooperation of the National Association of Mutual Casualty Companies and the National Conservation Bureau of the Stock Casualty Companies. These associations, which represent the safety and engineering departments of all the casualty companies operating in this country, are well aware of the hazard of noise and of the liability which it presents. They are more than willing to help in the development of protective measures. Their main difficulty at present is in convincing their individual policy holders that something must be done about it. The independent employers of labor are still more or less willing to "let sleeping dogs lie." They fear an avalanche of claims if this subject is stirred up. It is, therefore, the duty of the subcommittee by propaganda and education, to inform both management and labor that in intense noise lies a serious health problem and that in the end it is to their advantage to face and correct it. However, the subcommittee cannot do this job without help. It needs the active cooperation and help of every otologist and of every agency that is interested in the health of the people, and, as the destruction of the hearing function is one of the main deleterious effects of noise, every agency concerned with conservation of hearing should cooperate.

The Subcommittee on Industrial Noise believes that the most logical way of beginning the attack on this problem is to set up pilot plants in some industry in which noise is a special health factor. In such pilot plants the entire problem could be intensively studied and protective and preventive measures worked out. It believes that, when such pilot plants have been set up and are in operation, the leaven will gradually spread to other manufacturers. In a large manufacturing company with 18,000 employees and in its eight subsidiary plants, such a program has already been set up. This is only a beginning, and the subcommittee would like to suggest that every otologist interested in conservation of hearing exert himself to set up and supervise such projects in manufacturing plants in his immediate locality.

The subcommittee feels that the first procedure necessary in setting up such a pilot plant program is to send in a competent physicist who will measure the actual and potential noise level in every operation or department of the plant. After this has been done it believes that the actual operation of the program should be turned over to the medical department of the plant. These medical departments will need and should receive the active cooperation of every otologist.

Second, the subcommittee believes that a careful preemployment hearing examination should be made of every person who is to be placed in an operation

in which the noise level exceeds 90 decibels. This examination should include a history of previous working conditions and of previous military service. It should also include a history of present or previous ear trouble or disease and of familial factors. An otoscopic examination should be made. An initial audiometric examination should be made. This should be rechecked in one week, one month and after six months. It would be preferable to do this in a sound-treated room, but, if this is too much to expect, a relatively quiet room will do, provided that bilateral ear phones are used and provided that the relative ambient noise level remains about the same at all times.

The subcommittee advocates a rigid preemployment hearing examination—just as a preemployment physical examination of other parts of the body is made. It does not at this time advocate an audiometric examination of all the existing plant personnel, first, because it is a job of such magnitude that no employer would agree and, second, because it hesitates to do something which would stir up a multitude of medicolegal claims, many of which would be unjustifiable. However, by a continuing program of preemployment audiometric examinations, the employer will soon accumulate a base line on the hearing function of all of his employees working in noisy operation.

PREVENTIVE MEASURES

Preventive measures are of three types:

1. The redesigning of buildings and machinery to permit less noisy operation. With the buildings and machinery now in use it is extremely doubtful whether any manufacturer would go to the enormous expense involved. It is also somewhat doubtful whether the intensity of noise could be reduced to a noninjurious level by these methods. At any rate, this is an idea which can be agitated for future construction.
2. The removal or transfer of a worker with especially noise-sensitive ears to some less noisy operation.
3. The reduction of injurious noise at the ear of the worker. Occlusion of the external canals of the ears by suitable obturators or ear plugs will theoretically reduce the intensity of noise reaching the ear to a non-injurious level. Various types of these ear defenders are on the market. However, the great problem is to get the worker to wear them. Unless individually fitted, they are apt to be uncomfortable. Unless freshly issued each day, they are apt to carry dirt and infection into the canal. Certain persons with ears which are sensitive to external otitis and eczematous processes cannot wear them. They are apt to trap moisture in the ear and favor the growth of fungi. While they reduce the level of injurious sound reaching the ear, they also interfere with the worker's ability to hear the voice. They are so small and inconspicuous that their use cannot be verified. The answer may be in the construction of external ear coverings of some material like sponge rubber, held firmly in place by a head band, much on the order of the double earphones of an audiometer or the intercommunication helmet of the airplane pilot.

MEDICOLEGAL ASPECTS

The general counsel and vice president of a large industrial corporation recently said to me, "If we assume that in industrial noise we have a health hazard and we do, then, as good businessmen, we must regard it as a liability." Would that all manufacturers were that smart.

Loss of hearing from exposure to noise of an injurious level is an occupational disease. Occupational disease, quite apart from isolated accidents, is now compensable in thirty-three states as well as in the District of Columbia, Hawaii and Puerto Rico.¹¹ Such protection is also given to employees covered by the Federal Employee's Compensation Act and the Longshoremen's and Harbor Workers' Act. We recognize the fact that under certain conditions the hearing function can be damaged by industrial noise, but every hearing defect in the worker in a noisy occupation is not caused thereby. There are many causes for depreciated hearing, particularly in persons who are no longer young. Compensation claims increase in periods of depression and mass layoffs. Until there is closer cooperation between the industrial physician and the otologist and until a careful preemployment audiometric examination is made of every worker who may be subjected to excessive noise, one will not be able to separate the true from the false, the wheat from the chaff. Many workers will receive compensation for a defect in no way connected with their occupation or only partially so, and, vice versa, many a worker whose hearing has been seriously damaged by his occupation will have doubt cast on his claim.¹

The subcommittee hesitates to stir up "the sleeping dog," but this health problem can no longer lie dormant. It is a challenge to the medical profession and should be tackled intelligently.

Council on Physical Medicine and Rehabilitation

REPORTS OF THE COUNCIL

The Council on Physical Medicine and Rehabilitation has authorized publication of the following reports.

HOWARD A. CARTER, *Secretary.*

ALPHATRON RADON OINTMENT NOT ACCEPTABLE

Manufacturer: Canadian Radium & Uranium Corporation, 630 Fifth Avenue, New York 20.

Alphatron Radon Ointment is a solution of radon gas in wool fat U. S. P. Radon, also called radium emanation, is radioactive though chemically inert; in its disintegration to radium A, radon emits alpha particles. The alpha particles are stated to have a range of 0.30 mm. in tissue, and the half-life of the radon is given as 3.825 days.

When confined in a container, radon proceeds to accumulate equilibrium amounts of its products, that is radium A, B and C. Equilibrium is established in about four hours. Radon, like radium, emits alpha rays, and when it is in equilibrium with its products of disintegration the container emits the beta and gamma rays belonging to them, e. g., radium B and C.

The Alphatron Radon Ointments first introduced were found, in examinations reported to the Council office, to be irregular in composition and distributed without adequate protection for the handlers and users. The early claims for such preparations included many therapeutic uses, but most of these have now been abandoned. More recent promotional literature for Alphatron Radon Ointment suggests its use in treating irradiation ulcers, other chronic ulcerations (including those of the varicose

and arteriosclerotic types), nonhealing wounds, chronic eczema and certain other diseases of the skin, and certain types of bursitis and arthritis. The considerable number of available reports on these and on other aspects of the subject have been considered by the Council, which at this time favors only continued, well controlled clinical investigation of materials of this sort and cannot regard any of the aforementioned therapeutic suggestions as incontrovertibly justified.

In view of the lack of further evidence for beneficial effects of Alphatron Radon Ointment, the Council on Physical Medicine and Rehabilitation voted *not* to include this item in its list of accepted devices.

ISOLETTE INFANT INCUBATOR MODEL C-35 ACCEPTABLE

Manufacturer: Air-Shields, Inc., County Line Road, Hatboro, Pa.

The Isolette Incubator and Isolation Unit Model C-35 houses infants who require control of temperature, humidity and oxygen content of their environment. The Isolette is furnished for operation with 110 to 120 volts, 60 cycle alternating current. The motor draws an average of 23 watts and the maximum current used is 190 watts, corresponding to 1.5 amperes.

The height of the Isolette without the stand is 55 cm. (21½ inches); with the stand it is 133 cm. (52½ inches). Other dimensions are 48 by 86 cm. (19 by 34 inches). The weight of the unit with the stand and casters, which are standard equipment, is 49 Kg. (109 pounds). The shipping weight is 73 Kg. (161 pounds). Accessories include a weighing scale which permits weighing the infant without removing it from the incubator and a Serdex laboratory hygrometer. Extra arm holes in the hood are optional equipment.

Isolette Infant Incubator, Model C-35

Evidence was obtained from a variety of clinical sources acceptable to the Council that the Isolette worked as claimed by the manufacturer. The Council recognizes the fact that a hazard exists when a device that includes combustible materials such as bed clothes is operated in the presence of oxygen and external sources of ignition. Personnel responsible for operating such equipment must be acquainted with its dangers. The firm supplied evidence that the Isolette has been given final approval for listing by Underwriters' Laboratories, Inc.

The Council on Physical Medicine and Rehabilitation voted to include the Isolette Infant Incubator, Model C-35, in its list of accepted devices.

COMFORT PILLOW ACCEPTABLE

Manufacturer: Hauptman Feather Company, Inc., 75 Wallabout Street, Brooklyn 11.

The Comfort Pillow is designed to be used by pregnant women for the support of the abdomen during sleep. It is roughly H-shaped in outline, so that the two stuffed outlying sections to right and left of the abdomen are connected by a stuffed central section under the back.

The Council obtained evidence that the Comfort Pillow was well made, helped expectant mothers to get needed rest and sleep and was safe to use.

The Council on Physical Medicine and Rehabilitation voted to include the Comfort Pillow in its list of accepted devices.

Comfort Pillow

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

THE RULES OF THE COUNCIL ON PHARMACY AND CHEMISTRY

In view of the numerous inquiries received by the Council office concerning the rules under which the Council work is carried on, it is deemed advisable to publish a series of informative comments for the benefit of pharmaceutical manufacturers and others who are interested. A copy of the complete rules of the Council on Pharmacy and Chemistry may be obtained from the Council office on request.

The following brief explanatory statements have been adopted by the Council for publication.

AUSTIN SMITH, M.D., *Secretary.*

Introductory Statement

As a result of the long effort of the Council on Pharmacy and Chemistry, with the loyal support of the American Medical Association Board of Trustees and of *THE JOURNAL*, physicians and professional manufacturers of pharmaceuticals generally recognize the significance of "Council acceptance" of a medicinal or allied agent. It means that the claims for a drug have been reviewed by a carefully selected group of disinterested experts with special experience in such evaluation; that the full evidence for the claims has been carefully weighed, and the permissible claims fairly adjudged; that the drug itself is nonsecret and is what it is claimed to be; that it is manufactured under proper conditions of chemical control, and that it is marketed and advertised according to the established standards of the medical profession.

To gain an understanding of the rules by which the Council accepts a product, it is necessary to reflect that their object is the encouragement of and provision for rational therapeutics; in other words, to give the physician the necessary chemical and pharmacologic information concerning a given medicinal agent, thus enabling him to use it intelligently and effectively in the treatment or prophylaxis of disease. This involves knowledge of the identity (chemical composition, correct name), the proved action (experimental and clinical evidence, permissible therapeutic or prophylactic claims) and reliable production (proper controls, competent personnel, efficient manufacturing standards) of the drug he is asked to use in the care of his patients. All these are provided for in the Council's rules, which are the result of long experience in the evaluation of medicinal agents and which have been the model for similar regulations both in this country and abroad.

The Council is a standing committee appointed directly by the Board of Trustees of the American Medical Association. Routine business is carried on by the paid staff in the Secretary's office, which includes personnel of professional rank. But final decisions are made by the Council as a group, often with the aid of consultants who are authorities in the various fields concerned.

Members of the Council are appointed by the Board of Trustees of the Association for five year terms. Each member is selected from a list of names submitted by the Council members after a series of three eliminative votes. No special effort is made to distribute the membership among the various fields of medicine, though in practice the list is usually representative. The Council has at all times been able to enlist the services of specialists as consultants in any branch of knowledge involved in its considerations.

The work of the Council is carried out by correspondence, summarized in a bulletin that is circulated to the members every two weeks throughout the year, for discussion and voting. This makes rather heavy demands on the time of the members, and they deserve credit for the conscientious manner in which they fulfil the exacting duties. The time and work are freely

given. The Council members feel that this is a duty which they owe to the profession, to medical science and practice, and they are stimulated and repaid by the results. Those who find it impossible to give the necessary time withdraw from the Council. This is sometimes unavoidable, much as it may be regretted.

Particular phases of the Council rules will be discussed in further articles, to which this is an introduction.

Rule 1—Composition, and Rule 2—Identification

The first two of the rules under which the Council considers the merit of preparations for inclusion in New and Nonofficial Remedies require that the composition of the product be stated fully and completely and that procedures and criteria for determining the composition and standardization be furnished. This information, when received with the formal presentation of a product, is transmitted to the American Medical Association Chemical Laboratory. The chemical unit was established as an indispensable adjunct at the outset of the Council's battle in the cause of rational therapeutics and truth in medical advertising. From modest beginnings the laboratory facilities have through the years developed into a first class, modern scientific organization, always generously supported by the Board of Trustees of the Association. Individual members of the staff are specialized in particular fields, such as organic, inorganic, biologic and physical chemistry, microchemistry, spectrophotometry, bacteriology and pharmacy. Its facilities were adequate in the early days when it was necessary to analyze and expose preparations of secret or fraudulently declared composition, and it is now further equipped to provide aid in assessing and standardizing the host of new agents which a more scientific era is supplying for the physician.

Perusal of the early reports of the Council furnishes convincing evidence of the necessity for insistence on adequate declaration of composition as a cardinal principle. For example, a product marketed as "Liquid Life" and declared to be a "true antitoxine" was found to contain sodium sulfate, magnesium sulfate, quinine sulfate and a dangerous amount of zinc sulfate. This was, of course, pure quackery. On a more scientific plane, one cites the lengthy report in the same year (1911) on quinine tannate, which showed that the available commercial supply was not sufficiently uniform for practical purposes. The report included adequate standards which were adopted for publication in New and Nonofficial Remedies. This sort of blanket investigation was a feature of the earlier days of the Council and the chemical laboratory and resulted in the promulgation of tests and standards for many drugs later adopted for the U. S. Pharmacopoeia and the National Formulary. The compilation of chemical tests and standards still continues; they are first published in *THE JOURNAL* along with the monographs on preparations which the Council has accepted, thus obtaining worldwide publicity. They are then republished in a separate section of New and Nonofficial Remedies, where they are available to those interested.

It is hardly necessary to emphasize the importance of the early publication of tests and standards to insure the uniformity and purity of new and nonofficial preparations in as definitive form as may be possible; thus the nature and expected action of drugs used in experimental investigations may be assured, with consequent clarity, and certainty in the interpretation of results. The work of the Council in this field is supported and supplemented by the new Therapeutic Trials Committee, which has been established by the Council to secure and aid unbiased and critical clinical investigation at the very outset of new therapeutic agents, as well as investigations of new uses for already established agents. This, of course, necessitates proper initial consideration of composition, identity and purity of the products concerned.

When first published the Council's rules were elaborated by inclusion of explanatory comments designed to aid the manufacturer in determining the information necessary to make presentation of a product for consideration. These comments have been further elaborated from time to time as necessitated

by emergence of new problems. For these corollary comments those interested are referred to the current edition of *New and Nonofficial Remedies* or to a small pamphlet which may be obtained on request from the Council's office. With respect to Rules 1 and 2 these comments give specific details for proper presentation of composition, controls, necessary chemical information, declaration of preservatives and vehicles. It is emphasized that the Council does not accept "confidential information" which it could not publish if it is deemed advisable. Manufacturers are required to present a formal agreement to notify the Council promptly on the discovery of an error affecting the standards of strength, identity, purity or quality of an accepted preparation whether the discovery has been made by the firm itself or by a government or other outside agency.

The results of the Council's pioneer efforts in the field of drug control as initiated by its first two rules are reflected not only in a more enlightened medical profession but also in the increasingly scientific and research-minded attitude of pharmaceutical manufacturers, who realize that progress is conditioned on knowledge, not on secrecy.

Rule 3—Advertising

Much of the routine activity of the Council, especially of the Council's office, is concerned with medical advertising. Indeed, one of the main reasons for the founding of the Council was the false and misleading character of the advertising and other promotional devices offered at the turn of the century. The Council has always recognized the value of honest, straightforward presentation of warranted claims to promote the use by physicians of acceptable preparations. In fact, the Council is as anxious as anyone to see that the profession is informed of new but proved drugs and uses for drugs. Nor does it object to advertising to the lay public of certain classes of drugs which will be discussed later.

Council acceptance carries with it the right to advertise in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* and other medical publications that follow the Council. This includes most of the state medical journals and some of those privately owned or published by allied medical organizations. There is no question of dictation by the Council either to the publication or the manufacturer concerned; there is merely a pursuit of the principles of sound and rational therapeutics participated in by those with mutual interests.

Aside from the requirement of Council acceptance of a product, all advertisements appearing in *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* and the journals affiliated with the Cooperative Advertising Bureau of the American Medical Association must conform to certain principles, all of which are corollary to the basic requirements laid down in the Council's Rule 3. These include freedom from sweeping superlative claims or inferences and from disparaging statements concerning competing products; conformance to the allowable claims as given in *New and Nonofficial Remedies*; appearance of recognized synonyms or generic designations in the case of articles bearing protected names; inclusion of adequate statement of composition for pharmaceutical mixtures. Advertisements for medicinal preparations submitted to *THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION* are referred to the Council's office for scrutiny as to conformance with these principles.

When a product is submitted to the Council for inclusion in *N. N. R.*, the manufacturer is required to furnish with the formal presentation copies of all labels, package enclosures and each piece of advertising (leaflets, circulars and brochures) used in its promotion. If the article belongs to a class of drugs already accepted by the Council, this material is scanned for conformity to recognized claims appearing in *N. N. R.*; if the advertising makes any extension of these claims, adequate evidence must be submitted in support, or the new claims must be deleted before acceptance. In the case of a new preparation, allowable claims are formulated from the presented evidence and the advertising is required to conform to these before the article can be accepted. These considerations are carried out

by the entire Council in the biweekly bulletin containing reports, general discussion and final vote. Thus all considerations become a matter of permanent record, permitting, among other things, consistency in consideration of submitted products.

In general, the Council disapproves the advertising of medicinal preparations to the lay public for the obvious reason that it promotes dangerous self medication. Misdirected and inadequate treatment, failure to recognize serious disease until too late for effective treatment, the spread of infectious disease when hidden from the physician, these dangers are a few of those involved. Further dangers are: suggestion by description of symptoms to the minds of people that they are suffering from the diseases described in such advertising, unconscious formation of drug habit, the possibilities of starting allergic reactions. These dangers not only exist with direct advertising of medicinals to the public, but apply also to the naming of diseases and therapeutic indications on labels which may fall into the hands of the patient and lead to the same results. However, the Council recognizes that such label indications may be necessary for proper instruction in the use of articles that may be properly advertised to the public; they are therefore considered unobjectionable in the case of such products. Such articles are (a) disinfectants, germicides and antiseptics promoted as prophylactic agents, (b) laxatives promoted in such a way as not to lead to abuse, (c) antiserums, vaccines and diagnostic agents which are not adapted for self medication, and (d) other preparations which may be safely used for relief of symptoms, such as antacids and analgesics. Agents falling within these exceptional classes should carry adequate and acceptable labeling statements, such as "for the relief of minor aches and pains" for analgesics, and "for the treatment of occasional constipation" for laxatives. Extension of the list of exceptions and of proper safeguards for control is being continuously studied by the Council as the presentation of various products offers occasion.

The measure of control which this rule of the Council exercises over the advertising of acceptable preparations is in no sense unreasonable, and does not interfere seriously with professional advertising. Unbridled enthusiasm and unrestrained imagination tend to destroy the confidence of the reader in the truth of the advertising. The moderation which characterizes the tone of the current advertisements in most of the American medical journals is sure to "pay dividends" in the long run. The Council likes to believe that its rules have contributed materially to this healthy attitude.

Rule 4—Therapeutic Claims

What are the criteria on which the Council accepts therapeutic claims for a new preparation or extension of claims for an already accepted one? In general, the existence and formal presentation of documented supporting evidence, usually by the pharmaceutical manufacturer who actually markets or distributes the product. Such evidence must offer objective data, with such citation of authority as will enable the Council to confirm the facts and establish the scientific value of the conclusions. The evidence should be adequately detailed, presenting results of comparative trials when feasible. It should present the work of investigators whose reputation for scientific ability and critical judgment is known. It should not consist of uncontrolled case reports or observations, however voluminous.

Once a product is accepted, the material used in its promotion to physicians must conform to the allowable claims under which it was included in *N. N. R.*, or to accepted extensions of these claims.

In the pamphlet containing the Council's rules, detailed instructions are given for the presentation of products and of confirming evidence for their usefulness. This material is first reviewed by a referee, and then by the entire Council in the ensuing consideration.

In order to keep abreast of the scientific advances on the frontiers of rational therapy, monographs in *N. N. R.* are restudied and if necessary revised at least annually. Instances can be cited of the recognition and implementation of new thera-

peutic developments, even in the brief period between the annual revisions of New and Nonofficial Remedies.

The quasijudicial character of the Council must be emphasized in this connection. Due consideration and evaluation of new evidence is a duty imposed on each member of the Council by reason of his own scientific training and rank in his chosen field. When special knowledge is required in any given case, the Council has at all times been able to secure the advice of the best and most competent authorities in the field. Any proponent of a new therapeutic procedure or preparation may feel assured that the evidence he presents in its support will be given sympathetic but competent and wholly adequate consideration.

Rule 5—Nomenclature

In general, the Council does not recognize names that suggest therapeutic use and prefers names, both protected and common or generic, that indicate the potent element or constituent of the product. The Council's Committee on Nomenclature, which is charged with preliminary consideration of names, works in close collaboration with other groups, scientific and governmental, interested in rational drug terminology. Fundamental, of course, is the provision of a single "generic" name for each drug.

The Council recognizes the importance to a manufacturer of a name which shall identify his own product. In the case of new discoveries, it recognizes the preferential right of the discoverer to choose a name. It has become the custom to use such names in connection with a properly scientific, systematic common or generic designation. The Council requires that such a generic name appear on the labels of accepted preparations marketed under trademarked names and that it be given at least half the display value of the protected name.

The owner of a patent may license other firms to produce the drug concerned; the Council will recognize a proper trademark designation for this product, as marketed by the second firm, to be used in connection with the common or generic name.

Protected names are not accepted for U. S. P. or N. F. articles or for nonofficial modifications or dosage forms of such articles unless such names were in commercial use before the products became official or unless they concern products which are otherwise entitled to protected names in the judgment of the Council.

The Council also recognizes "line" names, when not in themselves misleading and when not used as the name for a single product. The firm's name or initials, when not of such character as to be misleading or cause confusion, may also be used thus.

If the Council is consulted with regard to any specific protected or generic designation before it is placed in use subsequent differences of opinion may be avoided.

Rule 6—Patents and Trademarks

Information under this head is required for purposes of record and identification. It is especially important if the product is registered in a foreign country under a different name. The recently adopted provision for recognition of protected names used in connection with the duly recognized common or generic designations renders the proper record of trademark registry of increased importance.

Rule 7—Unscientific and Useless Articles

This rule was especially valuable in the early activities of the Council as a means of eliminating and condemning complex and worthless mixtures which venal promoters of those days foisted on the physician and the public. Its usefulness today is mainly in connection with the Council's Rule 4, which requires the presentation of such evidence of therapeutic value as would automatically eliminate from consideration articles which have no definite usefulness and which may be harmful or uneconomical. This includes, of course, needlessly complex mixtures or compounds, the constituents of which are of no demonstrable assistance to each other, as well as articles which involve danger of toxic effects disproportionate to their therapeutic value.

QUESTIONS AND ANSWERS ON COUNCIL RULES

1. What is eligible for inclusion in New and Nonofficial Remedies?

ANSWER.—Pharmaceutical and drug substances that possess originality or other important qualities which in the judgment of the Council entitle them to such place. Official preparations may also be included provided they have not been official for twenty or more years and provided the Council feels that the medical profession may not yet be fully informed concerning their use. Other articles may be included if such inclusion is believed to provide useful information for the physician.

Articles which are advertised to the public and which are not considered by the Council to be safe for use by the general population without medical supervision are ineligible for inclusion in New and Nonofficial Remedies. Included among the agents which the Council has so far classified as acceptable for inclusion in N. N. R., even though they are advertised to the public, are antiseptics for prophylactic application to minor injuries of the skin and certain laxatives, antacids and analgesics that normally can be used safely for temporary relief. The Council will not accept any agent promoted to the public for the treatment of a condition requiring medical attention.

A drug that has not been released for interstate commerce normally will not be considered by the Council unless it seems evident that the product soon will be placed in interstate commerce. The Council does not consider for acceptance articles marketed solely outside the United States.

At the request of the manufacturer or distributor the Council or its office will determine the status of a product individually. Instruments and devices which are not intimately a part of a drug package and which are not necessarily restricted to the administration of the accompanying drug are not within the scope of N. N. R.

Articles belonging to a class of preparations already rejected by the Council are obviously ineligible for inclusion in N. N. R. unless new evidence is forthcoming to overcome previous objections. A list of references to rejection reports by the Council may be found in the bibliographic index of N. N. R.

2. How can the eligibility of a product be determined?

ANSWER.—By looking in New and Nonofficial Remedies to determine whether the product or its counterpart is accepted; by reading the Council rules, copy of which is available on request; by asking for an interpretation from the Council office.

3. How should a product be presented?

ANSWER.—An acceptable outline for the description and presentation of a product has been made available by the Council in its rules. Among the material that is required is a complete description of the product in duplicate in accordance with the form outlined by the Council; three trade packages of each dosage form to be considered; one sample of each active ingredient contained in the product; twenty-two copies each of all labels (container, package, carton), package enclosures and other labeling and promotional material, and evidence to support the claims made.

The material should be presented in complete form, not piece meal. Consideration is expedited if the labels are mounted on normal size letter paper so that twenty-two separate sets of labels will be available for examination.

4. Who is responsible for the submission of evidence?

ANSWER.—The manufacturer or distributor submitting the product is responsible for evidence to support all claims made for the product. The actual presentation, however, may be made by a duly qualified agent of the manufacturer or distributor.

5. How much evidence should be submitted?

ANSWER.—If the product is one of which no brand has been previously admitted to New and Nonofficial Remedies, the manufacturer or responsible agent must present protocols of laboratory and clinical evaluations (toxicity, pharmacology, therapeutics, deterioration, etc.). Such protocols should include

not only evidence collected by the firm in its own investigations but references to published papers if available. All claims should be supported by pharmacologic, bacteriologic and other evidence necessary to demonstrate the usefulness of the submitted product. In general, this should include a summary of the various conditions treated, the number and type of cases treated, the dosage, frequency and duration of the administration of the drug, the therapeutic effects and any untoward reactions observed. The outline of description should be supplemented by twenty-two copies of reprints or suitable abstracts of available experimental and clinical evidence, including references to the published scientific literature or to the sources from which it is derived. When extensive, the detailed reports may be submitted in duplicate and twenty-two copies of a suitable comprehensive and unbiased summary or abstract may be furnished for the Council.

6. What constitutes acceptable evidence?

ANSWER.—To be acceptable the clinical evidence must offer objective data with such citation of authority as will enable the Council to confirm the facts and establish the scientific value of the conclusions. The amount and character of the evidence that is required depend on the inherent probability of the claims, no evidence being needed for a self-evident claim but strong evidence being required when the claim is beyond the trend of accepted data or previous scientific knowledge. Acceptable evidence is determined mainly by its quality. It must be furnished in sufficient detail to permit judgment as to the care with which it was gathered and the legitimacy of the deductions. Comparative trials facilitate and often are necessary for such judgment. The creditability of the data and the justification of the deductions are influenced by the reputation and experience of the investigators as to disinterestedness, technical ability and critical judgment. "Testimonials" do not constitute acceptable evidence.

The submitted evidence should withstand statistical analysis if such seems indicated. It is better to accumulate sufficient cases in a few centers than a few cases in many centers, since the latter are usually inadequate for controlled observation and critical analysis. Some indication of the animal and clinical data that often are required in the evaluation of a new drug or technic is offered in a report of the Council entitled "Laboratory and Clinical Appraisal of New Drugs" (J. A. M. A. 126: 958-961 [Dec. 9] 1944). (Reprints may be secured from the Council office.)

7. Does the evidence submitted to the Council need to be published before it is offered on behalf of a product?

ANSWER.—Because of the long delay that normally occurs between the completion of a study and publication of the findings and because some investigators do not wish to publish their findings until they have studied other phases of interest which are not necessary to determine the lack of harmfulness and the usefulness of a preparation, it is not necessary for the evidence to be published before it is submitted to the Council.

8. Is evidence presented in foreign publications acceptable?

ANSWER.—Normally, distributors and manufacturers have found it to their interest to have original work done in the United States, where a manufacturer or distributor can watch closely and work with the person or persons undertaking the research.

9. Is it necessary for a manufacturer or distributor to submit additional evidence or review available evidence if he is merely submitting another brand of a product already described in N. N. R.?

ANSWER.—When the article submitted represents only a new brand of a preparation already described in N. N. R., such evidence is not required so long as the claims for the product do not go beyond the statements set forth in N. N. R.

When the article submitted is simply a dosage form of a brand of a product already accepted, only that information is required which is essential to supplement the original presenta-

tion and afford a clear description of the composition, purpose and usefulness of the new dosage form.

10. Can a manufacturer or distributor use in advertising literature claims exceeding those described in N. N. R.?

ANSWER.—Therapeutic claims accepted by the Council are set forth in the N. N. R. monograph for the accepted article or class of articles. Claims made subsequent to the acceptance of an article must be submitted to the Council for review if such claims exceed or substantially modify those made at the time the product was accepted.

If new claims are contemplated, they should be presented to the Council with supporting evidence before being used in promotion.

11. Does the Council have any specific criteria for gathering evidence on drugs?

ANSWER.—The Council has indicated the type of evidence that may be necessary when undertaking an evaluation of a new agent. Its thinking is reflected in one of its reports entitled "Laboratory and Clinical Appraisal of New Drugs" (J. A. M. A. 126: 958-961 [Dec. 9] 1944). (Reprints may be secured from the Council office.)

Criteria for certain groups of products have been adopted by the Council in an attempt to encourage consistency in the collection of evidence for the agents in these groups. So far the Council has prepared criteria for anti-infective agents, antifungal agents and contraceptive agents. Copies of these criteria are contained in the Official Rules of the Council and may be obtained on request from the Council office.

12. Does the Council accept mixtures?

ANSWER.—Despite its general opposition to the indiscriminate marketing of mixtures of drugs in fixed proportions, the Council recognizes that certain ready-made dosage forms of synergistic or mutually adjuvant constituents may be desirable for the convenience of physicians. The Council will accept such mixtures if they otherwise conform to its rules.

13. Must advertising material be submitted in finished form at the time the product is presented to the council?

ANSWER.—Proposed labeling and advertising material may be submitted in manuscript or proof form. In fact, such submission is encouraged, as the claims may be more readily modified to meet Council suggestions. However, the responsible agent will be expected to see that the printed material conforms in every respect to what has been agreed on by the Council.

14. Can minor changes in labeling and advertising be effected at the next printing of this material?

ANSWER.—A reasonable time will be afforded by the Council to effect minor changes in labeling and advertising.

15. Are trade names recognized by the Council when a new drug is presented?

ANSWER.—Trademark names for medicinal articles are accepted if the Council deems the use of such protected names not to be harmful to health, and if they are used in connection with a common or generic name which shall not be unduly subordinated to the trademarks in the labeling and advertising. It is desirable that trade names be coined so as to indicate the potent element or constituent.

Trade names for official articles will not be accepted unless the trade names were in actual commercial use before the drug was admitted to or tentatively adopted for inclusion in the U. S. Pharmacopoeia or National Formulary.

16. Will the Council consider trade names before they are placed in use?

ANSWER.—Yes: It is highly desirable that trade names be passed by the Council before they are publicized, in order to avoid confusion and loss of investment if they should be found unacceptable. The Council is therefore willing to pass on proposed trade names even before the acceptance of the drug itself is determined.

THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION

535 NORTH DEARBORN STREET - - - CHICAGO 10, ILL.

Such notice should mention all journals received from this office. Important information regarding contributions will be found on second advertising page following reading matter.

SATURDAY, JUNE 25, 1949

THE ATLANTIC CITY MEETING

Attendance at the Ninety-Eighth Annual Session of the American Medical Association was second largest in the history of the Association. More than 13,000 physicians and almost 15,000 visitors were registered. Many physicians from foreign countries were present, evidence of the international standing of the Association and the worldwide interest in its activities.

No one phase of activity was most interesting, since the varied interests of physicians and guests drew maximum attendance in every section and exhibit. The scope of this session was tremendous, including 212 scientific exhibits and 341 technical exhibits; more than 300 scientific papers were presented at the Scientific Section meetings. The color television show alone attracted over 30,000 visitors. Demonstrations and interviews, and the interest shown in them, were continuously in evidence. The audiences at the Section meetings were among the most attentive attracted to such programs.

The actions of the House of Delegates were reported in part in last week's issue of THE JOURNAL, and other topics are reflected in this and forthcoming issues.

Dr. Ernest E. Irons, long associated with the Council on Pharmacy and Chemistry and with the Board of Trustees, was inducted into the Presidency of the Association. By unanimous vote, Dr. Elmer L. Henderson, formerly chairman of the Board of Trustees, was made President-Elect. Dr. F. F. Borzell and Dr. James P. Reuling were reelected Speaker and Vice-Speaker, respectively, of the House of Delegates. Reelected to the Board of Trustees was Dr. Louis H. Bauer, who became Chairman of the Board. Dr. F. J. L. Blasingame of Wharton, Texas, was elected to fill the vacancy on the Board created by the expiration of Dr. Henderson's term. Other elections included those for the Judicial Council, Council on Scientific Assembly, Council on Medical Education and Hospitals and Council on Medical Service. Dr. George F. Lull and Dr.

J. J. Moore were reelected Secretary and Treasurer, respectively.

On Sunday previous to the meeting inspiring addresses were offered at an open religious service by His Eminence Francis Cardinal Spellman, Rabbi Morris S. Lazaron and Rev. Joseph McCartney. A dinner for the House of Delegates was addressed by Lord Horder, and the Joseph Goldberger Award in Clinical Nutrition was presented, posthumously, to Dr. Randolph West.

Other activities too numerous to describe in detail reflected the breadth of current medical problems and the intensity of interest shown by the medical profession in solving these problems. From time to time reports on these activities will appear in THE JOURNAL. Their substance was made available immediately to the general population through the press. Thus the public is kept informed of the work of the medical profession to prevent illness, cure disease and make available the best possible medical care. There were more than twenty radio interviews and newscasts under sponsorship of the Association.

The next session of the Association will be the 1949 clinical session in Washington, D. C., December 6-9, followed by the annual session in San Francisco, June 26-30, 1950. Officers and various committees of the Association have already completed arrangements to make these meetings successful.

FENESTRATION OPERATION FOR OTOSCLEROSIS

Recently Dr. Julius Lempert¹ described the present status of the "Lempert Fenestra Nov-Ovalis Operation for the Restoration of Practical Unaided Hearing in Clinical Otosclerosis." Since Dr. Lempert first described the one stage method for surgical management of otosclerosis, improvements in technic have been made. Moreover, means for ascertaining preoperatively the likelihood of obtaining practical and serviceable results have been improved. For restoration of practical hearing the preoperative bone conduction hearing for the 512, 1,024 and 2,048 pure tone frequencies should not be lower than the 30 decibel level. The decibel level of bone conduction hearing should be at least 25 to 30 decibels higher than the decibel level of air conduction hearing. With an adequate cochlear nerve function reservoir, no matter how great the preoperative hearing loss, restoration of practical hearing is considered possible. Dr. Lempert has described in detail his "bone-dust free fenestra nov-ovalis technic." The main principle of this new technic is prevention of the entrance of bone dust into the operative area, since such dust may be responsible later for osteogenesis that interferes with or closes

1. Lempert, J.: Lempert Fenestra Nov-Ovalis for the Restoration of Practical Unaided Hearing in Clinical Otosclerosis: Its Present Status, *Proc. Roy. Soc. Med.* 51: 617 (Sept.) 1948.

the fenestration. The technic includes burnishing the fenestral rim with pure lead to prevent osteogenesis at the freshly cut bony edge.

Since the original operation was described, Dr. Lempert has performed 3,700 fenestration operations and 450 revisions. Most frequent adverse complications have been osteogenesis at the operative site, bleeding or oozing postoperatively, the development of postoperative inflammation of the tympanomeatal flap and postoperative labyrinthitis. The three latter complications have recently been almost completely controlled by improvements in operative technic and the administration of 300,000 units of penicillin each day for ten postoperative days. The introduction of the lead burnishing technic should greatly reduce the number of closures of the fenestra from osteogenesis.

Successful restoration of hearing obviously depends on proper selection of patients, the operative technics used and careful evaluation of preoperative and postoperative audiometric measurements. Dr. Lempert estimates that unaided hearing can be restored by operation in approximately 80 of 100 patients considered most suitable for operation. At the end of two years, however, hearing regression will have occurred in 20 of this group of 80, thereby netting a 60 per cent successful two year result. Results at the end of two years are considered essentially permanent. With the latest advances in technic, better results are expected, but Dr. Lempert warns that there is great need for utmost caution in evaluating results in order that accurate preoperative prognoses may be made.

Reports from some other authors have claimed a much higher percentage of successful operative results. Thus Shambaugh and Juers² and Shambaugh³ in recent studies using a modified technic in a group of patients designated as class A (ideal), a group which may be said to correspond to Dr. Lempert's (100 most suitable for operation), stated that successful two year results are possible in 80 per cent. Features of the Shambaugh modification include enchondralization of the fistula, placing the fistula on the horizontal semi-circular canal laterally and the use of a sea sponge and head frame technic to prevent postoperative serous labyrinthitis. In 1946 Shambaugh⁴ stated that 92 per cent of an operative series measured audiometrically two years postoperatively showed improvement, although not all patients had maintained their maximum gain. As standards of selection of patients, changes in operative technic and methods of postoperative and preoperative audiometric evaluation have changed, this estimate of prognosis has apparently been revised downward. Other authorities suggest that the 20 per cent difference in estimate of good prognosis (60 per cent

by Lempert and 80 per cent by Shambaugh) probably does not relate to a real difference in operative results obtained or technics employed but is a factor of differences in standards of patient selection and differences in concept of what may be considered a successful result.

POSTONCOLYTIC IMMUNITY

In 1946 Aptekman¹ and his associates of the Wistar and Carnegie Institutes prepared an alcoholic extract of rat sarcoma tissues. Concentrates of this extract injected into transplanted sarcomas in homologous inbred strains of rats caused a rapid lysis of the sarcomas, followed by sloughing and complete healing. Tested several weeks or months later the recovered rats were found to be wholly refractory to reimplantations with homologous type sarcoma.

Confirmation of this postoncolytic tumor immunity with attempted determination of the chemical nature of the specific oncolysin is currently reported by the same investigators.² Primary sarcomas were induced in various inbred strains of rats by a local injection of 3 mg. methylcholanthrene dissolved in mineral oil. Tumors thus induced were found to be 100 per cent transplantable to rats of the same inbred strain. Grafts from these primary tumors implanted into 1 month old susceptible rats of homologous strain usually attained a size of about 20 by 8 by 5 mm. by the end of seven days. To prepare the lytic concentrate, tissues from primary or transplanted sarcomas were minced, mixed with an equal volume of 95 per cent ethyl alcohol and ground for four to six hours at room temperature in an electrically driven ball mill. The fine emulsion thus obtained was centrifuged free from undissolved residue. Two volumes of 95 per cent ethyl alcohol were then added to the clear supernatant fluid. The substances precipitated by this addition were removed by filtration. The resulting clear yellow solution was then concentrated to about one sixth of its original volume by vacuum distillation. The resulting concentrate contained 30 per cent alcohol. The concentrate was injected in 0.5 to 0.75 cc. doses into rapidly growing tumors seven or eight days after implantation. The injections were repeated every two or three days until the tumor was destroyed. In some cases only two or three injections were required. In others, as many as six to ten injections were needed to bring about complete lysis.

Of 210 rat tumors thus treated, 203 were completely destroyed. Most of the 7 rats not cured died from anesthesia. Of the 203 rats cured by oncolysis, 149 were tested three to four weeks later for acquired tumor resistance. They were then given a challenging dose of homologous sarcoma on the opposite side of the body. The rats were retested with larger sarcoma doses

2. Lewis, M. R.; King, H. D.; Aptekman, P. M., and Seibert, F. B.: *J. Immunol.* 60: 517 (Dec.) 1948.

ten to twelve months later. All were found to be 100 per cent resistant to homologous retransplants. Control transplants of the same tumor into normal rats usually gave rise to large tumors (50 by 25 by 20 mm.) within twenty-one days.

Detailed chemical and physicochemical analyses of the alcoholic concentrates have led to tests of numerous suspected fractions dissolved or suspended in 30 per cent alcohol. Nicotinamide, cocarboxylase, ascorbic acid and certain other substances have been found to increase the growth rate of rat sarcomas. Control extracts from normal tissues as well as certain other suspected factors decrease tumor growth rate. But none of them thus far tested has destroyed the tumor. Human malignant tumor extracts were prepared by the same technic from carcinoma of the intestines. These were found to be more toxic than similar extracts from rat sarcomas, since 40 per cent of the rats repeatedly given injections of the human concentrates died from the injections. In the surviving rats the tumors were destroyed, followed by an effective tumor immunity.

A second finding of theoretic interest is the result of their tests of the possible hereditary transmission of this acquired oncolytic tumor immunity. Five healed and immune female rats were mated with 5 healed and immune males. When the offspring were 30 days old, in them and their parents fragments were engrafted of the same kind of tumor that had undergone oncolysis in the parents. The tumor grafts grew in every one of the offspring, but failed to grow in the parents. The physiologic mechanism of this postoncolytic immunity to cancer has not yet been determined.

Current Comment

DR. LEWIS HILL WEED RETIRES

Friends and hundreds of leading physicians who have been associated with Dr. "Lew" Weed in the work of the Division of Medical Sciences of the National Research Council for the last eleven years will be shocked to hear that he is seriously ill with tuberculosis involving both the lungs and the larynx and is now in the sanatorium at Saranac Lake. Among the positions he has occupied recently have been trustee of the Institute for Advanced Study, trustee of the Carnegie Institution in Washington, chairman of the Division of Medical Sciences of the National Research Council, member of the Medical Advisory Committee of the American Red Cross, member of the Advisory Council of the Insurance Research Fund and member of the Board of the Honorary Consultants of the Army Medical Library. He was for many years a professor of anatomy in Johns Hopkins University School of Medicine and for some time dean of the School of Medicine. In 1946 he received the Medal of Merit with a citation in which he was hailed as "eminent scientist and medical administrator" and which specified his "especially

meritorious conduct in the performance of outstanding service." The citation reads, "By his vision and energetic action, Dr. Weed has rendered unquestionable service to his country in the mobilization of eminent civilian specialists and through the stimulation and support of scientific projects which to so large an extent formed the basis of effective measures for the prevention and cure of diseases and battle injuries among the armed forces of the United States." His genial character and fine sense of humor, his extraordinary facility for resolving differences in point of view endeared him to all who were privileged to work with him. Dr. Weed has the very best wishes of the medical profession of our country and of the innumerable scientists who have been associated with him, for recovery from his illness and for many years of relaxation from the arduous duties that he has undertaken in a career marked by brilliance and important achievement.

POISONING FROM ANILINE MARKING ON DIAPERS

Kagan and his co-workers¹ have warned against the hazard of aniline intoxication in infants, particularly premature infants, from the use of diapers stamped with inks containing aniline dyes. Sixty-three such cases have been reported of which five terminated fatally. Kagan and his group have added 9 cases to this series. Aniline may be absorbed through the skin. In the body it produces cyanosis through conversion of hemoglobin to methemoglobin, a non-oxygen-carrying pigment. Such conversion is slow, and prolonged absorption of the dye is required to produce a significant effect. Infants, especially premature infants, are particularly susceptible to diminished supply of oxygen and hence even slight degrees of methemoglobinemia may be serious. Prevention of such accidents is simple. If the diapers are boiled after they are stamped and thoroughly dried before use, the dye becomes fixed and absorption does not occur. The ideal method of prevention would be the use of nontoxic dyes, but unfortunately, vegetable pigments, charcoal and silver nitrate lack the permanence required for marking clothing in large institutions.

POSTGRADUATE COURSES FOR PHYSICIANS

In this issue is the semiannual list of postgraduate courses prepared by the Council on Medical Education and Hospitals covering the period July 1, 1949 to Jan. 15, 1950. These courses are offered in fifty-two subjects and vary in length from a few days to more than a year. There are 834 courses. In eighty-five instances the course can be arranged to suit the convenience of the student. Medical schools and hospitals as well as state and special medical societies will give the courses, although many other agencies will cooperate. This type of training continues to be popular among physicians. The list of courses in this issue covers more varied opportunities than were provided in any previous list.

PROCEEDINGS of the ATLANTIC CITY SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF
THE AMERICAN MEDICAL ASSOCIATION, HELD IN
ATLANTIC CITY, JUNE 6-10, 1949

HOUSE OF DELEGATES

First Meeting—Monday Morning, June 6—Continued

REPORT AND SUPPLEMENTARY REPORT OF COUNCIL ON MEDICAL SERVICE

Dr. James R. McVay, chairman, presented the following report and supplementary report of the Council on Medical Service, which were referred to the Reference Committee on Insurance Plans and Medical Service:

Report of the Council on Medical Service

To the Members of the House of Delegates of the American Medical Association:

PREPAYMENT MEDICAL CARE

The rapid and orderly growth of voluntary prepayment medical and hospital care plans has been one of the striking and stimulating economic developments supported by American medicine during the past fifteen years. The initiating and propelling force of these plans was the medical profession acting through its local and state societies and later its national organization. This movement has attained national proportions. At the present time over 30,000,000 persons are covered by Blue Cross type hospital insurance and over 10,000,000 by Blue Shield type medical care insurance. This stimulus and the accumulated experience gained by these organizations have prompted many private insurance companies to enter this field, and they are making substantial contributions toward the accomplishment of the ultimate objective; namely, voluntary health insurance at a nominal cost for all the people in the United States. The total number of persons covered by all voluntary agencies is 55,000,000 for hospitalization and 37,000,000 for surgical or medical care.

The American Medical Association is not engaged in the insurance business and has no intention of giving a preferential standing to any one type of voluntary plan. The American Medical Association does believe, however, that it has a definite function to perform, that of evaluating any insurance plan presented to the people, thus protecting them as far as possible against unscrupulous or unsound plans. The American Medical Association further believes that the people should be free to purchase the type of health security they desire. To this end the Council on Medical Service for the past four years has critically examined various plans and has given its approval to numerous plans operating on a local or state basis. The Council has felt the need for a national organization which would act as a trade and coordinating agency for all medically sponsored plans.

Therefore the Council on Medical Service recommends:

1. The formation of a national coordinating agency representing all qualified voluntary prepayment plans in accordance with the proposal made to the Board of Trustees by the Council on Medical Service.

2. That there shall be no official connection between the American Medical Association and the Associated Medical Care Plans. However, the American Medical Association will continue to approve or disapprove all voluntary medical care plans.

3. The recognition of A.M.C.P. as a trade organization of member plans and Blue Cross as occupying a similar position for voluntary prepayment hospital care plans.

4. The recognition of the responsibility of the American Medical Association to:

(a) Promote the principle of voluntary insurance by educating the people as to their need for such coverage and by obtaining full

cooperation from state and county medical organizations in the local field.

(b) Inform the American people of the availability of approved plans that propose to supply on a prepayment basis security against the economic hazards of serious illness.

Respectfully submitted,

JAMES R. McVAY, Chairman.

Supplementary Report of Council on Medical Service

I. Positive Approach to Action: Since the Interim Session in St. Louis, the Council on Medical Service and its correlating committees have met with leaders of labor, farm and industrial groups, and representatives of consumer health cooperatives, Associated Medical Care Plans, private insurance organizations, the American Hospital Association, the American Medical Association's National Education Campaign managers and numerous state medical associations.

In most instances the problems have been difficult; points of view often have been divergent and solutions hard to find. In every instance the Council has approached each particular problem openly and objectively and has based its decisions on what it believes is in the best public interest and will guarantee, so far as possible, the highest standards of health service to every American citizen.

Your Council on Medical Service recommends to the House of Delegates positive, decisive, progressive action without sacrificing any of the fundamental principles of American medicine.

II. Five Specific Recommendations: Specifically, the Council recommends that the House of Delegates take definite action on five following subjects:

1. Approve complete and absolute separation of Associated Medical Care Plans from the American Medical Association and adopt the joint statement of the Board of Trustees and the Council on Medical Service as presented in the report of the Council.

The Council on Medical Service desires at this time to acknowledge the efforts of Associated Medical Care Plans in promoting through its member plans the principle of voluntary prepayment health insurance, and believes that Associated Medical Care Plans has reached a state of development where it can function more adequately as an autonomous trade association.

2. Approve the tentative principles set up to guarantee good medical service to subscribers of lay sponsored voluntary health plans.

3. Approve arrangements made at the suggestion of the Council with Whitaker and Baxter that the Council develop the positive phases of the National Education Campaign, principally the nationwide promotion of the voluntary health insurance campaign on all fronts.

4. Approve the plan of action of this over-all campaign using all the agencies portrayed in the Scientific Exhibit on "Voluntary Health Insurance," and in accord with the promotional

program adopted by the Atlantic City June 4 conference of groups working in the voluntary health insurance field.

5. To carry out the recommendations and to further the effectiveness of the Council's correlating committees on (a) prepayment hospital and medical service, (b) extension of hospitals and other facilities, (c) medical care of veterans, (d) medical care of industrial workers, (e) medical care of the indigent, (f) medical care of children and (g) relations with lay sponsored voluntary health plans, the Council further recommends that the House of Delegates approve the necessary increase of the Council's staff personnel so that (1) full time assistance may be available to forward the activities of the correlating committees, and (2) an active program of field promotion may be instituted immediately to bring about increased enrolment through all approved voluntary health programs and plans in the shortest possible time.

III. Detailed Addenda: Copies of this report together with addenda giving detailed data on each of these points is herewith supplied for the information of the House of Delegates and its appropriate Reference Committee. Each of the addenda is numbered to conform with each of the five recommendations.

Respectfully submitted,

JAMES R. McVAY, Chairman.
ELMER HESS, Vice Chairman.
THOMAS A. MCGOLDRICK.
H. B. MULHOLLAND.
JESSE D. HAMER.
J. D. MCCARTHY.
WALTER B. MARTIN.
R. L. SENSENICH.
EDWARD L. BORTZ.
GEORGE F. LULL.
MR. THOMAS A. HENDRICKS,
Secretary.

ADDENDA (IN REFERENCE TO II (2))

At the direction of the Board of Trustees the Council on Medical Service has drawn up the attached suggested principles to use to evaluate lay sponsored voluntary health plans.

BACKGROUND

In December 1946, the Committee on Rural Medical Service reported to the Board of Trustees (and House of Delegates):

The development of cooperative associations and other consumer controlled groups for provision of medical care has received considerable attention. There are some eighty-nine cooperatives in thirty-one states now operating. This is an interesting experiment in the rural effort to do something constructive from the point of view of the consumer. The medical profession should be concerned in all these plans with the view that a high level of medical care be supplied. Since these groups expect to employ physicians, some minimum standards, or the basic principles involved in such contracts, should be adopted by this House of Delegates for the guidance of physicians entering such employment and for the consideration of employing groups interested in establishing a high standard of medical care.

Acting on this report the Reference Committee recommended the following resolution which was adopted by the House of Delegates:

WHEREAS, There is some difference of opinion regarding the establishment of consumer cooperative medical care programs, nevertheless they are functioning in certain areas of this country; and

WHEREAS, It is necessary that in order to insure good medical care certain basic principles be formed; therefore be it

Resolved, That this House of Delegates request the Board of Trustees to set up proper standards to be used by cooperative or consumer controlled groups when providing medical service.

The Board of Trustees referred the resolution to the Council on Medical Service.

On receipt of this resolution, the Council on Medical Service initiated a survey of lay sponsored voluntary health plans. In reporting this survey to the House of Delegates the Council described it as a study to determine the possibility of formulating standards for this particular type of medical practice.

This survey, when completed, indicated that some one hundred and seventy-one lay sponsored voluntary health plans had been organized in forty-three states and were serving an estimated 1,600,000 persons. Certainly more important, however, was (and is) the growing emphasis on the so-called fringe benefits in collective bargaining. While the American Medical Association

has no part in the collective bargaining effort itself, we must recognize a responsibility in seeing to it that the principles under which any health plans, resulting from such collective bargaining are organized, give assurance to the individual participants that the quality of medical care will not be adversely affected.

To the end that such assurance might be given wherever lay sponsored prepayment plans are operated, the Council on Medical Service has sought the counsel and experience of many individuals and groups. As a final step in the development of suggested principles for lay sponsored health plans the Council selected a special committee composed of three persons well acquainted with the problem. This committee met with a similar committee representing the lay sponsored plans with a specific instruction to prepare suggestions as to principles. This special committee, composed of Dr. L. W. Larson, Bismarck, N. D., Committee on Rural Health of the American Medical Association; Dr. Norman Scott, Newark, N. J., executive vice president and medical director of the Medical-Surgical Plan of New Jersey, and Mr. C. H. Crownhart, Secretary of the State Medical Society of Wisconsin, is to be commended for the excellence of its work, which resulted in a series of detailed suggestions. The Council considered these suggestions at length and developed the following twenty principles which it presented to the Board of Trustees.

The Board of Trustees, in turn, transmitted the principles to the Bureau of Legal Medicine and Legislation of the American Medical Association for review and requested the Council on Medical Service to submit copies to the House of Delegates as addendum to this Supplemental Report:

SUGGESTED PRINCIPLES FOR LAY SPONSORED VOLUNTARY HEALTH PLANS

1. The plan shall be nonprofit, paying no dividends to beneficiaries or others; all surplus earnings shall be devoted either to improving the services, to making compensation of physicians and other staff members more adequate for their responsibilities and services, to purchasing facilities and equipment, to increasing the scope of benefits, or to building adequate reserve funds. All income to the plan shall be devoted to services for beneficiaries.

2. The plan shall comply with the Principles of Medical Ethics of the American Medical Association, which provide that it is unprofessional for a physician to dispose of his professional attainments or services to any lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit a direct profit from the fees, salary or compensation received to accrue to the lay body or individual employing him.

3. If incorporated, the plan shall be adequately financed and organized without capital stock.

4. The plan shall be operated under an autonomous administration or trust, with segregated funds, and shall be devoted exclusively to the provision of health service.

5. Promotion, sales, organization and administrative expense of the plan shall be kept at a minimum as judged by the accrediting body.

6. The quality of medical service shall be maintained at the highest possible level. All participating physicians shall be doctors of medicine duly licensed to practice medicine in any state in which the plan operates. Each physician engaged in the practice of a specialty shall be required to have adequate qualifications for that specialty. The personnel and facilities of the plan shall be adequate to insure a high quality of medical care.

7. The plan shall provide all services as set forth in the agreement with the beneficiary. When, in the opinion of the medical staff, a professional service set forth is not available because of an emergency or because of the need for highly technical procedure, or for any other reason, then such service shall be otherwise provided by the plan.

8. The plan, in its agreement entered into with the beneficiary and which shall be distributed to each beneficiary, shall state clearly the services and benefits to be provided and the conditions under which they will be provided. All exclusions, limitations, waiting periods and deductible provisions shall be clearly

stated in the agreement with the beneficiary and in promotional and descriptive literature.

9. The plan shall, in its agreement with the beneficiary, state clearly the amount of dues or subscriptions to be paid. The amount of dues or subscription shall be adequate to provide for the benefits and services offered and to insure proper financing of the risks involved.

10. No promotional material shall invite attention to the professional skill, qualifications or attainments of the physicians participating in the plan.

11. Participating physicians may be compensated in any manner not contrary to the Principles of Medical Ethics of the American Medical Association relating to contract practice.

12. Any duly licensed physician in the community who wishes to participate in the plan, who meets its professional and personnel standards and who agrees to abide by its terms and the requirements of its beneficiaries shall be admitted to the plan.

13. The names of all participating physicians of the plan shall be made available to the prospective beneficiary. The beneficiary shall, within reasonable geographic and professional limitations, have free choice among participating physicians.

14. There shall be no interference by the governing body with the medical staff in the practice of medicine. The traditional and confidential relationship of the physician and patient shall be preserved.

15. Adequate provision shall be made for effective participation of the medical staff in the deliberations of the governing body. It is recommended that the membership of the governing body include representatives of the medical profession.

16. All services rendered by the participating physician, not included in the beneficiary's contract, shall be payable by the beneficiary to the participating physician on a fee for service basis.

17. The method of operation of any hospital owned or under contract to the plan shall be in accordance with sound public policy.

18. The plans shall provide for like rates, benefits, terms and conditions for all persons in the same class.

19. Investment of reserve funds shall be made only in securities deemed prudent for such purposes.

20. Any plan desiring approval under these principles shall agree to such periodic reviews and to abide by such regulations as may be deemed necessary by an appropriate accrediting body of the American Medical Association in consultation with representatives of the sponsors of the plan.

ADDENDA (IN REFERENCE TO II [3 AND 4])

At the request of the Council on Medical Service, a meeting was held with Whitaker and Baxter at the La Salle Hotel, Chicago, April 30, 1949. The meeting was attended by the following: Drs. McVay, Hamer, McCarthy, Martin, Mulholland, McGoldrick and Hess of the Council; Dr. Howard and Messrs. Rember and Hendricks of the American Medical Association staff.

Agreement was reached with Whitaker and Baxter that the Council would have charge of the promotion of the enrolment campaign for voluntary health insurance. All approved groups and agencies are to be used in furthering this campaign, among them being Associated Medical Care Plans, private insurance carriers, the Western Conference of Prepaid Medical Care Plans and the Conference of Medical Society Prepayment Plans. Help in promoting this campaign is to be enlisted from the United States Chamber of Commerce, the Farm Bureau and other farm organizations, state and local federations of women's clubs, parent-teachers associations, leaders of industry and labor.

Representatives of the various voluntary health insurance groups were invited to meet with the Council in Atlantic City on June 4. At that time suggestions were made as to ways and means of supporting that part of the National Education Campaign that has to do with voluntary health insurance.

Total enrolment in voluntary health insurance has long been a moot question. In an endeavor to reach some reasonable estimate of the present status in regard to voluntary plan enrolment, nationwide and by states, the Council enlisted the cooperation of Associated Medical Care Plans, the Health

Insurance Council and Blue Cross. The resultant picture is not as accurate or as clear as the Council would wish, but we believe it is the best presented to date. The conclusions are portrayed at the Scientific Exhibit on "Voluntary Health Insurance." This exhibit, sponsored jointly by Associated Medical Care Plans, the Health Insurance Council and the Council on Medical Service, is an expression of the Council's conception as to the over-all plan of action in reaching the voluntary enrolment goal. It will take the best efforts of all of us to achieve the goal.

ADDENDA (IN REFERENCE TO II [5])

Additional staff requirements to enable the Council's correlating committees to function effectively and actually to carry on a program of field promotion of all approved voluntary health programs have been estimated as follows:

(1) One staff assistant whose full time can be devoted to the preparation of news stories, pamphlets and other copy on the subject of voluntary health insurance, as well as related medical care programs—to be assigned to the Council from the staff of Whitaker and Baxter or the Public Relations office of the American Medical Association.

(2) One field assistant, with a knowledge of medical society activities and prepayment medical care plans, whose full time can be devoted to consulting with and assisting medical societies, prepayment plans, etc.

(3) One field assistant, with insurance experience, whose full time can be devoted to activities paralleling those noted in (2).

REPORT OF COUNCIL ON MEDICAL EDUCATION AND HOSPITALS

Dr. Reginald Fitz, member of the Council on Medical Education and Hospitals, presented the following report, which was referred to the Reference Committee on Medical Education:

Under the new Constitution and By-Laws, the Council on Medical Education and Hospitals will make its annual report to the House of Delegates at the interim session. However, there are three matters that the Council would like to present to the House of Delegates at this session. The first of these has to do with the evaluation of foreign medical schools. The second is a revision of the "Essentials of Approved Residencies and Fellowships" and the third is a revision of the "Essentials for Approved Examining Boards in the Specialties."

1. Up to this time the Council on Medical Education and Hospitals has never attempted to classify foreign medical schools. During the past two years it has become increasingly evident to the Council that a reliable and authoritative classification of foreign medical schools should be available to the licensing boards and other official and voluntary agencies in the United States that deal with graduates of foreign medical schools. In the past fifteen years more than 10,000 foreign trained physicians have migrated to the United States, and it may be expected in the years ahead that at least 1,000 foreign medical graduates will be coming to this country annually.

State licensing boards at this time have no way by which they can intelligently evaluate the training of these physicians and determine whether or not they should be admitted to their examinations for licensure. As a result, some state boards are excluding all foreign medical graduates from their examinations, while others admit all foreign medical graduates to their examinations without regard to the type of education that they have received.

After lengthy consideration, the Council believes that the American Medical Association has an obligation to classify foreign medical schools. The Council, therefore, requests authorization from the House of Delegates to establish after thorough study of all available information a list of foreign medical schools that appear to provide adequate educational programs. Such a list will make it possible for state licensing boards to adopt a more intelligent and enlightened policy with respect to foreign medical graduates without lowering the standards of licensure that have been developed for the protection of the public.

2. The Council is submitting to the House of Delegates for ratification a revised text of the essentials for residency training

in physical medicine. These essentials have been revised to recognize the fact that the field of physical medicine in recent years has been broadened to include rehabilitative medicine. The Council now proposes that residencies in the field of physical medicine be known as residencies in physical medicine and rehabilitation.

3. In February 1949, the Council voted to approve the newly formed American Board of Preventive Medicine and Public Health. The Council now requests authority of the House of Delegates to amend its "Essentials for Approved Examining Boards in the Specialties" to include this new board in the list of boards approved by the Council.

Respectfully submitted,

H. G. WEISKOTTEN, Chairman.
REGINALD FITZ.
VICTOR JOHNSON.
RUSSELL HADEN.
HARVEY B. STONE.
W. L. PRESSLY.
WILLIAM S. MIDDLETON.
DONALD G. ANDERSON, Secretary.

ESSENTIALS FOR RESIDENCY TRAINING IN PHYSICAL MEDICINE AND REHABILITATION

Residencies in this specialty should include experience in the various aspects of rehabilitation and training in the clinical and diagnostic use of all physical agents except those employed in radiology. As used in these Essentials, rehabilitative medicine is considered to be that phase of medicine which is concerned with the care, treatment and restoration of the physically and psychiatrically handicapped patient and of the convalescent. A complete program should include physical therapy, corrective speech, psychologic services, social service, occupational therapy, vocational guidance, education and planned recreation, correlated with the necessary medical, surgical and psychiatric care. (Programs presently limited to training in physical medicine should be expanded to meet the requirements of the broader concept of this specialty.)

A department of physical medicine and rehabilitation should be organized as a major service with a qualified department head and associates, as well as trained technical personnel. It should operate as a service department to the clinical divisions.

Sufficient space in the hospital and adequate equipment should be provided to carry out a comprehensive and well planned program. The allocation to this service of a sufficient number of beds, as well as treatment rooms, offices, class rooms and space for recreation and other activities, is highly advantageous, if not essential.

A minimum of three years of residency training is considered necessary to train a physician who desires to specialize in this field. Shorter training periods in this specialty of six to twelve months may be valuable for residents in medicine, surgery and other specialties.

A three year program should encompass the entire field of physical medicine including its basic science aspects; medicine, in the rehabilitative aspects of arthritic, cardiovascular and other chronic diseases; ophthalmology-otolaryngology, in the rehabilitation of the blind, deaf and otherwise handicapped patient; psychiatry, as it applies to the care and treatment of the convalescent medical and surgical patient and the psycho-neurotic; neurology, particularly in its application to special problems such as hemiplegia and other chronic neurologic disorders; orthopedics, as it applies to congenital and acquired deformities; surgery, as it applies to traumatic, amputee and plastic cases; and pediatrics in its relation to patients with poliomyelitis, rheumatism, cerebral palsy and similar diseases. Theoretic and practical training should be given in the use of braces and prosthetic appliances, special techniques and equipment for the evaluation diagnosis and treatment of the physically and mentally handicapped. Psychosocial and prevocational rehabilitation of the convalescent and chronically ill patient should be an integral part of the program. In those cases in which the outpatient activity is limited, affiliation with other institutions offering training in special aspects of this field is indicated.

Quantitative Requirements: To supply an adequate amount and variety of teaching material, there should be a minimum

of 500 admissions and 7,500 patient visits to the department annually.

Applied Basic Science Instruction: Training at the graduate level in anatomy, physiology, physics, biophysics and pathology is considered essential. The training in anatomy should include functional anatomy and kinesiology. The training in physics should include radiation physics, electronics and instrumentation. Study in applied basic sciences should be closely correlated with clinical experience.

Board Requirements: The American Board of Physical Medicine requires candidates for the certifying examination to have completed an approved rotating internship, following graduation from a medical school approved by the Council on Medical Education and Hospitals, a period of study after the internship of not less than three years of approved supervised training and not less than two additional years of study and/or practice in this specialty.

The board requires that the special training following the internship include a period of study in clinics, dispensaries or hospitals recognized by the Council on Medical Education and Hospitals and by the American Board of Physical Medicine as competent to provide a satisfactory training in physical medicine and rehabilitation. During this period, the resident should be assigned directly to the department of physical medicine and rehabilitation for a minimum of one and one half years. The period of specialized preparation should include (a) graduate training in anatomy, including kinesiology and functional anatomy; physics, including radiation physics, electronics and medical instrumentation; physiology, pathology, and other basic sciences which are necessary to the proper understanding of the specialty; (b) an active experience of not less than two years in hospitals, clinics or dispensaries approved by the Council and the American Board of Physical Medicine. An additional period of not less than two years of study and/or practice in the specialty is considered necessary to complete the applicant's training. The candidate is required to pass a written and oral examination given by the board which will include questions concerning the basic sciences, clinical practice and laboratory and public health problems related to physical medicine and rehabilitation.

REPORT OF JUDICIAL COUNCIL

Dr. E. R. Cuniffe, chairman, presented as the report of the Judicial Council a revised Principles of Medical Ethics, consideration of which on motion of Dr. G. Henry Mundt, Illinois, seconded by Dr. Mather Pfeifferberger, Illinois, and carried, was postponed to a later meeting of the House.

REPORT OF REFERENCE COMMITTEE ON RULES AND ORDER OF BUSINESS

Dr. A. F. R. Andresen, New York, chairman, presented the following report:

Your Reference Committee on Rules and Order of Business, agreed unanimously to the following: First, that the House adjourn today at 12:30 p. m.; that it reconvene at 2 p. m., instead of 2:30 p. m., which is stated on the program, and that because of its effect on public relations, an executive session be avoided, if possible, but if later it be found desirable, your committee recommends that tomorrow, Tuesday, at 1:15 p. m., the House convene in executive session.

On motion of Dr. Val H. Fuchs, Louisiana, seconded by Dr. Walter E. Vest, West Virginia, and carried, the report of the Reference Committee was adopted.

REPORT OF COUNCIL ON SCIENTIFIC ASSEMBLY

Dr. Charles H. Phifer, member of the Council on Scientific Assembly, presented the following report, which was referred to the Reference Committee on Reports of Officers except the portion referring to amendments to the Constitution and By-Laws which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

To the Members of the House of Delegates of the American Medical Association:

INCREASE IN MEMBERSHIP OF COUNCIL

In its supplementary report at St. Louis in 1948 the Council on Scientific Assembly stated:

Enlargement of the Council: The Council on Scientific Assembly as now constituted consists of five Member or Service Fellows elected by the House of Delegates on nomination by the Board of Trustees (By-Laws, Division Three, Chapter X, Sec. 4. Standing Committees.—(B) Membership). Due to the increasing amount of work devolving on the Council by virtue of an additional Scientific Assembly at the Interim Sessions and because of the enlarged scope of the activities of the Council under the new By-Laws, a request is made to the House of Delegates to give consideration to enlarging the membership of the Council from five to seven. The Council also suggests, if the request for enlargement be granted, that, when feasible, one of the additional members be a general practitioner or a Fellow who has intimate knowledge of the needs of general practitioners in relation to arranging the programs for the Scientific Assembly at the Annual Sessions and at the Interim Sessions.

The Reference Committee on Sections and Section Work, to which the report of the Council was referred, reported as follows:

The advisability of granting an increase in the membership of the Council from five to seven in number was clearly apparent for reasons adequately expressed; therefore, the committee approves of such an enlargement and recommends that the indicated change in the By-Laws be presented at the next meeting of this House of Delegates for consideration at that time.

In accordance with this action of the House of Delegates, the Council submits the following amendment:

**PROPOSED AMENDMENT TO BY-LAWS, DIVISION THREE,
CHAPTER X, SECTION 4(B)**

Amend the first sentence in the second paragraph of Division Three, Chapter X, Section 4(B) to read: "The Council on Scientific Assembly shall consist of seven Member or Service Fellows elected by the House of Delegates on nomination by the Board of Trustees for terms of seven years, so arranged that at each annual session the term of one member expires, except that at the 1949 annual session, one member shall be elected for a term of five years, one for a term of six years and one for a term of seven years.

**RECOMMENDATION FOR ESTABLISHMENT OF A SECTION ON
PHYSICAL MEDICINE AND REHABILITATION**

**PROPOSED AMENDMENT TO DIVISION TWO,
CHAPTER VII, SECTION 1**

A group of physicians primarily interested in physical medicine and rehabilitation has requested the Council on Scientific Assembly to recommend to the House of Delegates that it create a Section on Physical Medicine and Rehabilitation. The Council agreed, at a meeting held on April 7, to recommend that the House of Delegates create a Section on Physical Medicine and Rehabilitation, and that the By-Laws be amended as follows:

Amend Division Two, Chapter VII, Section 1, by changing "19. Miscellaneous Topics" to "20. Miscellaneous Topics" and by adding "19. Physical Medicine and Rehabilitation."

Respectfully submitted,

HENRY R. VIETS, Chairman.

CHARLES H. PHIFER.

L. W. LARSON.

STANLEY P. REIMANN.

ALPHONSE MCMAHON.

ERNEST E. IRONS, President-Elect.

MORRIS FISHBEIN, Editor, THE JOURNAL. } Ex officio.

GEORGE F. LULL, Secretary.

NEW BUSINESS

Proposed Amendment to By-Laws

Dr. Allen H. Bunce, Georgia, presented the following proposed amendment to the By-Laws, which was referred to the Reference Committee on Amendments to Constitution and By-Laws:

Amend Division Three, Chapter XII, Section 6 (A) by adding the words "Judicial Council and" just before the words "Scientific Assembly."

Resolution on the General Practitioner

Dr. P. J. DiNatale, New York, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, For the best interests of his patients the general practitioner at this time deserves particular consideration; therefore be it

Resolved, (1) That general practitioners should receive special training in medical colleges; (2) that internships of at least two years' duration should be arranged for general practitioners; (3) that wherever possible a hospital should contain a section for general practice, particularly those hospitals approved for intern training by the American Medical Association, and (4) that wherever possible hospitals should have general practitioners on their attending staffs.

**Resolution on American Medical Association
Assessment and Dues**

Dr. Andrew A. Eggston, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The President of the United States, representatives of the Federal Security Agency and certain Senators and Representatives are using all possible means to achieve the enactment of some form of legislation which will include a program of compulsory health insurance; and

WHEREAS, We believe the promoters of this legislation are men not qualified to evaluate health needs or methods of providing health services but are influenced by political pressure from organized groups that are interested in "free medical care" and socialistic trends in government; and

WHEREAS, It is universally conceded that we have the best medical care in the world and the best medical schools, research centers, hospitals and public health systems; and

WHEREAS, Compulsory health insurance leads inevitably to a deterioration in the quality of medical care, to greatly increased over-all costs in providing medical care and eventually to a complete socialistic economy; and

WHEREAS, The practicing physicians of the United States who are best qualified to evaluate health needs and methods of providing medical care are overwhelmingly opposed to any system of compulsory health insurance; e.g., in Westchester County, on the basis of replies to a questionnaire sent to 1,100 physicians in the county, 95 per cent indicated unalterable opposition; and

WHEREAS, The only means of interpreting the facts concerning the hazards involved in government medicine and the cost thereof to the public is through education; now therefore be it

Resolved, That this House of Delegates of the American Medical Association recommends the establishment of annual dues for all members beginning in 1950, such dues to be available for the advancement of the Association's National Education Campaign.

Resolution on Compulsory Health Measures

Dr. R. B. Robins, Arkansas, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The medical profession has expressed its firm opposition to compulsory health measures under governmental plan; and

WHEREAS, The educational program of the American Medical Association gives every evidence of promoting knowledge among the people of the United States of the dangers inherent in governmental plans for medical care; and

WHEREAS, A well established technic of so-called planners is to attempt to secure major legislation of a revolutionary type in piecemeal pattern; and

WHEREAS, S. 1411, H. R. 3942 and H. R. 4660, which would provide diagnostic and therapeutic care for all the school children of the United States, are, in effect, compulsory health insurance, and, as such, should be resisted by the American public; now therefore be it

Resolved, That the American Medical Association disapprove enactment of such legislative proposals and take appropriate measures to acquaint Congress and the public of its opposition.

Resolutions on Voluntary Health Insurance

Dr. W. B. Rawls, New York, presented the following resolutions, which were referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, The problem of making voluntary health insurance available to everyone is of paramount interest to every physician; and

WHEREAS, We believe that some form of a national plan is necessary in order to accomplish this end; therefore be it

Resolved, That a national enrolment agency be established under the direction of the Blue Shield and medical profession and to include an insurance company legally qualified to write voluntary health insurance in those areas where this is not available and also to act as an enrolment agency for local plans; and be it further

Resolved, That this organization develop a contractual agreement at the top level with the corresponding organization now being formed by the Blue Cross Commission for hospital insurance in order that both sickness and hospital insurance may be presented to the public.

Resolutions on Health Plan for the United States

Dr. Walter E. Vest, West Virginia, presented the following resolutions, which were referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, Unity of thought and action is necessary in order to develop a sound, positive and progressive program in our fight against the efforts

of political bureaucrats to introduce compulsory sickness insurance into this country, thereby debasing medical service and medical progress and enslaving the medical profession; and

WHEREAS, In order to combat successfully the threat to the freedom of medicine, of the individual and of the profession, a positive program must be proposed by the profession providing for voluntary sickness insurance, with freedom of choice of physician and hospital, preservation of the present personal doctor-patient relationship, and retention of the voluntary free enterprise system of the American way of life; therefore be it

Resolved, By the Council of the West Virginia State Medical Association that the following ten principles be presented as a positive program for the solution of the problems of medical and hospital care in our present system of medicine:

1. Extension of voluntary prepayment sickness insurance, nonprofit or commercial, to cover the rural areas. Such insurance should provide for hospital and medical and surgical care while in the hospital, as well as diagnostic procedures by qualified physicians in their offices or in clinics.
 2. Federal grants-in-aid to the states, to be disbursed at the local level, to provide for hospitalization and medical care of the indigent and medically indigent through nonprofit insurance plans.
 3. Extension of voluntary commercial health and accident group insurance in industrial and rural areas to compensate wage earners for loss of wages during illness.
 4. Expansion of agreements between employer and employee for the continuance of regular wages during personal illness.
 5. Continued study and further agreements by industry with workers for health and welfare funds similar to the one set up by the United Mine Workers of America.
 6. Expansion of public health services so that all counties or groups of counties will have a full time health unit.
 7. Liberalization of the federal hospital construction act (Hill-Burton bill) to provide additional funds on a fifty-fifty matching basis.
 8. Federal grants to qualified institutions for research in medicine and allied sciences.
 9. Federal grants to medical, dental and nursing schools for construction, teaching and expansion purposes.
 10. An educational campaign to enlighten the public concerning preventive medicine, hospitalization and medical care; and, be it further
- Resolved*, That our delegates be instructed to offer to the House of Delegates of the American Medical Association, at the annual session in Atlantic City, June 6-10, 1949, a resolution providing that the Congress of the United States be requested to enact into law a program embodying these principles.

Resolution on Establishment of Committee on General Practice

Dr. Paul A. Davis, Section on General Practice, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, At the meeting of the House of Delegates of the American Medical Association in Chicago in 1948 a Committee to Study Conditions of General Practice reported; and

WHEREAS, This report made certain definite recommendations for action by the American Medical Association, and also recommended that the committee be continued to carry on its work; and

WHEREAS, There has been no meeting of such committee called during the past year in spite of the fact that there are many problems in general practice to be considered; therefore be it

Resolved, That the House of Delegates specifically order that such committee be established by the incoming officers of the American Medical Association and that such meetings as may be necessary be called during the coming year to consider further the problems of general practice and to assure that the recommendations of the former committee are being carried out; and be it further

Resolved, That this committee report directly to the House of Delegates at the next interim session of that body.

Resolution on Establishment of Committee to Confer with Congress

Dr. James Z. Appel, Pennsylvania, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

Resolved, That the Board of Trustees of the American Medical Association be empowered to create a committee, the membership of which is to be composed of representatives of the Board of Trustees of the American Medical Association, representatives of its House of Delegates and other leaders in the medical profession, to call a conference with members of the Congress, with a view to developing legislation that would meet the objectives of the program of the American Medical Association in its efforts to solve the problem of making medical care accessible to the American people.

Resolution on Hospital and Medical Care of Veterans for Non-Service-Connected Disabilities

Dr. R. B. Wood, Tennessee, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The Seventy-Third Congress enacted a law (Section 706, Chapter 12, Title 38, found in U. S. Code 1940 edition) which reads: "Provided, That any veteran of any war who was not dishonorably discharged, suffering from disability, disease or defect, who is in need of hospitalization or domiciliary care and is unable to defray the necessary expenses therefor (including transportation to and from the Veterans' Administration facility) shall be furnished necessary hospitalization or domiciliary care (including transportation) in any Veterans' Administra-

tion facility, within the limitations existing in such facilities, irrespective of whether the disability, disease or defect was due to service. The statement under oath of the applicant on such form as may be prescribed by the Administrator of Veterans' Affairs shall be accepted as sufficient evidence of inability to defray necessary expenses"; and

WHEREAS, This legislation has led to the appropriation of large sums of money (over \$1,000,000,000) by the Congress to finance the expansion of existing Veterans' hospitals and the construction of new ones in order to meet the needs of veterans entitled to these benefits; and

WHEREAS, A large majority of the admissions to existing Veterans' Hospitals are veterans with disabilities which are not service connected; and

WHEREAS, These benefits are not equally accessible to all veterans eligible to them because Veterans' hospitals are not equally accessible to them; and

WHEREAS, The Congress of the United States enacted the Hospital Survey and Construction Act (The Hill-Burton Bill) in 1946 for the purpose of (1) conducting a study of the needs of the civilian population of the nation with respect to hospitals, and (2) to extend federal aid in the construction of needed civilian hospitals wherever needed in cooperation with civilian agencies and local governments; and

WHEREAS, The studies that have been conducted show that the nation should be divided into approximately 2,300 hospital service areas in each of which a hospital should be located if one does not exist; and

WHEREAS, Veterans become civilians when they are discharged from military service and are distributed throughout these hospital service areas in approximately the same proportion as other civilian citizens, and are counted in determining the hospital needs of a hospital service area; and

WHEREAS, It would be necessary for a Veterans' Hospital to be located in each of the several hospital service areas for these service benefits to be as accessible to veterans as they would be if administered in civilian hospitals; and

WHEREAS, These two federal hospital programs—one by the Veterans' Administration and the other by the Administrator of the Hospital Survey and Construction Act—are in conflict with each other at many points. There are conflicts in basic policies. One seeks to establish large hospitals in large centers, the other seeks to establish hospitals in hospital service areas to make them accessible to the people. There is conflict between the two systems for trained personnel. There is competition for patronage and funds. These conflicts result in the overlapping of services and in many forms of waste; and

WHEREAS, If the Veterans' Administration should construct and operate a sufficient number of veterans' hospitals to make hospital service benefits available to all veterans entitled to them under existing laws, it would create a federal hospital system of such proportions as to destroy our civilian system of hospitals; and

WHEREAS, It is the desire and purpose of this House of Delegates not to destroy or impair any benefit to which any veteran is entitled under existing laws, but rather to change the form of these benefits in such a way as to make them more readily available to veterans who are eligible to them and to bring their administration into harmony with our civilian system of medical and hospital care and financing; therefore be it

Resolved, By the House of Delegates of the American Medical Association, that we petition the Congress of the United States to enact legislation which would have the following effects:

1. Repeal Section 706, Chapter 12, Title 38, of the World War Veterans' Act and substitute therefor a new law with the following provisions: (a) that the administrator of Veterans' Affairs be authorized and directed to issue to each veteran eligible to receive such benefits, a medical and hospital service contract with a benefit provision in an amount sufficient to cover the costs of (1) necessary hospitalization in a civilian hospital that is approved for service to veterans by the Veterans' Administration and (2) necessary medical and surgical services rendered in such hospitals, on the basis of the fee schedule that applies to veterans with service-connected disabilities; or that the Administrator of Veterans' Affairs be authorized to purchase such a contract from corporations engaged in the sale and administration of such contracts if in his judgment it is feasible to do so; (b) that such contracts cover all diseases and disabilities which require hospitalization except the following: (1) disabilities covered by compensation laws; (2) service-connected disabilities; (3) chronic illness (extending over ninety days); (4) tuberculosis, and (5) mental illness; (c) that veterans with disabilities in the categories mentioned in (b) excepting those covered by compensation laws, be eligible for admission to Veterans' hospitals, and (d) veterans with disabilities which are in dispute as to whether or not they are service connected, be eligible for admission to Veterans' hospitals for study, treatment and adjudication and that the disability then be classified for these benefits according to such judgment, (e) that the eligibility of a veteran to receive the contract mentioned above be determined on the basis of his or her net income and that the net income be determined by the same methods used in determining his or her liability for the payment of federal income tax; (f) that the veteran be required to file an application for the contract on a form prescribed by the Administrator of Veterans' Affairs, in which the veteran states under oath, the pertinent facts concerning his net income and dependents; and be it further

Resolved, That the Speaker of the House is authorized and directed to appoint a Committee on Veterans' Affairs of not less than seven Fellows of the Association whose duty it will be to use their best efforts to bring about the actions above set out.

Resolutions on the Confidential Nature of Birth Records

Dr. L. D. Bristol, Section on Preventive and Industrial Medicine and Public Health, presented the following resolutions, which were referred to the Reference Committee on Executive Session for report as to their nature and later referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Physicians attending at births are required by the respective state laws to complete and file a certificate of birth and have an interest

in seeing that the confidential nature of the birth certificate is maintained and that none of the data contained therein are used to the detriment or embarrassment of the child and family concerned; therefore be it

Resolved, That the American Medical Association commends the efforts of the American Association of Registration Executives, the Council on Vital Records and Statistics, the Children's Bureau and the National Office of Vital Statistics of the Federal Security Agency to formulate a policy maintaining the confidential nature of birth records which was published in January 1949 under the title "The Confidential Nature of Birth Records"; and be it further

Resolved, That the American Medical Association urge state legislatures and registration officials to study carefully the recommendations made in this publication and wherever possible to put them into effect by enactment into law or by administrative regulation. It especially urges that the right of inspection of birth records be restricted to the registrant, if of legal age, his parents, guardian or their legal representative, health and official agencies on the approval of the official custodian of vital records or on court order.

Resolution on Inspection of Hospitals

Dr. William R. Brooksher, Arkansas, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, The American Medical Association is the only organization representative of the entire medical profession of the United States; and

WHEREAS, The medical profession recognizes the need for investigation and accrediting of hospitals which meet high standards of medical care; and

WHEREAS, The American Medical Association now approves hospitals for intern and residency training; and

WHEREAS, Such approvals might well be extended to hospitals generally, thus providing for one agency charged with the duty of making inspections and granting approval to all institutions meeting proper standards; now, therefore, be it

Resolved, That the Arkansas Medical Society recommend to the House of Delegates of the American Medical Association that it request the Council on Medical Education and Hospitals of the American Medical Association to investigate the feasibility of extending its inspection to all hospitals within the United States, granting approval to those which meet proper standards.

Resolution on Need of Physicians for Armed Forces

Dr. C. B. Conklin, District of Columbia, presented the following resolution, which was referred to the Reference Committee on Emergency Medical Service:

WHEREAS, The armed forces are urgently in need of physicians and voluntary enrolment has so far failed to meet this need; therefore be it

Resolved, That whenever essential requirements of the armed forces cannot be met in any other way, the Council on National Emergency Medical Service be authorized to develop a method of equitable selection from among V-12 and A.S.T.P. trained physicians and those deferred from military service to complete their medical education; that the method proposed be submitted to the House of Delegates for its approval, except in an emergency when the Board of Trustees shall act on the proposal, and, further, that the mechanism approved be submitted to the federal government for its consideration.

Resolution on Free Choice of Physicians for Federal Employees

Dr. J. Stanley Kenney, New York, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, It is the custom of the United States Employees Compensation Commission to appoint designated surgeons in all localities where a U. S. Marine Hospital or Veterans Facility is not available for the care and treatment of injured employees; and

WHEREAS, All injured employees are directed to one of these designated surgeons when injured in line of duty; and

WHEREAS, Certain other branches of the federal government, namely, the Veterans Facilities, have recognized the free choice of physician plan in home treatment of veterans; and

WHEREAS, All injured employees in New York State enjoy this privilege under the New York State Compensation Law; now therefore be it

Resolved, That the Board of Trustees of the American Medical Association is hereby requested to seek amendment to the Federal Law on Workmen's Compensation to the effect that all covered federal employees be granted free choice of physician for injuries sustained in line of duty.

Resolution on Medical Care and Health Plans

Dr. Warde B. Allan, Maryland, presented the following resolution, which was referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, The Government of the United States is urging numerous health measures without consultation with the leading body of American medicine; and

WHEREAS, The American Medical Association is conducting an extensive educational program; therefore be it

Resolved, That the American Medical Association immediately initiate under its own auspices a conference of representatives of all groups, medical and lay, with the purpose of forming a joint planning committee for the preparation of a truly comprehensive plan of curative and preventive medicine for the nation.

Resolution on Membership in American Medical Association

Dr. Stephen R. Monteith, New York, presented by title the following resolution, which was referred to the Reference Committee on Executive Session for determination as to whether or not it should be considered by that committee or referred to another reference committee:

Resolved, By the Medical Society of the State of New York that the House of Delegates of the American Medical Association be memorialized to appoint a committee to study the matter of membership in the American Medical Association, where such membership is banned for other than professional or ethical reasons, and to report back to this House.

Resolutions on Amendment to Constitution of United States

Dr. E. Vincent Askey, California, presented the following resolutions which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, America is the product of a people's faith in constitutional law designed to protect the property and enterprises of each citizen from political competition or confiscation; and

WHEREAS, Attacks on this principle have produced many governmental agencies which are now in active conflict with the individual enterprises of the American people; and

WHEREAS, Many proposals now before Congress, will, if adopted by a mere majority, further jeopardize the rights of the American people to their individual property and enterprises; and

WHEREAS, The intent and purpose of the Tenth Amendment to the Constitution was to prohibit governmental exercise of powers not specifically delegated to it; and

WHEREAS, The intention of the Fifth Article of the Constitution was to provide a means for the proper delegation of powers to government through a procedure which requires a two-thirds majority of both Houses of Congress and the approval of three-quarters of the states; therefore be it

Resolved, That we, the members of the House of Delegates of the American Medical Association, in regular session assembled this sixth day of June, 1949, exercise our constitutional power to petition the Congress to preserve the intent and purposes of the Constitution by initiating an amendment to the Constitution, for submission to the people of the various states, to provide that: The government of the United States shall not engage in any business, professional, commercial or industrial enterprise in competition with its citizens except as specified in the Constitution; and be it further

Resolved, That a copy of this resolution be spread on the minutes of this meeting, and that copies of it be sent to (1) the President of the United States, (2) members of the United States Senate, (3) members of the House of Representatives, (4) the governors of all states, and (5) two copies to the American Progress Foundation, 569 I. W. Hellman Building, 124 West 4th St., Los Angeles 13, for the record of American vigilance being compiled.

Resolutions on Medical Specialty Boards

Dr. Edward P. Flood, New York, presented the following resolutions, which were referred to the Reference Committee on Medical Education:

WHEREAS, The specialty boards in the various fields of medicine serve the purpose of setting criteria of scholarship, training and ethics; and

WHEREAS, Certification by a specialty board confers on a physician recognition of proficiency which is highly regarded by his colleagues and the layman; and

WHEREAS, To deny to a physician who meets the basic training, postgraduate and ethical requirements for entrance to the examination necessary for certification in a specialty withholds from the candidate the recognition in such specialty of his colleagues and the patients he serves thereby by inference branding him as inferior to those who are certified; and

WHEREAS, Since a specialty board certification is an extremely important factor in obtaining admittance to the staffs of most recognized hospitals, the denial of certification to a physician who meets the basic training, postgraduate and ethical requirements of the specialty board accordingly unduly restrains him in the full practice of his profession; now, therefore, be it

Resolved, That the House of Delegates of the American Medical Association recommends that all physicians who are duly licensed to practice medicine in these United States, and who meet the basic training, postgraduate and ethical requirements of a specialty board be admitted to the examination given by such board; and be it further

Resolved, That the Secretary of the American Medical Association is directed to send copies of this resolution to the president of each specialty board and the chairman of the Advisory Board for Medical Specialties.

Resolutions on Suggested Educational Device

Dr. Ralph T. B. Todd, New York, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The poster reproduction of Sir Luke Fildes' painting called "The Doctor," with appropriate information beneath the picture, seems to be an effective means of bringing pertinent information to the public; and

WHEREAS, The effectiveness of this device will depend largely on the extent of distribution obtained; therefore be it

Resolved, That the Medical Society of the State of New York recommend to the American Medical Association and the National Education Campaign headquarters that a stamp type reproduction of this picture be made in color with a simple subtitle such as "Keep Politics Out of This Picture, Oppose Compulsory Health Insurance!"—this stamp to be printed in such volume that quantities could be sent to every physician in the United States to be affixed to all bills and other mail from his office and large quantities also be sent to state and county societies that maintain administrative offices to be affixed to all mail sent to the general public; and be it further

Resolved, That at least two copies of this poster be sent to all pharmacies in the United States for display together with quantities of appropriate literature; and be it further

Resolved, That suitable cuts or mats be prepared in various sizes to facilitate the reproduction of this poster on the cover of medical journals and other publications, such as industrial house organs, women's club magazines and the like; and be it further

Resolved, That arrangements be made, if possible, to have it run at frequent intervals as a free or paid slide on the various television networks and in motion picture theaters.

Resolution on Supporting the American Medical Association

Dr. Leo G. Christian, Michigan, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The Michigan State Medical Society with fifty-five component county societies, with a total membership of 4,960, has enthusiastically endorsed and supported the public relations program of the American Medical Association; and

WHEREAS, Every county or district society of the Michigan State Medical Society has endorsed the program and is paying the twenty-five dollar assessment; and

WHEREAS, The Michigan State Medical Society has developed a public relations program second to none, with its members enthusiastically and actively supporting it; and

WHEREAS, Certain county societies in some major states have voted to repudiate the program of the American Medical Association by refusing to pay the assessment; therefore be it

Resolved, That the House of Delegates of the American Medical Association urge the Board of Trustees, its individual members, presidents of state societies or associations, presidents and other officers of such county societies and members of the House of Delegates to use their influence on these county societies whereby a united front can be used against the foes of a free democratic government, who not only would socialize medicine, but would foist on our citizens the evils of a government by bureaucracy.

On motion of Dr. Charles H. Phifer, Illinois, seconded by Dr. George W. Kosmak, New York, and carried, the House recessed at 12:25 p. m. to meet at 2 p. m.

Monday Afternoon, June 6

The House reconvened at 2:05 p.m. and was called to order by the Speaker, Dr. F. F. Borzell.

NEW BUSINESS—(Continued)

Resolution on Affiliation of Medical Students with American Medical Association

Dr. H. B. Mulholland, Virginia, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The medical students of America are the source of our future doctors and

WHEREAS, They desire to make contact with the American Medical Association in an organized way; and

WHEREAS, It is desirable that they be fully informed as to the ideals, purposes and practices of organized medicine; and

WHEREAS, The medical students of the University of Virginia have effected an organization and have expressed a desire to affiliate with the American Medical Association; therefore be it

Resolved, That the Judicial Council be instructed to receive and consider communications from the medical students of the University of Virginia and the medical students of any other school and to recommend to the House of Delegates methods and procedures for providing an effective affiliation of medical students with the American Medical Association.

Resolution on Recruitment of Physicians Educated in Part or in Whole at Government Expense

Dr. David B. Allman, New Jersey, presented the following resolution, which was referred to the Reference Committee on Emergency Medical Service:

WHEREAS, Many physicians received their premedical and/or their medical education, in whole or in part, at the expense of the federal government, they being deferred from active service in the armed forces during this period; and

WHEREAS, Many of the physicians so educated have not fulfilled their moral obligation to the federal government to serve a definite period as medical officers in the armed services; and

WHEREAS, There is presently a grave deficiency in the number of medical officers now serving in the armed forces; therefore be it

Resolved, That the Secretary of Defense of the United States be urged to take appropriate measures to assure that all the above designated physicians be made available for service in the armed forces.

Resolution on Medical Personnel Requirements of the Armed Forces

Dr. David B. Allman, New Jersey, presented the following resolution, which was referred to the Reference Committee on Emergency Medical Service:

WHEREAS, The American Medical Association has been informed that there is apparently a serious deficit of medical officers to meet the anticipated needs of the armed forces, and that there appears to be no prospect, under present methods, of overcoming this apparent deficit; and

WHEREAS, The American Medical Association recognizes its responsibility to aid the government in obtaining a sufficient complement of young physicians and qualified specialists for the armed forces; therefore be it

Resolved, That the American Medical Association suggest that the National Security Resources Board be given adequate statutory authority to meet the requirements of the armed forces for medical personnel under a plan embodying the following principles:

1. Deferment of recent graduates until completion of an internship not to exceed two years;

2. Deferment of medical students to complete their medical education and an internship, the latter not to exceed two years;

3. Obligation of the physicians constituting both the above groups, on completion of internship, to accept a term of service in the armed forces equivalent to that served by draftees, regardless of their attained age at completion of internship;

4. Acquisition of the needed complement of specialists and other especially qualified physicians on a contract basis without regard to age limitations and on a salary sufficient to attract such personnel, and

5. Institution of a survey of the personnel of medical teaching institutions to the end that each institution release one or more of its staff for a period of at least one year for service with the armed forces.

Resolutions on Blue Shield Coverage of American Medical Association Employees

Dr. W. H. Huron, Michigan, presented the following resolutions, which were referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, The House of Delegates of the American Medical Association in regular session at the annual session in Chicago, June 23, 1948, adopted the report of the Reference Committee on Medical Service and Prepayment Insurance reading in part as follows, Part 1, paragraph 4:

"Your committee recommends, because of the above stated opinions, that at the expiration of the present contract of hospital and medical health coverage, the American Medical Association through its proper officials, make every sincere effort to procure this coverage for its employees through the Blue Cross-Blue Shield local organization. The committee understands that this coverage is and will be available"; and

WHEREAS, The officials of the American Medical Association have ignored this directive of the House of Delegates of the American Medical Association, and have secured the medical coverage from other than a Blue Shield Plan, and there is Blue Shield available locally in Chicago; therefore be it

Resolved, That the officers of the American Medical Association be hereby directed to conform at once with the instructions heretofore given them, and secure coverage for the employees under Blue Shield service immediately; and be it further

Resolved, That the House of Delegates recognize the immense progress made by doctors of medicine in establishing the Blue Shield plans, demonstrating their feasibility, and offering a logical proof that compulsory national health insurance is not necessary.

Resolutions on Associated Medical Care Plans

Dr. T. K. Gruber, Michigan, presented the following resolutions, which were referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, The House of Delegates in session in June 1948 placed certain restrictions on the proposed action by the Blue Shield Commission, refusing permission to form an insurance agency for national sale until submitted and approved by it; and

WHEREAS, The Council on Medical Service and the Board of Trustees of the American Medical Association on April 15, 1949, published the following: (1) The formation of a national coordinating agency representing all qualified and voluntary prepayment plans in accordance with the proposal made to the Board of Trustees by the Council on Medical Service, Feb. 10, 1949; (2) That there shall be no official connection between the American Medical Association and the Associated Medical Care Plans. However, the American Medical Association will continue to approve or disapprove all voluntary medical care plans; (3) the recognition of Associated Medical Care Plans as a trade organization of member plans and Blue Cross as occupying a similar position for voluntary prepayment hospital care plans; (4) the recognition of the responsibility of the American Medical Association to (a) promote the principle of voluntary insurance by educating the people as to their need for such coverage and by obtaining full cooperation from state and county medical organizations in the local field; (b) inform the American people of the availability of approved plans that propose to supply on a prepayment basis security against the economic hazards of serious illness; and

WHEREAS, By this action the officials of the American Medical Association are divorcing American medicine from the most outstanding and progressive move in American medicine for the past generation; that is,

making a provision so that the public may budget their health service through voluntary, nonprofit, prepayment plans; and

WHEREAS, These plans are a development of the medical profession; now, therefore, be it

Resolved, That the House of Delegates in convention assembled reverse the action of the Council on Medical Service and the Board of Trustees and reassert its endorsement of the program of a nonprofit, voluntary, prepayment medical service as opposed to the compulsory program being sponsored by government; and be it further

Resolved, That there be appointed (elected) six representatives of the American Medical Association to the Blue Shield Commission.

Resolution on Training of Interns

Dr. J. Wallace Hurff, New Jersey, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, Most hospitals are unable to procure an adequate complement of interns; and

WHEREAS, Present trends in medical education are more concerned with the training of specialists than with the training of the general practitioner; therefore be it

Resolved, That the American Medical Association appoint a committee consisting of five members of the House of Delegates, two of whom shall be general practitioners, to study the whole internship problem, and especially to study the advisability of recommending the inauguration of a two year rotating internship training program, covering the main branches of medicine, surgery, obstetrics and gynecology with standards of teaching acceptable to the American Medical Association and the Association of American Medical Colleges as a prerequisite for licensure in the various states.

Resolution on Social Security

Dr. L. A. Alesen, California, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, Extension of "social security" to the self employed of the United States is under consideration by the 81st Congress; and

WHEREAS, Provision for the exigencies of old age is an individual matter which should be left to the decision of self employed individuals on a strictly voluntary basis; and

WHEREAS, So-called "social security" is in fact a compulsory socialistic tax which has not provided satisfactory insurance protection for individuals where it has been tried but, instead, has served as the entering wedge for establishment of a socialistic form of governmental control over the lives and fortunes of the people; and

WHEREAS, The private insurance companies of the country offer a great variety of programs which are available to individuals according to their individual requirements and desires; now, therefore, be it

Resolved, That the House of Delegates of the American Medical Association disapproves of the extension of so-called "social security" to physicians and surgeons and that the Secretary be instructed to forward copies of this resolution to the appropriate members of the Senate and the House of Representatives of the United States.

Proposed Amendment to By-Laws

Dr. L. A. Alesen, California, presented the following proposed amendment to the By-Laws, Division One, Chapter II, which was referred to the Reference Committee on Amendments to Constitution and By-Laws:

Amend Division One, Chapter II, of the By-Laws of the American Medical Association by striking out the words "one year" in line 3 of page 10 of the printed copy of the By-Laws and inserting therefor the words "eight months."

Resolution on General Practice Sections in Hospitals

Dr. L. A. Alesen, California, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The rapid and constant increase of medical knowledge in the past twenty years has necessarily resulted in greater specialization with its greater demand on hospital facilities leaving very little room for the general practitioner; and

WHEREAS, This trend is destroying the effectiveness of the general practitioner in treating the public and is undermining the prestige he has always had; and

WHEREAS, The high cost of medical care is in a large part due to this inability of the general practitioner to hospitalize and treat his patient, still the major part of the public, and this contributes greatly to the demand for socialized medicine; and

WHEREAS, These inequities have received official recognition as evidenced by the resolution passed unanimously by the House of Delegates of the American Medical Association on Dec. 10, 1946, encouraging hospitals to set up general practitioner services; and

WHEREAS, This resolution has either been ignored or ineffectually carried out by many large hospitals throughout the country; therefore be it

Resolved, That the House of Delegates of the American Medical Association reaffirm its action of Dec. 10, 1946, concerning general practice sections making this action mandatory for such hospitals, with continued approval contingent on such action, and that a copy of this resolution be sent to the American College of Surgeons with the request that that body voice approval of the resolution in its Manual of Hospital Regulations.

Proposed Amendment to Article 11 of Constitution

Dr. L. A. Alesen, California, presented the following proposed amendment to the Constitution, Article 11, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

Amend Article 11 of the Constitution of the American Medical Association to read as follows:

Article 11—Funds: Dues and Assessments

Funds may be raised by an equal annual levy of dues or by an equal special assessment, or both, levied or assessed on each of the active members, on recommendation by the Board of Trustees and after approval by the House of Delegates. Funds also may be raised from the publications of the Association and in any other manner approved by the Board of Trustees to defray the expenses of the Association, to carry on its publications, to encourage scientific investigations and for any other purpose approved by the Board of Trustees. Failure of an active member to pay annual dues or a special assessment within the time required by the resolution levying or assessing such dues or assessments, shall subject the member to such discipline or other action as the By-Laws shall prescribe.

Resolution on Hospital Standardization

Dr. John J. Curley, Massachusetts, presented the following resolution, which was referred to the Reference Committee on Medical Education:

WHEREAS, The American College of Surgeons has been the sole agency of the medical profession in the standardization and improvement of hospitals for the past several years and has been outstanding in improving the physical plants and the practice of surgery in these hospitals and in the United States by setting the proper standards of surgery; and

WHEREAS, This House of Delegates voted in June 1948 to approve the Report of the Committee to Study Conditions of General Practice at its annual session; and

WHEREAS, In this report there was a recommendation that the American Medical Association be the evaluating agent in the following fields: (1) medical education; (2) hospital standardization; (3) intern training, and (4) resident training, and that no other medical society or organization as such should be represented in this work; therefore be it

Resolved, That this House of Delegates rescind the action taken in regards to the standardization of hospitals; that this organization go on record as praising the work done by the American College of Surgeons in the standardization of hospitals; that the Secretary of the American Medical Association be instructed to inform the Secretary of the American College of Surgeons of this action; that furthermore the American Medical Association give its unqualified approval to the hospital standardization work of the American College of Surgeons, and that this Association aid the American College of Surgeons in any way possible in its furtherance of its aim in the perfection of surgical work in hospitals and its standardization of hospitals.

Resolution on Displaced Physicians

Dr. D. M. Vickers, New York, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, There is at present a large group of physicians who, with their countrymen, have been rendered homeless and are now living as displaced persons in care of the International Refugee Organization in Western Germany and elsewhere; therefore be it

Resolved, That a committee be appointed by the Board of Trustees of the American Medical Association to study the problem of displaced physicians in cooperation with the Displaced Persons Commission, Rochambeau Apartments, 815 Connecticut Avenue, Washington 25, D. C., the various state authorities and the International Refugee Organization of the United States, Mr. W. Hallen Tuck, Director General, Palais Wilson, rue de Paris, Geneva, Switzerland.

Resolutions on Associated Medical Care Plans and National Enrolment Agency

Dr. L. Howard Schriver, Ohio, presented the following resolutions, which were referred to the Reference Committee on Insurance Plans and Medical Service:

WHEREAS, The American Medical Association has vigorously supported all bona fide forms of voluntary health insurance, and, in the words of the Council on Medical Service, has recognized its responsibility to "promote the principle of voluntary insurance by educating the people as to their need for such coverage and by obtaining full cooperation from state and county medical organizations in the local field"; and

WHEREAS, Associated Medical Care Plans, as the federated agency of state and local medically sponsored prepayment plans (Blue Shield Plans), has diligently endeavored to further the progress and development of voluntary health insurance as directed by the Board of Trustees and this House; now, therefore, be it

Resolved, That the continued functioning of Associated Medical Care Plans as an independent federated agency representing state and local Blue Shield Plans is supported by this House of Delegates; and be it further

Resolved, That the several state and local Blue Shield Plans continue the development of an enrolment agency to act in their interest in the field of so-called "national accounts" using their best judgment (and that of sponsoring societies) with respect to the methods, means, procedure and form of organization by which the problems related to national accounts may be solved.

Resolutions on Diabetes Detection Drive

Dr. Scott L. Smith, New York, presented the following resolutions, which were referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, It is within the province of the American Medical Association on a national, state and county level to direct public health education and disease detection drives for the public benefit; and

WHEREAS, Lay directed organizations have taken the leadership in these campaigns and public fund raising has become a prominent feature of these projects; and

WHEREAS, The federal government through the United States Public Health Service has already taken steps in regard to the problem of detection and education in diabetes; and

WHEREAS, Diabetes being neither contagious nor epidemic is not truly a government problem; and

WHEREAS, The American Diabetes Association, a branch of the profession of medicine, has begun a nationwide detection drive to be conducted annually and directed solely by members of the medical profession without fund raising appeals; and

WHEREAS, The American Diabetes Association has and will carry its detection drive to the people only through the American Medical Association, the state and county societies; therefore be it

Resolved, That the House of Delegates of the American Medical Association hereby records its approval of the American Diabetes Association's Detection Drive; and be it further

Resolved, That the Board of Trustees of the American Medical Association is requested to implement cooperation between the American Medical Association and the American Diabetes Association in furtherance of the annual Diabetes Detection Drive.

Resolutions on Single Membership Classification

Dr. Carl A. Lincke, Ohio, presented the following resolutions, which were referred to the Reference Committee on Miscellaneous Business:

WHEREAS, The existence of two classes of members within the American Medical Association, namely, "Members" and "Fellows," has led to much confusion among the membership; and

WHEREAS, It would seem practical and advisable to have all eligible physicians of the country united under one membership classification, with equal privileges and benefits; therefore be it

Resolved, That the House of Delegates of the American Medical Association favors a single membership classification for the American Medical Association, the annual capita dues for which shall be fixed by the Board of Trustees; and be it further

Resolved, That the Board of Trustees shall prepare the proper amendments to the Constitution and By-Laws of the American Medical Association to carry out the foregoing policy, which amendments shall be submitted to the House of Delegates for action at the earliest appropriate time.

Resolution on General Practitioner's Award

Dr. Joseph H. Howard, Connecticut, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business:

WHEREAS, There are no proper and adequate criteria set forth for the qualifications for the Outstanding General Practitioner; and

WHEREAS, No practical method of choice exists; and

WHEREAS, Any choice would of necessity be arbitrary and in most instances, by inference, reflect unfavorably on those not chosen; and

WHEREAS, It has been voted to disapprove the annual selection of an Outstanding General Practitioner within Connecticut or throughout the country; therefore be it

Resolved, That the delegates from the Connecticut State Medical Society to the House of Delegates of the American Medical Association be instructed to introduce this resolution before the House of Delegates of the American Medical Association at its annual meeting in 1949 and to oppose the continuation of the annual General Practitioner's Award by the Association.

Resolution on Child Health Programs on the State and Local Level

Dr. William Weston, Section on Pediatrics, presented by title the following resolution, which was referred to the Reference Committee on Executive Session:

WHEREAS, The Academy of Pediatrics has a particular interest in the field of child health; and

WHEREAS, It is recognized that certain deficiencies exist in this field; and

WHEREAS, It is desirable that definite programs be set up on the state and local level to correct these deficiencies where they exist; and

WHEREAS, The Academy of Pediatrics has gone on record as opposed to Senate Bill 5 or any similar bill proposing to establish a system of socialized medicine; therefore be it

Resolved, That the American Medical Association favor the development of sound child health programs on the state and local level by pediatric groups working in cooperation with the several state medical associations and local component county societies and in conformity with the Principles of Medical Ethics as laid down by the American Medical Association.

Report of Coordinating Committee

Dr. E. L. Henderson, Chairman, reported as follows, which report together with the addresses of Miss Leone Baxter and Mr. Clem Whitaker, was referred to the Reference Committee on Legislation and Public Relations:

Mr. Speaker and Members of the House of Delegates: As Chairman of the Coordinating Committee, I am supposed to make a report of that committee. As yet, I have been unable to get the formal report.

However, at this time, I felt that something much better than a report from the Coordinating Committee would be a talk from Whitaker and Baxter.

I wish to tell you, however, that following the meeting of the House of Delegates in St. Louis, we were authorized to select someone to head this educational campaign. We investigated numerous public relations firms over the country. As a result of that investigation, we finally called Whitaker and Baxter and asked them to meet the Executive Committee of the Coordinating Committee in Chicago on December 8, at which time they were employed.

You must realize that a firm of that kind must have some time to take care of accumulated business in their office, so that they were unable to come to Chicago until January 8, and they opened an office on January 10. That office had to be entirely rebuilt. I was in the office numerous times and had to walk over rugs halfway put down and everything of the kind.

On February 12, we had a formal meeting of representatives from the various states, at which time we opened the campaign. We had a great many complaints for the first two or three months. The campaign has been under way for only four months. It took time to get the office opened up and get ready. The doctors over the country were very restless. They felt that we were not doing anything, that we were too slow. But during the past six weeks or two months, I have had nothing but compliments on the Committee and on the public relations firm that we have employed.

I have been in almost daily conference with either Whitaker or Baxter by telephone or in person in Chicago, and I have never known anyone that was more interested in the cause that they were fighting for than Mr. Whitaker and Miss Baxter. They have devoted not six or eight or twelve hours a day to this work—I have been in Chicago on numerous occasions when they worked sixteen and eighteen hours a day.

This has been a terrific job to get under way, and I feel that those of you who were restless at first and who felt that we were not getting under way as rapidly as we should, should feel differently about it at this time, and I hope that you do. I should like permission to introduce Miss Baxter and Mr. Whitaker and have them address the House.

On motion offered by many, seconded by many, and carried, the House unanimously granted permission to Dr. Henderson to introduce Miss Baxter and Mr. Whitaker.

ADDRESS OF MISS LEONE BAXTER

Dr. Henderson introduced Miss Baxter, who addressed the House as follows:

Mr. Speaker, Members of the House of Delegates: Sometimes when you have a patient who is very ill, when there is no treatment which will bring quick relief, and when surgery won't meet the problem, all of you, as doctors, know what it is to do a job the hard way if it's to be done at all.

You know what it is to rebuild a body that is spent and ravaged. You know how to keep that spark of life from fluttering out.

All of you as doctors probably know a great deal more about painstaking, tedious work than you know of miracle cures!

We think it is good that you have that preparation and also the great patience born of practicing medicine because as practitioners of the kind of medicine we practice, public relations medicine, Whitaker & Baxter, unfortunately, can't offer any miracle cure for compulsory health insurance. We wish we could. This job of curing it and ending the infection will have to be done the hard way, too.

I know that all of you have diagnosed this case very carefully, and if you have you know that this is an infection that can't

be ended simply by defeating the Compulsory Health Insurance bills in Congress.

The infection goes much deeper than that. Socialization, which has been sweeping the world, has made inroads in America. For years, there has been a relentless propaganda campaign in our country, as well as in other nations, to convince people that they must depend on Government for security if they want it at all, and that security is more precious than liberty.

In the case before us, outside of the question of the people's health, which, of course, is the paramount consideration of the medical profession, one of the greatest basic issues involved is, "Is it Socialism?"

One of the claims that our opponents seem most anxious to impress on the people is that compulsory health insurance is antiseptically pure as far as the germs of socialism are concerned.

Now, President Truman may not feel that his bills are an invitation to socialism; Mr. Ewing may not feel that it is inherently socialistic. Irrespective of what you or I may feel here today in that regard, I can tell you from the standpoint of looking out at the Nation from your National Campaign Office, the people of America are looking across the Atlantic and comparing Britain's government-controlled medical system with the plan proposed here, and they are approaching the conclusion that the plan in its very essence guarantees socialism.

On one of the first days of the Congressional hearings on the proposed legislation, Senator Pepper made a formal request of your own Dr. Lowell Goin, of California, to (and I quote) "... stop calling the advocates of compulsory health insurance advocates of socialism."

Well, frankly, on the basis of reason and facts, it seems to me more important that those advocates stop calling their proposal health insurance, for, under legitimate insurance, the insured is told the exact amount of his premiums and exactly what benefits are guaranteed, and, on that basis, certainly government-controlled medicine is no more insurance than a poll tax is insurance.

But even in America, as all of you know, such false creeds make some converts. However, the great majority of American people, we think, still prize liberty and incentive and opportunity above security, above the kind of security leveled off and apportioned by the government or anybody else. But the danger lies in the fact that the advocates of socialism seldom state the issue completely and honestly, and our freedoms are not curtailed all at once but a little at a time. That is why this issue has to be fought out before the people and not just in Congress. That is the reason we have all been occupied, almost everybody in this room, putting together your National Education Campaign for the American Medical System.

We have a constructive and a challenging job to do, and the medical profession, we believe, is very well equipped to do that job. We have to restore the economic and political health of the country. We have to renew faith in the sound precepts that we know will keep America healthy and strong, and, from the standpoint of the Nation's health, protect it from those who would sacrifice it to politics.

We have another very vital job to do, and this also calls for a nationwide campaign of education. We urgently need to present the principle of voluntary health insurance to the American people. We need to expand and improve the voluntary health insurance system. We need to encourage the American people to provide themselves with prepaid medical care and to give them the facts in order to prove to them that there is nothing government can do for them in this field that they can't do better for themselves, and at less cost.

There is nothing static about medicine. I don't need to tell you that. And there is nothing static about the American way of life. New problems require new solutions, and nobody knows that better than a doctor.

American medicine, by the tremendous progress it has made in defeating disease and extending life, also has helped to create some problems in medical economics. Many of the new life-saving medical procedures are costly, and so it is vital that we increase the availability of medical care through budget-

basis medicine. That is one of the most important phases of the campaign ahead of us now.

Mr. Whitaker, in his report to you, will discuss some of the progress that has been made, the scope of the work which lies ahead, and some of the mediums which we believe should be used in getting facts to the people.

I would like to take you on a very brief excursion, however, into the field of campaign literature, as we so elegantly and somewhat inaccurately call the pamphlets, posters and leaflets and campaign materials we prepare. This happens to be my specialty in the kind of medicine practiced by Whitaker and Baxter.

Your National Campaign Office has produced some twenty-five different types of informative material for different uses in the campaign, with which you doctors and laymen and members of allied professions, friends of medicine, and your wives, Auxiliary members, have done a very excellent job of distributing 25,000,000 copies throughout the country in the past four months.

There is one specific phase of that work that I want to discuss, and that is the pamphleteering drive. Pamphlets will play a major role in getting the story of American medicine to the people and in awakening them to the danger that confronts their health standards and their medical care.

At the National Headquarters, we have discovered that throughout the country there is a tremendous public interest in this question. That public interest is clearly reflected in the prominence which the newspapers and the great national magazines are giving the issue in their columns. The people honestly want the facts, and, surprisingly, and this is very good news to Mr. Whitaker, to me and the rest of our staff, and a very unusual thing on a public issue, people seem to want a lot of facts. They have a great many questions they really want to know the answers to. That is the reason that one of our newest pamphlets, "The Voluntary Way Is The American Way," is presented in question and answer format. We have endeavored in that pamphlet to answer the 50 questions which we have found people asking most frequently on this issue.

We have a smaller pamphlet for those who prefer to assimilate their facts in smaller doses, the one that carries the picture of the doctor on the front of it. I presume you all have seen it because it has been sent, I believe, to every doctor's office in the country by this time. This is being used as a mail-enclosure piece.

Both of these were particularly designed for doctors' reception rooms and for mass distribution through all the facilities available to us. It is not necessary that people generally read either of these in their entirety. They are good for all types of people—doctors and dentists and housewives and taxi drivers and farmers and professional people and students. The whole story is there, and for those who really want the answers, they will probably find them there, and I hope that we have made it difficult for even the busiest person to read a paragraph without wanting to know more about the subject.

We are happy to report that we have had a very splendid reaction to these two new pieces of literature, and shipments to the state and county medical societies now have exceeded 5,000,000 copies, that is, in the past five weeks. They were issued five weeks ago.

The big job now, of course, is to get this material into the hands of individual doctors, friends of medicine, who are aiding in the fight, and on into the hands of the general public.

It is critically important that this phase of the work not bog down. I mention this because there has been a slight disposition on the part of a few who have not thought it through, to assume that because we have got safely past our first Congressional crisis, we may now halt the treatment.

Frankly, our field has merely shifted since our opponents have declared their intentions of making compulsory health insurance a major issue in the coming Congressional contest. That we certainly shall welcome. It permits us to take our case personally to the people, out into the grass roots of America, and that is the doctor's field, that is the proper place to determine this public issue, an issue of more vital concern to the welfare not just of the medical profession but of the whole nation, than any of us ever has seen in his lifetime.

We know that all of you, when this convention is over, as you return to your homes, can be wonderfully helpful in seeing that your state and county societies follow through, help get those pamphlets into distribution. And the national campaign needs your help, too, and the prestige in your home states and communities in encouraging every member of the profession to display that colored poster, "The Doctor," with its caption, "Keep Politics Out of This Picture." As members of the House of Delegates of the American Medical Association, if you were to set a hundred per cent example, it would be tremendously valuable. More than 40,000 doctors already have ordered the poster, and that is a wonderful response and it is a heartening indication, too, that rank and file doctors all over America are determined to play a part in this campaign.

At the rate the orders are coming in now, it appears that that "Doctor" poster will be on display in more than 50,000 doctors' offices before the end of this month. You can be very sure that the impact of that showing will be felt in the halls of Congress and in the White House itself.

I don't mind telling you now that when we first discussed this poster and placed an order for its production, Mr. Whitaker and I set our objective at 50,000. We thought if the doctors achieved that goal it would be a real accomplishment, because we had been warned by some of our friends in medicine that the doctors are rather conservative people and probably wouldn't yield very kindly to displaying a political poster in their offices, but it appears we had underestimated the doctors. They are conservative but apparently their hearts are in this fight. They believe in the freedom of the practice of medicine, and they are willing to do battle to save it.

Now, we need to raise our sights. We need to give a demonstration throughout the nation at this time of the unanimity of the medical profession.

You know and we know that Britain wouldn't have socialized medicine today if British doctors, despite the economic and political pressure placed on them, had found it possible to stick together, to act together and to prove that they knew more about the building and maintaining of the health of Britishers than the politicians knew.

We need 100,000 doctors' offices displaying this poster, distributing campaign literature, and acting actually as their own branch campaign headquarters in their own area. We want to make this poster a symbol of enlistment, a measure of the doctor's devotion to the cause of the nation's health, and a notice to patients and to other members of his profession that each doctor has taken his stand for sound medical practice.

I know you all understand that we don't think that a poster, even a dramatic poster, will win this battle. It is only one phase of a very broad campaign, a very little thing, but it is of tremendous importance, and I will tell you why.

The critics of the American Medical Association charge that the doctors of America are divided, that they don't really believe in this fight, and we need to demonstrate publicly that individually the doctors of America do believe in this fight, that they are unalterably opposed to the socialization of their profession, and 100,000 doctors' offices displaying the "Doctor" poster will be the best possible answer to our critics, and I don't need to tell you the effect this will have on the millions of patients going through those doctors' offices.

The medical profession has a vitally important story to tell, and who in the world is to tell it so well or with more truth or with more sincerity than doctors themselves?

There is another very important factor. The painting of the doctor may be old fashioned in some respects. We have had a few critical letters from doctors asking why we didn't portray a modern practitioner in a streamlined office. But there is something in that picture which represents one of the most priceless possessions you men of medicine have in your whole fight against assembly line medicine. In that doctor's face there is compassion, there is personal concern for the welfare of his patient, there is personal loyalty to the patient as a human being, and that is not old fashioned; that is something very vital and very enduring. Most of your patients don't know too much about the prescriptions you give them probably. They may not even know much about your years of preparation or your scientific accomplishments. But they have faith in you.

They want you, not some other doctor. They know you are personally concerned in their welfare and whether they get well or whether they die, and that is something you have to give that no doctor assigned from a political list and allotted patients in a similar manner ever can give. That is what this poster says, and that is the truth, and America needs to be told that truth and needs to remember it.

We are going to win this campaign. We are going to win this crusade against the absorption of the medical profession by the government. We are going to win it if we proceed in the way we have begun, keeping our eyes on the big objectives, remembering that the final force that crumpled British medicine was simply inability to get together and stay together to oppose the forces that threatened the existence of their profession.

And when it is over and the threat is behind us in this country, we are all going to lift our heads a little more proudly because this we will know, this the world will know, and this history will know, that by giving the people better medical care at less ultimate cost than any government bureau can possibly provide under a compulsory system, by having the courage and the leadership to strike out against the tide of "State-ism" that offends the principles of the majority of Americans but which so many people apathetically accept as inevitable, and by proving that this so-called trend toward "State-ism" is no more inevitable than the people permit it to be—by these things, American doctors will have saved their own profession from engulfment; they will have saved other professions from the same fate. American doctors will have saved and preserved the American way of life.

ADDRESS OF MR. CLEM WHITAKER

Dr. Henderson then introduced Mr. Clem Whitaker, who spoke as follows:

Dr. Henderson, Mr. Speaker, Members of the House of Delegates: It is a very great responsibility to represent you in this critical hour, and it is a very great privilege, too. I want you to know that Miss Baxter and I recognize the deep obligation both to this House of Delegates and to American Medicine. I think we know, for the first time, how you feel when a patient's life hangs in the balance. This is a life and death struggle, and we would all be guilty of faulty diagnosis if we failed to identify it as such.

The next two or three years will determine, in all likelihood, whether the American medical system which has kept this country healthy and strong will live or die. This isn't just another skirmish in the fight against compulsory health insurance. This is the decisive battle that will determine the fate of American Medicine for generations to come, and if the decision once goes against medicine, there will be no turning back. There will only be a tightening of the lockstep you walk in. This isn't just a disagreement over procedures in providing the people with prepaid medical care. Freedom in medicine either for the doctor or the patient simply could not survive the stultifying political controls proposed in the Truman program, and the enactment of that system would be a devastating blow not only to the medical profession but to the health of the American people.

The question at issue is whether the reputable men of American Medicine or the political medicine men in Washington will control and direct the practice of medicine in this nation.

As I think we all recognize, there is a basic issue which goes even deeper. It isn't only sound medical practice which is at stake; it isn't only the physical welfare of America that is in jeopardy. Our freedom in everything we count important is at issue.

This fight that American Medicine is waging is a fundamental struggle of free men against government domination, and it is probably the most momentous issue which will be fought out before the American people in our lifetime.

The trends toward "State-ism" in America has become unmistakable. The concentration of power in Washington is frightening, and the constant reach for more power is unending. It is only a short step from the "Welfare State" as our Washington planners envision, to the "Total State," which taxes the wage earner into government enslavement, which stamps out incentive and soon crushes individual liberty.

The danger signals are clearly visible. Already the American people are being compelled to contribute from 25 to 30 per cent of their earnings to support our sprawling governmental bureaucracy, and the program of the "Welfare State," if it is enacted, eventually will take another 20 per cent of every worker's paycheck in this country. That is not my estimate; that is the official government estimate. That would mean every one of us would work every other day for government. Then, why not every day?

That is the pattern for the evolution of the "Welfare State" and of the "Socialist State" or the "Total State." Call it what you will, that is not the American way. That is an alien way, foreign to everything we believe in, and that is a pattern for human misery and degradation.

It was inevitable, of course, that finally there would come a crucial battle in the war between those who believe in the American way of life and those who covertly seek to impose government regimentation on us. This is that battle.

American Medicine has been singled out by the socializers for this supreme test of their power. If they can win on this front, if they can impose government domination on doctors and their patients, they will have won a decisive battle in the fight for complete socialization of this country. We don't have to guess at that or speculate about it. History has taught us that, the tragic history of every great nation which has adopted socialized medicine. In Russia and in Germany the spurious promise of free medicine, socialized medicine, was one of the lures used to lull people into nonresistance, while complete enslavement was accomplished.

Britain began with compulsory health insurance on a supposedly moderate scale back in 1911. Since then the cancer of socialization has spread to almost every part of the British economy. It has eaten up the Bank of England, the cable and wireless services, civil aviation, the transportation industry, the coal industry, the electric industry and, more recently, the gas industry, and now it is about to spread to the steel industry.

There were those in Britain, when compulsory health insurance was first proposed, who thought it was a harmless experiment. And some of their cousins live here in America. But today Britain is plunging headlong toward a regimented society that will blot out every vestige of liberty for the British people, unless the tide is turned back.

This truth we know—and this truth we must some way make all America know: When medicine is socialized, the beginning of the end is in sight. It is one of the final, irrevocable steps toward complete state socialism. And at the end of that road is loss of everything that means most to free men.

This, without doubt, is the greatest emergency any of you ever has confronted in all your years of practice. Not just one life hangs in the balance, but the life of a nation is in your hands—a nation that has become the last hope of all the liberty-loving people in the world.

In all reverence, I want to say: Thank God that this House of Delegates and the American Medical Association have accepted the challenge. Thank God for the courage, the sound convictions and the tireless energy of American doctors.

This isn't just a heavy obligation that has been laid upon you, and I am sure that you don't look at it that way. This is the greatest opportunity any of us ever will have to serve America, to champion our good way of life and to play a vital part in shaping the destiny of our country. The plague of socialization, with all its demoralizing consequences, has become epidemic throughout most of the world. It has impaired and crippled the productive capacity of great nations and stripped them of their political independence. It has undermined the character, the moral fiber and the individual initiative of untold millions who were once prideful, self-reliant, self-supporting people. It has made them serfs of their own governments, dependent on government for their very existence.

In many countries, it has killed hope and maimed freedom. Here, in America, let us stop that plague. American doctors are directing the fight to stop it, just as they would fight any other scourge which threatened the health and welfare of the American people.

This is the challenging and tremendous task we have undertaken to alert and awaken the American people to the danger which threatens them; to crystallize and mobilize public opinion, so that the people's mandate on this issue shall be unmistakable, and to rekindle faith in sound, fundamental American precepts which have made this country healthy and strong, in body and in spirit.

We are making splendid progress with that work, too, I am happy to report, even though our nationwide grass roots campaign has barely begun. All over America, the people are beginning to speak out against socialized medicine, against political compulsion and against government regimentation.

It wasn't just lack of time which caused some of the advocates of government medicine to announce recently that they would not press for the enactment of their program at this session of Congress. It was lack of votes, lack of public support for their program that brought this change in their time table. It was the storm of letters from the people back home, pouring into Congress and the White House, in aroused protest against this scheme of political medicine which slowed the march of the socializers.

We still have a Congress responsive to the voice of the people, in the best American tradition, and for this we should be eternally grateful. That is our last line of defense against regimentation and the scourge of socialization.

For this, too, we can be grateful: American medicine isn't fighting alone now. This is rapidly becoming a great public crusade and a fundamental fight for freedom. The American Farm Bureau Federation, the American Legion, the American Bar Association, the National Grange, the National Association of Small Business Men, the National Fraternal Congress, with its hundreds of lodges, and the great General Federation of Women's Clubs, with its 5,000,000 members—these are just a few of the powerful public organizations which have taken their stand beside American medicine in this battle.

In less than five months, nearly eight hundred organizations in America, representing people in virtually every walk of life, have come out strongly against compulsory health insurance, and have said, in emphatic language, "The voluntary way is the American way to meet the need for prepaid health care."

That is only a beginning. State and county medical societies all over America are at work, getting the facts before public groups in their respective states and communities. Thousands of doctors are at work, carrying American medicine's story to their patients and their friends, their community leaders, their civic groups, their lodges, churches, farm bureaus, chambers of commerce, labor unions, and their clubs and their patriotic organizations. Thousands of leaders in the many organizations that have become allies of medicine are at work, too, alerting their membership and arousing other organizations, because they have made this fight their fight, in the defense of our American way of life.

We have made a good start, but it is only a start. There are eight hundred organizations on record against socialized medicine. By the end of this month, we should have at least one thousand, and by the end of this year, we want five thousand other organizations standing beside medicine.

We can't be lulled into overconfidence by developments in Congress, or a change in tactics on the part of our opponents. We can't afford to relax our vigilance until every city, town and hamlet in this country has heard the truth, and until all the citizens of this great country, no matter where they live, know the real significance of the attempt that is being made to infringe on their lives and their personal freedom.

Tens of thousands of Americans already have heard the facts, and acted on them. The thousands of letters to members of Congress prove that. The tremendous demand for pamphlets and other educational material gives further corroboration.

Already, there is a noticeable shift in public sentiment. American medicine is gradually emerging from a defensive position and is reaching the people with its affirmative campaign.

But we are still far from our objective. We are still fighting against great odds. There are millions of Americans who haven't yet heard both sides of this case, who have heard only

the government's continuing din of misleading propaganda, and it is our job in the year ahead to see that every American has the facts.

We need have no fear of the people's verdict once they have the facts, once they know the costly price they would pay for government-controlled medicine—in exorbitant taxes, in inferior medical care, in invasion of their privacy and in loss of personal freedom.

We can safely rest our case with the American people, but first we must get the facts before the people. That, I know, is the heart and purpose of your program, because your plan of action was clearly outlined in the resolution adopted by this House of Delegates on Dec. 1, 1948, directing that this campaign of public education be undertaken. That resolution reaffirmed the American Medical Association's support of voluntary health insurance to provide the people with prepaid medical coverage. Then it contained a ringing statement, declaring that the American people enjoy the finest standards of medical care achieved by any great country in the history of the world, and that the accomplishments of American medicine are the result of development by a free profession, working under a free system, unhampered by governmental control. That resolution also contained this vigorous condemnation of government medicine:

Compulsory sickness insurance, notwithstanding misleading bureaucratic propaganda, is a variety of socialized medicine, or state medicine, and possesses the evils inherent in any politically controlled system. It is contrary to American tradition, and is the first and most dangerous step in the direction of complete state socialism. The American Medical Association rejects any such scheme. We are equally certain that when the people understand the facts they also will reject it with the same finality.

Your House then laid down these specific steps in getting the facts before the people: that the American Medical Association campaign of education should disseminate all necessary information to these groups: (1) state and county medical societies and individual physicians, (2) the general public and the congress of the United States.

That, in abbreviated statement, is the framework of your campaign. That is the type of campaign American medicine is conducting—a campaign that squares with every principle of popular government and democratic action.

I reviewed the essentials of that program today, because there are some men in Washington who apparently question American medicine's right to conduct it. There has been a deliberate attempt on the part of the critics of medicine to misrepresent the American Medical Association National Education Campaign, and to convince the people that there is something reprehensible about doctors taking their case to the people.

We don't need to be too disturbed about the angry accusations of the socializers, however, because the American people have learned to discount the intemperate statements of those who resort to abuse and invective when they fear to go to trial on the merits of their case.

I believe we all anticipated, too, that when American medicine challenged entrenched bureaucracy, to force a showdown before the people on this issue, we would get "roughed up" a bit. That is part of the price of remaining free men.

The arrogance of government bureaucrats, as they reach out for increasing power over the lives of the people, is limitless, and that arrogance never has been more clearly demonstrated than in their repeated attempts to terrorize the medical profession into nonresistance on this issue. But, again let me say, thank God that American doctors have the courage of their convictions.

There is a fundamental principle of freedom at stake here, and on principle there can be no compromise. There can be no let-up in this fight until the people have spoken and until the issue has been finally resolved.

Let me put the record straight in another regard, too. This isn't a partisan fight, despite the frantic attempts of some partisan politicians to make it appear so. American medicine has staunch supporters in both major political parties in Congress. There isn't any party line drawn here. The issue is

drawn on much broader lines. Republicans and Democrats alike, who know the pattern of "State-ism" and who recognize the danger of further concentration of power in Washington, are rallying to medicine's cause.

But we would be foolhardy indeed if we underestimated the tremendous power of the government propaganda machine which is beating the drums for socialized medicine and recklessly misusing public funds in a desperate attempt to sell the American people this quack cure-all.

There are 45,000 full-time and part-time government press agents and propagandists in Washington, supported by the taxpayers at a cost of \$75,000,000 a year. That is our opposition.

Just how many of them have been ordered to devote their energies to the campaign to discredit American medicine and to promote compulsory health insurance before the people and in the halls of Congress, we haven't been advised. But we do know that there are officials and employees of the Federal Security Administration and various other government agencies, running all over America, on government expense accounts, no doubt, frantically endeavoring to create public support for the program of socialized medicine now before Congress. You will find them in virtually every state, speaking before public meetings, showing up unexpectedly whenever compulsory health insurance is under discussion, and loudly expounding the alien philosophy that only government can care for the people's needs. I am ashamed that any representative of American government would present that to the American people.

This is the type of opposition with which we are confronted. It is a little amazing that our social bureaucrats, under such circumstances, would have the effrontery to question American medicine's right to present its side of the case. It is the people's health that is in jeopardy, and who should talk to them if not their doctors?

The staff of the American Medical Association National Education Campaign, by comparison with that government brigade, seems very modest indeed. It numbers less than forty persons, including the secretaries, stenographers and telephone operators. In Washington, that staff wouldn't be considered adequate to cover a good-sized congressional district!

But this battle isn't going to be won in Washington, and it isn't going to be won in Chicago. It is going to be won by the doctors of America, by men and women like yourselves, working in their home communities, speaking before their luncheon clubs, talking to their friends and passing pamphlets to their neighbors. This is a grassroots campaign in the finest meaning of that term, and American medicine can be very proud of the type of campaign it is conducting.

It isn't an easy job. It is going to mean double duty and endless hours of hard work for tens of thousands of doctors and their friends all over this country. It is going to mean loss of sleep, loss of leisure, many evenings away from home and many frustrations and irritations. That is just part of the price of liberty. There is no substitute for personal work and personal interest in this nationwide job of public education.

It is going to mean a heavy burden on state and county medical societies, too, directing their respective campaigns, getting out publicity, keeping their speakers' bureaus functioning, securing the support of their local organizations and handling the flood of pamphlets and posters that must be distributed to doctors' offices.

Then it is going to mean all-out work for the prepaid medical and hospital plans and all the other voluntary health insurance systems, because America needs budget-basis medicine, and there is a tremendous job to be done in stepping up promotional work and sales, so that this problem can be finally resolved. For we are not just working to beat a bill, even though that phase of the fight is immediate and urgent. We're going to do something about taking the economic shock out of illness.

There are more than 55,000,000 people covered today in hundreds of voluntary health insurance systems serving this country, and the enrolment is growing by the millions every year. The American people instinctively know that the voluntary way is the American way to cope with the problem of prepaid

health insurance. They are plainly demonstrating their faith in that precept, in increasing numbers every day, by turning to the voluntary plans for the protection which they want and need.

The phenomenal growth and development of voluntary health insurance has been one of the most remarkable and significant achievements in medical economics in our times, and American doctors can be very proud of the major part they have played in that development.

While the socializers have been talking about this problem, doctors have been doing something about it. In less than two decades, the voluntary health insurance systems have left their swaddling clothes behind them and have achieved such strength and stature that the problem of prepaid medical care can finally be resolved within the next few years, if we can keep politics out of this picture.

American medicine, the prepayment systems and the insurance industry, working together, are well on the road to solution of this problem. The means of increasing the availability of medical and hospital care are at hand. The job now is largely one of public education and constant improvement in the coverage offered.

There are still millions of people who need health insurance protection but who haven't yet learned either that it is available to them or that it can be bought at a reasonable cost, and without a heavy drain on the family budget. It is part of our job in this American Medical Association National Education Campaign to get the facts to the people, to make American health insurance conscious, so that those who need budget-basis medicine as a protection against the costs of sudden illness will provide themselves with that protection.

We don't have to depend alone on ideological arguments to beat political medicine; we don't have to depend wholly on the people's inherent aversion to compulsion and regimentation. The American people, in the final analysis, always will buy the best product, at the best price, if it is properly presented. We have the best product at the best price in voluntary health insurance.

There is nothing cheap about government medicine, except its quality. It is a poor product at a premium price, with much of the medical dollar eaten up by bureaucratic overhead. We don't need to guess at that. The record of government medicine, in every country that has adopted it, is a record of shameful waste and incompetence, and steady deterioration in the quality of medical care.

We never have had to reduce our standard of living in this country to compete with peasant labor in other lands, and we don't have to reduce our health standards just to satisfy a few politicians in Washington who have lost confidence in the people's ability to care for their own needs in their own way. We are the healthiest, strongest nation on the face of the globe today, and that strength stems from the people, not from any government bureau in Washington. We just need to go to the people of this country and tell them the facts, in simple American fashion.

I might say that Miss Baxter, in addition to being the best-looking woman in my life, is also a prodigious worker, and Miss Baxter believes in a great deal of detail. I might interpose here the statement that at 2:30, on Wednesday, she will speak before the Medical Society Executives Conference and will outline in great detail the specific job which is being done—in more detail than I am going to put it to you today.

There is a lot of work to be done on every front in this campaign, but it isn't just drudgery. This is an opportunity, an inspiring opportunity. This is an emergency, and we are calling on every doctor to offer his services. There isn't a man or woman in medicine worthy of the high ideals of your profession who wouldn't respond to an emergency call if a person's life was in danger or if a family was in difficulty or a community was in trouble. But this emergency is so vast, it is hard to grasp. If it is even hard to arouse some of the doctors in America, think how much harder it is going to be to arouse all the people of this country to the full implications of this struggle.

But think what a glorious job it will be, too! We have fought two world wars in defense of our liberty, so we have no illusions about the price of freedom. No matter what the cost—in money, in energy, in extra hours and in tireless devotion to the cause—the cost of this crusade will be just a fraction of the terrific price we would pay if this fight were lost.

The price of liberty comes high, but the loss of liberty—that's a price none of us can afford to pay!

Let Whitaker and Baxter give you this strong, personal assurance: This fight can be won. It must be won, and it will be won. In the winning of it, all of you, and all of the other doctors throughout America who get into the battle, will have the deep satisfaction of knowing that you have contributed to the well-being of this nation in greater measure than you ever have had opportunity to do before. You won't just help in saving your profession. You will help in saving the country that has been good to you. You will help America.

This is the greatest challenge any of us ever has confronted. This is an opportunity to change the course of history, to defend our good way of life and to leave a priceless inheritance to all who will follow us.

We need a spiritual revival in politics. We need a new flaming idealism. We need to reconsecrate ourselves to the fundamental principles of freedom that have made America the inspiration and hope of a sick world. We need every doctor imbued with the vital importance of this cause and fighting not only for his own freedom but for all our fundamental freedoms that make life in America better than in any other land. And American medicine, I am confident, will face up to that challenge.

Introduction of Dr. Austin Smith

Dr. E. L. Henderson, Chairman, Board of Trustees, introduced to the House Dr. Austin Smith, Associate Editor of THE JOURNAL.

Report of Board of Trustees

REPORT OF COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

Dr. James C. Sargent, Wisconsin, presented the following report, which was referred to the Reference Committee on Emergency Medical Service except the portions dealing with amendments to the Constitution and By-Laws, which were referred to the Reference Committee on Amendments to the Constitution and By-Laws.

ELEVATION OF POSITION OF SURGEON GENERAL OF ARMY

It is with considerable satisfaction that the Council is able today to report to the Board of Trustees and the House of Delegates that the Army has elevated the position of the Surgeon General in its internal structure to a position which will guarantee that the Surgeon General is in fact the direct Medical Advisor to the Chief of Staff and the Secretary of the Army; that he will be guaranteed direct access to the Chief of Staff and to the Secretary of the Army in all medical activities at all times. This elevation in status will be applicable in all echelons of medical service within the Army structure.

DIVISION OF MEDICAL SERVICES

The Council on National Emergency Medical Service respectfully calls the attention of the Board of Trustees and the House of Delegates to a directive, dated May 12, 1949, establishing in the Office of the Secretary of Defense a Division of Medical Services to be headed by a Director of Medical Services of the Armed Forces. It is recommended that a proper note of commendation be forwarded to the President and the Secretary of Defense in recognition of this constructive and forward-looking action.

REQUEST FOR SECTION ON MILITARY MEDICINE AND SURGERY

A communication has been received, dated May 16, 1949, from the Executive Secretary of the Committee on Medical and Hospital Services of the Armed Forces to the Office of the Secretary of Defense, requesting the Council on National

Emergency Medical Service to sponsor the establishment of a Section on Military Medicine and Surgery within the structure of the American Medical Association.

The Council on National Emergency Medical Service believes there is much to justify such a Section and recommends that in its consideration the Council on Scientific Assembly seek the views of the service representatives in the House of Delegates.

PROPOSED AMENDMENTS TO CONSTITUTION AND BY-LAWS

The Council on National Emergency Medical Service desires to bring to the attention of the Board of Trustees, for action by the House of Delegates, the need for several amendments to the Constitution and By-Laws of the American Medical Association.

At the present time the medical officers of the United States Army, the United States Navy, the United States Public Health Service, and the Veterans Administration are eligible to become Service Fellows and each of these government medical services is entitled to one voting delegate to the House of Delegates.

On May 12, 1949, the Secretary of Defense established an autonomous Medical Service of the United States Air Force; the By-Laws of the American Medical Association, Division Two, Chapter IV, Section 2 (A) 2, which provide for Service Fellows, contain no provision for Service Fellow status for medical officers of the United States Air Force; therefore it is recommended that Division Two, Chapter IV, Section 2 (A) 2 of the By-Laws be amended so that the words "United States Air Force" be inserted after the words "the United States Navy."

The Council on National Emergency Medical Service desires to present the following proposed amendment calling for changes in the Constitution and By-Laws of the American Medical Association, so that the medical officers of the newly formed medical service of the United States Air Force may enjoy the same privileges and responsibilities within the American Medical Association as their colleagues in the other government services.

Neither the Constitution nor the By-Laws as presently written provide for representation in the House of Delegates of the Medical Service of the United States Air Force established by order of the Secretary of Defense on May 12, 1949.

The Medical Service of the United States Air Force should enjoy the same representation, privileges and responsibilities in the House of Delegates of the American Medical Association as that of the United States Army and the United States Navy. It is recommended therefore that Article 6, Section 2, of the Constitution be amended so that the words "the United States Air Force" be added to the first sentence after the words "the United States Navy," and that Division Three, Chapter IX, Section 1 (b) of the By-Laws be amended by adding the words "the United States Air Force" after the words "United States Navy" in the first sentence.

RESOLUTIONS ON ACTION FAVORING PASSAGE OF H.R. 3039 AND S. 1698

The following resolutions are respectfully submitted for consideration of the House of Delegates:

WHEREAS, Numerous difficulties have arisen, making it impossible for all but a very few Army, Navy and Air Force Medical Corps Reserve officers to attain the point credits necessary to complete a satisfactory year of federal service during the first year of operation of Public Law 810, 80th Congress; and

WHEREAS, It is the opinion of the American Medical Association that national security requires an active and adequate medical reserve in each of the three departments; and

WHEREAS, The present inability of medical reserve officers to attain a sufficient number of points for a satisfactory year will, through resignations and administrative transfers to the inactive reserve, seriously deplete the medical reserve forces available to our country; be it therefore

Resolved, That the American Medical Association go on record as favoring the passage of S. 1698 and H.R. 3039 and/or other suitable legislation looking toward the deferment for one year of the date on which the point requirements in said law shall become effective; and be it further

Resolved, That copies of this Resolution be forwarded to the President of the United States, to the Secretary of Defense, to the Secretaries of the Army, Navy and Air Force, to the Chairmen of the Armed Services Committees of the Senate and the House and to Senator Johnson and Representative Ford.

REPORT OF THE JUDICIAL COUNCIL

The Vice Speaker, Dr. James R. Reuling, assumed the Chair.

At the request of the Speaker, Dr. E. R. Cunniffe, Chairman of the Judicial Council, presented a revised Principles of Medical Ethics, which was adopted section by section and as a whole after amendment of Section 8 of Article IV of Chapter III by changing the word "resign" in the third line to the word "relinquish." The revised Principles of Medical Ethics as adopted by the House of Delegates reads:

To the Members of the House of Delegates of the American Medical Association:

The Judicial Council presents herewith for the approval of the House of Delegates the revised Principles of Medical Ethics of the American Medical Association:

PRINCIPLES OF MEDICAL ETHICS

"These principles are not laws to govern but are principles to guide to correct conduct." (James Percival's Principles of Ethics, 1803.)

Chapter I

GENERAL PRINCIPLES

CHARACTER OF THE PHYSICIAN

SECTION 1.—The prime object of the medical profession is to render service to humanity; reward or financial gain is a subordinate consideration. Whoever chooses this profession assumes the obligation to conduct himself in accord with its ideals. A physician should be "an upright man, instructed in the art of healing." He must keep himself pure in character and be diligent and conscientious in caring for the sick. As was said by Hippocrates, "He should also be modest, sober, patient, prompt to do his whole duty without anxiety; pious without going so far as superstition, conducting himself with propriety in his profession and in all the actions of his life."

THE PHYSICIAN'S RESPONSIBILITY

SEC. 2.—"The profession of medicine, having for its end the common good of mankind, knows nothing of national enmities, of political strife, of sectarian dissensions. Disease and pain the sole conditions of its ministry, it is disquieted by no misgivings concerning the justice and honesty of its client's cause; but dispenses its peculiar benefits, without stint or scruple, to men of every country, and party and rank, and religion, and to men of no religion at all."*

GROUPS AND CLINICS

SEC. 3.—The ethical principles actuating and governing a group or clinic are exactly the same as those applicable to the individual. As a group or clinic is composed of individual physicians, each of whom, whether employer, employee or partner, is subject to the principles of ethics herein elaborated, the uniting into a business or professional organization does not relieve them either individually or as a group from the obligation they assume when entering the profession.

ADVERTISING

SEC. 4.—Solicitation of patients, directly or indirectly, by a physician, by groups of physicians or by institutions or organizations is unethical. This principle protects the public from the advertiser and salesman of medical care by establishing an easily discernible and generally recognized distinction between him and the ethical physician. Among unethical practices are included the not always obvious devices of furnishing or inspiring newspaper or magazine comments concerning cases in which the physician or group or institution has been, or is, concerned. Self laudations defy the traditions and lower the moral standard of the medical profession; they are an infraction of good taste and are disapproved.

EDUCATIONAL INFORMATION NOT ADVERTISING

SEC. 5.—Many people, literate and well educated, do not possess a special knowledge of medicine. Medical books and journals are not easily accessible or readily understandable.

*Sir Thomas Watson.

The medical profession considers it ethical for a physician to meet the request of a component or constituent medical society to write, act or speak for general readers or audiences. The adaptability of medical material for presentation to the public may be perceived first by publishers, motion picture producers or radio officials. These may offer to the physician opportunity to release to the public some article, exhibit or drawing. Refusal to release the material may be considered a refusal to perform a public service, yet compliance may bring the charge of self seeking or solicitation. In such circumstances the physician should be guided by the decision of official agencies established through component and constituent medical organizations.

A physician who desires to know whether, ethically, he may engage in a project aimed at health education of the public should request the approval of the designated officer or committee of his county medical society.

The most worthy and effective advertisement possible, even for a young physician, especially among his brother physicians, is the establishment of a well merited reputation for professional ability and fidelity. This cannot be forced, but must be the outcome of character and conduct. The publication or circulation of simple professional cards is approved in some localities but is disapproved in others. Disregard of local customs and offenses against recognized ideals are unethical.

The promise of radical cures or boasting of cures or of extraordinary skill or success is unethical.

An institution may use means, approved by the medical profession in its own locality, to inform the public of its address and the special class, if any, of patients accommodated.

PATENTS, COMMISSIONS, REBATES AND SECRET REMEDIES

SEC. 6.—An ethical physician will not receive remuneration from patents on or the sale of surgical instruments, appliances and medicines, nor profit from a copyright on methods or procedures. The receipt of remuneration from patents or copyrights tempts the owners thereof to retard or inhibit research or to restrict the benefits derivable therefrom to patients, the public or the medical profession. The acceptance of rebates on prescriptions or appliances, or of commissions from attendants who aid in the care of patients is unethical. An ethical physician does not engage in barter or trade in the appliances, devices or remedies prescribed for patients, but limits the sources of his professional income to professional services rendered the patient. He should receive his remuneration for professional services rendered only in the amount of his fee specifically announced to his patient at the time the service is rendered or in the form of a subsequent statement, and he should not accept additional compensation secretly or openly, directly or indirectly, from any other source.

The prescription or dispensing by a physician of secret medicines or other secret remedial agents, of which he does not know the composition, or the manufacture or promotion of their use is unethical.

EVASION OF LEGAL RESTRICTIONS

SEC. 7.—An ethical physician will observe the laws regulating the practice of medicine and will not assist others to evade such laws.

Chapter II

DUTIES OF PHYSICIANS TO THEIR PATIENTS

STANDARDS, USEFULNESS, NONSECTARIANISM

SECTION 1.—In order that a physician may best serve his patients, he is expected to exalt the standards of his profession and to extend its sphere of usefulness. To the same end, he should not base his practice on an exclusive dogma or a sectarian system, for "sects are implacable despots; to accept their thralldom is to take away all liberty from one's action and thought."* A sectarian or cultist as applied to medicine is one who alleges to follow or in his practice follows a dogma, tenet or principle based on the authority of its promulgator to the exclusion of demonstration and scientific experience. All

voluntarily associated activities with cultists are unethical. A consultation with a cultist is a futile gesture if the cultist is assumed to have the same high grade of knowledge, training and experience as is possessed by the doctor of medicine. Such consultation lowers the honor and dignity of the profession in the same degree in which it elevates the honor and dignity of those who are irregular in training and practice.

PATIENCE, DELICACY AND SECRECY

SEC. 2.—Patience and delicacy should characterize the physician. Confidences concerning individual or domestic life entrusted by patients to a physician and defects in the disposition or character of patients observed during medical attendance should never be revealed unless their revelation is required by the laws of the state. Sometimes, however, a physician must determine whether his duty to society requires him to employ knowledge, obtained through confidences entrusted to him as a physician, to protect a healthy person against a communicable disease to which he is about to be exposed. In such instance, the physician should act as he would desire another to act toward one of his own family in like circumstances. Before he determines his course, the physician should know the civil law of his commonwealth concerning privileged communications.

PROGNOSIS

SEC. 3.—The physician should neither exaggerate nor minimize the gravity of a patient's condition. He should assure himself that the patient, his relatives or his responsible friends have such knowledge of the patient's condition as will serve the best interests of the patient and the family.

THE PATIENT MUST NOT BE NEGLECTED

SEC. 4.—A physician is free to choose whom he will serve. He should, however, respond to any request for his assistance in an emergency or whenever temperate public opinion expects the service. Once having undertaken a case, the physician should not neglect the patient, nor should he withdraw from the case without giving notice to the patient, his relatives or his responsible friends sufficiently long in advance of his withdrawal to allow them to secure another medical attendant.

Chapter III

DUTIES OF PHYSICIANS TO EACH OTHER AND TO THE PROFESSION AT LARGE

ARTICLE I.—DUTIES TO THE PROFESSION

UPHOLDING THE HONOR OF THE PROFESSION

SECTION 1.—A physician is expected to uphold the dignity and honor of his vocation.

MEMBERSHIP IN MEDICAL SOCIETIES

SEC. 2.—For the advancement of his profession, a physician should affiliate with medical societies and contribute of his time, energy and means so that these societies may represent the ideals of the profession.

SAFEGUARDING THE PROFESSION

SEC. 3.—Every physician should aid in safeguarding the profession against admission to it of those who are deficient in moral character or education.

SEC. 4.—A physician should expose, without fear or favor, incompetent or corrupt, dishonest or unethical conduct on the part of members of the profession. Questions of such conduct should be considered, first, before proper medical tribunals in executive sessions or by special or duly appointed committees on ethical relations, provided such a course is possible and provided, also, that the law is not hampered thereby. If doubt should arise as to the legality of the physician's conduct, the situation under investigation may be placed before officers of the law, and the physician-investigators may take the necessary steps to enlist the interest of the proper authority.

* Nicom, father of Galen.

ARTICLE II.—PROFESSIONAL SERVICES OF PHYSICIANS
TO EACH OTHER

DEPENDENCE OF PHYSICIANS ON EACH OTHER

SECTION 1.—As a general rule, a physician should not attempt to treat members of his family or himself. Consequently, a physician should cheerfully and without recompense give his professional services to physicians or their dependents if they are in his vicinity.

COMPENSATION FOR EXPENSES

SEC. 2.—When a physician from a distance is called to advise another physician about his own illness or about that of one of his family dependents, and the physician to whom the service is rendered is in easy financial circumstances, a compensation that will at least meet the traveling expenses of the visiting physician should be proffered him. When such a service requires an absence from the accustomed field of professional work of the visitor that might reasonably be expected to entail a pecuniary loss, such loss may, in part at least, be provided for in the compensation offered.

ONE PHYSICIAN IN CHARGE

SEC. 3.—When a physician or a member of his dependent family is seriously ill, he or his family should select one physician to take charge of the case. The family may ask the physician in charge to call in other physicians to act as consultants.

ARTICLE III.—DUTIES OF PHYSICIANS IN
CONSULTATIONS

CONSULTATIONS SHOULD BE ENCOURAGED

SECTION 1.—In a case of serious illness, especially in doubtful or difficult conditions, the physician should request consultations.

CONSULTATION FOR PATIENT'S BENEFIT

SEC. 2.—In every consultation, the benefit to the patient is of first importance. All physicians interested in the case should be candid with the patient, a member of his family or a responsible friend.

PUNCTUALITY

SEC. 3.—All physicians concerned in consultations should be punctual. When, however, one or more of the consultants are unavoidably delayed, the one who arrives first should wait for the others for a reasonable time, after which the consultation should be considered postponed. When the consultant has come from a distance, or when for any other reason it will be difficult to meet the physician in charge at another time, or if the case is urgent, or it be the desire of the patient, his family or his responsible friends, the consultant may examine the patient and mail his written opinion, or see that it is delivered under seal to the physician in charge. Under these conditions, the consultant's conduct must be especially tactful; he must remember that he is framing an opinion without the aid of the physician who has observed the course of the disease.

PATIENT REFERRED TO CONSULTANT

SEC. 4.—When a patient is sent to a consultant and the physician in charge of the case cannot accompany the patient, the physician in charge should provide the consultant with a history of the case, together with the physician's opinion and outline of the treatment, or so much of this as may be of service to the consultant. As soon as possible after the consultant has seen the patient he should address the physician in charge and advise him of the results of the consultant's investigation. The opinions of both the physician in charge and the consultant are confidential and must be so regarded by each.

DISCUSSIONS IN CONSULTATION

SEC. 5.—After the physicians called in consultation have completed their investigations, they and the physician in charge should meet by themselves to discuss the course to be followed. Statements should not be made nor should discussion take place in the presence of the patient, his family or his friends, unless all physicians concerned are present or unless all of them have consented to another arrangement.

RESPONSIBILITY OF ATTENDING PHYSICIAN

SEC. 6.—The physician in charge of the case is responsible for treatment of the patient. Consequently, he may prescribe for the patient at any time and is privileged to vary the treatment outlined and agreed on at a consultation whenever, in his opinion, such a change is warranted. However, after such a change, it is best to call another consultation; then the physician in charge should state his reasons for departing from the course decided at the previous conference. When an emergency occurs during the absence of the physician in charge, a consultant may assume authority until the arrival of the physician in charge, but his authority should not extend further without the consent of the physician in charge.

CONFLICT OF OPINION

SEC. 7.—Should the physician in charge and a consultant be unable to agree in their view of a case, another consultant should be called or the differing consultant should withdraw. However, since the patient employed the consultant to obtain his opinion, he should be permitted to state it to the patient, his relative or his responsible friend, in the presence of the physician in charge.

CONSULTANT AND ATTENDANT

SEC. 8.—When a physician has acted as consultant in an illness, he should not become the physician in charge in the course of that illness, except with the consent of the physician who was in charge at the time of the consultation.

ARTICLE IV.—DUTIES OF PHYSICIANS IN CASES
OF INTERFERENCE

MISUNDERSTANDINGS TO BE AVOIDED

SECTION 1.—A physician, in his relationship with a patient who is under the care of another physician, should not give hints relative to the nature and treatment of the patient's disorder; nor should a physician do anything to diminish the trust reposed by the patient in his own physician. In embarrassing situations, or whenever there seems to be a possibility of misunderstanding with a colleague, a physician should seek a personal interview with his fellow.

SOCIAL CALLS ON PATIENT OF ANOTHER PHYSICIAN

SEC. 2.—When a physician makes social calls on another physician's patient he should avoid conversation about the patient's illness.

SERVICES TO PATIENT OF ANOTHER PHYSICIAN

SEC. 3.—A physician should not take charge of, or prescribe for another physician's patient during any given illness (except in an emergency) until the other physician has relinquished the case or has been formally dismissed.

CRITICISM TO BE AVOIDED

SEC. 4.—When a physician does succeed another physician in charge of a case, he should not disparage, by comment or insinuation, the one who preceded him. Such comment or insinuation tends to lower the confidence of the patient in the medical profession and so reacts against the patient, the profession and the critic.

EMERGENCY CASES

SEC. 5.—When a physician is called in an emergency because the personal or family physician is not at hand, he should provide only for the patient's immediate need and should withdraw from the case on the arrival of the personal or family physician. However, he should first report to the personal or family physician the condition found and the treatment administered.

PRECEDENCE WHEN SEVERAL PHYSICIANS ARE SUMMONED

SEC. 6.—When several physicians have been summoned in a case of sudden illness or of accident, the first to arrive should be considered the physician in charge. However, as soon as is practicable, or on the arrival of the acknowledged personal or family physician, the first physician should withdraw. Should the patient, his family or his responsible friend wish some one other than he who has been in charge of the case, the patient or his representative should advise the personal or family physician of his desire. When, because of sudden illness or accident,

a patient is taken to a hospital without the knowledge of the physician who is known to be the personal or family physician, the patient should be returned to the care of the personal or family physician as soon as is feasible.

A COLLEAGUE'S PATIENT

SEC. 7.—When a physician is requested by a colleague to care for a patient during the colleague's temporary absence, or when, because of an emergency, a physician is asked to see a patient of a colleague, the physician should treat the patient in the same manner and with the same delicacy that he would wish used in similar circumstances if the patient were his responsibility. The patient should be returned to the care of the attending physician as soon as possible.

SUBSTITUTION IN OBSTETRIC WORK

SEC. 8.—When a physician attends a woman who is in labor because the one who was engaged to attend her is absent, the physician summoned in the emergency should resign the patient to the first engaged, on his arrival. The one in attendance is entitled to compensation for the professional services he may have rendered.

ARTICLE V.—DISPUTES BETWEEN PHYSICIANS

ARBITRATION

SECTION 1.—Whenever there arises between physicians a grave difference of opinion, or of interest, which cannot be promptly adjusted, the dispute should be referred for arbitration, preferably to an official body of a component society.

ARTICLE VI.—COMPENSATION

LIMITS OF GRATUITOUS SERVICE

SECTION 1.—Poverty of a patient, and the obligation of physicians to attend one another and the dependent members of the families of one another, should command the gratuitous services of a physician. Institutions and organizations for mutual benefit, or for accident, sickness and life insurance, or for analogous purposes, should meet such costs as are covered by the contract under which the service is rendered.

CONDITIONS OF MEDICAL PRACTICE

SEC. 2.—A physician should not dispose of his services under conditions that make it impossible to render adequate service to his patients, except under circumstances in which the patients concerned might be deprived of immediately necessary care.

CONTRACT PRACTICE

SEC. 3.—Contract practice as applied to medicine means the practice of medicine under an agreement between a physician or a group of physicians, as principals or agents, and a corporation, organization, political subdivision or individual, whereby partial or full medical services are provided for a group or class of individuals on the basis of a fee schedule, or for a salary or for a fixed rate per capita.

Contract practice *per se* is not unethical. Contract practice is unethical if it permits of features or conditions that are declared unethical in these Principles of Medical Ethics or if the contract or any of its provisions causes deterioration of the quality of the medical services rendered.

FREE CHOICE OF PHYSICIAN

SEC. 4.—Free choice of physician is defined as that degree of freedom in choosing a physician which can be exercised under usual conditions of employment between patients and physicians. The intervention of a third party who has a valid interest, or who intervenes between the physician and the patient does not *per se* cause a contract to be unethical. A third party has a valid interest when, by law or volition, the third party assumes legal responsibility and provides for the cost of medical care and indemnity for occupational disability.

COMMISSIONS

SEC. 5.—When a patient is referred by one physician to another for consultation or for treatment, whether the physician in charge accompanies the patient or not, the giving or receiving of a commission by whatever term it may be called or under any guise or pretext whatsoever is unethical.

PURVEYAL OF MEDICAL SERVICE

SEC. 6.—A physician should not dispose of his professional attainments or services to any hospital, lay body, organization, group or individual, by whatever name called, or however organized, under terms or conditions which permit exploitation of the services of the physician for the financial profit of the agency concerned. Such a procedure is beneath the dignity of professional practice and is harmful alike to the profession of medicine and the welfare of the people.

Chapter IV

THE DUTIES OF PHYSICIANS TO THE PUBLIC

PHYSICIANS AS CITIZENS

SECTION 1.—Physicians, as good citizens, possessed of special training, should advise concerning the health of the community wherein they dwell. They should bear their part in enforcing the laws of the community and in sustaining the institutions that advance the interests of humanity. They should cooperate especially with the proper authorities in the administration of sanitary laws and regulations.

PUBLIC HEALTH

SEC. 2.—Physicians, especially those engaged in public health work, should enlighten the public concerning quarantine regulations and measures for the prevention of epidemic and communicable diseases. At all times the physician should notify the constituted public health authorities of every case of communicable disease under his care, in accordance with the laws, rules and regulations of the health authorities. When an epidemic prevails, a physician must continue his labors without regard to the risk to his own health.

PHARMACISTS

SEC. 3.—Physicians should recognize and promote the practice of pharmacy as a profession and should recognize the cooperation of the pharmacist in education of the public concerning the practice of ethical and scientific medicine.

Conclusion

These principles of medical ethics have been and are set down primarily for the good of the public and should be observed in such a manner as shall merit and receive the endorsement of the community. The life of the physician, if he is capable, honest, decent, courteous, vigilant and a follower of the Golden Rule, will be in itself the best exemplification of ethical principles.

Respectfully submitted,

EDWARD R. CUNIFFE, Chairman.

LOUIS A. BUIE.

WALTER F. DONALDSON.

HOMER L. PEARSON JR.

JOHN H. O'SHEA.

The Speaker resumed the chair.

Proposed Amendment to Constitution

Dr. James Stevenson, Oklahoma, presented the following proposed amendment to Article 3 of the Constitution, which was referred to the Reference Committee on Amendments to the Constitution and By-Laws:

WHEREAS, The constituent associations forming the American Medical Association are proud to be members of the world's greatest medical organization; and

WHEREAS, No constituent association has any formal recognition that it is an integral part of the American Medical Association; therefore be it

Resolved, that Article 3 of the Constitution of the American Medical Association be amended to read, "Constituent associations are those medical associations of states, territories or insular possessions which are or which may hereafter be federated to form the American Medical Association; and such constituent associations shall receive a charter from the American Medical Association."

After announcements by chairmen of reference committees of times and places of meetings, by Dr. Ernest B. Howard, Assistant Secretary, and by the Speaker, the House of Delegates recessed at 4:50 p. m., to meet at 1:15 p. m. Tuesday, June 7.

(To Be Continued)

Hearings On Health Insurance

Senate Bills 1106, 1456, 1581 and 1679

A Condensation

MAY 23, 1949

United States Senate, Subcommittee on Health of the
Committee on Labor and Public Welfare

SENATOR JAMES E. MURRAY (chairman of the
Subcommittee) Presiding

Present: SENATORS MURRAY, PEPPER AND TAFT

Also present: SENATOR HILL

SENATOR MURRAY: The subcommittee on health is today beginning hearings on four bills. Each has to do with some or several aspects of a subject which is of utmost importance to this country, the health and physical well-being of its people.

Despite our present differences of opinion as to the extent and the kind of health problems confronting us, even though we may disagree as to the methods of solving these problems, on some things we are unanimous. We agree that there is a problem and that it is our responsibility to find a solution.

Our program these first two days calls for explanation of S. 1679, the National Health Insurance and Public Health Act, sponsored by Senators Thomas of Utah, Wagner, Pepper, Chavez, Taylor, McGrath, Humphrey and myself. This will be undertaken by Senator Thomas and by Mr. Kingsley, Assistant Administrator of the Federal Security Administration.

Senators Taft and Donnell will then discuss S. 1581, the National Health Act of 1949, sponsored by Senators Taft, Donnell and Smith of New Jersey.

Following their presentation, Senator Hill and Mr. Bugbee will discuss S. 1456, the Voluntary Health Insurance Act, sponsored by Senators Hill, O'Connor, Withers, Aiken and Morse. Then Senator Lodge will discuss his bill, S. 1106, the Medical Aid Act of 1949.

I should add that neither titles III and V of S. 1679 nor Titles IV and V of S. 1581 will be considered by this subcommittee. They have been referred to Senator Hill's subcommittee and have been studied in connection with S. 614, S. 522 and other bills relating to expansion of hospital facilities and public health service.

SENATOR MURRAY: Our first witness will be Mr. Donald Kingsley, who will present the Federal Security Agency's position on the bills before us. While we are very glad to have Mr. Kingsley appear before us, I should like the record to show our extreme regret that the Honorable Oscar R. Ewing, Federal Security Administrator, has not yet recovered sufficiently from a serious illness to be able to appear personally.

Statement of J. Donald Kingsley, Acting Federal Security Administrator

MR. KINGSLEY: We have filed reports on four bills, S. 1106, S. 1456, S. 1581 and S. 1679. The first is covered in a separate report, since it has little in common with the others and is concerned primarily with the provision of expensive drugs, diagnostic services, etc. As for the other three, we have combined our detailed observations under topical headings, comparing the different proposals as they relate to medical care, facilities, services, personnel, research, hospital construction, public health services, and maternal and child health.

We are confronted immediately by three major problems whenever we consider how to improve the health of the American people. All three are problems in economics, not in medicine. First is the problem of man power and facility shortages; second, the problem of man power and facility distribution, and, underlying all others, the problem of inadequate medical purchasing power in the hands of a substantial proportion of our families.

These recognizable segments of the total problem are the ones for which all interested groups are seeking solutions. They are closely interrelated. It is the position of the Administration that the ultimate solution of any one of them depends on finding answers to all three. That is the firm conviction which underlies the comprehensive national health program recommended by the President as long ago as November 1945, and which underlay Mr. Ewing's report to the President, "The Nation's Health." It also is the fundamental assumption, it seems to me, on which the program provided in S. 1679 is based.

First is the problem presented by the current aggregate shortage of trained health personnel and health facilities: The shortages of doctors, dentists and nurses, of clinics and hospitals. These deficiencies are real, and there is widespread agreement that they exist. There is less agreement as to why they are so acute and as to the best means of overcoming them. There is, of course, no simple, inclusive explanation. But a major contributing factor is, unquestionably, a serious shortage of medical purchasing power. We do not have more hospitals, for example—even with the expenditure of substantial federal funds to assist in their construction—because the people in many shortage areas could not support them if they had them.

Second, there is the problem presented by the inequitable distribution of the man power and health facilities we do have. This results in wide discrepancies in the availability of medical care from one community to another. The twelve states with the highest ratio of doctors to population average 1 doctor to every 667 persons, but the twelve poorest states in this respect average only 1 doctor to every 1,223 of their citizens. Consequently, if you are taken ill today in one of the twelve most favored states, you have about twice as good a chance of getting a doctor when you need him as you do in one of the twelve least favored states. Contrasts between individual states and communities within states are even sharper. Moreover, the situation is similar in respect to other health personnel, and in the case of the distribution of hospital beds the discrepancies are even more marked.

The existing distribution is generally unfavorable to the South and West and to rural areas in comparison with urban. But our most serious health problems—the highest death rates among mothers and children, for instance, the greatest incidence of disease, the most pressing need for medical man power and facilities of all kinds—these are found in precisely those areas that are so strikingly discriminated against.

The maldistribution of existing personnel and facilities aggravates the problem of providing adequate medical care to all of our people. A significant fact in connection with this pattern of distribution is that, in general, it follows closely the pattern of income distribution. By and large, the sections, states and localities with the highest ratio of health personnel and facilities are those with the highest per capita income. Conversely, the most undernourished areas from the standpoint of medical care are as a rule those with the lowest level of purchasing power. This is not surprising. Hospitals are built where they can be supported, and doctors settle where they can make a living. This means that the key to a more equitable distribution of health facilities is to be sought in some method of increasing the effective health purchasing power in the medically undernourished areas—a result which is directly accomplished through social insurance.

Third is the problem presented by the fact that a substantial portion of our people cannot afford to purchase medical care under a system in which most of the cost falls on the sick. Just what proportion of the population belongs in this category is, perhaps, a matter for honest difference of opinion. The American Medical Association has estimated that no more than 20 per cent of our people can meet the cost of a serious illness without assistance in the form of private or public aid. Whatever the number who cannot afford adequate modern care, it is substantial—certainly, at the very least, it includes that half of our population living in families with incomes of \$3,000 or less a year. In fact, under the present circumstances, only the relatively rich or the charity poor are in a position to take full advantage of the wonders of modern medicine. The great middle income group is left out in the cold, without wealth enough to meet a sudden emergency or to pay for modern preventive care, but too well off to qualify and too proud to ask for charity. They can only hope and pray that their own immediate families will be spared a serious and bankrupting illness.

It is of the utmost significance, I believe, that a common financial problem underlies all these others: the current shortage of personnel and facilities; the inequitable distribution of those we have, and the inability of large numbers of our people to utilize them fully. In undertaking to improve the nation's health, we can be confident, in my judgment, that the doctors are doing their part of the job magnificently. The problem now is one for the economist and the statesman.

I should like to turn now to what seems to me to be the central issue raised by the three major bills before your committee: that is, the various means by which all of them seek to make medical care available to those who need it. The methods proposed are different and the results would vary widely, but the broad objectives are similar.

As I read these three principal bills, my most significant impression is not that they are so widely different, but that they are so much alike.

The provisions of all of these bills reflect common recognition of the fact that today a substantial proportion of our population must depend on public or private charity or go without the type of medical care that modern science knows how to provide.

I want to stress the conviction that unless a comprehensive system of prepayment such as that provided in S. 1679 is established, it will be impossible to meet the nation's medical needs without an ever increasing measure of state medicine.

The extent to which government already is involved in the provision of medical care to individuals is often overlooked in our zeal to identify our system for the care of the sick with our business system of private enterprise.

By its very nature medical care is uneconomic. In modern times, it has never rested on the rule of the market place, because public interest has required that illness be treated somehow, whether the individual could afford it or not. From the beginning, the economic basis of medicine has been a loosely defined triple standard: first, a rough and ready sliding scale of prices for the well to do; second, private charity in various forms for the "medically indigent," meaning those who are self supporting except in emergency, and, third, government medicine and various forms of public charity for the poor. It is a makeshift system.

In spite of these catch as catch can financial arrangements, the medical profession has made remarkable progress. This is not a tribute to the system of payment, however, but to the devotion of the medical profession and to our national readiness to improvise.

Without a workable economic base on which the private practice of medicine and our voluntary hospital system could improve and expand at a pace consistent with the advance of medical knowledge and general social standards, we have turned over to government a greater and greater share of responsibility, until today some 24,000,000 citizens are receiving various kinds and degrees of medical care from the federal government alone, according to the Hoover Commission.

The expansion of government's responsibility for medical care has been steady and sure through much of our history, but until the comparatively recent past it has been confined for the most part to states, counties and municipalities. Since the turn of the century, however, the pressure on government at all levels to take over a larger and larger share of the load has been increasingly strong. The reason for this is clear.

Medical schools grew, hospitals expanded and their facilities multiplied in number and complexity. The result was more progress in fifty years than in all the centuries since Hippocrates. But as knowledge increased, as new skills were developed, the practice of medicine became infinitely more effective, and equally more expensive and beyond the ability of rich men's fees and private charity to support. The people and the profession itself turned more and more to government.

Today, government owns and operates three quarters of all the hospital beds in the United States. Government employs thousands of doctors and pays fees to many more. In addition, the taxpayers carry the full load in that vast field of medical service known as "public health," and provide large sums to support medical research and education.

We have gone so far along this road, impelled by irresistible circumstances rather than by design, that the real issue is already quite different from what it is usually presented as. The real issue is not between voluntary, private health insurance and a national system based on our social insurance experience, but rather between national health insurance and state medicine. I am convinced that nothing short of the social insurance method can prevent the further—and eventually the complete—substitution of state for private medicine. On the other hand, I believe that social insurance can prevent it, because it would establish exactly the thing that has always been lacking and which has rendered private medicine incapable of doing the full job. That is, a sound, firm, reliable economic foundation on which private medicine can expand and flourish.

I am not in any sense opposed to voluntary health insurance. I, personally, have been a subscriber for a long while. I simply am convinced that voluntary health insurance cannot do the job which all of us agree must now be done. The situation has changed radically since the American Medical Association took its original stand. Voluntary insurance has not exactly led to revolution, but neither has it halted the trend toward state medicine. On the contrary, no period in history has seen such rapid development in that direction.

Voluntary health insurance costs too much for most people to buy, and it cannot pay its own way on lower premiums. We

are told that health insurance has made gigantic strides and now affords protection to 52,000,000 Americans, or one third of the nation. The question arises, "What are they protected against?" And the answer is that less than 2½ per cent have anything even approaching the comprehensive protection that is provided for in S. 1679. Other voluntary insurance subscribers have protection ranging from next to nothing under policies with a great deal of fine print, to limited protection under several different policies for hospital, surgical and medical care. The cost is in proportion to protection, and it is not cheap.

Another question would be, "Who is protected under voluntary insurance?" Most voluntary insurance policies are issued by Blue Cross Hospitalization Plans—the American Medical Association says 32,000,000 of them—providing limited insurance for hospital care only. About 60 per cent of these policies are held by citizens of six rich industrial states which contain about 36 per cent of the total population of the United States. Only about 17 per cent of Blue Cross members live in Southern and Western states with 43 per cent of the population. Less than 3 per cent of the rural population belong. Two thirds of our people have no protection of any kind under voluntary insurance. And this after twenty years of intensive advertising and selling.

The history of health insurance proves that, if one of our objectives is the prevention of state medicine, then we ought to be extremely wary of proposals that we merely go wading in health insurance now. With all respect, for I know the sponsors have worked devotedly to solve a complex problem, this is our chief objection to S. 1456 and S. 1581, that they invite us to go wading in a stream where one must swim or sink. S. 1679, on the other hand, not only invites us to swim, but provides a set of water wings as well.

S. 1456 and S. 1581 do not place very much faith in voluntary insurance. Instead, it appears that both of them, while one requires and the other permits the use of the voluntary plans' administrative machinery, rely in effect if not in purpose on public charity—a medical dole. Moreover, both are so limited in scope that whatever beneficial effect they might have would serve merely to intensify the dissatisfaction of those who would be excluded from their benefits. S. 1456 is the more specific of the two. It bears the title "Voluntary Health Insurance Act."

Leaving out all of the provisions for state plans, etc., it provides for the appropriation of an unspecified amount of money, to be matched by the states. The state, either before or after a person becomes ill, is to give the individual a card which will entitle him to get medical and hospital care—apparently about the same extent of service he would get if he belonged to the combined Blue Cross-Blue Shield plans today. This would be far less protection than he would get under S. 1679.

Is this insurance at all, voluntary or otherwise? If the recipient were to get his card even a few days in advance of illness, presumably he could, if he chose, look on it as insurance without premiums. But as far as the state is concerned, it would merely be a requisition on the insurance plan for the purchase, through it, of whatever medical and hospital care the holder might need, within the limitations. The bill provides that payment by the state to the insurance plan must cover the full cost of whatever care the plan purchases for the holder of the card, plus the plan's administrative expenses. If this interpretation is correct, then the taxpayer, at least, must look on it, not as insurance in any sense, but as direct relief to the recipient. On that basis, it might be open to question whether the insurance plan contributes anything essential, or whether the state itself might not handle the administration more economically without the middleman.

This might be even more pertinent if the bill would make possible the payment of these public funds for the purchase of medical care through commercial, profit-making insurance companies as well as the voluntary nonprofit plans. This question arises particularly in connection with the Blue Shield plans. In some states the only service they provide is to endorse and recommend commercial insurance policies. Could public money, under S. 1456, be paid to these Blue Shield plans, to be paid by them in turn to commercial insurance companies, to be used by them in turn for the purchase of medical and hospital care for the holder of the card? I feel sure that this is not intended, but I cannot tell by reading the bill whether the answer is "yes" or "no." If the answer were "yes," then it would be pertinent to point out that in some cases as much as 70 per cent of the subscriber's payments to commercial plans go for overhead expense.

The next question is, how many will get such cards? The only ones we can be sure of are those "on relief" and those receiving unemployment compensation. These can be certified with no further investigation as being unable to pay all or part of

the cost of premiums. The rest is uncertain. It may be that some simple method of certification is contemplated but not written into the bill, even though this presumably would open the door to a great deal of waste and inequity. However, if the state is to follow the procedures worked out over the years for such purposes, then certification of those not already on the rolls as indigent will be unavoidably costly and time consuming.

SENATOR TAFT: What does your plan do for people who have no money? How do you take care of them?

MR. KINGSLEY: As I would read S. 1679 provision is made for direct service by the state to people who are on the rolls. Anybody who is not on the roll is not covered. And this question does not arise under S. 1679 as I would read it.

SENATOR TAFT: They do not cover people who are not enrolled at all, do not take care of the indigent and the poor at all, you mean?

MR. KINGSLEY: The people on the indigent and relief rolls, and therefore already identified by the state, would be taken care of, as I would read S. 1679. But the problem that arises here is one of interpretation. It may be that under these bills only the people on the relief rolls already are to be taken care of.

SENATOR TAFT: They have to pay hospitals or doctors or somebody to take care of them just as Mr. Hill's bill provides for taking care of them by private insurance funds if necessary.

MR. KINGSLEY: The question that I am raising here is one of administrative difficulty. It would seem from reading these bills, particularly Mr. Hill's bill, there are two possible interpretations. One is that it is restricted to people already on the relief rolls, already identifiable in the state, and in that event it seems that taking care of them can be best done by an amendment to the Public Assistance Title of the Social Security Act, which has already been recommended by the Administration and has been considered by the House Ways and Means Committee, and ultimately will be considered by the Senate Finance Committee.

SENATOR TAFT: In one way or another you give free medical care to the people who cannot pay for it under any of the bills?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: And whether you give it by insurance fund or a private hospital or a city hospital, I do not quite see the difference in administration. The principle is the same.

MR. KINGSLEY: I agree there is no difference in principle. The point I am attempting to develop is that if Senator Hill's bill is restricted to people on the relief rolls already, then our position would be that that could be most easily handled without the intervention of voluntary insurance systems or anything else except an amendment to the Social Security Act.

SENATOR TAFT: You cannot give them medical care by an amendment. Somebody has to give it to them, hospitals or doctors or somebody. Whether it is by private insurance fund, or private hospital, or public hospital. I do not quite see the point. They would have to take care of the poor and the indigent and the people who do not pay a tax under the insurance fund.

MR. KINGSLEY: Except, as I am sure you know, most of the existing voluntary plans do not provide anything in the way of service. They just collect money. They are just financial channels.

SENATOR TAFT: That is right, and that is what you are proposing the Government be.

MR. KINGSLEY: The next line is on the assumption that perhaps the people who are eligible under this bill are not those merely restricted to relief rolls. Beyond this, what is to be the basis for the distribution of "insurance" cards to those not already certified as indigent? Presumably, everyone else is self supporting or has been too proud to ask for charity. Is the state to seek them out and urge them to get on the rolls, to sign up as partial charity cases and accept "voluntary insurance" cards? What would be the advantage to the individual? He has exactly the same assurance of aid if he waits until he gets sick, and meanwhile he can at least nurse the hope that he will be a lucky one and will not have to admit his dependence.

Why should the state go out of its way to sign up recipients in advance, since the requirement in any case is to pay the full cost of medical and hospital services provided, plus the insurance plan's administrative expense? Since the state is to give this guarantee, is the same guarantee to apply in reverse? If not, the advantage would seem to be one-sided. In that case, I ask this question: What rates are going to be

charged? People in the lower income brackets are looked on by the insurance experts as "bad risks," and therefore chargeable at a much higher rate than is carried by most of the policies now in effect. This is one additional reason why the voluntary plans have never reached down below the upper third of the population.

It seems to me that either S. 1456 or S. 1581, if adopted, would confront the nation with a dilemma. They could be interpreted in either of two ways: to make medical care on a limited basis available only to those already "on relief," or to lift the ceiling on pauperism and include the "medically indigent" as well.

If the first interpretation is intended, then these bills would not do more than the Administration has proposed we should do for the indigent, in its recommendations for the expansion of medical care under the Public Assistance Title of the Social Security Act.

If, on the other hand, the ceiling is to be raised to include the "medically indigent" in a program of public charity, then we face a number of serious questions:

1. Is it good public policy to encourage normally self-supporting citizens to seek charity?

2. Would it be possible, without such encouragement and without in some way removing the onus which attaches to the "means test," to bring into such a scheme any significant number of persons who are now too proud and self reliant to ask for charity?

3. If such a scheme were successful in providing coverage on an adequate basis for all those who need it, would not the cost be even greater than the cost of national health insurance as provided in S. 1679?

SENATOR TAFT: This provision in your bill, on page 111, section 705, provides that the state may contract with the federal government to give these services, just as Mr. Hill's bill provides they may contract with private insurance funds.

MR. KINGSLEY: As this bill is written, Senator, in effect you have a contractual arrangement between the federal government and the state for all provisions.

SENATOR TAFT: It provides for the state care of the indigent, and a contract with the federal government, and to pay the premium to them. I do not see how that is a different principle from Mr. Hill's bill, which provides an insurance fund—the state goes to them and lets them provide the care to the indigent. I do not see the difference in the principle you are trying to make in this whole discussion when it comes to dealing with the strictly indigent. I am not speaking about the intermediate group.

MR. KINGSLEY: In respect to that, Senator Taft, this is not in every aspect, every detail, our bill. This is a bill which was prepared by the sponsors to meet the broad provisions of the President's program.

SENATOR TAFT: You are speaking of S. 1679 now?

MR. KINGSLEY: Yes, S. 1679.

SENATOR TAFT: Will you tell us then, how you would change it?

MR. KINGSLEY: It would be our position that if the Administration's recommended amendment to the Social Security Act is adopted by the Congress, which, in effect, provides for payments by the federal government to the states on behalf of medical expenditures for the indigent in the state, then there would be no need for this particular section in S. 1679, and that that would be, from our point of view, a more direct method of approaching this. S. 1679, on the other hand, offers a real solution to the major problems I outlined at the opening of this discussion.

As I suggested, however, the finest medical service is of little value, no matter where or in what amount, unless it can be maintained economically. Title VII of S. 1679 deals with this problem in the only effective way I know, by applying the method of social insurance which we have tried and tested for more than a dozen years.

SENATOR TAFT: In which field do you mean, old age pension?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: It has not been notoriously successful, I would think, when you now need a complete change in the whole system.

MR. KINGSLEY: I would say it has not kept pace; the system has not kept pace with the changes in the price level and the coverage has not been extended to the extent we would have hoped and that S. 1679 provides.

SENATOR TAFT: Not only that, but it provides less income than noncontributors get in many states already.

MR. KINGSLEY: That is right.

SENATOR TAFT: That is not a very good thing on which to base an argument that the principle should be extended.

MR. KINGSLEY: That would seem to me to be because the Congress by and large had chosen to raise public assistance benefits rather than to raise the insurance benefits. But in terms of the system I think there is no reason at all why the insurance system benefits could not have been raised to keep pace with changes in the price level, and the Administration has recommended that.

SENATOR TAFT: It was purportedly a system of insurance, and it is supposed to pay for itself, and as a system of insurance it has not and will not. Therefore, I do not see that it is any argument for insurance. The reason it has not been changed is that it was supposed to have been an insurance operation, whereas direct aid varies according to need. Now you propose to throw away the actuarial system and change the whole thing.

MR. KINGSLEY: I do not see it that way, because our proposals are also for raising the base, from \$3,600 to \$4,800, so at the same time the benefits are raised there is an increase in return in premium and return to the system, again based on changes in wage and price levels. So I think the principle is maintained in the Administration's proposals.

SENATOR TAFT: You said "by applying the method of social insurance which we have tried and tested for more than a dozen years." It did not seem to me that, as an example to be followed, that is particularly justified by our experiences.

MR. KINGSLEY: We have a difference of opinion on that point. By this method, it would establish a firm, dependable economic foundation under the whole structure of private medical practice. It would result in the establishment and the effective maintenance of doctors, hospitals and all other health personnel and facilities wherever they were justified by the number, not the wealth, of prospective patients. For the first time, it would make it economically worth while for doctors to use their talents where they are most urgently needed. No longer would the doctor be forced to hold a stethoscope on the patient's heart and pocketbook at the same time, and adjust his fees accordingly. No longer would he feel compelled to reserve the prescription of expensive treatments and drugs, regardless of their effectiveness, to those whose health permits their use. Instead, he would be completely free, for the first time, to consider each patient solely on the basis of professional judgment and not with the appraisal of a bill collector.

As for the patient, no longer would he be compelled to consider the cost of illness first and its consequences later. He would not feel hesitant, for fear of the cost, about going to the doctor at the first sign of illness, and thereby reaping the benefits of modern preventive medicine.

It is hardly necessary to picture for you the endless chain of beneficial results which would flow automatically from the mere fact that, on the enactment of this bill, almost all of the people in the United States would have the purchasing power with which to buy all the medical care they need.

There are those who fear this program, who contend that it would "regiment" the doctor, interfere with the freedom of the patient, destroy the standards of medical care and lead to socialism.

These are fearful phantoms, and not one of them could possibly materialize under the terms of this bill. Its administrative provisions guarantee the widest decentralization of authority, with full representation of both doctors and laymen. They assure that the most important decisions affecting doctors and patients will be determined by their own local representatives, in their own communities. And to make the assurance doubly binding, the bill specifically spells out and guarantees all the freedoms which we are told it would take away.

It seems plain to me that only by this method of social insurance can we effectively shore up our voluntary hospitals and our system of private medical practice, and forestall the need for a further extension of state medicine. We are moving fast in that direction, and I sincerely hope that the President's program will not be delayed too long.

SENATOR TAFT: Mr. Kingsley, I have not interrupted you, but I do not want my silence to indicate my agreement even with some of your conclusions about our bills, or with some of the general statements.

You say, "It appears to be agreed, for instance, that our present system of payment for medical care is totally inadequate." I do not agree to that at all. But there is no use in getting into an argument on the general principles of the two bills. I simply want to say that I disagree with the conclusions you make in respect to a dozen different things in the statement.

I would like to find out exactly what S. 1679 does, if that is in order at this time. Mr. Chairman.

SENATOR MURRAY: I see no objection to proceeding along that line.

SENATOR TAFT: First is Title I, Education of Health Personnel. What has the Federal Security Administration done about consulting with the various medical schools, and what recommendations have they from the medical schools or public health schools? And exactly what is the provision that you are contemplating in this bill? I notice it covers nearly 70 pages.

MR. KINGSLEY: Last year Senator Thomas put in a bill on this subject which differs from the provisions in Title I of S. 1679. This current bill differs from that because of the number of consultations we have had with representatives of medical schools and with university presidents. In fact, the university presidents and the deans of medical schools have taken somewhat different positions as to the best approach to the problem.

SENATOR TAFT: Yes. I have talked to many of them, and I found many differences of opinion. That is the reason I want to raise this question. You notice in our bill, while we did provide some temporary things for doctors only, we provided for setting up a commission to try to study the problem. I wondered what you had already done in that respect.

MR. KINGSLEY: The medical deans set up a committee, or, perhaps, we set it up in consultation with some of their leaders. About thirty medical deans met with us on several occasions and canvassed this situation. And we have also met on two or three occasions with representatives of the university presidents.

The major request, I would say, from both the presidents and the deans was for federal assistance in maintenance and operation and federal assistance for construction. There was not great enthusiasm on the part of either group for an incentive system which would require them to expand their enrolment, although that is what we are primarily interested in. The presidents, I think, are more inclined toward that. In fact, President Conant recommended to us a differential. You have the same idea in your bill, \$500 for existing enrolment, and \$750—

SENATOR TAFT: Yes. Do you think you can get much increased enrolment by that? The limit seems to be on facilities and teachers rather than on the willingness to take people.

MR. KINGSLEY: It is a complex situation, and the bottleneck in any given school may not be the one that exists in other schools. In some places it is hospital beds, and in some places they need a teaching hospital. In some places it is the laboratory facilities, and in some instances it is a matter of the university budget. So the situation needs a sort of multilateral kind of approach, which is provided in this particular title. There are, as you know, provisions here for grants for maintenance and operation.

SENATOR TAFT: First you have grants direct to the school of so much per student, \$300 per student, and \$1,700 for every student over the average in recent years, whatever the formula may be.

MR. KINGSLEY: Yes. That \$1,700 figure was arrived at by taking the average cost of medical education and the average tuition paid and subtracting the tuition from the cost. It cost the average university about \$1,750 to educate each medical student.

SENATOR TAFT: Is there any provision for grants to medical schools to increase facilities, buildings, equipment, and so forth?

MR. KINGSLEY: Yes, there are provisions as far as construction is concerned for both loans and grants, and for both construction and equipment, in Section 373. There is a provision for an unspecified amount. It is a matter of appropriation authorization in general terms for these purposes.

SENATOR TAFT: Who distributes that? That always worries me when you get a federal thing like that; every state wants a new medical school whether they are able to handle it or not.

MR. KINGSLEY: It would be distributed directly to the schools by the Surgeon General. And there is only a broad general guide as to how he would distribute it.

SENATOR TAFT: It is in his discretion entirely?

MR. KINGSLEY: At his discretion except that grants are to be made in the order of significance of their effect in alleviating shortages.

SENATOR TAFT: And he determines that?

MR. KINGSLEY: Yes, sir, it is very broad—up to 50 per cent of cost of the project.

SENATOR TAFT: Can he set up new medical schools under that authority?

MR. KINGSLEY: Yes, it would be both.

SENATOR TAFT: It seems that I remember Dr. Parran's policy in the expansion of medical schools related to the gradual addition of a certain number of medical schools to the total rather than the expansion of existing schools. Am I correct in that?

MR. KINGSLEY: I think that is right. I think originally the position was support for creation of new schools.

SENATOR TAFT: My recollection was that he figured it would take ten years to get to the point that he thought you ought to reach.

MR. KINGSLEY: I think that is about what our estimates are today.

SENATOR TAFT: Have you any estimate on the cost of these two items, \$300 and \$1,700?

MR. KINGSLEY: The Public Health Service at the moment is making a survey on need for construction among medical schools. Whether they have advanced far enough to give a figure, I do not know.

SENATOR TAFT: Was there also included here a provision for scholarships direct to students?

MR. KINGSLEY: Yes, sir, there is a provision for scholarships and for the payment of maintenance costs to medical students; maintenance allowances to medical students varied in terms of dependents in addition to a tuition payment for fees and books. That is in Section 377 and Section 378.

SENATOR TAFT: Is there any particular immediate need for that? There may be in time to come, but is there any immediate need for that in view of the tremendous number, four or five times as many, people applying for medical schools than they can take in?

MR. KINGSLEY: I would say in viewing the problem merely from the standpoint of expanding the number of trained personnel, that at the moment there is not a need for it. On the other hand, in terms of providing, of getting the best trained personnel, there is need for it. But it is a different kind of emergency, a different kind of a problem rather than a shortage problem.

SENATOR TAFT: I notice the Gallop poll showing 28 per cent of all families wanted their sons to be doctors compared to 14 for engineers, and then about 9 or 10 for lawyers and business executives.

MR. KINGSLEY: The situation in that respect, I think is different, perhaps, in connection with dentists, where a large proportion of the dental students at present are under the G.I. bill, and where they have some concern as to whether they will keep up their enrolments as the G.I. benefits fall off, and the situation with respect to nurses where there is a real need to increase the allowances apparently for student nurses in order to recruit people into that.

SENATOR TAFT: To get enough?

MR. KINGSLEY: Yes. It is quite different from the doctor situation.

SENATOR TAFT: What is this long section on practical nurse training?

MR. KINGSLEY: That provides for training in the states through the vocational education agency, and at the federal level through the Office of Education, of practical nurses who are not fully qualified nurses. They are at a lower level of occupation, as you know, in terms of specialization than a fully qualified registered nurse. But they will help to fill the gap between supply and demand for nurses at the present time or for the foreseeable future.

SENATOR TAFT: It is a shorter course?

MR. KINGSLEY: A much shorter course. There are programs, as I understand, in a number of states at the present time.

SENATOR TAFT: Isn't there \$15,000,000 a year?

MR. KINGSLEY: I believe there is a specific authorization.

SENATOR TAFT: Page 36, \$15,000,000 a year.

MR. KINGSLEY: In general, my feeling is that one of the problems in terms of shortages that we face is a tendency toward overspecialization, toward more training than is needed for a particular kind of job. If we can get what we used to call during the war a job dilution approach, less highly trained persons could do a number of these things, and that would help greatly to solve the whole problem and to reduce the cost of medical care.

SENATOR TAFT: Title II deals with medical research. This whole field of medical research is being dealt with in detail and in general, and the basic research, we were told, is supposed to be in the National Scientific Foundation's work. Do you

need any additional treatment here, or what is the purpose of putting it in this bill?

MR. KINGSLEY: There are two important points in this particular title. The tendency of the Congress has been to set up a whole series of categories of research institutes under the national institutes of health. And in each session of Congress there is a tendency to set up new ones, and it is difficult to develop a coordinated, balanced research program under that kind of an approach, because obviously the number of categories could be multiplied almost indefinitely.

Now this provision, among other things, authorizes the Surgeon General, with the approval of the Administrator, in part (d) on page 32, Section 202, to create additional institutes, and it also permits him, I believe, to abolish institutes when enough emphasis has been given to that particular point.

SENATOR TAFT: Does it include the right to grant money to private institutions, I mean nonprofit institutions?

MR. KINGSLEY: Yes, this would not change the existing authority in that respect under the national institutes of health, and those grants are for the most part direct to institutions or individuals.

SENATOR TAFT: The effect of this title would be to transfer the whole control, so to speak, of this kind of thing to the Appropriations Committee.

MR. KINGSLEY: It might have that effect.

SENATOR TAFT: They would probably insist on detailed programs there before they granted any money, I assume.

MR. KINGSLEY: We would hope that they would not, but in terms of the history of the thing so far, I think that would be a good guess.

SENATOR TAFT: You mean you would like them to give you a lump sum.

MR. KINGSLEY: Well, in terms of the development of research programs involving scientific judgment, it seems preferable to have a good deal of leeway in the Surgeon General and the directors of the National Institute of Health as to just what diseases are going to be given emphasis at a given time, but I think the point is probably well taken that the tendency of the Appropriations Committee would be clearly to write in specific restrictions.

SENATOR TAFT: What is the connection of the National Research Foundation setup, the bill the Senate passed, and now in the House, between them and the Surgeon General's activities? Would they be coordinated?

MR. KINGSLEY: That has given me a good deal of concern, not only in terms of relations with the Surgeon General, but more broadly than that because I was the executive secretary of the present Scientific Research Board a few years back, and we surveyed the whole federal research effort, and it seems to me although there is no assurance in terms of the way the bill is now drafted that the National Science Foundation should be a capstone to this whole business, and should fill in gaps and attempt to coordinate and do a balancing kind of job in the fields of basic research. It cannot go into applied research, and a good deal of research of the National Institute of Health is what I would call applied research.

SENATOR TAFT: The attempt to find the cause of cancer is all basic research?

MR. KINGSLEY: There is no question about that, but when you get into the basic part of the research it does not make much difference whether you are working on cancer or something else. Because it is basic it is the kind of thing that cuts across the board and involves a lot of things about cell growth or disease.

SENATOR TAFT: Is this Title II in a separate bill, also, Senator Murray? Did you not have hearings on a bill on some of these special diseases?

SENATOR MURRAY: We have a number of separate bills here on cerebral palsy, multiple sclerosis, rheumatism and epilepsy. They are separate bills and we held hearings on them.

SENATOR PEPPER: Leprosy, also.

SENATOR TAFT: Did you also consider a possibility of reporting out something like Title II separately, perhaps, in lieu of a lot of new institutes?

SENATOR MURRAY: Yes, to have them all in one group, and I think that those who are advocating the bills would get together and agree on some such program as that. It would make it less expensive to operate than if you had a separate institution for each one because the specialists or experts on one disease would be available for work in the other diseases. They are all men trained along the lines that would make them available for almost any kind of a study, any kind of research.

SENATOR PEPPER: Mr. Kingsley, at present neither the Surgeon General nor the Federal Security Administrator has the authority to set up a new institute as such.

MR. KINGSLEY: That is correct.

SENATOR PEPPER: They do have authority to carry on general research.

MR. KINGSLEY: That is right.

SENATOR PEPPER: But heretofore we have been proceeding on the assumption that it required statutory authority to set up an institute. We are just coming to an awareness of many other things that need to be the subject of special study in addition to the few that already are embodied in the institutes that exist, and I think the idea was to authorize an administrative setup of various institutes when funds were available, and they felt ready to move into that field without, perhaps, Congress having to pass a separate bill on each subject from time to time. Was that not what was basically behind this?

MR. KINGSLEY: That is what I would understand, plus the fact that there would be greater administrative flexibility in terms of how the research program was laid out.

SENATOR PEPPER: That is true. At the present time will you enumerate the institutes we now have.

MR. KINGSLEY: We have the National Cancer Institute, Heart Institute, Mental Health Institute and Dental Institute.

SENATOR TAFT: Is there some special provision here about the payment of salaries to thirty specially qualified workers?

MR. KINGSLEY: In the research title? I do not recall any such provision.

SENATOR TAFT: Page 47.

MR. KINGSLEY: Oh, I am sorry. I do recall that now. It is similar to legislation which has already been adopted for the National Defense Establishment, and which permits them to select a specified number of highly qualified persons and pay them above the civil service ceiling. This would do the same thing for the National Institutes of Health.

SENATOR TAFT: That is to pay not less than \$10,000 or more than \$15,000 per annum?

MR. KINGSLEY: Yes, for no more than thirty positions.

SENATOR TAFT: Those people would be supposedly technically trained scientists.

MR. KINGSLEY: They would be outstanding scientists.

SENATOR TAFT: That is not for administrative purposes?

MR. KINGSLEY: No, sir.

SENATOR TAFT: Title III is the hospital survey and construction amendments. Is that more or less the same as the bill that Senator Hill's committee has considered?

MR. KINGSLEY: I believe this identical. In general what it does is to double the amount per year, raise the amount from \$75,000 to \$150,000 of federal money per year and to extend the program beyond the five year limitation.

SENATOR TAFT: We have already recommended that bill, have we not, Senator Hill?

SENATOR HILL: No, we have not. We have concluded the hearings on it, but we have not been in executive session on it yet.

SENATOR TAFT: It will probably be dealt with separately then, at least, by reporting out a separate bill on the subject.

SENATOR HILL: That is right.

SENATOR PEPPER: Will you allow me to interrupt right there? Title III, I believe, however, does embody the Holland-Pepper amendment that we offered to the Hill bill in making it retroactive, that is a formula that is presently embodied in the Hill bill retroactive to the beginning of the program.

SENATOR HILL: That is right, and the Pepper-Holland amendment is before our subcommittee in connection with the bills that we have there.

SENATOR TAFT: Title IV, Special Aid for Rural and Other Shortage Areas. Will you explain what the proposal is to meet that?

MR. KINGSLEY: Well, this title is devised to overcome as rapidly as possible the more striking discrepancies in the availability of facilities and personnel as between different sections of the country, particularly rural areas as compared to urban, and it has a number of separate provisions under Section 402. It provides for federal grants, which might be used to guarantee minimum incomes or to guarantee operating expenses to people who will go to the shortage areas, for grants to cover their transportation and that of their families and of

household goods, and for grants to subsidize the beginnings of group practice operations.

It also provides for loans for the cost of facilities, and it provides for grants and loans for the construction and equipment of health centers and clinics and so on.

SENATOR TAFT: Why is that not covered by the hospital bill as far as health clinics are concerned?

MR. KINGSLEY: We have raised a point in that respect in our report on this bill. There is a problem in respect to gearing this into the hospital construction program. There is a provision in here that that shall be done. I cannot put my finger on it right at this moment. Oh, yes, Section 403.

Presumably this activity which would be a special activity engaged in by the National Health Insurance Board is a part of the make ready effort to get ready for full service under health insurance, would be engaged in full light of the State plans under the Hospital Construction Act, but there is a problem there. There is no question about it.

SENATOR TAFT: We have in our bill, we do have the general question, I know, of doctors not going naturally to areas where they cannot earn a living. We have simply provided that in a general state plan the state may use federal money to provide inducements to physicians and dentists to practice in areas which would be unable to attract physicians or dentists, leaving it to the states to determine the exact method in which that money might be used in the plans that they submit to the Surgeon General.

It seems to me this is a rather elaborate plan for grants and loans to all sorts of different persons. They are rather confused with the hospital plan.

MR. KINGSLEY: With respect to your first point, Senator Taft, that this bill also provides in Title VII in having provisions for state plans, for the state to submit plans to do exactly the same thing, once they get in operation, so I would read this as being a title which would be mainly applicable in the period before the health insurance system is in full operation, although it could be used at any time to help equalize differences from one section to another.

SENATOR TAFT: This assistance to farmers' experimental health cooperatives, where does that come from? Is that your development or did farm organizations suggest it?

MR. KINGSLEY: I believe that was worked out by the sponsors. I am not certain with whom they worked. The criteria for selecting particular cooperatives to assist are sufficiently broad so that we think there might be some administrative problem involved in it.

SENATOR TAFT: It runs up about \$15,000,000 a year?

MR. KINGSLEY: Ten million dollars the first year and \$15,000,000 thereafter.

SENATOR TAFT: Title V, Grants to States for State and Local Health Work, that is the local public health units section, is it?

MR. KINGSLEY: Yes, and I think that is identical with the bill that is before—

SENATOR TAFT: We are now considering it in a separate bill.

SENATOR MURRAY: That is before the Hill committee. And also Title III.

SENATOR HILL: We have concluded hearings on that bill, too, and hope to go into executive session on it this week.

SENATOR TAFT: Title VI, Research in Child Life and Grants for Maternal and Child Health and Crippled Children's Services. Part (b) grants to states, is just an extension of the existing rule on maternal and child health program?

MR. KINGSLEY: Yes, and the research title is substantially identical except for the amount involved, with a bill introduced by Senator Douglas which I think is before this committee. His bill, as I recall, provides for \$7,500,000 for research grants, and this particular title provides for \$10,000,000.

SENATOR TAFT: Has it anything to do with health?

MR. KINGSLEY: Well, the general approach here has something to do with health ultimately, but there would be no research projects specifically in, let us say, infantile paralysis or a particular disease.

SENATOR TAFT: It sounds more like psychology than health.

MR. KINGSLEY: Well, it would provide for broad integrated programs, study in terms of the effect of environment on the child, and so on, involving almost all the social sciences rather than exclusively the biologic sciences.

SENATOR TAFT: It rather seems to me to be the subject of a separate bill. Title VII is the Prepaid Personal Health and Insurance Benefits.

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: Was this prepared in contrast to some of the other parts of the bill, by the Federal Security Administration in cooperation with the sponsors?

MR. KINGSLEY: Well, yes and no. It does not depart very far, with some modifications, but basically it resembles earlier bills which were prepared by, I believe, the counsel's office in the Federal Research Agency. In this particular instance, however, this is not specifically a bill which was prepared by us. In a few instances it perhaps departs in some small detail from what we would have suggested. It was prepared by the sponsors. We provided some assistance in drafting. We loaned one of our lawyers—

SENATOR TAFT: Well, do you approve of all of it? You say there are some things you might question? In what respect does it differ from the ideas of the Federal Security Administration?

MR. KINGSLEY: There are some things that need to be spelled out in more detail. There is a problem as to what is a specialist, for example, under Section 711. By and large, subject to some small details which again we have spelled out in our report on the bill, it does correspond with our views.

SENATOR TAFT: This insurance is paid—

MR. KINGSLEY: One other point, if I might interrupt. A major point seems to be that the methods of allocating funds under this title as written to the states, the methods of allocating funds are a little unprecise. Now whether they can be made more precise, I do not know. We would prefer, if a formula could be devised, an objective formula, to have such a formula. Some of our people have been working on that, but as it is written now it would be the guide to the Administrator or to the National Health Insurance Board in allocating funds as to just what basis you ought to move under, and the more precise you can make it, the less trouble you can get into.

SENATOR TAFT: How can you vary between the states? You have to provide the money that is called for by the operations system. There is no dividing of any money between the states, is there?

MR. KINGSLEY: Yes. Under this you would—

SENATOR TAFT: You insure people and give them a certain health service. Then you have got to give them that service no matter what state they are in.

MR. KINGSLEY: As this bill is written the maximum amounts which could be provided under the specific language of this bill would be a 3 per cent pay roll tax provided by workers and employees, half by each, plus the equivalent of 1 per cent of pay roll provided out of general revenue, or a total of 4 per cent which, on the basis of the present tax base, would be a total of about \$5,600,000,000, and that would have to be divided up in some way.

SENATOR TAFT: That is not in this bill, is it?

MR. KINGSLEY: I believe it is. I will have to look in the index. It is fiscal provisions, page 147. Now under (b) it reads:

There shall be appropriated to the account for the fiscal year ending June 30, 1952, and for each fiscal year thereafter—

(1) Sums equal to 3 per centum of all wages estimated to be received during such fiscal year;

(2) Sums equal to the estimated cost of furnishing dental services and home-nursing services as personal health-service benefits during such fiscal year;

(3) Any further sums required to meet expenditures to carry out this title.

I take (d) to be a general limitation on those provisions.

SENATOR TAFT: You cannot find any place where there is any tax levied.

MR. KINGSLEY: No.

SENATOR TAFT: Is that what is contemplated, do you know, a 3 per cent pay roll tax?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: There is nothing in here about dividing it between the employer and employee.

MR. KINGSLEY: I think that is correct.

SENATOR TAFT: That was left out so the bill would not go to the Finance Committee, was it not?

MR. KINGSLEY: That may have had something to do with it.

SENATOR TAFT: But to get this picture complete, there should be added to this bill, or the bill will be followed by a tax bill which levies $1\frac{1}{2}$ per cent on the worker and $1\frac{1}{2}$ per cent on each employer. Is that correct?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: What about the self employed?

MR. KINGSLEY: Self employed would pay $2\frac{1}{4}$ per cent.

SENATOR TAFT: Why do they pay $2\frac{1}{4}$ per cent against 3?

MR. KINGSLEY: Well, it is an arbitrary decision. It is their full part plus half of the employers, or the full part of the employer plus half of the worker's part.

SENATOR TAFT: Is it $2\frac{1}{4}$ per cent of their income up to \$4,800? Income derived from business?

MR. KINGSLEY: That is right, of net income up to \$4,800.

SENATOR TAFT: Now what is this 1 per cent on page 148?

MR. KINGSLEY: One per cent is a limitation on the contributions from general revenue. It provides that the maximum contribution, from general revenue in the years 1952 to 1954, fiscal year 1952 to 1954, shall be equal to $\frac{1}{2}$ of 1 per cent of aggregate pay roll, and thereafter equal to 1 per cent of aggregate pay roll. That is in subsection (d) of Section 771.

SENATOR TAFT: Well, that is the 3 per cent starting at $\frac{1}{2}$ per cent and it then goes on up to 1. That does not cover (c). What is that 1 per cent in (c)? Is that just a one year reserve?

MR. KINGSLEY: In (c) the first appropriation is the first year reserve, and thereafter whether this language says it or not, I believe the intent of that would be that there shall be an over-all limitation in terms of the contribution out of general revenue.

SENATOR TAFT: So you figure 3 per cent will come out of pay roll tax and 1 per cent out of general revenue?

MR. KINGSLEY: Or a total of 4 per cent.

SENATOR TAFT: And 4 per cent you figure on \$140,000,000,000.

MR. KINGSLEY: About \$140,000,000,000; yes, sir.

SENATOR TAFT: One hundred forty billion dollars of pay roll. Just going back to those self employed, if this thing costs 3 per cent plus 1 per cent, who pays the rest of the self-employed's money? They only pay $2\frac{1}{4}$ per cent. Do you general taxpayers pay it?

MR. KINGSLEY: I would think that comes out of general revenue.

SENATOR TAFT: I do not quite see the basis for the distinction.

SENATOR PEPPER: Mr. Kingsley, you said not to exceed 1 per cent, did you not?

MR. KINGSLEY: Yes, sir.

SENATOR PEPPER: Not to exceed 1 per cent out of the Government Treasury.

MR. KINGSLEY: As far as the self employed are concerned—well, for that matter as far as any of this is concerned, as Senator Taft points out—it would take another bill in terms of providing the money. These are our recommendations. I would certainly admit on the self employed it is a purely arbitrary type of thing.

SENATOR TAFT: I notice, in the division of national income in these economic indicators published by the Joint Committee on Economic Report, the compensation of employees is \$142,000,000,000 and that is just employees without counting the self employed.

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: That is the first quarter of 1949, so that your total figure might have to be figured on a larger basis than \$140,000,000,000, I take it.

MR. KINGSLEY: Well, of course, there is no \$4,800 limitation there.

SENATOR TAFT: Yes, that is correct. That reduces the total.

MR. KINGSLEY: And I believe—at least our people tell me—that on the basis of the \$4,800 limitation, it is approximately \$140,000,000,000, maybe \$141,000,000,000.

SENATOR TAFT: About \$5,600,000,000. Do you know what the British cost is today?

MR. KINGSLEY: Well, I think it is about \$600,000,000.

SENATOR TAFT: The appropriation proposed for national health services in Great Britain for fiscal 1949 budget is 263,000,000 pounds which, multiplied by four, is \$1,053,000,000, and there are three times as many people, approximately, in the United States, so that would be \$3,160,000,000. My estimate is that the type of services and cost of living, so to speak, the payments for doctors and all, would be nearly double here what it is in England. So that would more or less accord with your general estimate of \$5,600,000,000, would it not?

MR. KINGSLEY: Yes.

SENATOR TAFT: Now that money is levied and collected by the Internal Revenue Department to be paid into the Treasury.

MR. KINGSLEY: Yes, sir, in a separate account.

SENATOR TAFT: Under this provision Congress is authorized and more or less required, I would assume, to appropriate that sum into a special fund known as the personal health services account?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: Then what happens to that?

MR. KINGSLEY: The personal health services account is then, aside from the provisions for a reserve—there are some provisions here for a reserve at the beginning of 10 per cent—aside from those provisions and later 5 per cent, that fund is allocated to the several states by the National Health Insurance Board who are undertaking to provide this program.

Now as I read the bill, I think that the states have to file a state plan and to have approval to participate in the program. Once that has been done, then this fund would be allocated to them, and that is in Section 772. It begins on page 149.

In Section 772(a) it lists the bases upon which the allocation is to be made. As I have already indicated, these are very broad, and if we could get more specific ones, we would prefer it from an administrative standpoint.

SENATOR TAFT: As a matter of fact, does not the federal government keep a complete record of millions of persons who pay these funds? Is that not all kept here in Washington?

MR. KINGSLEY: Yes, sir, that is one of the advantages of this, that so far as the same people are covered both under O.S.I. and under this, and our recommendation for expenses of coverage under O.S.I. would make them identical for the coverage provided under S. 1679, so far as the coverage is identical, the same records can be used precisely, and there would be a considerable saving in administrative costs as a result of that.

You will note on page 152 that administrative costs cannot in any fiscal year exceed 5 per cent of the aggregate. Well, that is allotments to the states, but it would be even less than that so far as the federal government is concerned.

SENATOR TAFT: The costs of indigent care of which we spoke would be in addition to this \$5,600,000,000, would it not?

MR. KINGSLEY: Yes, sir.

SENATOR TAFT: Whether it is handled under this bill, the provision to which we referred, or whether it is handled under the other bill.

MR. KINGSLEY: That is correct.

SENATOR TAFT: It would be in addition to this figure?

MR. KINGSLEY: We have estimated that our recommended amendments to the Social Security Act which the Ways and Means Committee has considered might cost as much as \$200,000,000 for indigents.

SENATOR PEPPER: For persons not fully employed?

MR. KINGSLEY: It is for persons actually on relief, so in effect they are being taken care of now by one means or another.

SENATOR TAFT: That is a very small proportion, is it not? That is only one twenty-eighth, or around 3 per cent of the total falling in that class. Is that not a very small proportion to calculate for the indigents?

MR. KINGSLEY: Of course it is on a matching proposition as far as these particular amendments are concerned, so that the states would expend at least that much.

SENATOR TAFT: Now this subject of the states, this business of the money going to the states and state plans is entirely new, is it not, in this type of bill?

MR. KINGSLEY: I believe that it is a departure from the earlier bills.

SENATOR TAFT: Is it not a fact that the states have no discretion in what they pay out, the amount they pay out or the classes they take care of? Are not the states under this bill purely agents of the federal government?

MR. KINGSLEY: In effect, yes, sir.

SENATOR TAFT: And they are guided by regulations made by the Surgeon General and the National Health Insurance Board.

MR. KINGSLEY: And an advisory board.

SENATOR TAFT: Who pays the salaries and wages of the state personnel who handle it?

MR. KINGSLEY: They are paid by the state, but the administrative costs are included in the federal money.

SENATOR TAFT: Is this not a federal program, and is not the introduction of the states in here merely an effort to make it a decentralization of administration?

MR. KINGSLEY: I would describe it as a federal program with highly decentralized administration.

SENATOR TAFT: Yet in effect the states must take orders from the federal bureau, must they not? Take, for example, regulations, say regulations setting up under what conditions a man should have the right to have the state pay for the expense of a roentgenogram. That would be governed the same in every state by regulations issued by the federal bureau, would it not?

MR. KINGSLEY: Well, on that particular illustration, I would not be certain. In general the types of regulations which can be issued—I am looking for the section now—by the National Board are rather limited and broad, and there is a good deal of authority in terms of what the state can do, and even more in terms of what the localities can do under this.

SENATOR TAFT: I read to you from pages 106 and 107, Section 702, where it says:

Medical services, hospital services, and, except as otherwise provided in subsection (p) of this section, all other personal health services specified in Section 701 shall be made available as benefits to eligible individuals in all health-service areas within the United States.

That is a compulsory requirement that the state do it, and then in (b):

If the Board, after consultation with the advisory council, finds that the personnel or facilities or funds that are or can be made available are inadequate to insure the provision of all services included as dental, home nursing, or auxiliary services under Section 701 of this title, it may by regulation limit for a specified period the services which may be provided as benefits, or modify the extent to which, or the circumstances under which, they will be provided to eligible individuals.

MR. KINGSLEY: Of course that is specific in terms of these particular things; the dental and home nursing are auxiliary services.

SENATOR PEPPER: But, Senator, you did not read line 13. You left the impression by what you read that there was a mandatory requirement to give all these services to every covered person, but in line 13 it says, "as rapidly and as completely as possible having regard for the availability of the professional and technical personnel and the hospital and other facilities."

SENATOR TAFT: I was only trying to find out whether there was any discretion left to the states at all, or whether [by] this power of the Board to make regulations and withhold or modify services, those must be uniform throughout the United States.

SENATOR PEPPER: Mr. Kingsley, there is a state agency and a local authority. As a matter of fact, it is the physician, the general physician who determines whether you get a specialist or not, for example, is it not?

MR. KINGSLEY: Yes, services of a specialist are available on referral of the general practitioner.

SENATOR PEPPER: That is on the order of a general practitioner?

MR. KINGSLEY: Yes, sir.

SENATOR PEPPER: Do not these local boards and state agencies have authority for the general administration of the program?

MR. KINGSLEY: They do, as I would read it.

SENATOR TAFT: Except that the Board may change the regulations under which they operate every day, may they not, and that applies to all forty-eight states just as if they were branches of a federal department. Am I correct?

MR. KINGSLEY: I think that is not true because of the rather specific provisions in respect to the state plans. What shall be in state plans is outlined in some detail, and I would take it that no national organization, no national administrator could refuse to approve a state plan which met those broad specifications on the basis of any regulations it would draw up itself.

Section 712, on page 113, outlines what a state plan has to contain. It has to designate a single agency for its state administration, has to provide for the designation of a state advisory committee including both professional and lay people, provide for decentralizing administration for the localities; it has to provide for a merit system for making surveys of the resources and needs of the states, for such reports as the board may require; it has to provide for safeguarding federal funds, provide for cooperation with other public agencies of the states

or its public political subdivisions which are concerned with related programs. Then it says:

"The Board shall approve any state plan which complies with these provisions."

SENATOR TAFT: In other words, the states have no right to say who they will serve and who they will not serve. All of these provisions of the state plan seem to me to be merely administrative. It does not even suggest that a state could say, "We are not going to do this or that," or say that they will not comply with the regulation made by the federal government as to the dispensation.

MR. KINGSLEY: That is correct. Anybody who is covered by this bill would have to be provided with services under a state plan. This is a national determination of coverage.

SENATOR PEPPER: Mr. Kingsley, on page 130 there is a declaration of policies, is there not, which reads as follows:

It is the intent of Congress that the benefits provided under this title be administered wherever possible by the several states, in accordance with plans of operations submitted and approved as provided in this part, and in each state insofar as feasible by the same state agency which administers or supervises the administration of the state's general public health and maternal and child health programs.

I mean it is obviously the intention of the Act as much as possible to put the finality of decision at the local level in the hands of the states.

MR. KINGSLEY: Yes, I would think that that is quite clear in terms of the way in which this whole administration section is developed.

SENATOR TAFT: And then on page 134, if the state does not submit a plan, then the federal government steps right in and does it anyway itself, is that not correct?

MR. KINGSLEY: That is correct. We start out with a complete national coverage. We then contract out of it, in effect, if the state wishes to carry out the program.

SENATOR TAFT: Well, in effect it is an attempt to say that instead of having local administrative offices under the name of the federal government, the administration is by state officers but the state officers are subject to the direction in every respect of the federal bureau which bosses the job.

MR. KINGSLEY: Well, of course I would not agree in every respect.

SENATOR PEPPER: May I call your attention to page 134, where, after the provisions of the state plan which you referred to a moment ago, the following appears:

No change in a state plan shall be required within one year after initial approval thereof, or within one year after any change thereafter required therein, by reason of any change in the regulations or standards prescribed pursuant to this Title.

Page 134, the top of the page right after the content of these state plans, then appears to be a prohibition against the federal government within a period of a year requiring any alteration in these plans. It says:

No change in a state plan shall be required within one year after initial approval thereof, or within one year after any change thereafter required therein, by reason of any change in the regulations or standards prescribed pursuant to this Title, except with the consent of the state or in accordance with further action by Congress.

So that once a state submits a plan and it is approved, the federal government cannot require it to be changed within a year after it is initially submitted. It cannot require any change in a plan once approved for a period of a year thereafter. That is correct, is it not, the language I read?

MR. KINGSLEY: Yes.

SENATOR TAFT: My suggestion was that there was not anything in the plan that anybody would care much about changing. It does not have anything to do with the actual rules by which medicine is dispensed.

SENATOR PEPPER: Now one other thing, Mr. Kingsley. Is it not the state which employs the personnel which administers the program?

MR. KINGSLEY: Yes, sir.

SENATOR PEPPER: And I believe the state prescribes the compensation, does it not, that they receive?

MR. KINGSLEY: Yes, the only provision restricting personnel so far as the state is concerned is that they shall be applied under a merit system. I would like to say in respect to Senator Taft's last comment that the federal government would regulate everything having to do with medicine, it seems to me that quite the contrary is true, that the basic things having to do with the provision of the medical services are regulated by the local community and by either the local administrative

officer or the local administrative board, whichever a state plan provides for.

It is at that point where determinations are made as to the local supply of services and as to the methods by which physicians are going to be paid, and where local complaints are heard that the real administration occurs so far as the provision of medical services is concerned.

SENATOR PEPPER: Now just to emphasize that point, to let it come from you, there is no authority in the federal government that has anything to do with the application of professional treatment?

MR. KINGSLEY: None whatever.

SENATOR PEPPER: The Government of the United States has nothing to do with the kind of treatment or the lack of treatment that a qualified physician or technician prescribes?

MR. KINGSLEY: Absolutely not.

SENATOR PEPPER: It is very clear in the intention of this Act, is it not, that there is no intention on the part of Congress or desire to grant the authority to interfere with the free choice of doctor or other technician that the patient may make?

MR. KINGSLEY: No, sir, it is quite specifically provided that there shall be no such interference.

SENATOR PEPPER: And the doctor also or the technician is also allowed a free choice with respect to the patient he serves?

MR. KINGSLEY: That is correct.

SENATOR PEPPER: And doctors and other technicians determine voluntarily whether they will come into the plan or not, do they not? They may come partially in or they may stay out altogether or they may agree to accept the fees, the standard and scale of fees that the agency pays?

MR. KINGSLEY: That is correct.

SENATOR TAFT: But as to the provision in section 717, it says that each agreement that is made with doctors or hospitals or anybody else "made under this part shall specify the class or classes of services to be furnished or provided pursuant to its terms, shall contain an undertaking to comply with this Title and with regulations prescribed thereunder,"—that is by the federal government—"shall be made upon terms and conditions consistent with the efficient and economic administration of this Title, and shall continue in force for such period and be terminable upon such notice as may be agreed upon."

Every agreement made is subject to the regulations issued by the Surgeon General.

MR. KINGSLEY: That is every agreement made under Section 716, agreements with voluntary health insurance and other organizations.

SENATOR TAFT: Also 715, agreements with individual practitioners, hospitals and others. 717 applies to both, also 714, auxiliary services.

SENATOR PEPPER: Mr. Kingsley, if there should be any reason at all for anyone to believe or fear that this power to make regulations interfered with these freedoms that we just discussed a moment ago, you would have no objection to its being written into the law in clear terms that those freedoms cannot be interfered with by regulations or any other way?

MR. KINGSLEY: None whatever. In fact, the more specifically the rule-making authority of the national board is spelled out, the better it is administratively.

SENATOR TAFT: And does the Act require the payment of this money per service, not per capita, not on a salary basis?

MR. KINGSLEY: No, sir. It provides three alternative methods on page 117 of Section 718. The local community can decide, the doctors and the patients.

SENATOR TAFT: Having once started a per capita system, does not this business of your selecting your doctor and having the doctor select you go out the window the moment you have a per capita pay system?

MR. KINGSLEY: No, because you can change it at any time. Now it is limited in this sense.

SENATOR TAFT: As a practical matter has not the experience been in England that otherwise, where you have a panel of that sort, that right practically disappears? You get away from the payment per service basis.

MR. KINGSLEY: I do not think so. Now it is limited in this sense. You have a very popular doctor in an area; obviously he is going to have to limit the number of people he can take, but he does it already. He does it under the present system. He refused patients, and to that extent I cannot go to him if he is all filled up. The same thing would be true under this.

SENATOR TAFT: You never have gone to him. The claim is if you have a doctor, you can keep him. You have never been to that doctor under the present system. If he has had you as a patient, he will always take you back, but under the panel system, he cannot.

MR. KINGSLEY: You can always keep the same doctor under these provisions if (a) you wanted to, (b) he was in the system and (c) he wanted you. If those three conditions were met, you could keep the same doctor.

SENATOR PEPPER: But if he wants to get you off of his panel as soon as you can get on some other panel, he can get you off of his panel?

MR. KINGSLEY: Oh, yes, just as now he can say, "I do not want to treat you any more."

SENATOR PEPPER: And if you do not like him and want to get off of his panel, you can transfer to another?

MR. KINGSLEY: Yes, sir.

MAY 24, 1949

United States Senate, Subcommittee on Health of the
Committee on Labor and Public Welfare

SENATOR JAMES E. MURRAY, Presiding

Present: SENATORS MURRAY, PEPPER, HUMPHREY, TAFT
and DONNELL

**Statement of Honorable Robert A. Taft, United States
Senator from the State of Ohio**

SENATOR TAFT: We have today an extensive medical system in the United States. We feel that it is a good system and that our problems should be met by constructive study and by the adoption of measures which may effect a steady improvement in that system and not try to throw away the system and begin over again.

First we have the problems of public health, research and preventive medicine. That field has been and is today the field of government primarily. There is some important private research in that field, particularly in basic medical problems. There is a good deal of scattered work in the field of public health among private, charitable institutions, but in general, of course, it cannot be done on a commercial basis and it is and should be the function of government.

I think that probably includes the diagnosis and inspection of the health of school children and other general measures directed to preventing the development of disease. The government has a wide field in which those functions can be increased and improved. I think it is the first and primary function of government to bring about that improvement.

The second feature of our general medical system is that of providing medical care. It has always been assumed in this country that those able to pay for medical care would buy their own medical service and, just as under any system, except a socialistic system, they buy their own food, their own housing, their own clothing and their own automobiles. Obviously, many families have difficulty in providing food, housing, clothing and automobiles, but no more difficulty, certainly, in providing medical care.

The general appeal in this country has always been for those who are unable to buy medical care, unable to pay for their own expenses in the medical field. We have brought about, in order to meet that situation, a great development of private charity throughout the United States, for providing adequate medical care for those who are unable to pay for it. That work has been supplemented by the states and local communities through their general hospitals, free nursing and medical service in hospitals, services of preliminary and preventive nature through public health units and, in general, the medical care has been available to a large proportion of those who are unable to pay for it in the United States. In that system there are gaps, particularly in rural districts and poorer districts, perhaps, in the cities, and we have a definite interest in trying to fill up those gaps.

It also developed recently, the realization that illness may be concentrated; illness in the case of families who can pay for medical care may be concentrated in a single year and, thus, assume the nature of a catastrophe. This has ordinarily been met in the past by furnishing the same kind of free medical care as that furnished to those who could not pay for it at all; but it has been conceived that that problem could be met by

providing medical insurance that would take care of extreme cases of illness, just as fire insurance takes care of the destruction of a single building by fire and the tremendous loss which may occur at one time, and through the insurance system can be spread over a great number of people and a great length of time. This insurance has been gradually developing on a private basis and a not for profit basis in the United States until it is fairly generally available to the people.

We believe that the present system has done an excellent job. I disagree entirely with Mr. Kingsley's statement on page 7 of his report that:

"It appears to be agreed that our present system of payment for medical care is totally inadequate."

I do not think that is at all true. We have in this system as good a system of medical care as they have in any country in the world, with the possible exception of one or two small countries where their health problems are much less complicated and much easier to deal with.

Last year, when the Subcommittee on Health had more or less these same measures before it, the Brookings Institution was requested to make a study, at the request of Senator Smith, who was then Chairman of the Subcommittee on Health of this committee. That study was made by George W. Bachman and Lewis Meriam, under the support of the Brookings Institution, and I assume this report, entitled "The Issue of Compulsory Health Insurance," will be furnished to every member of the committee, and I hope every member of the committee will read it, if they have not already done so.

The conclusions of that report are stated on page 67, and I quote [Mr. Taft here quoted the conclusions of the Brookings report.—Ed.]

SENATOR PEPPER: Is it your impression that we did a good bit to save the lives of children and mothers with the service program that we had in effect during the war where mothers were assured better medical care and attention than they had previously had an opportunity to enjoy?

SENATOR TAFT: That probably helped some, although there was a steady decrease every year all the way from 1921 to 1943. I think most of the country had a fairly adequate diet. I think it is the application of diet and medical care and the knowledge developed which has probably effected this improvement all over the world.

Our problem, therefore, is, in the first place, to improve public health measures. In that field the government has a particular responsibility. Second, to improve and make systematic medical care for all of those unable to pay. The third is to see that insurance is available for those who desire it and who are able to pay for it. Those, I think, are the main purposes of the bill which we have introduced.

Turning to S. 1581, Title I establishes a National Health Agency. It attempts to combine in one division all of the health activities of the federal government, excepting the military and veterans' health. The authors of the bill feel that health is not a welfare problem, primarily, that it is a problem of providing medical care and health services of all kinds to reach all the people in the country; the fact that some are able to pay and others are not able to pay affords reason for your assistance but it does not justify the placing of all health activities under a Department of Welfare.

I may say that the report is more or less in accord with the Hoover Report on Medical Activities, made in March 1949, whose first recommendation is:

To accomplish these purposes, the Commission recommends the establishment of a United Medical Administration into which would be consolidated most of the large-scale activities of the Federal Government in the fields of medical care, medical research, and public health (in which we include preventive medicine).

On that issue the Commission was somewhat divided. They voted 8 to 3 in favor of that particular recommendation regarding the establishment of a separate Bureau of Health. Two other Commissioners dissented from placing of the military health operations within the Federal Department of Health. I think that is a question of reorganization more than of health activity.

SENATOR PEPPER: Senator, what do you put under this agency which is not now under the jurisdiction of the Federal Security Administrator?

SENATOR TAFT: Nothing. The Children's Bureau has been transferred already under the previous plan. We direct the Director of the Budget to make a study of the activities of the several departments and agencies of the federal govern-

ment to determine whether any activities of departments and agencies relating to health, in the interests of economy and efficiency of administration should be transferred to the agency, and to complete such study and report the results to the Congress on or before Dec. 31, 1949. The Veterans Administration is the most important overlapping activity.

SENATOR PEPPER: But your bill would make the Health Agency have cabinet status, would it?

SENATOR TAFT: No, it is an independent agency and I understand it is so under the Hoover Commission report. I personally have supported the idea of a Department of Health, Welfare and Education, as you know, and I would not object to putting this Health Agency into such a department.

My only view is that if we did that, it should be a distinct bureau of that agency and that the head of the health activity, the Health Bureau, should be responsible directly to the secretary who sat in the Cabinet, that he should have direct access to that secretary and not have some intermediate undersecretary or others through whom he would have to go.

The bill I supported here last year had that provision, three undersecretaries, one for health, one for education and one for welfare.

Various other parts of the bill cover this question of public health. Some of them are not before this committee, but we feel that the public health end of the bill and of the activities of this committee are just as important as the general problem of medical care. The authors of the bill have always favored the various bills for increased research in cancer, heart, psychiatry, dentistry. I cooperated with Senator Hill in writing and rewriting the Hill-Burton bill after Senator Burton was appointed to the Court, and we have generally favored the measures which gave government aid in this general field of public health.

Title IV of this general bill extends the hospital bill, gives more money for the general purposes of the Hill-Burton bill and provides an easier matching process by which poorer states are more able to match than they are under the present bill. Title V deals with the general question of medical education, which is coming before this committee by more direct testimony shortly. Title VI deals with the problem of providing more personnel for health service, and it seems to be universally agreed that more personnel is necessary as health service is expanded.

SENATOR PEPPER: What is your plan of aid?

SENATOR TAFT: I have talked to deans of medical schools, to members in other schools and representatives of other schools; I am on the Board of the Yale University, and one of our headaches is the Medical School, which draws tremendously on all the funds of the University. I cannot find any general agreement as to just what ought to be done.

We finally came to the conclusion that there ought to be a major study by a commission of distinguished men from all walks of life to try to work out the best possible system of giving federal aid to medical education. The problem of federal aid to higher education is a problem that has never been thoroughly studied or considered.

We set up here a commission of sixteen commissioners, including the Surgeon General of the Public Health Service, the Commissioner of Education, the Chief Medical Director of the Department of Medicine and Surgery of the Veterans Administration and a representative of the Medical Services of the National Military Establishment—that makes four of them—and twelve commissioners to be appointed by the President, who shall be persons not otherwise in the employ of the federal government. Eight of those shall be persons outstanding in the field of medicine, dentistry, nursing, public health or higher education who are familiar with the problems of man power in the health professions. The other four may be any public citizens.

We feel that there should definitely be such a study on an extremely impartial basis. We are not satisfied with the studies made up to date by the Federal Security Administration.

In the meantime, because it was evident that doctors were insufficient in number, we provide a direct subsidy to all established medical schools of \$500 for each student enrolled up to the average past enrolment of the school, and \$750 for each student in excess of the average past enrolment, to give encouragement to increase, but not the wide difference proposed by the Federal Security Administration of between \$300 and \$1,700.

SENATOR PEPPER: Do you allow any assistance for the enlargement of existing medical schools or construction of new ones?

SENATOR TAFT: No, we only did this temporarily because it takes so long to educate a doctor. We felt that the nurses could be left out, although we have no objection, on proper evidence of their great necessity, of inserting those other people. We left them out because we did not have the evidence and because we felt that in most cases those persons could be taken care of in a shorter time.

SENATOR PEPPER: You do not make provision in your bill for scholarships for students?

SENATOR TAFT: No. Yesterday Mr. Kingsley testified there was no emergency about that. You have four or five times the number of applicants who are able to pay their way through. This commission would consider the question of scholarships, would consider the question of aid in the construction of medical schools and the equipping of medical schools.

In the meantime to try to stimulate and help some schools which might go on the rocks completely and to encourage them to keep up their enrolment and perhaps increase it somewhat, we have this additional money. Most of them take the position that they cannot increase their enrolment without having increased facilities and that the effort to give schools \$1,700 for new students is an incentive to them to put on more than they could properly educate, which is likely without increased equipment to result in a decrease in the quality of medical education.

SENATOR PEPPER: You mean to include then for future study, at least, provision of additional training facilities for dentists, technicians, nurses, etc.

SENATOR TAFT: I wonder if it can be shown that there is an emergency. You see, this provides this aid for three years while this study is being made. We hope it might be completed sooner than that, but it provides for three years.

We would not object, on proper evidence, to including temporary aid for some of the other things such as, particularly, public health and, perhaps, graduate school students in medical schools.

I have been appealed to on the ground that we ought to do something for graduate study to provide teachers. They say, "We can get students, but we have no teachers to take care of them and this aid should be extended in particular to graduate students aiming at becoming teachers in medical schools."

SENATOR PEPPER: In a lot of areas such as, for example, in my state, I am afraid it is going to be impossible to start a medical school, which we feel we should have, unless we can get some assistance in providing facilities, buildings and equipment.

SENATOR TAFT: Dr. Parran had a plan for building up the number of medical students by adding about ten schools, I think. Certainly, this commission should consider such a provision. But, of course, if Florida wants a school, it is likely that every one of the other thirty states that do not have one would want one. We would probably have too many medical schools unless we developed them in a regional way, and there might not be a sufficient number of teachers to teach in them.

Title V of our bill, on page 42, is similar to the bill which increased the federal aid to states for local public health units. That is covered by Senator Hill's bill. Title III was the provision of health service to the schools, the bill which has already been passed by the Senate.

I think that if this session of Congress could pass those four bills separately—the hospital bill, the school health services, the local public health units, the hospital bill, also the medical education bill—that we would have accomplished a tremendous step forward.

SENATOR PEPPER: That medical recruitment, could not we give some impetus to that?

SENATOR TAFT: I am not purporting to lay down a program. These four things are what we picked out as the most important.

SENATOR PEPPER: If we make our program really outstandingly creditable, if we could add a beginning on health insurance, it certainly would be a fine accomplishment, would it not?

SENATOR TAFT: I understood the chairman of this committee has stated he does not expect this session of Congress to deal with it.

SENATOR PEPPER: Let's not take that as official, though.

SENATOR TAFT: Now, I come to the medical care plan, which is Title II of the bill. The first part of this title is a provision for an appropriation of \$5,000,000 for a survey to be made by the states on a matching basis on the providing of medical care in that state.

That is similar to the provision which we had in the hospital bill and which I think has been a most valuable provision, probably the most valuable provision of that bill.

The difficulty with medical care and the whole medical situation in this country is that it has been purely a casual growth, a hospital built here, some service started there, and the thing has not been ordinarily coordinated, even at the state level.

One of the objections to just throwing in a system of national health insurance and taking over the whole thing from a national standpoint is that we practically relieve the states of any further responsibility; and the scope of the national study, to my mind, will prevent its being as valuable as a survey made by each state of the particular detailed provision of medical care in each section of that state. The problem of medical care is different in different localities and different states.

Different states have different kinds of people and different medical problems for different kinds of people. We have not gone so far in the general problem of medical care that we can say that any solution is the ultimate solution. There may be many different kinds of solutions, and one solution may be suitable for one state and another for another state. *I do not think we need to go down the Socialist Party Line on a national pattern to provide a system of medical care, and we should encourage the states to develop the particular system each state thinks is desirable.*

Part B is the general provision providing for medical care. It follows the general plan of federal aid to the states, leaving as much discretion to the states as possible and complete control of administration and complete control of the selection of the kind of plan they want to adopt.

The essence of the state plan is set forth on page 16, paragraph 5, where it says that the plan must set forth, in order to get federal aid, a statewide program designed and calculated:

(A) to provide, within five years, medical and hospital services without discrimination to all those families and individuals in the state unable to pay the whole cost thereof;

(B) to provide dental services as far as practicable to such persons;

(C) to encourage the development of voluntary medical, dental, and hospital insurance plans operated not for profit;

(D) to provide for the establishment and staffing of general diagnostic facilities and the improvement of existing diagnostic facilities; and

(E) to provide inducements to physicians and dentists to practice in areas which, without such inducements, would be unable to attract needed physicians or dentists.

In regard to "D," that is somewhat of an overlapping, and it may or may not be desirable to continue it in this bill. It covers the school health inspection, for instance, and health units, and various other provisions, and the hospital bill itself also, which permits the setting up of clinics.

In regard to "E," that is instead of providing the national system which is set up in S. 1679.

I might continue:

The services provided for under subparagraphs (A) and (B) may, at the option of the state, be furnished in one or more of the following ways: In institutions, in the home, or in physicians' or dentists' offices. Such program may also provide for the furnishing of such services by means of payments (in the nature of premiums or partial premiums or the reimbursement of expenses or otherwise) by the state to any voluntary medical, dental, or hospital insurance plan or other plan operated not for profit. Such program may include and take account of services rendered or to be rendered by governmental subdivisions of the state, and by private non-profit organizations, and may provide for payments to such subdivisions or organizations for services furnished to families or individuals. Such program may provide for the collection of proper charges of less than the total cost of such services (whether provided by the state, governmental subdivision, private organization or non-profit fund) from persons unable to pay in whole, but able to pay part therefor.

The essence of the plan is to see that every state provides free medical service for all those people in the state who are unable to pay the cost thereof.

SENATOR PEPPER: Do you mean as well as all those who are unable to pay the whole cost thereof?

SENATOR TAFT: Yes, to pay the whole cost thereof, and then they may provide for collecting part of that cost back.

The dental services are not made compulsory. That is, there is no provision that they have to extend dental services to everybody. The problem of dental service is a very expensive one and it is a question of how far we should go in it. It is still somewhat experimental. Those most interested in dental services do not seem to think we should provide a universal requirement of dental service at the present time.

In general, the plan is intended to provide for those who are unable to pay, leaving those who are able to pay for their medical service the job of paying for that medical service.

SENATOR PEPPER: Do you prescribe any standards of ability to pay?

SENATOR TAFT: No.

SENATOR PEPPER: Is not that the difficulty you encounter?

SENATOR TAFT: It seems to me that is something that can be determined and will be determined in cooperation between the states and the federal department. What can a man pay? I do not know. The general theory is that medical care—I do not know whether it is the general theory, but take the cost of the proposed S-1679, suggesting 4 per cent of the payroll. That would suggest that a man can afford to pay 4 per cent of his income for medical care.

SENATOR PEPPER: Senator, you mean our bill?

SENATOR TAFT: Yes.

SENATOR PEPPER: It is 3 per cent and then 1 per cent, not to exceed 1 per cent, out of general taxation.

SENATOR TAFT: General taxation. He will pay that 1 per cent some other way but, in general, 4 per cent. I see no reason why a family should not pay 4 per cent for medical care. That means a \$2,500 family would pay \$100, for which they could buy general medical and hospital insurance at the present time for the family. That suggests a standard. I would not want to write such a standard into the bill. It seems to me that has to be worked out as you go on and will, of course, vary.

In housing, the general provision is that a man can afford to pay 20 per cent for housing. That is a kind of a rule of thumb adopted in the housing bill. If he cannot get decent housing for 20 per cent, then he is eligible for public housing. I see no reason why you should not have some such standard developed gradually in medical care, but I would prefer not to put it in the bill itself.

Now, in general, what we are trying to do is to improve the providing of medical care to the poor, which has always been a function of Government. So we give Federal aid to do that job and we encourage the making of a survey to determine exactly what the job shall be. The purpose in general is to extend and improve the present medical system for such people and to make available to others some kind of voluntary insurance, if they wish to take that insurance.

I do not agree at all that insurance should be forced on them if they do not want to take it any more than insurance for fire or insurance for any other activity in life is forced on those who may or may not want that service.

SENATOR HUMPHREY: Have we not forced on people insurance against automobile accidents in many states?

SENATOR TAFT: That is more for the people to whom they may do a direct injury. It is to protect the person they run into. That is a different matter.

SENATOR HUMPHREY: Is it not a bit of an analogy? Illness is not just a matter of the individual. It is also a community problem of some kind.

SENATOR TAFT: I do not see the parallel.

SENATOR HUMPHREY: I was only referring to the principle of compulsory insurance.

SENATOR TAFT: I think we should retain the freedom of, we will say, 75 per cent of the citizens to choose their own kind of medical care, decide whether they want medical care or not, determine how they will get it, and the person from whom they are going to get it; I think we ought to preserve the rights of states and local communities to decide, free from federal domination, the kind of medical system they want and the extent of the activity in which they are going to be engaged. I think we ought to preserve the freedom of the medical profession to work out its own solutions, because I think in the long run it is much more likely to develop good medical service than a system administered under the direction of the state. This plan is designed for that purpose.

I am going to contrast it to S. 1679 and then I will be glad to answer any questions.

Completing this, the distinction between this plan and the Administration plan is shown somewhat by the character of the regulations on page 24: "The director is authorized to make such administrative regulations as he finds necessary to carry out the provisions of this title."

We set up a National Medical and Dental Care Council of twelve members. If a state plan does not meet the approval of the Director, the state is not left solely subject to his arbitrary judgment, but may appeal to the National Medical and Dental Care Council, which Council has the right to approve the plan in spite of the Director if they decide that it complies with the general provisions which I have read relating to the nature of the plan.

In contrast to S. 1679, the first tremendous contrast is that between state control and national control. Under S. 1679 there is a state plan. There did not used to be. There did not used to be any pretense of a state plan in the earlier drafts of the bill we have had in past years, but this state plan relates only to personnel and administration.

The state is subject and its officers are subject in every respect to the regulations made by the National Bureau, made by the Surgeon General, and the National Council, whatever the body is that makes the regulations. The state is in effect only an agent to carry out the national plan.

It is an attempt to decentralize the administration. I would say that is certainly an improvement over attempting to have a completely federal bureau, although it has this disadvantage: It does split up the responsibility.

Under our theory, if the state does not do the job, the state is responsible, the governor is responsible, the legislature is responsible.

I want to call attention to this fact: I do not think there has ever been a successful national administration of a regulatory operation extending to every family and every farm and every person in the United States. I do not believe we have ever made a success of it. The country is too big to make a success of it.

We had the W.P.A., and it went out in a blaze of condemnation and disapproval. We had the O.P.A., and that went out in general national disapproval because the attempt to make regulations in Washington to cover the entire United States is a job that I do not think any government can successfully do. The national bureau is too far away.

I think we are bound to get rid of rent control shortly for very largely the same reason, and that is not nearly as extensive as it is contemplated that this shall be.

The reason I got elected in 1938 was largely that the farmers deeply resented the extreme federal regulation on what they could raise and what they could not raise, which reached its height in 1937 and then steadily decreased after that and disappeared entirely during the war. I just do not believe that the national government can do a good job in that field and I do not think the people will stand for it for any considerable length of time.

It is suggested that S. 1679 is insurance. We are not setting up insurance. I suggest to you that S. 1679 is not insurance at all, but it is taxation. We levy a payroll tax, 1½ per cent, according to Mr. Kingsley, on the employer, 1½ per cent on the employee, and 1 per cent more on the general taxpayer. I do not think that by any stretch of the imagination can be said to be insurance.

Insurance is a system by which you pay to spread your risk and you pay for the risk what the risk is worth. Under this plan you do not pay with any relation to your risk.

You may take a family of five persons and a man has an income, we will say, of \$2,000; he will pay, he and his employer, for that insurance \$60.

On the other hand, a single man earning \$4,800 will pay about \$150 for a risk or service asked for about one fourth or one fifth of what the other man gets for \$60. It has no relation to insurance at all.

To a certain extent it may be argued that these persons are paying slightly in relation to the services that they receive. However, I do not think even that is true, because the tax on the employer, without any question, is passed on in the price of the goods to the consumer of the goods. It cannot be otherwise.

SENATOR PEPPER: How do you describe the Old Age and Survivors' Insurance Plan now?

SENATOR TAFT: It is a tax for which we give free medical service. It is somewhat related, again, to what you pay, but distantly related. People who have been paying 1 per cent in the last ten years admittedly are not paying one fifth of the actuarial value of what they are going to get from that benefit.

We threw away the whole actuarial basis eight or ten years ago and said that we could not carry that out in the national plan. It is a tax for which we give free service, and that is what this is. This is a tax. The government is taxing the people \$6,000,000,000 and, in turn, giving them free medical service, just as they tax the people some such similar sum and give them free education. It is the same system.

SENATOR PEPPER: What does your bill do but tax the people and give them free medical service?

SENATOR TAFT: It does not give free medical service to those who can pay for it. This is not insurance. The 1½ per cent tax on the employee is not insurance because employees figure their salaries in take home pay and their trading with the employer is based on take home pay, and the 1½ per cent is passed over to the employer and on to the consumer. So far as I can see, nobody gets anything for nothing. We levy taxes equal to about 4 per cent of the payroll, or about \$6,000,000,000, according to Mr. Kingsley; that tax is reflected in the price of goods, and you pay for it through the increased price of goods; or, if you want to put it another way, in a decreased standard of living in other respects.

You pay for your medical care through the government instead of paying directly. But the only point I want to make is that it is not insurance. It is a tax which brings in \$5,600,000,000, to the federal government, or \$5,800,000,000, and then pays all the doctors in the country and the hospitals to give free medical service to all the people in the country, whether they can afford to pay for it or not.

I cannot see why the system will not be much more expensive in the end than the system that we now have, because the purpose is to provide a great many more services. Inevitably, you are going to have to pay the cost of those services. You may be able to reduce doctor's fees somewhat, but I do not believe the total amount of that would involve any tremendous sum. Otherwise, there is no possible saving, and there certainly must be a general increase, which is a burden on the public. Nobody can tell what the expense may be. This insurance plan does not cover those who are unable to pay, does not cover the indigent, at least, because there is a kind of provision here to take care of it outside of the insurance fund altogether.

In our particular bill we estimate that cost will run up from \$150,000,000 the first year to \$300,000,000 at the end of five years.

SENATOR PEPPER: You surely cannot hope to accomplish your purpose, that the states shall set forth a statewide program designed and calculated to provide within five years medical and hospital services without discrimination to all those families and individuals in the state unable to pay the whole cost thereof, without a federal contribution for it in excess of \$300,000,000 maximum.

SENATOR TAFT: I would not guarantee the \$300,000,000 maximum, but you must remember I wholly dispute the fact that we are starting now. Seventy-five per cent of these people or 80 per cent already getting medical service without any federal aid. States are providing it.

Every general hospital in the United States is providing it. Doctors are giving free care to a certain extent. This is not new. If you match the \$300,000,000 with about \$300,000,000 from the states, that is \$600,000,000, and add that to what is already being spent for free medical care to those unable to pay for it, I do not see why the \$600,000,000 will not be reasonably adequate to take care of it. I would hate to guarantee the figures, because we are talking about uncertain figures.

SENATOR PEPPER: Did not the American Medical Association in 1939 say that two out of three of our people were unable to pay the cost of serious illness?

SENATOR TAFT: I do not know what they said, but if what they meant was that one year they might have a heavy burden, that might be, but a large number of those people can take out insurance and will take out insurance; others are able to pay, I think. Some people believe in insurance and some people do not. It has been sold pretty well to the American people.

SENATOR PEPPER: I thought this ought to be made clear in the statement of issues involved, that S. 1679, the so-called National Health Insurance bill, with all of the disadvantages—and there is much that can be said against it—I think it would first have to be admitted that it covers more people, that it is proposed to make available medical care to more.

SENATOR TAFT: Everybody.

SENATOR PEPPER: It does have the broadest coverage. I think you gentlemen should take one or the other horn of the dilemma: Either say the great masses of the people do not need help or you should tell them your plan is going to cost several

billion dollars out of the public treasury if everybody needing help gets it.

SENATOR TAFT: That I would wholly deny. I do not know what the states are spending on this, but it must be two or three billion dollars. We are proposing to add \$600,000,000 to fill up the gaps for those unable to pay.

Your proposal would provide free medical care to everybody. That is socialization of medicine. The providing of free medical care to those unable to pay for it is not socialization. It never has been. We have always done it. Just as we provide relief to those unable to buy food, just as we propose to provide housing for those unable to provide housing. That is an effort to take care of people who are left behind in our general economic system, which I think on the average produces much the highest standard of living.

When you attempt to give free medical service to everybody in the United States, most of whom are perfectly able to pay for it, you are socializing medical service. If you are going to socialize medical service, I do not see why you should not gradually go on and provide food for everybody, provide housing for everybody.

SENATOR PEPPER: Now, the Senator has been making that statement for a long time, and it has colored the public thinking. Is it not a fact that under the Senator's bill a great many people will get assistance out of the public treasury who may not pay any tax at all into the public treasury; whereas, under S. 1679 every recipient is a taxpayer under that proposal, paying part of his regular income?

SENATOR TAFT: All the indigents do not pay.

SENATOR PEPPER: Yours is the bill which proposes to give people something out of the public treasury without exacting any return from them.

SENATOR TAFT: That is what you do now. You do it in every city in the United States. There is not a city that has not got a general hospital where somebody unable to pay can get service.

SENATOR PEPPER: Then medicine is already socialized and you are going to make it more so.

SENATOR TAFT: That is not socialization, to take care of people who are unable to take care of themselves—

SENATOR PEPPER: That is nearer socialization than insurance.

SENATOR TAFT: You do not have necessarily a choice between the two. You have, as I see it, a free enterprise system, the basis of which is incentive, payment for the value of the work that you do. That system, I think, has increased our production and our standard of living more than that in any other country in the world.

SENATOR PEPPER: We agree to that.

SENATOR TAFT: But since it is based on that, you will have a certain proportion of the people who fall behind, either because they cannot work or are not able to pay; perhaps they are no good and cannot work; perhaps they are working and making things that people just will not pay enough for so they can get a living wage out of it; and to say that a free enterprise system which proposes a minimum decent living is socialism is a misuse of the term.

I think that is charity, if you want to call it that, government charity, if you want to call it that, but I feel strongly that it is an essential and proper part of a free enterprise system, as in contrast to socialism.

When you provide a free service to everybody in the United States out of the government treasury, that is socializing that activity. You have socialized primary and secondary education. It is provided out of taxes to anybody who wants it, whether they can afford to pay for it or not.

The Post Office is a socialized business today. But I object to extending that socializing principle into the providing of medical care.

SENATOR PEPPER: Yet that is what you are doing. You are proposing out of the federal treasury, state and local, to give the medical services to those who cannot pay for them at all and to give the difference between what they can pay and what the services cost.

SENATOR TAFT: I do not think there is any use arguing. I do not think I can state more clearly the position I have stated.

SENATOR PEPPER: I say this, and it is my honest observation on your measure: With all the great virtue it has, you are forced to the logical necessity of saying, "We are only going to help the people in the lower income brackets or in the admittedly indigent class," and I had understood before you had said there was about 20 per cent of the people who could

not pay for medical costs and you were going to try to help those people. That is perfectly consistent with our traditions and our past practices. But that ought not to be sold to the American people as a plan that will provide adequate medical care to everybody in this country.

SENATOR TAFT: My general proposition is that if you increase your doctors and facilities and public health, that the medical care will be available to those who can pay for it with entire adequacy. I think practically it is available today with adequacy. But I think it can undoubtedly be improved, and I think also that you can meet a particular problem of emergency illness by making available voluntary insurance to everybody who wants it.

SENATOR PEPPER: When you pass above the 10 per cent or 20 per cent, there are about 10,000,000 people in the country who earn less than \$1,000 a year; you would have to include all those people and, I suppose, everybody who earns less than \$2,000 a year.

SENATOR TAFT: I think your figures are obsolete today, Senator. Those income figures have all changed, and they are not satisfactory.

SENATOR PEPPER: When you get above the admittedly indigent class in the case of catastrophic illness that comes to beset a family or an individual, you are going to have to give, if you carry out your objective here, assistance out of the federal treasury, state and national treasuries, to at least two thirds of the people of this country, and that is going to cost a large sum of money from the federal treasury.

SENATOR TAFT: Yesterday Mr. Kingsley made the statement that the average income of half of the families is \$3,000. There are about 35,000,000 families, so I think you will find that my figure of 20 per cent is not far wrong.

I would be perfectly willing to admit, that perhaps an additional group of people, by reason of a catastrophic illness or accumulated illness in a family, become unable to pay, so you would add 5 per cent more. It might be 25 per cent of the population. The costs under the British Government plan, which government adopted your plan in effect, were 60 per cent more than they planned. They had to increase the budget 60 per cent.

SENATOR PEPPER: Because people rushed in to get dental and medical care they never had a chance to get before.

SENATOR TAFT: I have a letter from an English doctor that I thought was rather interesting on that subject. It is from a doctor in St. Lawrence's Hospital, Caterham, Surrey, dated April 12, 1949, addressed to me. It reads:

I am of course a stranger to you. My only excuse for seeming to interfere in the future policies of the United States is that I spent my childhood and college life in and around Boston, Mass., up to the presidency of your esteemed father.

I am a physician and I wish to do what little I can to warn the people of the United States to avoid a National Health Service as it has prostituted medicine in Great Britain. The poor public has been converted into hypochondriacs en masse and it was bad enough prior to July 5th, 1948, but now it is terrible.

Doctors' waiting rooms are packed with Britishers and foreigners waiting for a bottle of Epsom salts—cheap iron tonics and cough mixtures, false hair, spectacles, false dentures and some chemists are persuaded to substitute beauty preparations for prescriptions.

The above is not, however, the worst. This service has led to a marked determination in the treatment of the sick people—the doctor who is paid about \$4.00 a year for each person is so busy that he has no time to examine them.

It is not a question of stripping the patient to the skin—the patients now are either not examined at all or are examined with their overcoats on.

But in reality this does not worry the average patient. A visit to the Panel Doctor becomes almost automatic and he wastes up to 4 hours waiting for his turn and usually demands his favorite bottle of medicine.

Thus the doctor has deteriorated to being the patient's obedient clerk. Millions of dollars are wasted every year in useless and cheap medicine which is a danger to the public and a source of income for the drug store.

This is paid for by a compulsory levy of \$1.25 a week. When the patient is too sick to work he gets \$6.25 a week which is not sufficient to pay for a furnished room of a very low standard over here. A very ridiculous sum; if a commercial insurance company charged the same the patient would receive \$35.00 a week for 11 months and \$15.00 per week indefinitely afterwards.

I would be pleased to help to fight this impending injustice in the United States.

SENATOR PEPPER: That doctor did not add what income he was making, did he? Since we at this table, you and your distinguished colleague, are not entirely insensible to political considerations, we might be interested in knowing that the Conservative Government has not dared to attempt to repeal

or advocate the repeal of that system, and recently there was a member of the House of Commons belonging to the Labor Party, a Labor Lord, who was here, and a member of the Conservative Party, who is not at all in sympathy with the general program of the Labor Party, all three told us that the health legislation in England did more to win for the Labor Party a recent election in a Conservative middle class constituency than anything else they had to rely upon in that election.

SENATOR TAFT: I notice the Labor Party, however, suffered rather a serious setback in two recent local elections. Possibly the people may have changed their minds. This is a national medicine, as against local and state control. This is government medicine as against the existing system, which I believe has been a successful system on which we should work for improvement.

You would have to have a tremendous body of clerks to keep count of about 70,000,000 different medical services every year in the United States. If you do that, then you pass to a system in which a certain number of patients, some hundreds of patients, are assigned to every doctor and go through on a perfectly automatic basis.

This is no reflection on the medical service of the Army and Navy, but the G.I.'s that I have talked to who got medical treatment, apart from the battle stuff, which, of course, was exceptional, were certainly exceedingly unfavorable. I do not think any of them felt they were getting any personal consideration whatever.

I think the result of the system is bound ultimately to lead to a salaried doctor force.

The International Labor Office, which is the principal international proponent of sickness insurance, admits this insurance is not really insurance and will not remain so for long. In their book entitled "Approaches to Social Security," they say this:

The fact is that once the whole employed population, wives and children included, is brought within the scope of compulsory sickness insurance, the great majority of doctors, dentists, nurses, and hospitals find themselves engaged in the insurance medical service, which squeezes out most of the private practice on the one hand, and most of the medical care hitherto given by the public assistance authorities, on the other. The next step to a single national medical service is a short one . . .

I think inevitably what we are proposing here at a cost of \$5,600,000,000 a year or more is the providing of free government medicine, free medical service, through government employees. I cannot see any outcome to it except ultimately the direct employment of all doctors on a salary who are engaged in this particular work.

In general our bill is based, as I say, on the theory that we will fill up the gaps in the present system, which has been a successful system, try to improve it in every way, spend energy on improving the public health services, in preventive medicine. I do not think we should throw away a successful American system and begin all over again on a new kind of medical system which has not, at least up to date, proved to be a success in any country in the world.

SENATOR PEPPER: You do not advocate or never have advocated repeal of the present Old Age and Survivors' Insurance?

SENATOR TAFT: No, but I would rewrite the whole thing, and I would be in favor, I think, under the present system of fixing it at a low rate and then making available a voluntary system to everybody who wanted to go above that, to integrate with that all of these other plans that are set up by this company and that company or by this union and that union. The whole subject ought to be, in my opinion, completely reconsidered, and I hope the Congress may do it.

SENATOR PEPPER: Is there any outstanding difference between your proposal and 1679? If a person wants to get medical or hospital or dental care under your bill and he wants public health to pay the bill, he has to satisfy some social worker or what some would call a bureaucrat as to his inability to pay, and he has got to make a disclosure about all that he has and all he can make. There are many people who do not like to come in and say they are either paupers or to a degree incapable of paying their bill.

SENATOR TAFT: This is an attack on the so-called means test.

SENATOR PEPPER: I know it, but if the Senator will let me present the other, that is what everybody has to do who gets any benefit under your bill; whereas, under 1679, he has his income, he may be self employed, then he becomes entitled by virtue of having made those payments—and the poorest person

who is employed gainfully by paying a percentage of what he makes is brought within the system—he is freed of the ignominy of having to meet the means test. Those distinctions do exist, do they not?

SENATOR TAFT: No, because your system does not take care of your indigent. The indigent have to take a means test to prove they have not any money.

SENATOR PEPPER: That is somebody who is not employed.

SENATOR TAFT: Yes, but they have to take that test.

SENATOR PEPPER: We separate those people. They are not in this bill.

SENATOR TAFT: The second thing is this: What is this means test? We have it in every provision for taking care of people who are not able to pay for what they get. We have it in housing and it is not any longer a difficult thing. Practically everybody pays an income tax. What it amounts to today is: What is your income? What are your wages? That is the extent of the means test in housing, that is the extent of the means test practically in any field today. You do not have that kind of searching examination that social workers used to give under the relief program.

One has already made a return to the federal government. What a man's income is today is perfectly ascertainable. That is what we base our housing on. Everybody who goes into public housing has to give those figures. They are not humiliated. All they have to do is go in and say, "I am employed by so-and-so, and these are my wages."

SENATOR PEPPER: If that is the criterion, why not tell the American people that your proposal proposes to give help to everybody making less than \$2,500 a year or making less than \$2,000?

SENATOR TAFT: That is not the rule. There would be different rules in different places, different rules in different states. It would be gradually worked out. I certainly would not want to prescribe a national figure any more than in housing. One of the big objections of the real estate interests is that they want a national figure. We said every state and every city is different, as is the case here.

SENATOR PEPPER: You agree that the one who pays the tax, whatever you call it, under 1679 does not have to be subject to a means test by a social worker or a bureaucrat?

SENATOR TAFT: No, and neither does anybody else. This means test is just a red flag. It is something which is at the base of our aid to those who are unable to pay, our aid in relief, our aid in housing, our aid in medical care today. You have the same thing in every general hospital in the United States today.

SENATOR HUMPHREY: Is it not true that the degree of indigency is always variable?

SENATOR TAFT: Yes.

SENATOR HUMPHREY: You do have this flexibility all the time as to just where the lines are of application of your particular plan.

SENATOR TAFT: You have a choice. Either you have a means test or you give your service free to all people in the United States, and that means that instead of paying, I would say, \$1,200,000,000 for free medical care, you are going to have to pay \$5,600,000,000, plus a lot of state assistance. You have the choice between socializing the service and adopting a means test.

SENATOR HUMPHREY: I am not in opposition to your plan as far as it goes. I think the real argument is whether or not this is an adequate extension of medical care to meet the health needs of our people.

SENATOR TAFT: I agree, that is the question, because your plan does not take care of the indigent, either. You have got to impose a means test there.

SENATOR HUMPHREY: The means test has already been imposed in terms of the social agency that just certifies them as being available for the insurance plan.

I would like to go back to one point because, just as you said about the means test, it is a bit of a red flag that is waved around at times; I think there have been some other things that have been said here that are red flags and it would be good to get them cleared up. For example, the term "Government medicine." Now, under the proposal of the National Health Insurance Program the medicine is not government medicine, the medicine is free medicine, private medicine; it is administered by private doctors; it is administered in the Presbyterian Hospital, or Catholic Hospital, or Baptist Hospital.

SENATOR TAFT: It is paid for by the government.

SENATOR HUMPHREY: It is paid for by the people.

SENATOR TAFT: No, by the government. The government pays for it and the government furnishes that service, and somebody in Washington makes all the regulations saying what you are entitled to, whether you are entitled to an x-ray in this case or that case, whether you are entitled to penicillin for this disease or that disease.

SENATOR HUMPHREY: That is not the case, you know.

SENATOR TAFT: That is the case in England. Those are the regulations in England.

SENATOR HUMPHREY: This is the United States of America, and the bill, S. 1679, provides for local use or for the local regulations as to the extent of medical care.

SENATOR TAFT: No, it does not.

SENATOR HUMPHREY: And the practice of medical—

SENATOR TAFT: It does not. You find it does nothing of the kind. The regulations are made by the National Board and the state administrators have nothing to do except comply with the regulations of the National Board.

SENATOR HUMPHREY: The matter of the standards of health care and the cost of payment are determined by local boards.

SENATOR TAFT: Not at all.

SENATOR HUMPHREY: Only administrative regulations as pertains to the use of the money and to the payment of the money are made by the national office, and I think that ought to be crystal clear. One other thing I want to point out is: We need a definition of the word "socialism." I have heard this word "socialism" kicked around. What is the orthodox meaning of "socialism"?

It is not what we have been talking about here this morning. It is state ownership of the means of production and distribution. That is basic, elementary economics from Garver and Hansen, Text Book, Economics No. 1.

Now, if there is any socialized medicine in this country, it is to be found in a municipal hospital. If there is any socialized medicine, it is in a state hospital or in a university hospital. If there is any other socialized medicine to be found, it is to be found in the Veterans hospitals.

SENATOR TAFT: I do not agree at all.

SENATOR HUMPHREY: Whether you agree or not, the point is the economists define socialism as state ownership of the means of production and distribution.

SENATOR TAFT: If the Government undertakes to levy all the taxes and furnish free educational service, then they have socialized education.

SENATOR HUMPHREY: They hire the teachers and they own the buildings, they own the means of production and the means of distribution. Under this program they do not hire the doctors, nor do they own the hospitals or the drug stores.

SENATOR TAFT: Under this program they do hire the doctors and they own many of the hospitals, and they can employ private hospitals, if they wish to do so.

SENATOR HUMPHREY: That is the present situation. This program does not provide for the government ownership of hospitals. It does not provide for the government hiring of the doctors.

SENATOR TAFT: But it provides for the government paying—

SENATOR HUMPHREY: —money for paying hospitals and doctors.

SENATOR TAFT: It provides for the government paying everybody's hospital bill and, therefore, it socializes the furnishing of medical service.

I do not think there can be any question that this is the socialization of medicine and also the nationalization of medicine. Whether this is desirable or not, is a legitimate argument, but that is what it is.

SENATOR HUMPHREY: When we discussed federal aid to education, there was testimony that in the State of Vermont there were certain private academies and that under the Federal Aid to Education bill this money would, through the state department of education, go to those private academies.

Are you going to say that those private academies, supported by tax funds, are the same thing as a public school system where the teachers are hired by the state department of education, where the buildings are owned by the local board of education? We made a differential.

SENATOR TAFT: Of course, it is not the same thing, but, on the other hand, that education in those schools is furnished free to those children by the State of Vermont and, therefore, their education is socialized to that extent, at least. I suppose the actual ownership of the school may make it more extreme socialism than otherwise.

SENATOR HUMPHREY: Let us assume that every single person in the United States, by some magic, took out a policy with Metropolitan Life Insurance Company for complete hospital and medical care. Would that be bad?

SENATOR TAFT: I think it would be a great mistake.

SENATOR HUMPHREY: I am happy to hear your point of view on it. I think it would be quite wonderful if the cost was not too much.

SENATOR TAFT: I think there is a good basis for health insurance, for voluntary insurance, in a large group of population, but I would say not all of them.

SENATOR HUMPHREY: Of course, this plan provides for about 85,000,000 people.

SENATOR TAFT: This interests me. I probably have had less trouble than most. Usually I have to go to doctors for colds. Why should the government furnish me with free medical service for colds? I would have been just as well off if I had gone to bed and not gone to a doctor in every case. I do not see why I should buy insurance to have that provided free because that is what the insurance rates would be based on: the fact that a lot of people want to do that and go when it is not necessary to go.

It would be unfortunate to have everybody in the United States take out voluntary insurance, because there are a lot of people who find it much cheaper not to do it.

SENATOR MURRAY: Senator, I took out health and accident insurance about forty years ago and carried it until I got to be 65, and then discontinued it.

SENATOR TAFT: I took out a disability insurance policy when I was a fairly young man, and I was paying \$170 a year and have been ever since and never got a cent back. I got to the point where it was going to run out, too. That is all right. I think probably at the time it was justified, but if I had not taken it out before I was 40 or 45 years old, it would have been a mistake.

SENATOR HUMPHREY: You used the term "free medicine." What do you mean by "free medicine"? When you are collecting \$6,000,000,000 in taxes, it is not free, is it?

SENATOR TAFT: You pay for it through taxes.

SENATOR HUMPHREY: Just like public schools. One is taxed whether one has children or not.

SENATOR TAFT: If you pay for things, you pay for the thing you buy at the time you buy it. If you are taxed, you pay for it in taxes. But as far as providing that particular service, it is free at that time. You can take it or not, and you do not pay a cent for it, and that influences a lot of people to go and get it free and if they had to pay for it, they would never go and get it. That is why you have had the tremendous run on the doctors in England.

To go back to the question in regard to the regulations, 1679, page 107, says that this National Board "may by regulation limit for a specified period the services which may be provided as benefits, or modify the extent to which, or the circumstances under which, they will be provided to eligible individuals."

It is absolutely necessary, if you are not going to have the expense run away with you, to limit that service, to say that a doctor cannot prescribe a very expensive medicine except in certain cases, just as the British Government does today. You have got that problem. You have got the problem right now of the fiscal officers in the British Government telling the hospitals that they cannot have so much money next year. They have to cut down this or that service and change the regulations.

I do not know whether they will provide free toupees and free eyeglasses or not, but those things are all going to be the subject of national regulation under this bill, and every state and every local officer is going to have to be bound by it.

SENATOR HUMPHREY: The reason for that is to eliminate abuses.

SENATOR TAFT: You have got to do it. That does not change the fact that you do it and that you have a completely regulated national system.

SENATOR HUMPHREY: They surely regulate the kind of medicine that you are talking about. If you have ever spent

one day or one hour in a general hospital, you know there are all kinds of regulations as to the kind of services that are offered.

SENATOR TAFT: Those are the things about getting free service. If you pay for it, you get what you want.

SENATOR HUMPHREY: Even in the best hospitals you get that kind of regulation. You have standard medical practice in the best hospitals. I spent a good share of my life filling prescriptions, and I can assure you I have some idea about the kind of medical care that is offered in even the best hospitals.

SENATOR MURRAY: What I am afraid of is that under your bill, if you are going to provide socialized medicine for 20 per cent of the people, the other 80 per cent, observing that situation, are going to begin to demand that socialized medicine be extended to the rest.

SENATOR TAFT: One great trouble about all welfare service is that you may gradually lead the people to think the government should support them all and to pay all their expenses. If you get to that point, you have lost the whole system of liberty in the United States, because when the government supports them all, it will tell them how to live, and that is the reason I am opposed to extending it further than we have already. We have got a pretty good extension. In a way we are now taxing about 25 per cent of the people's income, and to that extent we have taken away their freedom, and they have got 75 per cent of it left, to spend their money the way they want to spend it. I hate to see that go further in any substantial amount. I think we can afford \$300,000,000 for this job.

SENATOR MURRAY: I think, Senator, that the other 60 or 80 per cent of the people who will be observing this socialized medicine that you are providing are going to move in and demand that it be extended to the country.

SENATOR TAFT: You may be right, but that does not make the demand right.

SENATOR MURRAY: Already the labor organizations of the country are beginning to demand that their health be taken care of and the health of their families through increased wages and provisions for health and security, so that it seems to me that our bill is the more reasonable bill, the bill that is going to provide a system of medical care in which the people pay for it.

SENATOR HUMPHREY: I think, Senator, that a payroll tax is a restriction and is an impediment to the ever increasing demands of people for more and more services. Where you can take a lump sum out of the general treasury, there is no doubt in my mind that is a greater inducement to people's thinking they do not have to pay for it, but when they see it deducted from their check every week, they know they are paying for medical care.

SENATOR TAFT: They go in at the time of the next bargaining settlement and make the employer pay that much more, and they usually will. He has to look at it as take-home pay, just as they do.

Statement of Honorable Lister Hill, United States Senator from the State of Alabama, Accompanied by George Bugbee, Executive Director, American Hospital Association

SENATOR HILL: I have with me here this morning Mr. George Bugbee, executive director of the American Hospital Association, who has made a great contribution in the drafting and the work on this bill that I shall discuss.

Through the Senate Committee on Labor and Public Welfare, of which we are all members, the Senate and the Congress of the United States have the opportunity to enact legislation and do more for the health of the American people than any Congress in our history.

On us rests the responsibility to give the Senate a legislative program that can be put into operation promptly and effectively and meet the urgent health needs of the nation.

We can give recognition to the importance and complexity of the health problems of our modern industrial civilization by creating a Federal Department of Health and Welfare. The Secretary of Health and Welfare would give new direction and new coordination to the functions of our federal agencies for health. He would provide the leadership and speak with the authority of a member of the President's Cabinet.

With the passage of the Hospitals Survey and Construction Act in 1946, the nation undertook for the first time a nationwide program of planned and coordinated hospital construction. Today nearly eight hundred hospitals, health centers, nurse

homes and other hospital facilities are being built or have been approved for construction under the Act.

Recent hearings on S. 614 to amend that Act, held by the subcommittee of which I am chairman, have revealed that even this program of construction must be enlarged to meet the need for hospitals and health centers. Unless the program is enlarged federal participation will not keep pace with the rapidly expanding programs of the states. Our subcommittee plans within the next few days to submit to the full committee a favorable report on S. 614 to double the amount of federal aid, increase the aid to individual projects and permit the states to channel greater aid into their low income or rural counties and communities.

Preventive medicine through the public health services is a basic part of any modern health program. Yet last year some 40,000,000 Americans had no public health service. Another 85,000,000 had only doubtful protection from inadequately financed and understaffed health units. And only 10,000,000 of our 146 million people had the protection of full time, professional health departments.

Hearings on S. 522, the bill to provide increased federal aid to local public health units which our subcommittee plans to report favorably within the next few days, have convinced the members of our subcommittee that the ramparts of national health begin in the local health offices. Yet only one in ten of the local health offices is staffed and financed to carry on a reasonably adequate program. The strategic and vital importance of local health offices to the nation's health was emphasized at our hearings by Dr. James E. Perkins, managing director of the National Tuberculosis Association. Dr. Perkins declared:

The National Tuberculosis Association has long held the opinion that effective tuberculosis control can be achieved only if there are adequately staffed and adequately financed full time local health services. We know enough about tuberculosis today to rid our nation of the disease if there were local health officers and public nurses in the field to follow up each case and assure treatment. The chief function of our Association is educational. But education falls down if there are no x-ray machines and other facilities and not enough people in the local health agencies to actually do the work.

The Senate, as we know, already has passed and sent to the House the School Health Services bill reported by our committee, the Committee on Labor and Public Welfare, which provides for medical and dental examinations for every school child and, in some cases, medical and dental treatment. Through this measure and S. 522, the local Public Health Services bill, we can carry to the grass roots—farm and cross roads, town and city—protection against tuberculosis, malaria, typhoid and undulant fever, syphilis, infantile paralysis and the epidemic diseases. We can discover and correct many of the physical defects and ailments in our children at the all-important school age.

Medical research is health protection for tomorrow. The medical colleges, the privately endowed foundations and many private industries are carrying on great research work. The federal government is lending its support to research through the National Institute of Health, the National Heart Institute, the National Institute of Dental Research, the National Mental Health Act and the Atomic Energy Commission. I think we ought to go forward, and in many other fields that is a challenge for the federal government to help and do research work.

The Senate Committee on Labor and Public Welfare reported to the floor and guided through the Senate the National Science Foundation bill. This bill must be passed by the House and signed by the President, and provide a single agency for correlating and coordinating the vast research of the nation.

The success of our health programs is ultimately dependent on the training and experience and qualifications of the people who direct the programs. The finest hospitals and health centers, the ultimate in medical knowledge, are useless without doctors and nurses and trained workers.

America is suffering a man power shortage in the field of health. There are less than 200,000 active physicians for a population of some 146,000,000 people. The shortage of dentists, nurses, technicians and public health workers is equally serious. I strongly urge a comprehensive program; this committee has before it as one title in this bill that matter, and I hope they will bring forth a separate bill on this question of federal aid for scholarships, for grants to the schools and colleges for additional teachers, and grants to the states for expansion and construction of medical schools to train the doctors, dentists, nurses, sanitary engineers, technicians and health workers of all kinds that are so badly needed.

Surely, as the Senator from Ohio said in his statement, a bill of this character should be reported to the Senate by this

committee so that the Senate can act on it in this session of Congress, looking to its enactment at this session of Congress.

Our committee should not forget that the underlying foundation of the health of any nation is the soil and the food we obtain from the soil. I believe the committee will agree that an essential part of any health program must be steps to restore and maintain the health-giving minerals and nutrients of the soil—the objective of the National Soil Fertility bill, which some of us are sponsoring in the Senate.

There is a further step necessary to a comprehensive program of health for the American people—the provisions of adequate hospital and medical care for the individual.

This is the objective of S. 1456, the Voluntary Health Insurance bill sponsored by myself and Senators O'Connor of Maryland, Withers of Kentucky, Aiken of Vermont and Morse of Oregon. You are familiar with the Hospital Survey and Construction Act and its program. The Voluntary Health Insurance bill will perform the same initial service in providing hospital and medical care that the Hospital Survey and Construction Act is now providing in the building of hospitals and health centers.

The bill will not do this through a strange and untried system of compulsion. The bill strengthens and builds upon our existing medical institutions—the tried and tested methods of American medical practice and the voluntary prepayment health insurance plans which more than a third of our people have found effective and trustworthy.

The sponsors of the bill believe that the present system of medical care has been too valuable, too effective and too useful through the years to throw it aside for a new system which might not work. We sharply disagree with the statement of Mr. Kingsley yesterday that this present system is totally inadequate for the American people. We believe it is the course of wisdom first to examine our existing health and hospital and medical resources. Then to strengthen and build upon them. This the bill will do.

The purpose of S. 1456 is to bring adequate hospital and medical care within the reach of every American through the system of voluntary participation in prepayment health insurance plans. The bill will provide government-supported membership in health insurance plans for those who cannot pay. It will stimulate and encourage participation by self-supporting persons. It provides for surveys which will be the basis for programs to meet the shortage of doctors, especially in rural areas, and to determine the need for additional diagnostic facilities and the need for additional facilities for treatment of mental illness, tuberculosis and chronic diseases.

The federal phases of the program will be administered by the Surgeon General of the United States Public Health Service. Within six months after enactment of the bill the Surgeon General shall issue broad regulations—these are broad regulations such as we have today under the Hospital Survey and Construction Act, and the committee knows these are really broad, laying down broad policies, with the real control and administration in the hands of the states. These broad regulations establish: the general standards of eligibility of persons unable to pay subscription charges for health insurance; the general types of hospital and medical care to be provided under the program; the general standards for participation by voluntary prepayment plans; the general standards for participation by nonprofit prepayment plans; the general methods of encouraging and assisting in popular enrolment in the prepayment plans within the states.

A Federal Hospital and Medical Care Council composed of ten persons—two doctors, two hospital administrators, two prepayment plan officials and four representatives of consumers—will share responsibility with the Surgeon General in developing these broad policies of the program.

In the states the program will be administered by a state agency, which may be the same agency now administering the Hospital Survey and Construction program in the state. This agency will have a council with representation similar to that of the Federal Hospital and Medical Care Council.

Within the states—and I want to emphasize this—regions will be designated in which complete hospital and medical services should be made available. In many cases these regions already have been established under the operation of the Hospital Survey and Construction Act. Within each region a Hospital and Medical Care Authority will operate as a unit of the state agency. The regional authority will be composed of persons residing within the region and shall include representation from as broad a segment of the population as possible. The regional authority will encourage coordination of all health facilities and

services in the region and will recommend means for their effective use in serving the areas.

I cannot overemphasize that matter of coordination. As Senator Taft recalls, we had testimony as to what has been done in Rochester, N. Y., and that area in the coordination of hospitals and facilities in and around that outlying area. We also had testimony about certain coordination down in North Carolina, all of which was most interesting and challenging, showing what can be done if you tie those hospitals, those diagnostic facilities, the clinics and these other facilities together so as to provide a well rounded medical care program available for all the people.

The Voluntary Health Insurance program will be financed through federal funds and a variable percentage of funds provided from state and local sources under the formula used in the Hospital Survey and Construction Act. This formula allocates a greater percentage of federal funds to the states with lower per capita income.

The immediate aim of S. 1456 is to provide protection for people of limited income by giving them service cards in voluntary prepayment plans which will entitle them to the same kind of hospital and medical care as those who are able to purchase such protection on a voluntary basis.

The plan has three advantages. In the first place, it has been too often the case that persons receiving care at government expense receive an inferior quality of care which has often been called "charity care." By providing service cards to these people we avoid the necessity of identifying them as recipients of government assistance at the time they need hospital care, and we provide that they receive the same high quality of care as is today available to persons who purchase prepayment protection.

The second advantage is that an individual may apply for prepayment protection for himself and his dependents at any time, whether or not hospital and medical care is needed at the time. The determination of need is made easier and does not complicate an emergency situation. There is criticism of the "means test" because of the embarrassment and delay to an individual at the time he is ill.

The third advantage is that persons of limited income are encouraged to pay part of the cost of their hospital and medical care. Medical protection would be assured, however, through the state health insurance agency while the individual contributed to his protection within his own financial limits. It is important that we maintain this sense of individual responsibility. The independence of our people has been America's strength and this is one way to maintain and encourage that independence.

Another basic purpose of the bill is to stimulate and encourage every self-supporting citizen to protect himself and his family against the cost of hospital and medical care by voluntary enrolment in prepayment plans.

The mostly costly illness the average person is likely to encounter is that requiring hospital care. The cost of hospital or medical care under existing prepayment plans runs about \$5 a month for the worker and his family. The hidden costs of a government program would in the end be a greater burden on the average person. We can only imagine the infinite and vexing details of control that would have to be established for operation of a vast compulsory system affecting the lives and health of all the American people.

About a third of the American people now have some form of health protection through voluntary health insurance plans. A recent survey shows that an estimated 52,500,000 persons are protected by voluntary hospital coverage; more than 26,000,000 have voluntary surgical expense coverage, and nearly 9,000,000 have medical expense coverage. More than 31,000,000 of the nation's 58,000,000 employed civilians are insured under some form of voluntary protection against loss of income due to sickness or accident.

These plans have been built up under which a third of the people have some form of coverage and there has not been, so far as I have been able to observe, any great campaign of any kind to build them up. I never hear anything about these plans on the radio, I do not see anything about them in the newspapers; there has not been any great effort to build up these plans. These plans can be built up. And that is what I want to see done. I want to see the American people do this job. The fact that there has been very little or no encouragement, and certainly no campaigns on behalf of these plans, if there is a place in our American way of life for the voluntary system, here is a voluntary program that cannot be ignored.

With universal participation voluntary health plans can provide more comprehensive protection than they do now, that is self evident. The more members they have, the more, members are taken in, the more extensive can be the protection they give. The bill gives assistance to the states to survey the extent of enrolment and to develop methods of broadening protection and increasing the number of persons enrolled. The bill provides for payroll deduction of subscription charges for federal employees who request it, and encourages similar voluntary deduction for state and local government employees.

The greatest impetus, I think the life insurance companies will tell us, that was ever given the life insurance in this country was when the United States Government established War Risk Insurance during the World War. By that act of the government the people became insurance conscious and thousands of persons bought life insurance who never bought it before. Whenever you provide for membership by your federal employees and your state and city and county employees, you have given a tremendous impetus, you have given a great impact to voluntary prepaid insurance.

SENATOR HUMPHREY: The Social Security Act had that effect, too, did it not?

SENATOR HILL: It did. When persons enrolled in prepayment plans become unemployed, subscription charges will be paid during the period of unemployment compensation. In other words, when they are unemployed, these subscription charges will be carried on for them just as though they were on some payroll.

In its broadest effect the bill will stimulate the coordination and full use of the nation's health resources. The bill does this by assisting the states to survey their needs and to integrate the use of their hospitals and medical facilities in order to provide the greatest possible service for the greatest number of people.

In this the Voluntary Health Insurance bill follows the tested pattern of the Hospital and Health Center Construction Act. Before ground was broken or foundations laid for a single hospital, the first year under that Act was spent taking inventory of hospital and health center needs in each state. Once the facts were in hand, the states were able to move promptly with a construction program suited to their particular needs.

The proposed surveys under the Voluntary Health Insurance bill will, I am sure, reveal different needs for different areas. Some areas may find that the network of hospitals, health centers, diagnostic clinics and the supply of doctors and nurses and skilled technicians can provide a well rounded medical service. Other areas may need additional services or facilities in order to provide proper care. Cooperative use of certain facilities may be desirable for some areas. All of these matters can best be determined by the people right on the scene.

The bill provides that the federal government pay half of the cost of the following types of surveys by the states and the local communities:

Surveys of existing diagnostic facilities. Proper diagnosis is a necessary element of medical care and the growth and development of diagnostic clinics will be encouraged, especially in rural areas, so that such services will be available to everyone.

Surveys of existing facilities and services and financing for mental illness, tuberculosis and chronic diseases. The surveys will provide the basis for programs to increase and improve these facilities, at present considered primarily a state responsibility.

Surveys of areas which at present do not have adequate medical care because of economic inability to support a medical practice. We know that many areas, especially rural sections, have not been able to attract the doctors they need, and this is a matter of deep concern to all of us.

When the states have determined their needs, the states and the federal government then can and must take definite, intelligent action. From our experience with the Hospital and Health Center Construction Act we know that the surveys have led to specific programs to meet the deficiencies revealed.

It is the responsibility of this committee to submit legislation on which the Senate and the Congress can act. The health needs of our people demand action.

S. 1456 is a bill that can be passed, and passed now. The reaction to S. 1456 shows the people are ready for this program. It has general support and it has approval from the medical and hospital professions—whose aid and cooperation are essential to the success of any broad program of hospital and medical care.

The Voluntary Health Insurance bill builds on our traditional medical practices and makes use of our free American medical institutions.

There can be no doubt about the fact that, under these practices and under our free American medical institutions, our people have enjoyed the highest quality of medical care of, certainly, any comparable nation in the whole world. The bill enlists the voluntary prepayment health insurance plans which now serve a third of our people.

The program under the bill can be put into operation immediately to benefit those most in need of hospital and medical care. We have the doctors, nurses and hospital facilities to proceed with the program. At the same time, the bill recognizes the practical limits to the medical care which can be immediately provided and does not precipitate the nation into a program of universal medical care definitely beyond the capacities of our present health resources.

The bill is flexible and fosters the growth of the national health program to meet new needs and new conditions. As present programs go forward and increase the number of doctors and nurses and provide additional hospitals and clinics, we can provide in an orderly manner for expansion of the services which will be made available under the bill.

I have faith in the American people—their wisdom, their self reliance, their ability to do for themselves. The more we challenge and encourage and stimulate the people, the more they will respond, the more they will do for themselves.

The Hospital Survey and Construction Act has been inspiring proof of the ability and the desire of the people to act for themselves. Among the forty-eight states, Mississippi and Alabama and North Carolina have perhaps the finest programs for hospital construction. Yet these are among the lowest states in the income of their people.

Through the Voluntary Health Insurance bill the federal government will give financial aid and encouragement, leadership and wise guidance to the medical care program. But we rely on the initiative and ability and resourcefulness of the people by placing full control and administration of the programs in the hands of the states and the local communities. The details of the programs will flow from the needs, the customs and the determinations of the people. Democratic government must be government "by the people" as well as government "for the people."

This Eight-First Congress has the opportunity to stand with the great Congresses of American history—with the Sixty-Third Congress of Woodrow Wilson's first term, which enacted the income tax law, the anti-trust law, created the Federal Trade Commission and the Federal Reserve Board, and provided for popular election of United States Senators; with the Seventy-Third Congress of the historic Hundred Days in 1933, which with bipartisan support enacted the many great laws that lifted our nation from depression, and with the Seventy-Seventh Congress, which with bipartisan support responded to Pearl Harbor with the laws that mobilized our nation for global war.

SENATOR TAFT: What is the matter with the Eightieth Congress?

SENATOR HILL: Well, since the Senator has asked the question, I would like to answer it off the record.

[Discussion off the record.]

SENATOR TAFT: The Seventy-Ninth Congress passed the hospital bill.

SENATOR HILL: The Seventy-Ninth was outstanding. The health of the people is the greatest resource of any nation. We can render no greater service to the people of America, and to the people of the world who look to a strong America for leadership to peace, than to enact this legislation for the health, the strength, the self reliance and the happiness of our nation.

Let the Senate Committee on Labor and Public Welfare—our committee—give leadership and bring forth the legislation to make this Congress the great health Congress.

(To Be Continued)

Coming Medical Meetings

American Association of Railway Surgeons, Chicago, Drake Hotel, June 30-July 2. Dr. Chester C. Guy, 5800 Stony Island Ave., Chicago 37, Secretary.

Montana State Medical Association, Butte, Aug. 1-4. Dr. Herbert T. Caraway, 115 N. 28th St., Billings, Secretary.

West Virginia State Medical Association, White Sulphur Springs, The Greenbrier, Aug. 4-6. Mr. Charles Lively, 1031 Quarrier St., Charleston, Executive Secretary.

Washington Letter

(From a Special Correspondent)

June 20, 1949.

National Health Legislation Hearings Resumed

Congressional hearings on national health legislation were all but at a standstill during the week ended June 18. On June 16 and 17, the health subcommittee of the House Interstate Committee heard witnesses on federal aid to medical research. During the same week the corresponding subcommittee of the Senate Labor Committee held no public hearings but, instead, held conferences on subsidization of medical, dental and nursing education with representatives of the American Medical Association, Association of American Medical Colleges, American Dental Education, American Nurses' Association and other organizations.

Both Senate and House subcommittees were scheduled to resume hearings on full scale beginning June 20 and probably continuing with little interruption almost until the session's end. Congress is expected to adjourn late in July, possibly early August.

Witnesses tentatively scheduled to appear before the Senate subcommittee, of which Senator James E. Murray is chairman, late in June include Dr. George Baehr and Dr. Howard Craig, for the New York Academy of Medicine; Dr. Bernard C. Meyer, Physicians Forum; Dr. Joseph S. Wall, American Academy of Pediatrics, and Dr. E. L. Young and Dr. John Peters, Committee of Physicians for Improvement of Medical Care.

Senators Ives and Flanders Push Their Health Bill

Favorable action on the national health bill sponsored by ten Republican members, the most distinctive feature of which is a plan for federal support of voluntary prepayment plans, has been strongly recommended by two members of the group. They are Senators Irving M. Ives (N. Y.) and Ralph E. Flanders (Vermont). Their bill is known as S. 1970.

"This bill is diametrically different from the compulsory health insurance bill offered by the Administration," said their joint statement. "This program would be a voluntary one. It would place and preserve primary responsibility for the development of adequate health services in the states and local communities, where the needs are most accurately known and best can be met, rather than at the remote federal level.

"This pattern of medical service for our people is designed to give the maximum in assistance, without regard to an individual's income, and with the minimum of government direction, control and centralization. The financial relationship among the doctor and hospital and patient will be not through government as in the Administration's proposal, but through voluntary health plans."

National Science Foundation Bill Indorsed

Passed by the Senate early in the present session of Congress, the National Science Foundation bill (H. R. 4846) was favorably reported on June 14 by the House Interstate Committee. Estimated cost of effectuating the program is \$15,000,000 in 1950 and \$25,000,000 annually thereafter.

"The need to establish a National Science Foundation is today more urgent than ever," said the report. "Our national health, prosperity and welfare and, indeed, our national defense are dependent on pushing forward the frontiers of basic science."

Committee Approves Wider Use of Indian Hospitals

On June 14 the House Committee on Public Lands approved and sent to the floor for action a bill (H. R. 4815) authorizing admittance of non-Indians into Indian hospitals under certain conditions. The legislation was precipitated by a "critical situation" at Winslow, Ariz., where the town's only private hospital was forced to close because of lack of operating funds. Winslow adjoins the Navajo Indian Reservation.

"The town's need for a general hospital is aggravated by the fact that Winslow is on a transcontinental highway on which numerous traffic accidents occur," said the committee report. "A 50-bed hospital operated by the Indian Service has had during the past year an average use of only 29 beds. Under existing regulations, the Indian hospital can accept emergency cases but must remove such patients as soon as they begin to recuperate."

H. R. 4815, if enacted, will authorize the Secretary of Interior to make Indian hospital facilities available to the population on a reimbursable basis and provided that Indians' health needs are properly served. The measure also permits contractual arrangements for treatment of Indians in private hospitals and by private physicians.

New Department of Welfare Proposed

The Children's Bureau and the Office of Vocational Rehabilitation are included among units of Federal Security Agency which would be transferred to a new Department of Welfare under provisions of a bill (S. 2060) introduced by Senator Joseph R. McCarthy, Republican, of Wisconsin. The bill is the latest of several government reorganization measures now pending in Congress, most of which owe their genesis to recommendations of the Hoover Commission. Another bill, introduced a short time earlier, would transfer U. S. Public Health Service (now an F.S.A. component) and practically all Army, Navy and veterans' hospitals to a United Medical Administration, a step also recommended by the Hoover Commission.

New Method of Microsectioning Demonstrated

First public demonstration of a new method in ultramicrotomy was conducted June 13 at the National Bureau of Standards. The technic, developed at the Bureau by S. B. Newman, Emil Borysko and Max Swerdlow, is described as an inexpensive practical means of preparing minutely thin sections of cancerous or other biologic tissue for study with either the light or electron microscope.

Eugene W. Scott Executive Head of Committee

Eugene W. Scott has been appointed as the first full time executive secretary of the Interdepartmental Committee on Scientific Research and Development, whose task is to coordinate research operations of the various federal agencies. He is the holder of a Ph.D. degree in organic chemistry and, until his latest appointment, served as assistant executive secretary of the Research and Development Board of the National Military Establishment.

Dr. Baumgartner Assumes Children's Bureau Post

Dr. Leona Baumgartner was inducted June 2 as associate chief of the Children's Bureau, succeeding Dr. Martha M. Eliot. Among her responsibilities will be administration of \$18,500,000 in federal grants to states to improve maternal and child health services and services to crippled children. A pediatrician, Dr. Baumgartner formerly was in charge of the Bureau of Child Hygiene, New York City Health Department. "Her practical knowledge of how to do a community health job will be immeasurably valuable," stated Federal Security Administrator Ewing.

Veterans Administration Announces Intern Program

Plans have been announced by the Veterans Administration for maintaining 259 internship positions in 13 of its hospitals beginning in July 1950. Two of the institutions will launch "pilot" programs in July of this year. They are at McKinney, Texas, and Chamblee, Ga., and are affiliated, respectively, with Southwestern Medical College and Emory University.

GOVERNMENT SERVICES

ARMY

SERVICE FOR DISABLED VETERAN DOCTORS

The Surgeon General has written to physicians who are drawing compensation as a result of war wounds and who are considered physically able to render professional service, inquiring of their willingness to serve the Army Medical Department in a civilian capacity. This step was taken in view of the Army's present critical need of physicians and dentists. The letters stated, "It is possible for you to be employed in a civilian status without conflicting with the Federal Dual Compensation Status, as you can, in addition to the Civil Service pay, continue to receive your disability retirement benefits." Recipients were asked to state their availability, and their first, second and third preference for appointment in any geographic area or any Army hospital on either a full or part-time basis.

FOUR NEW MEDICAL GENERALS

Four brigadier generals received promotion to the rank of major general in ceremonies held in the office of Major General Raymond W. Bliss, Surgeon General of the Army. Shown (left to right) are Major General Thomas H. Green, Judge Advocate of the Army, who assisted Major General Bliss in the presentation; Major General Walter D. Love, Deputy Chief, Dental Division, Surgeon General's Office; Major General George E. Armstrong, Deputy Surgeon General; Major General Paul H. Streit, M.C., U.S.A., Commanding General of the Army Medical Center; Major General John M. Hargraves, Deputy Air Surgeon General, and Major General Bliss.

NATIONAL GUARD TO PARTICIPATE IN GRADUATE PROGRAM

National Guard medical officers will participate in the regular Army's Graduate Professional Education Program under arrangements completed with the Surgeon General. An initial quota of ten residencies in orthopedics and three in physical medicine has been assigned the National Guard. The courses, which will begin on July 1, 1949, will involve a full year of graduate professional training at Army General Hospitals at full pay and allowances.

Plans are under study for expanded participation of National Guard medical officers in the army program of graduate medical study, which provides approved training in the various fields of medical and surgical specialties. The National Guard has vacancies in Army and Air units of about 1,200 doctors and dentists in grades from first lieutenant to colonel. The 1949 medical and dental graduates have been invited to take advantage of the opportunities for service and training available as medical officers in the National Guard.

OFFICERS ACCEPTED FOR ADVANCED TRAINING

The following Medical Department officers have been accepted for advance training by the civilian schools and hospitals indicated. The first in the list is a colonel, the next two are lieutenant colonels, the fourth a captain, and the remainder first lieutenants.

Name	Institution	Training
William H. Amspacher	Baylor University, Houston, Texas	Training in surgery
Raymond T. Jenkins	American College of Chest Physicians, Chicago	Course in Diseases of the chest
Orland S. Olsen	New York University, New York City	Dermatology and syphilology
Thorwald R. Anderson	University Hospital, University of Nebraska, Omaha	Residency in pathology
Clifton W. Arrington	Provident Hospital & Training School, Chicago	Residency in medicine
Donald S. Wilkins	State University of Iowa Hospitals, Iowa City	Residency in anesthesia
Robert W. Spaulding	St. Mary's Group of Hospitals, St. Louis	Residency in urology
Gerriet A. Janssen	University of Nebraska Hospital, Omaha	Residency in obstetrics and gynecology
Donald H. Giesler	Kansas City General Hospital No. 1, Kansas City, Mo.	Residency in general medicine
Richard M. Fox	University of Minnesota Hospitals, Minneapolis	Residency in anesthesia
Paul W. Dale	Colorado Psychopathic Hospital, Denver	Residency in psychiatry
John G. Boutselis	St. Mary's Group of Hospitals, St. Louis	Residency in obstetrics and gynecology
Miles E. Thomas	Kansas City General Hospital, Kansas City, Mo.	Residency in pathology
James H. Sands	University of Minnesota Hospitals, Minneapolis	Residency in medicine
Lloyd J. Gregory Jr.	University of Texas Medical Branch Hospitals, Galveston	Residency in internal medicine
Dick D. Wetzel	Salt Lake County General Hospital, Salt Lake City	
Warren E. Porter	City Hospitals, Baltimore	Residency in neurology
Charles H. Meeks	Medical College of Virginia, Richmond	Residency in anesthesiology
John K. Leach	Lakewood Hospital, Lakewood, Ohio	Residency in medicine
Blackburn S. Joslin	University of Maryland Hospital, Baltimore	Residency in pediatrics
Lewis E. Jones	Norfolk General Hospital, Norfolk, Va.	Residency in medicine
Walter W. Hannah	City Hospitals, Baltimore	Internship in medicine
Hugh P. Curtis	City Hospitals, Baltimore	Internship in surgery
Norman J. Cole	City Hospitals, Baltimore	Residency in surgery
Joseph Allison	Queens General Hospital, New York; then Coney Island Hospital, Brooklyn	Fellowship in pediatrics Residency in pediatrics

EXHIBIT ON ATOMIC WARFARE

The exhibit on the Medical Aspects of Atomic Warfare prepared by the Medical Departments of the Army, Navy and Air Force was loaned to the Canadian Armed Forces, at the request of the Canadian Minister of National Defense, for display at the annual convention of the Canadian Medical Association, at Saskatoon, June 13-17. The exhibit comprised material collected from Hiroshima and Nagasaki. Accepted principles of civil defense are listed, and means by which the Armed Forces medical services can cooperate with civil defense are demonstrated. Representatives of the Army, Navy and Air Force accompanied the exhibit.

A similar exhibit was displayed by the Medical Departments of the Armed Forces at the American Medical Association convention in Chicago in 1948, and was later placed in the Museum of Science and Industry, Chicago, where it was seen by more than 300,000 persons.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

CALIFORNIA

Society News.—The California Society of Pathologists at their second annual meeting in Los Angeles May 8 installed Dr. Robert J. Parsons of Oakland as president and chose Drs. Alvin G. Foord of Pasadena as president-elect and H. Russel Fisher of Los Angeles, secretary-treasurer.

Faculty Changes at Stanford.—The following professors will retire from their active teaching duties at Stanford University School of Medicine, San Francisco, September 1 with the title emeritus: Dr. George D. Barnett, professor of medicine; Dr. Charles H. Danforth, professor and executive, department of anatomy; Dr. James R. Dillon, clinical professor and chief of the division of urology; Dr. Harold K. Faber, professor and executive of the department of pediatrics, and Frank W. Weymouth, Ph.D., professor and executive, department of physiology. Dr. John K. Lewis has been promoted to professor of medicine and will succeed Dr. Barnett on the Stanford Service at the San Francisco Hospital. The new clinical professor and chief of the division of urology will be Dr. Henry Weyrauch, member of the faculty since 1937. Dr. John A. Anderson will succeed Dr. Faber as professor and executive of the department of pediatrics. He has held a similar position at the University of Utah for the past five years. William W. Greulich, Ph.D., will succeed Dr. Danforth as executive of the department of medicine. Dr. Rodney R. Beard has been promoted to professor of public health and preventive medicine and will succeed Dr. Charles E. Smith as executive of the department. Dr. Smith has resigned, effective September 1, to accept an appointment in the Graduate School of Public Health at the University of California, Berkeley. Dr. Jefferson M. Crismon, associate professor of physiology, has been appointed acting executive in the department of physiology.

COLORADO

Health Director Retires.—Dr. Amos L. Beagler, the first director of health of Denver public schools, will retire June 28. He was named head of the health department when it was formed in 1923 and has built it up so that the department includes health rooms in every school, thirty-six nurses, two full time and seven half-time physicians.

Dr. Rovenstine to Lecture.—The Phi Delta Epsilon Graduate Club of Denver is sponsoring its first lecture to be held at Denison Auditorium, University of Colorado Medical Center, June 27 at 8 p.m. Dr. Emory A. Rovenstine, chairman of the department of anesthesiology, New York University-Bellevue Medical Center, will speak on "The Abuse of Hypnotics and Analgesics."

Radio Council Receives Award.—The Rocky Mountain Radio Council has been awarded a special citation for Service to Education through Radio by the George Foster Peabody Awards Committee. Jack W. Lewis, associate director of the council and writer of both the Colorado State Medical Society programs, "Man and Medicine" and "Dr. Tim, Detective," accepted the award. The council is an organization which specializes in the production of educational programs. A large measure of the council's public service has been of a medical nature.

CONNECTICUT

Connecticut Hospital for Alcoholic Addicts.—Construction of the first hospital in the United States devoted solely to the study, treatment and rehabilitation of alcoholic addicts began in Hartford in March. The project will be under the direction of the Connecticut Commission on Alcoholism, which will operate the building and organize and supervise its services. The building, which will cost \$423,500, will be located near the J. J. McCook Memorial Hospital.

Expand Psychiatric Guidance of Students.—A gift of \$2,000,000 from the Old Dominion Foundation of Washington, D. C., will allow Yale University to expand its work in psychiatric guidance of students. Yale's present program of psychologic and psychiatric assistance to students is under the supervision of Dr. Clements C. Fry, head of the division of psychiatry and mental hygiene of the Yale Department of Health. Dr. Fry will be in charge also of the expanded program. In discussing his division, Dr. Fry emphasized that

"the ultimate objective from the research point of view is to establish at Yale a center for the thorough study of the young adult within a psychiatric, psychologic and sociologic framework." The functions of the Division of Psychiatry and Mental Hygiene will be expanded in several directions: clinical, research, training, education and publication. On the clinical side the division will carry on and expand the work now being done in the prevention and treatment of the emotional problems of students. The staff will be enlarged, and closer relationships will be maintained with members of the university community. In the field of research, according to Dr. Fry, "the fundamental goal is the systematic observation and measurement of the emotional characteristics of the age group represented by students." In the field of training the division will function as a center for psychiatrists, clinical psychologists, physicians and social workers. In addition, such undertakings could be sponsored as postgraduate courses in neurology and psychiatry for physicians, nurses and social workers; and a summer course in college mental hygiene may be conducted in 1950 as a special supplement. If available funds are sufficient, it is planned to publish a journal devoted to problems and developments in college mental hygiene and to the results of the research and other work carried on by the division.

ILLINOIS

Another Downstate Cancer Clinic.—The twenty-fifth downstate Illinois cancer diagnostic clinic, located in the Good Samaritan Hospital, Mt. Vernon, began operation June 7 and will now receive patients on the first Tuesday of each month. Of the twenty-five cancer diagnostic clinics now functioning downstate, twenty-two are state aided. In Cook County there are two cancer clinics which are maintained solely by local funds. Dr. G. Howard Gowen, chief of the state division of cancer control, stated that on the basis of the present population Illinois should have forty more cancer diagnostic clinics throughout the state. The U. S. Public Health Service and the American Cancer Society in February of this year recommended that such a clinic be established for every 100,000 persons.

Chicago

Raymond B. Allen Awards.—Drs. Kurt Glaser and Edmund F. Foley have been chosen by seniors at the University of Illinois College of Medicine as recipients of the Raymond B. Allen Instructorship Awards. The award for excellency in didactic instruction was given to Dr. Foley, a professor of medicine. Dr. Glaser, an instructor in pediatrics, was honored for clinical teaching. The awards were established in 1948 by the Medical Student Council in honor of the former executive dean of the university's Chicago Professional Colleges.

Poliomyelitis Team Activated.—The Northwestern University poliomyelitis team is ready for action. The medical school unit is on call to aid polio-stricken communities anywhere in the United States. With Dr. Emil D. W. Hauser, assistant professor of bone and joint surgery, as its director, the team is assigned to duty and its expenses paid by the National Foundation for Infantile Paralysis. The crew has been on duty five years and has served in Boise, Idaho, and Rockford and Peoria, Ill. Services of the team include medical consultation to doctors of the affected community; teaching local hospital nurses proper bed posture for patients and the administration of hot packs; and instruction in physical therapy techniques of muscle reeducation and general functional exercises. The team is prepared to stay on duty up to six weeks, or until its work of organization, teaching and medical assistance is completed. Subsequently, the assistant orthopedist of the unit will remain in the stricken city as long as he is required. Members of the 1949 team, in addition to Dr. Hauser, are Dr. Arthur F. Abt, associate professor of pediatrics; Dr. Erwin J. Cummins, orthopedist; Miss Meredith Nordschow, instructor in physical medicine; Miss Anne Prochaska, chief physical therapist; and Mrs. Jean Sciora and Miss Lucille Kurzawa, physical therapists. In addition, provision has been made for the services of a medical social worker if the need arises. Other teams similarly organized under the National Foundation are those of Stanford and Harvard universities and the D. T. Watson School of Physical Therapy, Leedsdale, Pa.

MAINE

State Medical Meeting.—The Maine Medical Association held its annual meeting at Poland Spring House, Poland Spring, June 19-21, under the presidency of Dr. Forrest B. Ames, Bangor. Out-of-state speakers included: Paul A. Chandler, Boston, Glaucoma; George Gaillard, White Plains, N. Y., Allergy, and Chester Keefer, Boston, Antibiotics. The guest speaker at the dinner Monday evening was William A. Richard-

son, Rutherford, N. J., who spoke on "Free Medicine in Britain." Dr. Joseph S. Lawrence, director, Washington Office, American Medical Association, was the guest speaker at the dinner Tuesday evening.

MARYLAND

Dedicate Doctors Hospital.—Dedication ceremonies were held for the Doctors Hospital in Baltimore May 12. The hospital, a new structure with a capacity of 75 beds and 34 bassinets, was erected in 1947 through the efforts of a few physicians and in 1948 was reorganized under the control of a lay board of trustees. It is to be the policy of the hospital to cater to the general practitioners who make up a large majority of the more than fifty physician staff. It is the only hospital in Baltimore that has a clinical department of general practice. The dedication dinner address was delivered by Dr. Fred W. Kratz, chief of Office of Medical Program, the U. S. Public Health Service, who spoke on "The Role of Small Hospitals in Medical Care."

MASSACHUSETTS

New Department of Legal Medicine.—Dr. Walter W. Jetter, pathologist for the department of mental health and assistant professor of legal medicine at Harvard University, Boston, has been selected head of a new department of legal medicine at the Boston University School of Medicine, effective July 1. Dr. Jetter received his M.D. degree from the University of Buffalo (N. Y.) School of Medicine in 1931 and his M.S. in medicine in 1938 from the same school. Formerly he was pathologist at the university's Buffalo City Hospital and the Tauton (Mass.) State Hospital. In 1940 he was named state pathologist for the department of mental health and has been director of legal medicine for Massachusetts in that department. For the past nine years he has been active in conducting medico-legal autopsies for the state police and local and county medical examiners.

MISSISSIPPI

State Medical Election.—The Mississippi State Medical Association recently installed Dr. Braxton B. O'Mara, Biloxi, as president, and chose Dr. Billy S. Guyton, Oxford, president-elect for the coming year. The association will hold its 1950 convention in Jackson next May.

Community Honors Physician.—A community-sponsored program was held at the Magnolia Methodist Church May 15 for Dr. George W. Robertson, in recognition of his service as a practicing physician in the community since March 1899. Guest speaker was Dr. James P. Wall, Jackson, a past president of the Mississippi Medical Association. Dr. Robertson, a graduate of the Vanderbilt University Medical School, Nashville, Tenn., 1897, was presented a 50 year service award by Dr. Aubrey V. Beacham of Magnolia.

NEW JERSEY

Hospital Training Program.—The Intern and Resident Training Program at Atlantic City Hospital includes daily clinical conferences, at which teacher-clinicians from leading medical centers discuss diagnostic problems from the hospital wards. All licensed physicians and medical students may attend. The program for the summer lists the following visiting physician speakers:

June 27-July 1, A. McGehee Harvey, Baltimore.
July 4-9, tentative.
July 11-15, John Royal Moore, Philadelphia.
July 18-22, Robley D. Bates Jr., Richmond, Va.
July 25-29, Charles L. Brown, Philadelphia.
August 1-5, William G. Leaman, Philadelphia.
August 8-12, Robert W. Heinle, Cleveland.
August 15-19, Thomas M. Durant, Philadelphia.
August 22-26, Frank Mayfield, Cincinnati.
August 29-September 2, Alexander Marble, Boston.

NEW YORK

Health Officer Retires.—A testimonial dinner was given recently honoring Dr. Edward E. Gillick on his retirement after more than 30 years as health officer of Niagara Falls. Dr. Archibald S. Dean, regional health director, Buffalo, said that Dr. Gillick has made notable contributions to the development of generalized public health nursing, pasteurization of milk, reduction of tuberculosis and the eradication of smallpox and diphtheria in Niagara Falls.

New Infirmary at Craig Colony Opened.—The first building under New York State's postwar construction program to increase facilities of the department of mental hygiene is ready for occupancy. It is a 200 bed infirmary at Craig Colony, the department's institution for epileptics at Sonyea, Livingston County. The infirmary, equipped with all modern facilities for complete medical care, was officially opened June 9. Dr. Willard H. Veeder is director of Craig Colony, which now houses

about 2,224 epileptic patients and provides full medical care, including special treatment for convulsive disorders. Children of school age receive instruction in academic subjects so far as their capacities for learning permit, and occupational therapy is prescribed for patients of all ages. The colony is one of the 27 institutions under jurisdiction of the Department of Mental Hygiene. The state's building program will increase the capacities of several of these institutions, which include 20 hospitals for the mentally ill and 6 schools for mental defectives.

New York City

Medical School Increases Tuition to \$750.—Beginning with the academic year 1949-1950, the New York University College of Medicine will increase its tuition fee from \$650 to \$750.

Sculpture Presented to Hospital.—A sculptured head of the late Dr. Hugh Auchincloss was presented to Presbyterian Hospital June 13 by members of his family. His brother, Charles, made the presentation to Charles P. Cooper, president of the hospital. Dr. Auchincloss' contributions to the advancement of surgery were extolled by his former associate, Dr. Allen O. Whipple. Members of the school of nursing, Eleanor Lee and Margaret Eliot, spoke of Dr. Auchincloss' gift of letters, pictures and other souvenirs concerning Florence Nightingale. The mementos are kept in a specially designed room off the library of the nursing residence. Dr. Auchincloss died Sept. 21, 1947, after more than 35 years' association with the surgical service of Presbyterian Hospital.

Personals.—Among alumni who have earned the New York University Alumni Meritorious Service Award for 1949 for distinguished service to the University is Dr. Ralph L. Dourmashkin, New York. He was cited for his efforts in behalf of the New York University-Bellevue Medical Center Fund and the Dr. Hannah M. Stone Memorial Fund.—Dr. John M. Converse has been presented the Cross of Officer of the Legion of Honor and the Croix de Guerre for service to the French Army as a plastic surgeon during World War II. Awards were presented at the headquarters of the French delegation to the United Nations.—Dr. Emery A. Rovenstine, professor of the department of anesthesiology, New York University-Bellevue Medical Center, received the degree of Doctor of Science from Wabash College, Crawfordsville, Ind., at commencement ceremonies June 5. He was graduated from the college in 1928.—Dr. Oscar D. Ratnoff has been awarded the Montefiore Hospital Henry L. Moses Alumni Prize of \$500 for work during 1948 on "Proteolytic Enzyme in Human Plasma." The award was made on Alumni Day at the Hospital June 1.—Dr. Leonard P. Wershub was reelected president of the Alumni Association of the New York Medical College, Flower and Fifth Avenue Hospitals, at the annual meeting June 7. The Alumni Award was presented to the dean of the college, Dr. J. A. Werner Hetrick, class of 1918, for outstanding achievement and devotion to the college.

OKLAHOMA

State Medical Election.—The Oklahoma State Medical Association has chosen the following officers for the coming year: Drs. George H. Garrison, Oklahoma City, president; Ralph A. McGill, Tulsa, president-elect, and Lewis J. Moorman, Oklahoma City, treasurer. Dr. John F. Burton also of Oklahoma City was elected as delegate to the American Medical Association with Dr. Malcolm E. Phelps, El Reno, as alternate.

Preceptorship Program Under Way.—The first group of senior medical students began work under the preceptorship program of the University of Oklahoma School of Medicine, Oklahoma City, June 20. Senior medical students will be given an opportunity to observe general medical practice in smaller communities of Oklahoma. It is hoped that such experience will encourage students to consider locating in the smaller towns. Each senior student will spend 11 weeks in one of 18 towns in Oklahoma under the supervision of physicians. The program will extend the senior year to 44 weeks instead of the present 32 weeks. The preceptors are members of the general faculty of the school of medicine. The program was worked out jointly by the alumni association of the medical school, the Oklahoma State Medical Association, and the faculty of the school.

PENNSYLVANIA

Enlarge County Hospital.—Ground was broken for Delaware County Hospital's new addition early in May. The addition is to cost \$665,000 and will add 65 beds. The construction concludes years of effort on the part of a small group of hospital officials, friends and enthusiasts. The sum of \$200,000 is being secured by a federal grant.

Philadelphia

Medical School and Hospital to Affiliate.—Germantown Dispensary and Hospital and Jefferson Medical College and Hospital announce a proposed affiliation under which the two institutions will combine their efforts and will cooperate with each other in major activities. The affiliation does not constitute a merger. The institutions will maintain their separate identities and continue their business affairs under their respective governing boards and officers. They agree to joint consultation at the appropriate level on "all matters arising in connection with any activity of either institution which would directly and substantially affect the other institution to the end that the decisions shall be approved by both." A formal agreement approved by the boards and staffs of the two institutions is planned to go into effect within the next few months. Advantages expected to result are: Germantown, being in a position to offer to its physicians an opportunity to teach and develop specialties under the auspices of an outstanding medical college, will increase its standing and efficiency in the community. Hospital staffs will be enlarged and improved by providing that certain personnel will be on the staffs of both hospitals. Jefferson Medical College, now short of available beds for teaching purposes, will use Germantown's facilities for clinical training of its medical students. Jefferson Hospital, now crowded, will use some of the 400 Germantown hospital beds not now occupied. The agreement will provide for eventual joining of the medical staffs of the two hospitals and for eligibility of all present staff members of the Germantown hospital for teaching positions at Jefferson Medical College. There will be a free exchange in rotation of resident physicians between the two hospitals with respect to all services.

GENERAL

Poliomyelitis in Adults.—The National Foundation for Infantile Paralysis reported June 1 that the trend toward a higher proportion of poliomyelitis cases among adults continued during last year's epidemic. A survey based on cases from 22 states and the District of Columbia showed 17.8 per cent of 15,151 persons stricken in those areas were over 20 years of age. The United States had 27,894 cases last year.

National Health Council.—At the annual meeting of the National Health Council in New York on March 25, the National Foundation for Infantile Paralysis was voted an active member of the group. Its president, Basil O'Connor, New York City, was made a member of the group's executive committee. Dr. Hart E. Van Riper, New York City, medical director of the foundation, and Joe W. Savage, executive director, were named to the Health Council's board of trustees. Objectives of the council are the promotion of greater cooperation between medical and public health groups and the furthering of plans through which the entire community health program may be expanded.

Special Society Elections.—At the meeting of the American Gynecological Society at Hot Springs, Va., May 16-18, Dr. Joseph L. Baer of Chicago was elected president, Dr. Robert A. Kimbrough of Philadelphia treasurer and Dr. Norman F. Miller of Ann Arbor secretary. The next meeting of the society will be held at the Greenbrier Hotel, White Sulphur Springs, W. Va., May 11-13, 1950.—The American Geriatrics Society at its recent meeting in Atlantic City chose the following officers: Dr. Hollis E. Clow, White Plains, N. Y., president; Dr. Malford W. Thewlis, Wakefield, R. I., secretary; Dr. Elmer T. Gale, Narragansett, R. I., assistant secretary, and Dr. Richard J. Kraemer, Providence, R. I., treasurer.—The officers of the New England Dermatological Society for the coming year are Dr. Francis P. McCarthy, Boston, president; Dr. Leonard E. Anderson, Springfield, Mass., secretary, and Dr. Mildred L. Ryan, Brockton, Mass., treasurer.

Poliomyelitis Report.—According to the U. S. Public Health Service, the reported incidence of poliomyelitis declined from 155 cases the preceding week to 139 for the week ending June 4 (corresponding week last year 149, 5 year median for the week 71 cases). The following states reported increases of 5 or more cases currently: Oklahoma (from 7 to 19 cases), Tennessee (from 0 to 6), South Dakota (from 1 to 7) and Massachusetts (from 2 to 7). The largest numbers of cases in Texas have occurred in Tom Green and Bexar Counties, with Hidalgo County next; about half of the total cases reported in Texas to date have occurred in these three counties. A total of 1,757 cases have been reported in the United States to date this year, as compared with 1,226 last year and a 5 year median of 956 for the corresponding periods. The total since the average seasonal low point of the disease is 834, as compared with 878 last year and a 5 year median of 414 for the corresponding periods.

Foundation to Merge with Heart Association.—Preliminary steps for merging the American Foundation for High Blood Pressure with the American Heart Association have been approved by the boards of both groups, it was announced June 13. The high blood pressure group will become a section of the American Heart Association's Scientific Council and will be known as the Council for High Blood Pressure Research. Other sections within the association's Scientific Council now include the Section on Circulation and the American Council on Rheumatic Fever. The staffs of both groups will undertake a joint study to recommend methods of integrating personnel and operations of the two present organizations. When such arrangements have been mutually approved, the foundation will dissolve.

World Health Organization to Open Office in Alexandria.—Delegates and observers from twenty countries and territories met in Cairo, Egypt, during the second week of February to set up a World Health Organization Regional Office for the Eastern Mediterranean. Sir Aly T. Shousha, Pasha, Egypt's undersecretary of state for health and chairman of the Executive Board of the World Health Organization, was unanimously nominated director of the regional office to be established on July 1 at Alexandria. The office will have at its disposal a budget slightly over \$100,000 for the first six months. For the first quarter of 1949 advisory services are being provided to Pakistan for malaria control, to Pakistan and Egypt in tuberculosis and maternal and child health, to Egypt and Turkey for venereal disease and to Ethiopia for training programs in public health and sanitation. In addition more than thirty study fellowships have been granted to medical personnel from the area.

Fellowships for Latin-American Physicians.—The American College of Physicians and the W. K. Kellogg Foundation, with the cooperation of the U. S. Department of State and of medical schools in the United States, Canada and Latin-American countries, will inaugurate a program of postgraduate medical fellowships. Outstanding young physicians will be nominated to the college and foundation by local committees in the countries to the south, and those to whom fellowships are awarded will be brought to this country for a year or more of special training. The first fellows will begin their studies in the autumn of 1949. Eligibility requirements include citizenship in the country from which application is made and familiarity with its culture and economy, graduation from an acceptable medical school and completion thereafter of an internship of twelve months or more, ability to use the English language and assurance of a subsequent teaching affiliation with a medical school in the native country. Those needing some training in English will be assigned to a special course for the purpose in the United States.

The W. K. Kellogg Foundation will provide each fellow with a monthly stipend adequate for his basic living costs, an allowance for necessary travel within this country or Canada and will defray tuition charges. In view of the pressing need of Latin-American medical libraries, the foundation will reimburse the fellow for the cost of required textbooks on condition that they become the property of the medical school in which the fellow will teach on his return home. Representatives of the foundation will visit the fellows at intervals after their return home to evaluate the end results of their training and to offer any possible assistance to improve teaching, research and practice in internal medicine in their own countries.

Marriages

JOHN J. BLUMBERG, Elizabeth, N. J., to Miss Beverly Gayle Terry in Washington, D. C., May 21.

CLEMENT C. CURD JR., Ramsey, N. J., to Miss Patricia Ann McInerney of Brooklyn, April 18.

SILAS OWENS THORNE JR., Durham, N. C., to Miss Lucy Lee Kennedy of Kerr, May 21.

ALBERT J. PASCALE, Richmond Hill, N. Y., to Miss Maryann Giosa of Forest Hills, May 21.

CLOYD DINSMORE VAN HOOK to Miss Betty Ora Monroe, both of Ogden, Utah, May 7.

C. ROLLINS HANLON to Dr. Margaret Mary Hammond, both of Baltimore, May 28.

ARTHUR S. THURM to Miss Lorraine Northey, both of Trenton, N. J., May 26.

RODGER R. ENGEL, Santa Ana, Calif., to Miss Juanita Moore of Long Beach, recently.

Deaths

Robert Spann Cathcart ☉ Charleston, S. C.; born in Columbia, Sept. 25, 1871; Medical College of the State of South Carolina, Charleston, 1893; professor emeritus of surgery at the Medical College of the State of South Carolina, which he joined in 1913; member of the founders group of the American Board of Surgery; member of the House of Delegates of the American Medical Association in 1908 and 1909; past president of the Southern Surgical Association, South Carolina Medical Association and the Tri-State Medical Association (North and South Carolina and Virginia); a founder, a life member and from 1916 to 1943 a member of the board of governors of the American College of Surgeons; served during World War I; retired surgeon in chief at Roper Hospital; surgeon at the Citadel for many years, the South Carolina Power Company, Atlantic Coast Line Railway and the Seaboard Air Line Railway; died April 29, aged 78, of carcinoma of the larynx.

Louis Claiborne Posey ☉ Birmingham, Ala.; born in Marvel, Ala., Sept. 12, 1910; Harvard Medical School, Boston, 1935; specialist certified by the American Board of Pathology, Inc.; member of the Southern Medical Association, American Society of Pathologists and Bacteriologists and American Society of Clinical Pathologists; founding fellow of the College of American Pathologists; on the faculty of the University of Alabama School of Medicine; served in the medical corps of the U. S. Naval Reserve during World War II; affiliated with the Employees' Hospital of the Tennessee Coal, Iron and Railroad Company in Fairfield, South Highlands Infirmary, East End Memorial Hospital, Children's Hospital and St. Vincent's Hospital; died April 30, aged 38, of heart disease.

Dudley White Palmer ☉ Cincinnati; born in Cincinnati February 5, 1877; Medical College of Ohio, Cincinnati, 1906; formerly on the faculty of the University of Cincinnati College of Medicine; served during World War I; past president of the Cincinnati Academy of Medicine; member of the American Surgical Association; fellow of the American College of Surgeons; member of the founders group of the American Board of Surgery; on the staffs of the Christ Hospital, Cincinnati General Hospital, Deaconess Hospital and the Good Samaritan Hospital; died April 23, aged 72, of cerebral hemorrhage.

John Ten Broeck Bird ☉ Spokane, Wash.; Northwestern University Medical School, Chicago, 1909; specialist certified by the American Board of Internal Medicine; affiliated with Sacred Heart, Deaconess and St. Luke's hospitals; died in Victoria, B. C., Canada, April 21, aged 67, of coronary thrombosis.

Marion Martin Brown ☉ Mexia, Texas; Medical Department of Tulane University of Louisiana, New Orleans, 1907; fellow of the American College of Surgeons; member and past president of the state board of medical examiners; formerly member of the state board of health; past president of the Central Texas and Limestone County Medical societies; past president of the local chamber of commerce; founder of Brown Hospital, where he died April 20, aged 65, of arteriosclerosis.

Roy Hammond Cantrell, Dallas, Texas; Baylor University College of Medicine, Dallas, 1931; member of the American Medical Association; an officer in the Air Corps during World War II; served with the Veterans Administration; died in the Veterans Administration Hospital April 21, aged 46, of melanoma of the brain, pancreas and kidney.

Leonard Clare Chamberlain, New Orleans; Medical Department of Tulane University of Louisiana, New Orleans, 1901; at one time on the state board of health; member of the American Medical Association; affiliated with the Southern Baptist Hospital; physician for the police department; died April 28, aged 71, of cerebral hemorrhage.

Grover Cleveland Chamness ☉ Zeigler, Ill.; Barnes Medical College, St. Louis, 1906; died April 20, aged 63, of coronary heart disease.

Percy Wells Cobb, Sappington, Mo.; Western Reserve University School of Medicine, Cleveland, 1902; formerly on the faculty of Washington University School of Medicine in St. Louis; served in the regular army; died April 18, aged 75.

Frank M. Coyne, Philadelphia; Maryland Medical College, Baltimore, 1907; member of the American Medical Association; died April 11, aged 66.

Morton Everett Cummings, Malden, Mass.; Harvard Medical School, Boston, 1901; member of the American Medical Association; died April 20, aged 73, of carcinoma of the prostate.

John Forrest Dillon III, Montgomery, Ala.; Washington University School of Medicine, St. Louis, 1936; member of the American Medical Association; on the staffs of Fitts Hill Hospital and St. Margaret's Hospital, where he died March 20, aged 42, of uremia.

Kinton Francois Dorion, Lawrence, Mass.; School of Medicine and Surgery of Montreal, Quebec, Canada, 1902; member of the American Medical Association; died recently, aged 73, of coronary thrombosis.

Byron Eugene Farwell, Palm Springs, Calif.; State University of Iowa College of Medicine, Iowa City, 1929; member of the American Medical Association and the Michigan State Medical Society; died March 10, aged 45, of pulmonary tuberculosis.

Ralph Moody Funkhouser, Indianapolis; Indiana University School of Medicine, Indianapolis, 1912; served during World War I; on the neuropsychiatric staff of the Veterans Administration in Indiana and Illinois; on the staff of the Veterans Administration Hospital in Hines, Ill.; died in Methodist Hospital February 27, aged 64, of carcinoma of the pancreas.

Harold Ellsworth Gillett, Ramsey, N. J.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1916; died February 18, aged 56.

Eugene Edwin Gloor ☉ Aromas, Calif.; College of Medical Evangelists, Los Angeles, 1923; died in Salinas, March 18, aged 52, of a reaction following a transfusion.

Alfred Fredric Gray, Little Rock, Ark.; Memphis (Tenn.) Hospital Medical College, 1908; member of the American Medical Association; affiliated with Baptist State Hospital and St. Vincent Infirmary; died April 22, aged 68, of coronary occlusion.

George Edward James, Selbyville, Del.; University of Maryland School of Medicine and College of Physicians and Surgeons, Baltimore, 1909; served during World War I; member of the American Medical Association; on the medical board of Beebe Hospital in Lewes; died April 20, aged 66, of heart disease.

Joseph Thomas Jones, Houston, Texas; University of Virginia Department of Medicine, Charlottesville, 1920; member of the American Medical Association; died in St. Joseph's Infirmary, April 12, aged 54, of cerebral hemorrhage.

George H. Jordy, Hanover, Pa.; Baltimore University School of Medicine, 1898; died in Jefferson Hospital, Philadelphia, April 18, aged 75.

Henry Frederick Kammann, San Marino, Calif.; Chicago College of Medicine and Surgery, 1910; died April 30, aged 62, of coronary occlusion.

Samuel Solomon Keller, Saginaw, Mich.; Detroit College of Medicine and Surgery, 1914; affiliated with Saginaw General, St. Mary's and St. Luke's hospitals; died in Gulfport, Miss., April 18, aged 66, of heart disease and diabetes mellitus.

Thomas Neal Kitchens, Warm Springs, Ga.; Louisville (Ky.) Medical College, 1891; served as mayor of Warm Springs; formerly affiliated with the Georgia Warm Springs Foundation; died April 23, aged 86.

William Bernhard Kowenstrot, Milwaukee; Wisconsin College of Physicians and Surgeons, Milwaukee, 1904; also a pharmacist; died April 26, aged 74.

Walter Phillip Kriechbaum, Burlington, Iowa; Northwestern University Medical School, Chicago, 1914; certified by the National Board of Medical Examiners; died in Norbury Sanatorium in Jacksonville, Ill., recently, aged 58, of coronary thrombosis.

Willis Hess LeFevre ☉ Lancaster, Pa.; Medical College of Virginia, Richmond, 1913; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; fellow of the American College of Surgeons; past president of the Lancaster City and County Medical Society; past president of the city board of health; on the staff of Lancaster General Hospital, where he died April 29, aged 60, of cerebral hemorrhage.

Harry Fritz Leibert ☉ Bethlehem, Pa.; Medico-Chirurgical College of Philadelphia, 1904; specialist certified by the American Board of Radiology, Inc.; member of the Radiological Society of North America and the American College of Radiology; served during World War I; police surgeon and civil service commissioner; affiliated with St. Luke's Hospital; died April 12, aged 65.

James Francis Loughran, Lowell, Mass.; Harvard Medical School, Boston, 1896; member of the American Medical

Association; on the staff of St. John's Hospital; died April 17, aged 79, of arteriosclerotic heart and kidney disease.

Arthur Marcus McElhannon • Sherman, Texas; University of Texas School of Medicine, Galveston, 1912; fellow of the American College of Surgeons; on the staff of St. Vincent Hospital, where he died April 21, aged 67, of coronary occlusion.

John H. McLean, Caddo Gap, Ark.; Gate City Medical College, Dallas, 1905; member of the American Medical Association; past president and for many years secretary of the Montgomery County Medical Society; died April 25, aged 79.

Samuel Hoskins McLean, Jackson, Miss.; Medical Department of Tulane University of Louisiana, New Orleans, 1893; fellow of the American College of Surgeons; served as secretary and executive officer of the Mississippi State Board of Health; for many years county health officer; for many years physician for Belhaven College; died April 21, aged 77.

Edwin A. McManus, Mesick, Mich.; Michigan College of Medicine and Surgery, Detroit, 1898; member of the American Medical Association; past president of the Wexford-Messaukee Counties Medical Society; president of the village of Mesick for many years; health officer; on the staff of Mercy Hospital, Cadillac; died April 11, aged 85, of prostatic hypertrophy and uremia.

John W. Medley, La Harpe, Ill.; College of Physicians and Surgeons, Keokuk, Iowa, 1898; member of the American Medical Association; died April 10, aged 77, of heart disease.

Peter Meier, Crescent Springs, Ky.; American Medical College, St. Louis, 1913; served during World War I; formerly member of the board of health in Covington; on the staff of St. Elizabeth Hospital in Covington, where he died April 25, aged 72.

Robert Asa Melendy • Chicago; the Hahnemann Medical College and Hospital, Chicago, 1906; fellow of the American College of Surgeons; on the staff of the Chicago Memorial Hospital; died April 24, aged 66, of coronary occlusion.

John Whitworth Melvin, Camden, Miss.; Medical Department of Tulane University of Louisiana, New Orleans, 1911; served during World War I; died in St. Dominic's Hospital in Jackson April 29, aged 61, of a head injury received in a car accident.

Thomas Ralph Moye, Sanford, Fla.; Atlanta College of Physicians and Surgeons, 1899; member of the American Medical Association and the Medical Association of Georgia; died April 5, aged 75, of cerebral hemorrhage.

John Michael Murphy • Brockton, Mass.; Tufts College Medical School, Boston, 1906; died in the Goddard Hospital April 24, aged 68.

William Alex O'Brien, Chicago; Medical College of Virginia, Richmond, 1918; died April 7, aged 57, of lobar pneumonia and arteriosclerotic heart disease.

John Joseph O'Shea, Weehawken, N. J.; Columbia University College of Physicians and Surgeons, New York, 1930; member of the American Medical Association; served during World War II; on the staff of St. Mary's Hospital in Hoboken; died in New York April 9, aged 43, of heart disease.

Kate E. Peckardt, Chicago; Chicago Medical College, 1885; the Hahnemann Medical College and Hospital, Chicago, 1889; member of the American Medical Association; died March 23, aged 88, of chronic myocarditis and arteriosclerosis.

Philip Sheridan Pile • Latrobe, Pa.; Baltimore Medical College, 1905; served as a member of the board of education and the board of health; died April 11, aged 78, of coronary occlusion.

William James Quinn • Eureka, Calif.; Cooper Medical College, San Francisco, 1905; formerly city and county health officer; on the staff of General Hospital; died April 12, aged 72, of cerebral hemorrhage.

Walter Latham Rathbun • Cassadaga, N. Y.; Yale University School of Medicine, New Haven, 1903; member of the American Trudeau Society and the American Clinical and Climatological Association; medical superintendent of the Newton Memorial Hospital; died April 28, aged 71.

Rudolph Robert Remark, Sinking Spring, Ohio; Eclectic Medical College, Cincinnati, 1920; member of the American Medical Association; formerly mayor; served during World War I; died April 16, aged 70, of chronic myocarditis and arteriosclerosis.

Florence A. Amidon Richardson, Omaha; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1895; served as juvenile court physician; died in the Douglas County Hospital April 16, aged 81, of bronchopneumonia, arteriosclerotic heart disease and hypertension.

Marie Riegger, Philadelphia; Woman's Medical College of Pennsylvania, Philadelphia, 1901; died in Lankenau Hospital March 22, aged 75.

Grover Moss Rogers • Kingsport, Tenn. (licensed in Tennessee in 1915); died in Kingsport Hospital April 10, aged 64.

Leopold Miller Rohr, Jamaica, N. Y.; University and Bellevue Hospital Medical College, New York, 1908; served during World War I; formerly district health officer; died in the U. S. Naval Hospital, St. Albans, April 6, aged 63, of coronary thrombosis and cerebral accident.

Leon Rosenwald • Kansas City, Mo.; Marion-Sims College of Medicine, St. Louis, 1893; an Associate Fellow of the American Medical Association; died in the Wheatley-Provident Hospital April 21, aged 77, of arteriosclerotic heart disease.

Roxette Landis Runk • Takoma Park, Md.; American Medical Missionary College, Battle Creek, Mich., and Chicago, 1906; specialist certified by the American Board of Otolaryngology; member of the American Academy of Ophthalmology and Otolaryngology; for many years associated with the Washington Sanitarium and Hospital, where she died April 18, aged 77, of myelogenous leukemia.

Dawsey Ryan, Bernie, Mo.; St. Louis College of Physicians and Surgeons, 1904; died in Galatia, Ill., April 8, aged 67, of cerebral hemorrhage, hypertension and arteriosclerosis.

Clarence Elmer Sanders • Kansas City, Mo.; University of Kansas School of Medicine, Kansas City, Kan., 1907; served during World War I; on the staff of St. Mary's Hospital, where he died April 28, aged 63, of carcinoma.

Charles Hassiepen Sanderson • Philadelphia; University of Pennsylvania School of Medicine, Philadelphia, 1909; on the staff of Fitzgerald Mercy Hospital, Darby, Pa., where he died April 12, aged 64, of pyelophlebitis and peritonitis.

Paul Edward Santangelo, Brooklyn; Fordham University School of Medicine, New York, 1921; member of the American Medical Association; served during World War I; on the staffs of Prospect Heights Hospital, Cumberland Hospital and the Brooklyn Cancer Institute; died April 25, aged 50, of hypernephroma of the right kidney with generalized metastasis.

Augustus Bernhard Santry • Little Falls, N. Y.; University of Maryland School of Medicine, Baltimore, 1896; an Associate Fellow of the American Medical Association; formerly mayor; on the staff of Little Falls Hospital; for many years health officer; died April 23, aged 81.

Elizabeth Rice Sawyer, Valhalla, N. Y.; Western Reserve University School of Medicine, Cleveland, 1948; intern, Grasslands Hospital; died in the Neurological Institute of the Columbia Presbyterian Hospital, New York, April 5, aged 24.

Joseph Schwarz, New York; Magyar Királyi Ferencz József Tudományegyetem Orvostudományi Kara, Szeged, Hungary, 1929; member of the American Medical Association; died February 25, aged 49, of tumor of the brain.

James Sutherland • Spokane, Wash.; Trinity Medical College, Toronto, Ont., Canada, 1891; an Associate Fellow of the American Medical Association; fellow of the American College of Surgeons; served as president of the staff of Deaconess Hospital, where he died March 31, aged 84, of coronary occlusion.

Grant D. Walker • Eldon, Mo.; American Medical College, St. Louis, 1890; served as president of the Miller County Medical Society; died March 24, aged 81, of malignancy of the pancreas.

John Wertheimer, Waterbury, Conn.; University and Bellevue Hospital Medical College, New York, 1918; member of the American Medical Association; on the staff of St. Mary's Hospital, where he died April 16, aged 55, of probable pulmonary atelectasis.

J. Cliff Wetherill • Weston, Ohio; Starling-Ohio Medical College, Columbus, 1909; served during World War I; formerly county coroner; died April 26, aged 65, of coronary thrombosis.

Stephen Stockton Woolston, Tuxedo Park, N. Y.; University of Pennsylvania School of Medicine, Philadelphia, 1929; died in New York April 3, aged 46, of a fractured skull received in a fall.

Rennie Wright • New Braunfels, Texas; University of Texas School of Medicine, Galveston, 1913; past president of the Comal County Medical Society; for many years city health officer; served overseas during World War I and was awarded the French Croix de Guerre; recipient of the Silver Beaver Award; died April 22, aged 60, of coronary occlusion.

Foreign Letters

PARIS

(From Our Regular Correspondent)

April 30, 1949.

Foreign Doctors Permitted to Practice on Condition of Reciprocity

A bill has been adopted by the General Assembly which permits certain foreign practitioners to practice medicine and dentistry in hospitals established in France by foreign organizations and recognized as of value to the public. This law stipulates that a properly qualified subject of a foreign state may practice his art in France by order of the Minister for Public Health and Population. Authorization to practice will be granted to the individual candidate. One of the requirements is knowledge of medicosocial laws applicable to France. Such authorization can be withdrawn at any moment.

International Congress on Neurology

The fourth International Congress on Neurology will be held September 5-10 in Paris. On the agenda will be discussion of the anatomy of the thalamus by Professor Le Gros Clark, Oxford, and the physiology of the thalamus, by Professor J. Lhermite, Paris. Also under discussion will be diseases caused by filterable viruses, including the general problems of neurotropic viruses, by Dr. Albert B. Sabin, United States; the viruses responsible for poliomyelitis, by Dr. Sven Gard, and viruses in herpes zoster, lymphocytic choriomeningitis and rabies, by Dr. Pierre R. Lepine, Paris. Surgery for the relief of pain will include discussions of operations on the sympathetic nervous system, by Professor R. Leriche, Paris; cordotomy, tractotomy and radicotomies, by Professors Sjöqvist, Sweden, and Krayenbuhl, Switzerland, and surgical treatment of migraine, by M. G. F. Rowbotham, England. Other topics include electroencephalography, by Professor F. Brehmer, Brussels; electroencephalography in (1) neurosurgical diagnosis, by Dr. Herbert Jasper, Montreal, Canada, and (2) psychomotor epilepsy, by Dr. F. A. Gibbs, United States; electromyography in neurologic diagnosis of (1) diseases of the central nervous system, by Dr. F. Buchtal, Copenhagen, and (2) diseases of the peripheral neuron and the muscles, by Dr. Harvey, London.

The general secretary of the congress is Dr. Raymond Garcin, 19 rue de Borgogne, Paris.

Obesity

At a meeting February 11 of the Medical Society of Paris, Albert P. Netter and associates described a condition the chief features of which are progressive obesity, long-standing fever, headache, accelerated pulse, pseudohyperthyroid excitability and occasionally a goiter. Despite the obesity and the usually low basal metabolic rate, the latter symptoms and signs sometimes lead to the erroneous diagnosis of toxic diffuse goiter (Graves' disease). The syndrome usually occurs during puberty or immediately after a pregnancy. In the first case, the authors point out the etiologic role of primary tuberculosis. The trouble seems to be due to a lesion or functional disturbance of the hypothalamus (Netter, A.; Mathé, G.; Pottier, R., and Dinot-Laulanié: Obesity with Fever, Pseudohyperthyroidism and Headaches, *Bull. et mém. Soc. méd. d. hôp. de Paris* 65: 111-117, 1949).

Etienne May and A. Netter found in all forms of obesity a great increase of the venous blood pressure contrasting with a normal arterial blood pressure. In many instances, the spinal fluid pressure varied according to the venous blood pressure. This increase of venous blood pressure seems to be one of the factors of water imbalance in obesity (to be published in *Bull. et mém. Soc. méd. d. hôp. de Paris*).

New Technic of Vitamin Therapy

While studying chronic tetany, L. Justin-Bezancon, H. Klotz and P. Barbier (Bichat Hospital) developed implantation in vitamin therapy (only used, up to now, with hormones). In 7 cases of parathyroidal deficiency they noted a remarkable therapeutic effect obtained through the subcutaneous implantation of a pellet (of an average of 75 mg.) of vitamin D₂. The hypercalcemia which develops last five to seven weeks in chronic tetany and spasmodophilia. This action has been controlled in the acute tetany of a parathyroparal dog. The administration of vitamin D₂ by implants has a better effect on calcemia in chronic tetany than the oral administration; in several patients, the same dose given undivided, by means of an implant, increased calcemia by 10 per cent, whereas divided in five daily oral doses the calcium rate has not been altered. Up to now, a strong dose does not seem to act better than a weak one. In most cases, they used the 75 mg. dose, which avoids the state of functional inhibition of the parathyroid. If the hypercalcemia rate obtained appears to be excessive (above 120 mg.), it can be lowered by means of estradiol benzoate. The authors think that the operative inclusion of one pellet of vitamin D₂ would also be indicated in thyroid surgery, in order to avoid the eventual accident of acute tetany; it would also be possible, in this manner, to insure the administration of calciferol (vitamin D₂) to certain mental patients sometimes difficult to control.

An Arthropod as Vector of Tularemia

On February 18 G. Girard presented to the Medical Society of the Paris Hospitals the first case in France in which it had been possible to demonstrate the role of an insect as the vector in the transmission of tularemia. The disease began a few days after the patient had been bitten by a tick, which he tore away from his skin and which has been identified as *Dermacentor marginatus*. A direct connection between the seat of the bite and an adenopathy, the absence of the handling of hare or of any suspect animal, excludes any other mode of contamination. This tick is an ectoparasite of wild animals; e. g., fox, wild boar, polecat, deer, two species of which were responsible for several human cases of tularemia in the "Côte d'Or," a district adjacent to the one inhabited by the patient. The author has emphasized that henceforth *Dermacentor marginatus* is to be considered as a vector of tularemia in France. Further observations may define its importance as a virus reservoir.

Streptomycin in Tuberculosis of Bone and Joint

Professor E. Bernard, P. Padovani and A. Lotte have treated with streptomycin 20 patients with osteoarticular tuberculosis in the tuberculosis ward of the Laennec Hospital.

At a meeting of the Academy of Surgery, M. Sorrel reported on the use of streptomycin for the treatment of abscesses and fistulas. Others who have been studying the effects of streptomycin on tuberculosis and who have reported their results include Galland and Froyez (Berck) and M. P. Ingelrans.

Method of Desensitization to Streptomycin

To permit the continuation of streptomycin treatment in the presence of sensitization, C. Mattei and P. Balozet have developed a process of desensitization. Their technic consists of the use of three solutions in an isotonic solution of sodium chloride of increasing concentration, administered in increasing doses.

Autopotentialization of Sodium Paraaminosalicylate

J. Solomides and E. Bourland also studied the bactericidal effect of sodium paraaminosalicylate in a concentrated solution and found that such a solution is three hundred times more active than dilutions of aqueous solutions against the growth of the tubercle bacillus in Sauton's medium. The authors believe that

this phenomenon may be due to the polymerization of hydroxylated molecules of sodium paraaminosalicylate in a concentrated solution and that it would disappear in the presence of an excess of water.

Congresses

The Sixty-Eighth Congress for the Advancement of Sciences will take place in Clermont-Ferrand July 18-23. The general secretary is Professor Verne, 28 Rue Serpente, Paris (6).

The twenty-fourth annual meeting of the French Society of Orthopedy will take place in Paris in September. On the agenda are "Nontuberculous Sacroiliac Arthritis" (M. Ingelrans, Lille and Oberthur, Paris), and "Cervicobrachial Neuralgia, Especially That of Disk Origin" (M. Ricard and P. Girard, Lyon). The general secretary is Dr. Padovani, 1, Rue Octave-Feuillet, Paris (16).

The Forty-Seventh Congress of Psychiatrists and Neurologists of France and of French-Speaking Countries will take place in Clermont-Ferrand September 12-17. On the agenda are Psychiatry: "Legitimacy and Limitations of Reaction Psychosis" (P. Chatagnon, Maison Blanche at Neuilly-sur-Marne); Neurology: "Physiopathologic Consequences of Surgical Interventions on the Occipital Lobe" (M. David, Paris); Forensic Psychiatric Medicine: "The Swindler, Medicolegal and Psychiatric Study" (P. Gouriou, Villejuif). Permanent general secretary is Dr. Paul Cossa, 29 Boulevard Victor Hugo, Nice (Alpes Maritimes).

TURKEY

(From Our Regular Correspondent)

ANKARA, May 20, 1949.

Control of Tuberculosis

Professor Ordinarius Tevfik Saglam Pasha, former president of Istanbul University, an authority on tuberculosis in Turkey who for more than fifteen years has directed the tuberculosis prevention work in Istanbul, opened the tuberculosis week with a conference at Ankara University. At present the number two public health problem in Turkey is tuberculosis, which has increased among the poor of urban communities during the last nine years. World War conditions raised food prices four to ten fold and retarded many a building project, creating a housing shortage, which, together with high prices for rent and food, was detrimental to the health of families in the lower income groups. Professor Saglam stressed the necessity of public cooperation with governmental agencies and gave the following account:

While in 1931 the tuberculosis death rate in Istanbul was 203, it had decreased by 1939 to 187, but had risen to 267 per hundred thousand in 1947. In Ankara the tuberculosis death rate in 1931 was 179; in 1939 it had decreased to 110, but rose to 142 per hundred thousand in 1947. From 1931 to 1939 there were 22,563 deaths, or an average of 2,500 a year or 166 per hundred thousand, from pulmonary tuberculosis in twenty-one provincial towns, among a population of 1,500,000; accordingly, about 31,000 persons die every year of tuberculosis in the provinces.

Recent regulations at Istanbul University call for a radiographic examination of all applicants. In 1948, of 3,025 applicants, in 25, or 0.82 per cent, radiographic examination revealed pulmonary tuberculosis, of 15,410 primary school children examined at the tuberculosis prevention dispensaries 24, or 0.15 per cent, had pulmonary tuberculosis; 1.22 per cent of the 15,410 children, though not in the infectious state, were in need of medical supervision. The Istanbul Society for the Prevention of Tuberculosis procured a Westinghouse mobile unit, and a mass examination in seventeen primary schools revealed that 0.55 per cent had infectious pulmonary tuberculosis and 2.01 per cent were in need of medical supervision. The first society for tuberculosis control work was established in Istanbul in 1916,

but because of the prolongation of the first world war, and the many untoward conditions after it, the society was short lived. Actual tuberculosis control work started in 1923 with the founding of the Izmir Society for the Prevention of Tuberculosis and the reestablishment of the Istanbul Society in 1926. The first Istanbul tuberculosis dispensary was opened in 1929 in Eyup, an overcrowded district on the Golden Horn. By 1948 eleven other poor districts had tuberculosis dispensaries; nine more are to be opened in the near future. The dispensaries have modern x-ray apparatus, laboratories and pneumothorax instruments (collapse therapy), a small infirmary, specialist physicians, visiting nurses and technicians. All examinations and treatments are free; very poor patients receive free medications and victuals. The dispensaries are open from 9 a. m. to 5 p. m. Expenses are met by public contributions and monthly subscriptions from members of the society. The largest contribution comes from the 10 per cent tax on cinema tickets exacted by the municipalities in accordance with a law promulgated in 1948. In Istanbul city this tax brings in almost 1,000,000 pounds a year. The Istanbul society purchased a Westinghouse mobile unit for 83,000 pounds. This is the only apparatus of this kind in the country.

At present there are fifty-two societies for the prevention of tuberculosis, but, as there are sixty-three provinces, eleven more are needed. The governors head the societies; health officers and municipality physicians as members, with the cooperation of public-spirited citizens, manage the societies. At present tuberculosis control work is confined to the establishment of dispensaries, locating open cases, providing treatment and finding places in sanatoriums or hospitals, arranging for conferences, distributing pamphlets, imparting knowledge concerning preventive measures and soliciting of funds. Town and district dispensaries in provinces with insufficient incomes are aided by the Turkish Red Crescent Society, which procured x-ray apparatus and other equipment. The Junior Turkish Red Crescent, which has 450,000 members, collects funds to send primary and high school pupils to preventoriums and sanatoriums. The Turkish Red Crescent has also established soup kitchens in the large towns; in 1948, 5,000,000 portions were served.

Health and sickness insurance not yet having been established, and the urgent needs of tuberculous persons constantly being brought to the attention of health and other departments, the government has taken emergency measures and resorted to legislation. Governmental sanatoriums and hospitals where care is free have at present a waiting list of almost 3,000 open cases, and persons sometimes die before their turn comes. In comparison with other groups, civil servants, teachers, students, widows and orphans are most often afflicted with tuberculosis.

The bill introduced by the Ministry of Health and Social Assistance became law last April, and accordingly 3,000,000 pounds are to be allocated yearly for ten years. Two thirds of the yearly allocation is to be spent on the construction of pavilions and one third on equipment. If found advantageous, prefabricated pavilions are to be imported from the United States or Sweden. The pavilions are to serve as annexes to general hospitals where specialists, x-ray equipment and laboratories are already available, thus lessening expenses. The Ministry of Health and Social Assistance will be authorized to use part of the allocation for coming to the assistance of needy municipal and rural hospitals by providing x-ray equipment and funds for additional nourishment for tuberculous patients.

Though the passing of the antituberculosis law has the approbation of all classes, it is generally believed that unless there is a considerable decrease in the national defense budget, which for the last ten years has taken 35 to 48 per cent of the government budget, to remedy the situation effectively, it will leave much to be desired.

POSTGRADUATE CONTINUATION COURSES FOR PHYSICIANS

Compiled by the Council on Medical Education and Hospitals for the Period July 1, 1949 to January 15, 1950

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
ALLERGY			
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Personal Course in Allergy	One month, full time, every month	\$300.00
	Allergy	Part time, one day a week for ten weeks, beginning Sept. 23	125.00
University of Illinois Colleges of Medicine and Pharmacy, 1853 West Polk St., Chicago 12	Six Month Personal Course in Allergy	Six months, arranged, full time	500.00
	Allergy Course for Clinicians	Twelve months, full time, begins Oct. 1	300.00 ¹
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 26	Allergy Clinic ² and Conference	Twelve weeks, part time, Sept.-Dec., Dec.-March (tentative)	25.00
American College of Allergists, 423 LaSalle Medical Bldg., Minneapolis, and Baylor University School of Medicine	Graduate Instructional Course in Allergy	Six days, Oct. 31-Nov. 5	100.00
At: Baylor University School of Medicine, Houston, Texas			
Washington University School of Medicine, Euclid Avenue and Kingshighway, St. Louis	Postgraduate Course in Allergy	One week, full time, November	40.00
Joint Committee on Post-Graduate Education, 1813 Bedford Ave., Brooklyn 16, Medical Society of the County of Kings, Long Island College of Medicine	Allergy (II)	Part time, 1 hour per week, 8 weeks, October	20.00
At: Kings County Hospital			
At: Beth El Hospital	Allergy (I)	Part time, 2 hours per week, 8 weeks, October	30.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32	Medicine PM 81, Clinical Allergy	Two weeks, full time, Oct. 17-23	120.00
At: Roosevelt Hospital			
At: Mt. Sinai Hospital	Medicine PM 36, Allergy	Five days, full time, Oct. 19-24	40.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Allergy	Two months, part time, arranged	50.00
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	543-A Allergy	Part time, eight sessions, Jan. 6-Feb. 24	Not given
	5415-A Allergy	Full time, three weeks, Oct. 17-Nov. 4	Not given
	Allergy Technology	Twenty-four months, full time, arranged	50.00 ³
	Course of Training in Clinical Allergy	Twelve months, full time, Jan. 1	None
The Thomas Clinic, Richmond, Va.			
ANATOMY			
College of Medical Evangelists Graduate School of Medicine, Boyle and Michigan Aves., Los Angeles	Surgical Anatomy	Thirty-three weeks, part time, Oct. 3-June 10	100.00
University of California, 465 Hilgard Ave., Los Angeles 24	Surgical Anatomy	Part time, 1 evening every 2 weeks, Sept.-Feb.	100.00
Yale University School of Medicine, 333 Cedar St., New Haven, and Connecticut State Medical Society	Anatomy 201, Special Dissections in Anatomy	Arranged	Not given
	Anatomy 104, Demonstrations in Anatomy	Part time, 1 period each week, Sept. 26-June 2	150.00
At: Yale University School of Medicine	Anatomy of the Extremities on the Cadaver	Ten weeks, part time, Oct. 5	125.00
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Surgical Anatomy on the Cadaver	Ten weeks, part time, Oct. 6	125.00
University of Illinois College of Medicine, 1853 West Polk St., Chicago 12	Dissection No. 305, without formal instruction	One quarter (12 weeks), part time, arranged	75.00 ⁴
	General Anatomy "A"	Six months, part time, arranged	Not given
University of Maryland School of Medicine, Lombard and Greene Sts., Baltimore	Surgical Anatomy "B"	Fifteen weeks, part time, arranged	150.00
Harvard Medical School, 25 Shattuck St., Boston 15, Mass.	Surgical Anatomy	Eight weeks, part time, Sept. 6-Oct. 25	205.00
Tufts College Medical School, 30 Bennett St., Boston	Surgical Anatomy	Eight weeks, part time, Oct. 31-Dec. 24	255.00
At: New England Medical Center	Surgical Anatomy "B"	Part time, 3 hours daily, 2 days a week, 15 weeks	150.00
University of Michigan School of Medicine, 1313 East Ann St., Ann Arbor	General Anatomy "A"	Arranged	Not given
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 26	Surgical Anatomy	Twenty-four weeks, part time, Dec.-June (tentative)	70.00

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
	ANATOMY—Continued		
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Applied Anatomy for the General Surgeon	Approximately 250 hours, arranged	\$375.00
	Anatomy of the Thorax	Approximately 100 hours, arranged	150.00
	Anatomy of the Abdomen	Approximately 100 hours, arranged	150.00
	Applied Anatomy for the Otolaryngologist	150 hours, arranged	275.00
	Applied Anatomy of the Urogenital System	130 hours, arranged	300.00
	Applied Anatomy for the Anesthetist	125 hours, arranged	275.00
New York Polyclinic Medical School and Hospital, 341-353 West 50th St., New York 19	Anatomy for the Orthopedic Surgeon	100 hours, arranged	150.00
	Head and Neck Dissection	Six weeks, part time, arranged	150.00
New York University-Bellevue Medical Center, 356 Second Ave., New York 10 and Post-Graduate Medical School of the New York University	411-A Anatomy of the Head and Neck	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	412-A Anatomy of the Thorax and Its Viscera	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	413-A Anatomy of the Abdomen	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	414-A Anatomy of the Female Pelvis (A)	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	415-A Anatomy of the Male Pelvis (B)	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	416-A Anatomy of the Musculoskeletal System	Part time, 12 weeks, between Sept. 26 and June 17	150.00
	417-A General Anatomy	Part time, eight weeks, between Sept. 26 and June 17	150.00
	418-A Surgical Anatomy of the Hand	Part time, six weeks, arranged	Not given
	411-A Anatomy of the Head and Neck	Part time, 16 weeks, between Sept. 26 and June 17	200.00
	411-A Anatomy of the Head and Neck	Part time, eight weeks, between Sept. 26 and June 17	225.00
	413-A Anatomy of the Abdomen	Part time, 12 weeks, between Sept. 26 and June 17	200.00
	413-A Anatomy of the Abdomen	Part time, eight weeks, between Sept. 26 and June 17	225.00
College of Medical Evangelists, Graduate School of Medicine, Boyle and Michigan Aves., Los Angeles	416-A Anatomy of the Musculoskeletal System	Part time, 16 weeks, between Sept. 26 and June 17	200.00
	ANESTHESIOLOGY		
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Anesthesiology	Four months, full time, every two months	300.00
	Endotracheal Anesthesia	Two weeks, full time, every two weeks	150.00
	Inhalation Anesthesia (Ether & Nitrous Oxide)	One month, full time, first of each month	125.00
	Intravenous Anesthesia and Spinal Anesthesia	Two weeks, full time, every two weeks	150.00
University of Minnesota, Minneapolis 14	Inhalation Anesthesia (Ether, Nitrous Oxide, Ethylene & Cyclopropane)	One month, full time, first of each month	200.00
	Anesthesiology	Sept. 12-14	20.00
At: Center for Continuation Study			
Joint Committee on Post-Graduate Education, 1313 Bedford Ave., Brooklyn 16, Medical Society of the County of Kings, Long Island College of Medicine	Anesthesiology	Part time, 2½ hours a week, 6 weeks, October	30.00
At: Jewish Hospital			
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32	Anesthesia PM 30, Diagnostic and Therapeutic Nerve Blocking ¹²	One month, Oct. 21-Nov. 22	50.00
At: Mt. Sinai Hospital			
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Clinical Anesthesiology	Three months, full time, arranged	200.00
	Basic Science Course leading to the Degree of Master of Medical Science	Nine months, full time, Oct. 4 ⁵	710.00
New York Polyclinic Medical School and Hospital, 341-353 West 50th St., New York 19	Applied Anesthesia	Three months, full time, October and January	300.00
	511-A Anesthesiology ¹²	Two weeks, full time, between Sept.-June	150.00
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	512-A Regional Anesthesia	Two weeks, full time, Sept. 6-16, Jan. 3-13	200.00
	513-A Anesthesiology	One year, full time, Sept. 6 ⁴³	600.00
University of Pennsylvania Development Fund, Room 209, Broad Street Station, Philadelphia	514-A Anesthesiology	Three months, full time, Sept. 26-Dec. 16	300.00
	Anesthesiology	Eight months, beginning October	Not given
At: University of Pennsylvania School of Medicine			
	University of Pennsylvania Graduate School of Medicine, 36th and Pine Sts., Philadelphia	Segmental Neuralgias ⁶ ; Regional Anesthesia	Three weeks, Oct.-May
	Anesthesiology	Thirty-two weeks, Oct. 3-May 27	\$90.00
ARTHRITIS			
Joint Committee on Post-Graduate Education, 1313 Bedford Ave., Brooklyn 16, Medical Society of the County of Kings, Long Island College of Medicine	Arthritis	Eight weeks, part time, October	30.00
At: Jewish Hospital			
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	5414-A Arthritis and Allied Rheumatic Disorders	Ten days, full time, Oct. 10-21	Not given
	542-A Arthritis and Allied Rheumatic Disorders	Part time, eight sessions, Jan. 3-Feb. 21	Not given
BACTERIOLOGY			
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Medical Bacteriology and Immunology	Five weeks, part time, Oct. 6	75.00
	Bacteriology	Thirty-six hours, lecture, October-March	50.00 ⁵⁰
University of Illinois College of Medicine, 1853 West Polk St., Chicago 12	Refresher Course in Bacteriology, Immunology and Preventive Medicine	Twenty-four weeks, part time, Sept. 26	100.00
	Bacteriology	Three weeks, Dec. 5-16 and Jan. 3-7	Not given
University of Michigan Medical School, 1313 East Ann St., Ann Arbor, Wayne University College of Medicine, Michigan State Medical Society and Michigan Department of Health			
At: University of Michigan Medical School			
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Bacteriology	Three months, half time, arranged	100.00

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
BASIC SCIENCES			
College of Medical Evangelists, Boyle and Michigan Aves., Los Angeles 33	Internal Medicine	Eight months, full time, Oct. 3-June 9	\$762.00
	General Surgery	Eight months, full time, Oct. 3-June 9	760.00
	Urology	Eight months, full time, Oct. 3-June 9	760.00
	Gynecology and Obstetrics	Eight months, full time, Oct. 3-June 9	760.00
	Otolaryngology	Eight months, full time, Oct. 3-June 9	760.00
University of Illinois College of Medicine, 1833 West Polk St., Chicago 12	Basic Science Course	Nine months, Oct. 1-June 17	260.00 ⁵⁰
University of Kansas Medical Center, Kansas City 3	The Physiological Approach to the Practice of Medicine (Basic Medical Sciences)	Sept. (tentative)	Not given
University of Maryland School of Medicine, Lombard and Greene Sts., Baltimore	Basic Sciences as they Apply to Gynecology and Obstetrics	Four months, full time, Oct.-Feb.	375.00
University of Michigan School of Medicine, 1313 East Ann St., Ann Arbor	Basic Sciences as applied to Obstetrics and Gynecology	Twenty weeks, full time, Oct.-Feb.	375.00
Washington University School of Medicine, Euclid Ave. and Kingshighway, St. Louis 10	Basic Science	Eight months, Oct.-June	600.00
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	Basic Sciences, Bacteriology, Physiology and Biochemistry	Twenty-four sessions, part time, arranged	Not given
Jefferson Medical College, 1025 Walnut St., Philadelphia	Basic Sciences, Anatomy, Physiology, Biochemistry, Bacteriology and Immunology, Pharmacology and Toxicology and Pathology	September	Not given
University of South Dakota School of Medicine, Vermillion	Basic Sciences ⁷	Three-six months, arranged	None
	Individual Review in Basic Sciences	Part time, daily or weekly, Sept.-June	25.00 ¹⁰
CARDIOVASCULAR DISEASE			
California Heart Association, 45 Second St., San Francisco	19th Annual Postgraduate Symposium on Heart Disease	Four days, Oct. 27-30	15.00 ⁸
At: St. Francis Hotel, San Francisco	Cardiovascular Disease	Oct. 12-15	Not given
At: San Francisco	Cardiovascular Disease	Oct. 18-19	Not given
University of Southern California School of Medicine—Medical Extension, 3551 University Ave., Los Angeles	Cardiology and Vascular Disease, Course No. 732	Twelve months, full time, Sept. 12	1,000.00
At: Los Angeles County General Hospital			
Chicago Medical Society, 30 North Michigan Blvd., Chicago	Cardio-Renal and Peripheral Vascular Diseases	One week, Oct. 17-22	50.00
At: Northwestern University Medical School	Cardiovascular Diseases	Ten weeks, part time, begins Sept. 21	80.00
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Cardiology	Three and one-half months, full time, Jan. 28-May 10	505.00
Harvard Medical School, 25 Shattuck St., Boston 15	Cardiology ⁹	Twelve exercises of 3 hours each, Nov. 2-Jan. 18	75.00
At: Beth Israel Hospital	Clinical Heart Disease	One month, full time, July 1-30	265.00
At: Boston City Hospital	Cardiovascular Disease	Twelve months, full time, Oct. 1-Sept. 20	805.00
At: Peter Bent Brigham Hospital	Phonocardiography	Five days, part time, Sept. 12-16	35.00
At: Massachusetts General Hospital	Hypertension and Nephritis	Eight weeks, part time, October	20.00
Tufts College Medical School, 30 Bennet St., Boston	Diseases of the Cardiovascular System for General Practitioners	One day to one week, to be announced	3.00 ⁵¹
At: New England Medical Center			
Joint Committee on Post-Graduate Education, 1313 Bedford Ave., Brooklyn 16, Medical Society of the County of Kings, Long Island College of Medicine	Medicine PM 48—Bedside Diagnosis and Treatment of Heart Disease with Special Emphasis on Measurements of the Circulatory Dynamics	Two months, part time, Oct. 11-Dec. 13	45.00
At: Jewish Hospital	Medicine PM 46—Bedside Clinics in Heart Disease	Seven weeks, part time, Oct. 17-Dec. 6	50.00
State of New York Department of Health, Albany 1 and Medical Society of the State of New York	Medicine PM 31—Cardiovascular Diseases	Two weeks, full time, Oct. 4-19	125.00
At: Medical schools or Hospital Centers throughout the State	Medicine PM 60—Cardiology	Eight months, part time, Sept. 29-June 8	250.00
	Medicine PM 61—Intermediate Cardiology	Four months, part time, Sept. 27-Jan. 24	150.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32	Cardiology	Part time, 20 successive Wednesday mornings, beginning October	150.00
At: Mt. Sinai Hospital	Diagnosis and Treatment of Diseases of the Heart	Three weeks, part time, arranged	75.00
At: Montefiore Hospital	5417-A Cardiology	Five days, full time, Oct. 3-7	Not given
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	5418-A Peripheral Vascular Diseases	Five days, full time, Nov. 28-Dec. 2	Not given
New York Polyclinic Medical School and Hospital, 341-353 West 50th St., New York 19	544-A Cardiology	Seven sessions, part time, Jan. 9-Feb. 20	Not given
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	5413-A Peripheral Vascular Diseases	Eight sessions, part time, Jan. 3-Feb. 21	Not given
American College of Physicians, 4200 Pine St., Philadelphia 4, University of Southern California, Massachusetts General Hospital and National Institute of Cardiology of Mexico	Cardiovascular Disease	One week, full time, Dec. 26-31	30.00 ⁵²
At: Los Angeles	Recent Advances in the Diagnosis and Treatment of Cardiovascular Disease	One week, full time, Nov. 14-19	30.00 ⁵³
At: Massachusetts General Hospital	Cardiology	Two weeks, part time, Aug. 15-27	60.00 ⁵⁰
At: Mexico City	Cardiology	Forty-eight hours, part time, beginning in October and January	80.00
University of Pennsylvania Graduate School of Medicine, 36th and Pine Sts., Philadelphia	Cardiovascular Diseases	Five days, Nov. 7-11	25.00
McCurry Medical College, 1005 18th Ave., Nashville 8, Tenn.			
DERMATOLOGY AND SYPHILOLOGY			
College of Medical Evangelists Graduate School of Medicine, Boyle and Michigan Aves., Los Angeles	Dermatology	Eighteen hours, part time, begins Jan. 3	40.00
	Clinical Course in Dermatology ¹²	Twelve months, full time, arranged	1,000.00
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Intensive Two-Week Course in Dermatology	Two weeks, full time, Oct. 24	100.00
	Clinical Dermatology	Two weeks, full time, or four weeks, begins every Monday	75.00 ¹⁰ 125.00 ¹¹

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
DERMATOLOGY AND SYPHILOLOGY—Continued			
Harvard Medical School, 25 Shattuck St., Boston 15 At: Massachusetts General Hospital	Dermatology and Syphilology	Twelve months, full time, Oct. 1-Sept. 30	\$805.00
Tufts College Medical School, 30 Bennet St., Boston At: New England Medical Center	Dermatology I	Full time, five days, Oct. 31-Nov. 4	45.00
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 6 At: Receiving Hospital At: Social Hygiene Clinic	Dermatology Seminar	Twelve weeks, part time, Sept.-Dec., Dec.-March	15.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32 At: Montefiore Hospital At: Mt. Sinai Hospital	Conference on Venereal Diseases	Twelve weeks, part time, Sept.-Dec., Dec.-March	15.00
	Dermatology PM 63—Common Skin Diseases and Treatment	Eleven weeks, part time, Oct. 3-Dec. 5	40.00
	Dermatology PM 61—Relation of Skin to Internal Medicine	Three and one-half months, part time, Sept. 12-Dec. 26	55.00
	Dermatology PM 30—Venereal and Skin Diseases	Three days, full time, Dec. 5-7	30.00
Cornell University Medical College, 1300 York Ave., New York	Exfoliative Cytology	Fall 1949 (tentative)	Not given
	Training for Specialization in Dermatology and Syphilology	Three years, full time	520.00 ¹³
	Dermatology and Syphilology for the General Practitioner, Seminar A	Five days, full time, arranged	75.00
New York Polyclinic Medical School and Hospital, 341-453 West 50th St., New York 19	Dermatology and Syphilology for Specialists, Seminar B	Five days, full time, arranged	75.00
	Seminar in Dermatologic Histopathology	Five days, full time, Sept. 12-16	55.00
New York University—Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	522-A Seminar in Dermatology and Syphilology	Five days, full time, Sept. 26-30	75.00
	524-A Dermatology and Syphilology	Three days, full time, Oct. 3	Not given
	525-A Dermatology and Syphilology	Thirty-two weeks, Oct. 3-May 27 ¹⁴	800.00
University of Pennsylvania Graduate School of Medicine, 36th and Pine Sts., Philadelphia	Dermatology and Syphilology		
DIABETES			
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Medical and Surgical Diabetes	Ten weeks, part time, Sept. 14	80.00
Harvard Medical School, 25 Shattuck St., Boston 15 At: New England Deaconess Hospital	Diabetes Mellitus in Relation to General Medicine	Five days, full time, July 11-15	55.00
Joint Committee on Postgraduate Education, 1313 Bedford Ave., Brooklyn, Medical Society of the County of Kings, Long Island College of Medicine At: Jewish Sanatorium and Hospital for Chronic Diseases	Diabetes Mellitus	Ten weeks, part time, October	20.00
ELECTROCARDIOGRAPHY			
Yale University School of Medicine, 333 Cedar St., New Haven, and Connecticut State Medical Society At: Yale University School of Medicine	Medicine 203, Introductory Electrocardiography	Twelve sessions, part time, Sept. 22-Dec. 15	45.00
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Electrocardiography and Heart Disease	Four weeks, full time, Sept. 7	250.00
	Electrocardiography and Heart Disease	Two weeks, full time, July 18	150.00
	Electrocardiography and Heart Disease	Ten weeks, part time, Sept. 7	125.00
Michael Reese Hospital Postgraduate School, 29th and Ellis Ave., Chicago 16	Electrocardiography	Two weeks, full time, Aug. 15-27	150.00
University of Louisville, 101 W. Chestnut St., Louisville	Electrocardiography	Part time, ten weeks, Sept.	Not given
Tufts College Medical School, 30 Bennet St., Boston At: New England Medical Center	Electrocardiography I	Full time, five days, Oct. 17-21	45.00
	Electrocardiography II	Full time, three days, Dec. 12-14	30.00
	Electrocardiographic Diagnosis	One week, full time, Aug. 23-Sept. 3	50.00
University of Michigan Medical School, 1313 East Ann St., Ann Arbor, Michigan State Medical Society, Wayne University College of Medicine and Michigan Department of Health At: Ann Arbor	Electrocardiography and Clinical Cardiology	Five weeks, part time, October	20.00
Joint Committee on Postgraduate Education, 1313 Bedford Ave., Brooklyn, Medical Society of the County of Kings, Long Island College of Medicine At: Jewish Hospital At: Beth El Hospital At: Maimonides Hospital	Clinical Electrocardiography	Five weeks, part time, October	30.00
	Basic Electrocardiography	Five weeks, part time, October	20.00
	Clinical Cardiology and Advanced Electrocardiography	Five weeks, part time, October	20.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32 At: Mt. Sinai Hospital	Medicine PM 41—Intensive Course in Elementary Electrocardiography	Six days, full time, Sept. 26-Oct. 1	60.00
	Medicine PM 42—Intensive Course in Advanced Electrocardiography	Five days, Dec. 19-23	40.00
New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Electrocardiography	Two weeks, part time, October	100.00
New York Polyclinic Medical School and Hospital, 341-453 West 50th St., New York 19	Electrocardiographic Interpretation	Two weeks, part time, arranged	75.00
New York University—Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	5423-A Electrocardiography	Five days, full time, Nov. 14-18	Not given
ELECTROENCEPHALOGRAPHY			
University of Illinois College of Medicine, 1553 West Polk St., Chicago 12	Training Course in Electroencephalography	Three months, full time, arranged	200.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32 At: Columbia Presbyterian Medical Center At: Mt. Sinai Hospital	Neurology PM 212—Clinical Electroencephalography and Interpretation	Three months, full time, Oct. 1-March 31	150.00
	Neurology PM 212—Clinical Electroencephalography	Three months, part time, Oct. 6-Jan. 19	60.00
New York University—Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of the New York University	642-A Electroencephalography	Eight weeks, part time, Jan. 9-Feb. 4	300.00
University of Pennsylvania Graduate School of Medicine, 36th and Pine Sts., Philadelphia	Electroencephalography	Two weeks, full time, arranged	200.00
Baylor University College of Medicine, 509 Lincoln Ave., Houston, Texas	Introduction to Clinical Electroencephalography	Twenty hours, Jan. 1-30	25.00

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
ENDOCRINOLOGY			
University Extension, University of California, 405 Hilgard Ave., Los Angeles 24, and the University Medical Schools at Los Angeles and San Francisco At: University of California, Los Angeles	Therapy of Metabolic and Endocrine Disorders	Three months, evenings, Sept. 28-Dec. 7	\$35.00
Michael Reese Hospital Postgraduate School, 29th and Ellis Ave., Chicago 16	Diseases of the Endocrines—Physiology and Diagnostic Methods	Ten days, full time, Oct. 17-28	100.00
Harvard Medical School, 25 Shattuck St., Boston 15 At: Massachusetts General Hospital	Pediatric Endocrinology	Five and one-half days, full time, Oct. 3-8	80.00
Wayne University College of Medicine, 1512 St. Antoine St., Detroit 26	Endocrinology	Twelve weeks, part time, Dec.-March	25.00
Joint Committee on Postgraduate Education, 1313 Bedford Ave., Brooklyn, Medical Society of the County of Kings and Long Island College of Medicine At: Jewish Hospital	Disorders of the Endocrine System	Six weeks, part time, October	40.00
At: Jewish Sanatorium and Hospital for Chronic Diseases	Female Sex Endocrinology	Ten weeks, part time, October	20.00
At: Beth El Hospital	Applied Endocrinology	Six weeks, part time, October	30.00
	Endocrine Disorders in Children and Adolescents	Eight weeks, part time, October	20.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32 At: Mount Sinai Hospital	Medicine PM 38, Diseases of Metabolism	Five days, full time, Nov. 9-14	40.00
	Medicine PM 39, Endocrinological Diseases	Five days, full time, Nov. 30-Dec. 5	30.00

Postgraduate Continuation Courses for Physicians—July 1, 1949 to Jan. 15, 1950—Continued

Institution	Title of Course	Schedule of Course	Registration Fee and/or Tuition
THERAPY			
Yale University School of Medicine, 333 Cedar St., New Haven, and Connecticut State Medical Society At: A community hospital	Therapeutics 200, Modern Drugs and Common Problems in Therapy	Eight sessions, part time, arranged	Not given
University of Kansas Medical Center, Kansas City 3	General Therapeutics	October (tentative)	Not given
Joint Committee on Post-Graduate Education, 1313 Bedford Ave., Brooklyn, Medical Society of the County of Kings and Long Island College of Medicine At: Jewish Sanitarium and Hospital for Chronic Diseases	Clinical Therapeutics	Seven weeks, part time, October	\$40.00
Columbia University College of Physicians and Surgeons, 630 West 168th St., New York 32 At: Mount Sinai Hospital	Medicine PM 44, Recent Advances in Therapy	Seven weeks, part time, Oct. 19-Dec. 7	\$5.00
TROPICAL MEDICINE			
Tulane University of Louisiana School of Medicine, 1430 Tulane Ave., New Orleans 13	Tropical Medicine and Public Health leading to the degree of Master of Public Health	Sept. 1	Not given
New York University-Bellevue Medical Center, 356 Second Ave., New York 10, and Post-Graduate Medical School of New York University	Tropical Medicine, 631-A	Eight weeks, full time, Oct. 3-Dec. 3	\$250.00
UROLOGY			
College of Medical Evangelists, Graduate School of Medicine, Boyle and Michigan Aves., Los Angeles and Los Angeles Urological Society	Genito-Urinary Diseases	Five days, part time, Nov. 14-18	\$50.00
College of Medical Evangelists, Graduate School of Medicine, Boyle and Michigan Aves., Los Angeles 33	General Urology	Thirteen and one-half hours, part time, beginning Jan. 4	\$5.00
Los Angeles County Urological Society, 6233 Hollywood Blvd., Los Angeles 28	Graduate Course in Urology	Six days, part time, third week in November	\$50.00
Cook County Graduate School of Medicine, 427 South Honore St., Chicago 12	Division of Urology Practical Course in Cystoscopy	Two weeks, full time, Sept. 26 Ten days, full time, July 11, July 25, Aug. 8, Aug. 22, Sept. 12, Oct. 10, Oct. 24, Nov. 7 and Nov. 28	\$225.00 \$150.00
James Buchanan Brady Foundation, New York Hospital, 525 East 68th St., New York New York Medical College, Flower and Fifth Avenue Hospitals, 20 East 106th St., New York 29	Postgraduate Course in Urology	Thirty-one weeks, July 1	\$500.00
The Frank E. Bunts Educational Institute, 2020 East 93rd St., Cleveland, Ohio At: The Cleveland Clinic Foundation	Basic Science Course Leading to Degree of Master of Medical Science	Three years, full time, Oct. 4 ⁵	\$710.00
University of Pennsylvania Graduate School of Medicine, 36th and Pine Sts., Philadelphia American Urological Association, 899 Madison Ave., Memphis 3, Tenn. At: Sherman Hotel, Chicago At: St. Louis, Mo.	Diseases of the Kidney and Genitourinary Tract	Two and a half days, part time, Nov. 17-19	\$15.00
Joint Committee on Post-Graduate Education, 1313 Bedford Ave., Brooklyn 10, Medical Society of the County of Kings and Long Island College of Medicine At: Long Island College Hospital	Urology	Thirty-two weeks, full time, Oct. 3-May 27	\$800.00
New York Polytechnic Medical School and Hospital, 341-353 West 50th St., New York 19	Graduate Course in Urology	Six days, full time, Dec. 5-9	\$50.00
	Graduate Course in Urology	Six days, full time, first week in Nov. One month or more, October	\$50.00 \$50.00
	Urology	Full time, 8 months, October	\$800.00
	Advanced Course in Urology, ¹² 671-A	Two months, full time, Oct. 3-Nov. 26	\$300.00
	Advanced Course in Urology, ¹² 671-A	Two months, full time, Jan. 3-Feb. 25	\$300.00
	Urology, 672-A	Nine months, full time, Sept. 26-June 17	\$600.00
VENEREAL DISEASE			
Bureau of Social Hygiene, Department of Health, New York City At: Central Clinic	Practical Seminar in Diagnosis, Treatment and Control of Venereal Disease	Two mornings a week throughout the year	None
U. S. Public Health Service, Hot Springs National Park, Ark.	Postgraduate Venereal Disease Training Course	One week, October	None
United States Public Health Service Institute for the Study of Venereal Disease, 237 Medical Laboratories, Philadelphia At: University of Pennsylvania School of Medicine	Essential Basic Training Course	Six months, arranged	\$800.00

- \$800 for out of state residents.
- Limited to 8 students.
- Breakage fee annually.
- Plus laboratory fees.
- Basic science training followed by two year residency in approved hospital as partial fulfillment of requirements.
- Available only to physicians certified by American Board.
- Course designed specifically to meet qualifications of specialty boards.
- Residents, interns, students and physicians in service no charge.
- For local physicians.
- For two weeks.
- For four weeks.
- For specialists.
- First year \$500.00, second year \$300.00, third year \$200.00.
- Additional three months until Sept. 2 available optionally with no added fee.
- For six weeks.
- For three months.
- Prerequisite course, \$730.00.
- Twelve dollars per week, \$125.00 per quarter.
- Admitted first of each month; \$150.00 for three months, \$300.00 for six months.
- Beginning first Monday in any month except July and August.
- One lecture per week in each town for ten weeks.

- Date not set.
- Sponsoring agency will pay the tuition of \$200.00 compensation for residents of Pennsylvania.
- Two hours per week for ten weeks in each center.
- \$2.50 for interns.
- Specialists in ophthalmology or otolaryngology.
- For local practitioners only.
- \$75.00 per month plus \$50.00 cadaver fee.
- New students admitted quarterly.
- Course for physicians other than psychiatrists.
- For staff members of mental institutions.
- Limited to candidates in psychoanalysis.
- Limited to psychiatrists and candidates in training.
- Limited to psychiatrists engaged in psychotherapeutic work with children.
- Limited to psychiatrists engaged in psychotherapeutic work with groups.
- Repeated if sufficient demand.
- For twelve months.
- Open to physicians who have an appointment or have served in an assistant residency or preceptorship approved by the American Board of Obstetrics and Gynecology.
- Nine months formal teaching, three months in-plant work.

- Eighteen months full time residency and University of Pittsburgh, eighteen months full time in-plant service.
- For M.D.'s with special qualifications.
- For D.D.'s only.
- Enrollment after date given by arrangement.
- Twenty-four weeks, \$400.00.
- Per hour.
- Per year.
- \$5.00 for Pediatric Society members.
- May be taken for shorter period if there is opening in the course.
- \$2.00 for one period of two hours; \$15.00 for ten periods.
- Per quarter.
- For single course; \$10.00 for all courses.
- Per month.
- Tuition, monthly stipend and travel expenses to and from place of training paid by New York State Department of Health.
- Stipend \$3,015.
- Fellowships available for physicians interested in entering full time public health work.
- Paid by Department for accepted candidates.
- \$10.00 to \$10.00 payable by Department of Health.
- \$90.00 non-members.
- \$120.00 non-members.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers. June 20-22, Sept. 12-14. *Part III*. June, various centers. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written*. Various Centers. July 15. *Oral*. Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*. Oct. 17. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF NEUROLOGICAL SURGERY: *Oral*. Chicago, June 1949. Sec., Dr. W. J. German, 310 Cedar Street, New Haven, Conn.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC. *Part I*. Various Centers. Feb. 3. Final date for filing application is Nov. 5. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part II*. New York City, Feb. 9-10. Final date for filing application for Part II is Aug. 15. Address: Sec.-Treas., Dr. Harold A. Sofield, Room 1856, 122 S. Michigan Ave., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY: Chicago, Oct. 7-8. Final date for filing application is Sept. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

AMERICAN BOARD OF PEDIATRICS: *Written*. Under local monitors. June 24. *Oral*. Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: *Parts I and II*. New York, Oct. 22-24. Final date for filing application is July 22. Sec., Dr. Ernest L. Stebbins, 615 N. Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. *Special Examination*. Chicago, Oct. 24-25. Final date for filing application is July 15. December, New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing application is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*. Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18, Minn.

BOARDS OF MEDICAL EXAMINERS

ALABAMA: *Examination*. Montgomery, June 28-30. Sec., Dr. D. G. Gill, 519 Dexter Ave., Montgomery.

ALASKA: * *Juneau*, Sept. 6. Sec., Dr. W. M. Whitehead, Box 140, Juneau.

COLORADO: * *Endorsement*. Denver, July 5. Sec., Dr. W. W. King, 831 Republic Bldg., Denver.

CONNECTICUT: * *Examination*. Hartford, July 12-13. Secretary to the Board, Dr. Creighton Barker, 258 Church Street, New Haven.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

DISTRICT OF COLUMBIA: * *Examination*. Washington, Nov. 14-15. Sec., Dr. G. C. Ruhland, 4130 E. Municipal Bldg., Washington.

FLORIDA: * *Examination*. Jacksonville, June 26-28. Sec., Dr. Frank D. Gray, 12 N. Rosalind Ave., Orlando.

GUAM: *Endorsement*. Agaña, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam. % F.P.O., San Francisco, Calif.

HAWAII: * *Examination*. Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

ILLINOIS: Chicago, June 28-30. Superintendent of Registration, Mr. Fred W. Ruegg, Capitol Building, Springfield.

MAINE: Augusta, July 5-6. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

MASSACHUSETTS: *Written*. Boston, July 12-15. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

MONTANA: Helena, Oct. 3-5. Sec., Dr. Otto G. Klein, First National Bank Bldg., Helena.

NEVADA: Carson City, Nov. 7. Sec., Dr. George H. Ross, 112 N. Curry St., Carson City.

NEW HAMPSHIRE: Concord, Sept. 8-9. Sec., Dr. J. S. Wheeler, 107 State House, Concord.

NEW MEXICO: * Santa Fe, Oct. 10-11. Sec., Dr. Charles J. McGoe, Coronado Bldg., Santa Fe.

NEW YORK: Albany, Buffalo, New York and Syracuse, June 28-July 1. Sec., Dr. Jacob L. Lochner, 23 South Pearl St., Albany.

NORTH DAKOTA: * *Written*, Grand Forks, July 5-7. *Reciprocity*, Grand Forks, July 8. Sec., Dr. C. J. Glaspel, Grafton.

OREGON: * *Examination*. Portland, July 7-9. *Reciprocity*. Portland, July 22. Exec. Sec., Mr. Howard I. Bobbitt, 609 Failing Building, Portland.

PENNSYLVANIA: *Examination*. Philadelphia and Pittsburgh, July. Acting Sec., Mrs. B. G. Steiner, 351 Education Bldg., Harrisburg.

PURTO RICO: San Juan, Sept. 6-10. Sec., Dr. Luis Cueto Coll, Box 3717, Santurce.

RHODE ISLAND: * *Examination*. Providence, July 7-8. Chief, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

SOUTH CAROLINA: *Examination*. Columbia, June 27-29. *Endorsement*. Columbia, June 27-28, Aug. 1, Sept. 5 and Oct. 3. Sec., Dr. N. B. Heyward, 1329 Blanding St., Columbia.

SOUTH DAKOTA: * *Examination*. Pierre, July 19. Sec., Dr. G. J. Van Heuvelen, Capitol Bldg., Pierre.

UTAH: *Examination*. Salt Lake City, July 13-15. Sec., Dept. of Registration, Miss Rena B. Loomis, 324 State Capitol Bldg., Salt Lake City.

VERMONT: Burlington, June 21-23. Sec., Dr. F. J. Lawliss, Richford.

WASHINGTON: * Seattle, July 18-20. Sec., Mr. Edward C. Dohm, Department of Licenses, Olympia.

WEST VIRGINIA: Charleston, July 7-9. Commissioner, Public Health Council, Dr. N. H. Dyer, State Capitol, Charleston 5.

WISCONSIN: * *Examination*. Milwaukee, June 28-30. Sec., Dr. C. A. Dawson, Tremont Bldg., River Falls.

* Basic Science Certificate required.

BOARDS OF EXAMINERS IN THE BASIC SCIENCES

ALASKA: Juneau, Aug. 28. Sec., Dr. C. Earl Albrecht, Box 1931, Juneau.

DISTRICT OF COLUMBIA: Washington, Oct. 24-25. Sec., Dr. G. C. Ruhland, 4130 E. Municipal Bldg., Washington.

IOWA: Des Moines, July 12. Sec., Dr. Ben H. Peterson, Coe College, Cedar Rapids.

MICHIGAN: *Examination*. Detroit and Ann Arbor, Oct. 14-15. Sec., Miss Eloise LeBeau, 101 N. Walnut St., Lansing 15.

NEBRASKA: Omaha, Oct. 4-5. Director, Bureau of Examining Boards, Mr. Oscar F. Humble, Room 1009, State Capitol Bldg., Lincoln 9.

OREGON: Portland, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

RHODE ISLAND: *Examination*. Providence, Aug. 10. Administrator of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WASHINGTON: Seattle, July 13-14. Sec., Department of Licenses, Mr. Edward C. Dohm, Olympia.

WISCONSIN: Milwaukee, Sept. 24 and Dec 3. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Medical Motion Pictures

FILM REVIEWS

The Story of Wendy Hill. 16 mm., color, sound, 725 feet (1 reel), showing time eighteen minutes. Prepared in 1949 by the Federal Security Agency, Public Health Service and American Diabetes Association. Produced by Warner News, Inc. Procurable on loan from your State Health Department.

The story is portrayed by Dr. Wood, a general practitioner, about Wendy Hill, a young married woman, who is injured in traffic and found to have glycosuria when hospitalized. Dr. Wood, Wendy and her husband enact part of her emotional adjustment to the diagnosis of diabetes mellitus. Suspense is built up to the birth of her first baby.

Dr. Wood tells about some other diabetic persons in his community and emphasizes the occurrence of the disease in 2 children. There is emphasis on the way people worry and confuse the patient with misinformation about diabetes mellitus.

This production is intended to acquaint the lay audience with the fact that an asymptomatic diabetic faces hazards and that an early diagnosis is a basis for satisfactory treatment aimed at avoiding complications.

The motion picture is recommended for wide showing to lay audiences since it removes undue apprehension and misinformation about diabetes mellitus. The color photography and narration are excellent.

Communicable Diseases. 16 mm., color, sound, 1,250 feet (1 reel). Showing time thirty-five minutes. Prepared in 1949 in the Isolation Hospitals, Los Angeles, San Francisco and Oakland, Calif., through the cooperation of the local public health departments. Procurable on loan from Cutter Laboratories, Berkeley, Calif.

This motion picture illustrates the various aspects of common virus and bacterial diseases among children, although some adult cases are shown. It presents the clinical manifestations of various diseases such as measles, rubella (German measles), chickenpox, smallpox, typhus, tetanus, meningitis, poliomyelitis, diphtheria, scarlet fever and pertussis. In general, it covers the mode of transmission, incubation period, prodrome, syndrome, differential and direct diagnosis and the course of each disease. In some cases complications are stressed. Immunization at the appropriate time is the only reference to prevention. Both active

and passive immunization are mentioned for some of the diseases. Only slight reference is made to treatment.

One feature of this film which is not common to many films and may warrant some explanation is the fact that the physical structure is such that complete excerpts of both picture and narration could be made for each disease without alteration. It would be a simple matter of reproducing and cutting to produce a short on each disease which would permit the showing of any disease under discussion in four or five minutes without having to show the entire film at one time. The sequence for each disease is entirely independent of the others.

The film in its present state is probably much too long and covers too much information for normal class use, except when shown for overview, summary or review. It is designed primarily for use with all types of medical personnel who are working in positions or receiving training where recognition of common virus and bacterial diseases is essential. It should have special value for beginning practitioners who may never have come in contact with a number of these diseases during their training or internship, interns, medical students, public health workers and hospital staffs.

The narration is a little too rapid, especially at the beginning of the film, and a somewhat slower pace would have improved the teaching qualities of the film. The photography is very good, with the exception of the one scene illustrating rubella which is overexposed.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Malpractice: Joint Liability of Physicians.—The plaintiff and his wife filed separate suits for damages against Dr. Davis and Dr. Woodard for injuries alleged to have resulted from their treatment of the wife's fractured leg. The two suits were consolidated for trial. The trial court entered judgments on directed verdicts in favor of Dr. Davis against both plaintiffs. The cases against Dr. Woodard were submitted to the jury, which found him guilty but fixed damages in favor of the wife only. The wife did not appeal from either judgment. The plaintiff-husband appealed both adverse judgments to the Court of Appeals in Kentucky.

The plaintiff's wife suffered a fractured femur in her right leg and Dr. Davis, who had treated the wife for other ailments, was consulted by telephone. On his instructions she was taken to the Norton Infirmary. It was recommended by Dr. Davis, and agreed to by the plaintiff, that since the fracture was of the oblique type, it should be treated by open reduction and the use of screws, pins or plates. This method involves surgery, which consists of making an incision through the flesh, exposing the bone and pinning the ends of the bone together, so Dr. Davis engaged Dr. Woodard, an orthopedic surgeon, to perform the necessary operation. This was done, according to the plaintiff without gaining the consent of either the plaintiff or his wife. Dr. Woodard attempted to reduce the fracture by applying external fixation, also contrary to their wishes. This method consists of placing pins above and below the break and connecting the pins with an external plate. By "screwing up on the plate" the bones are supposed to slip back into position, there to be held until healed. When external fixation can be used successfully, the average fracture will mend in eight weeks, so, approximately eight weeks after the accident, but without taking roentgenograms to make sure that the segments had properly united, both defendant physicians ordered the patient discharged from the hospital. The plaintiff objected to the discharge, however, and refused to remove his wife until roentgenograms had been made to determine whether or not union had been accomplished. Accordingly, a picture was made which disclosed that the segments were not united and that they were held in a position rendering it impossible for the bone to mend under the treatment applied. The pins and plates were therefore removed and traction was applied. This method was also abandoned when it was discovered that the segments were

still out of alignment. The leg then was placed in a plaster cast. This method also failed; and about five months later, to avoid further extension of the injury, the leg was amputated by a third physician not a party to this suit.

The plaintiff contended that the evidence introduced, together with that offered but rejected by the trial court, was sufficient to entitle him to have the case submitted to the jury on the theory that Dr. Davis did not relinquish control of the case on his wife's admission to the hospital, but rather that he continued in charge thereof and supervised the care of the patient, thus rendering him responsible for any negligence which occurred, either his own or that of Dr. Woodard.

The evidence offered and rejected was the print of a roentgenogram, the negative of which disappeared during the trial of the case. The trial court erred in rejecting this evidence, said the Court of Appeals. The print made from the negative of the roentgenogram is no less authentic than a print made from the negative of any other film. It is an exact reproduction of the picture on paper, or some other material, and often, if not always, is clearer than the negative to the eye of a layman. Continuing, the Court of Appeals said that the positive evidence of the plaintiff that Dr. Davis did continue in charge of the case and was in almost constant attendance on the patient while she was in the hospital was sufficient to warrant submission of the issues to the jury. The defendant physicians both testified that Dr. Davis retired from the case and completely turned it over to Dr. Woodard when the plaintiff's wife was admitted to the hospital. Dr. Davis further testified that he did not consult with the plaintiff or his wife in respect to the orthopedic work. However, the plaintiff testified that he constantly consulted Dr. Davis about the case, that he complained of the treatment and that he finally demanded that Dr. Davis discharge Dr. Woodard and engage another orthopedic surgeon. He also testified that Dr. Davis declined to dismiss Dr. Woodard and informed him that he could not call in another surgeon as long as Dr. Woodard was on the case. The plaintiff asked Dr. Davis on several occasions to show him roentgenograms, but the doctor, with one excuse or another, failed to comply with the request. Dr. Davis admitted that he called on the patient while she was in the hospital but claimed that he was treating her for other ailments; however, his testimony in respect to his visitations, before and after she suffered the broken leg, refuted this contention. He stated that before the leg was broken he was called on to treat her on an average of approximately once every two and half months, whereas, in the seven month period that she was confined in the hospital, he visited her eighty-eight times, an average of approximately three visits per week. He did not deny that he directed the patient to be removed from the hospital without having caused roentgenograms to be taken of the condition at that time.

As to whether or not Dr. Davis was liable for Dr. Woodard's negligence, the court said that where two physicians are engaged to treat the same patient concurrently, they may make such division of service as the circumstances may require, and each in serving with the other is rightly held answerable not only for his own negligence but also for any wrongful act or omission of the other which he observed and permitted to continue without objection, or which in the exercise of reasonable diligence in the circumstance he should have observed. From the evidence in this case, continued the Court of Appeals, the jury could have found either that Dr. Davis, in serving with Dr. Woodard, observed wrongful action or omissions on the part of the latter and permitted them to continue without objection, or that he failed in the exercise of reasonable diligence in the circumstances to observe such wrongful acts or omissions, if any occurred. We therefore hold that the evidence for the plaintiff was sufficient to require the submission of the case to the jury on this issue and that the trial court erred in directing a verdict for Dr. Davis.

The Court of Appeals also held that the jury should have awarded damages to the plaintiff against Dr. Woodard for expenses incurred because of the doctor's negligence. Accordingly the judgment in favor of Dr. Davis was reversed and a new trial granted and the judgment in favor of Dr. Woodward was reversed and the case remanded for the purpose of fixing proper damages.—*Beauchamp v. Davis et al.*, 217 S.E. (2d) 822 (Ky., 1948).

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Roentgenologic Examination of Small Intestine.—Weintraub and Williams found that by using a barium sulfate-isotonic sodium chloride mixture as the contrast medium followed by ice cold isotonic sodium chloride solution they were able to obtain a considerable decrease in the transit time of the meal through the small intestine without distorting the mucosal pattern. In many cases the mucosal pattern was more clearly delineated, and there was more complete filling of the entire small intestine than that obtained by the hourly film technic. In 90 per cent of the normal cases studied, the examination was completed in one hour. In pathologic cases the rate of transit was also accelerated without sacrificing the appearance of the lesions. It is known that in "deficiency states" or "disordered motor function patterns" and in sprue there is a delay in the passage of the barium sulfate through the small intestine. The authors found this to be true with their method, but the delay is only relative. Tumors of the small intestine and lesions of enteritis are clearly demonstrated with the rapid method.

Intervertebral Disk Protrusion Contralateral to Side of Symptoms.—Murphy emphasizes the value of myelographic investigation of patients with protrusions of the lumbar intervertebral disks in revealing the unsuspected or obscure. The

clinical impression in both of the 2 cases described in this report was that of herniated nucleus pulposus on the left, and myelograms disclosed the protrusion to lie on the right. Had operation been undertaken without myelography, the site of major pathologic condition might not have been investigated in either of these cases. Bilateral exploration of the lumbar interspaces was performed in each, because of discrepancy between clinical and roentgenographic findings, but the disk protrusions were found only where the myelograms had indicated that they were present. Without contrast medium examination the usual unilateral exposure might well have resulted in persistence of symptoms and signs, inasmuch as the wrong side would have been explored.

Loose Dentures as Esophageal Problems.—Richardson states that many dentists and some physicians do not appreciate the danger to the patient when a denture fails to pass through and instead lodges in the esophagus. The growing use of radiolucent acrylic compounds for the construction of dentures makes the roentgenologist's job of diagnosis increasingly more difficult. When no radiopaque pins are used to hold the tooth to the denture, roentgen diagnosis will be missed sometimes. The endoscopist must be consulted. For the removal of large dentures, ether is the anesthetic of choice. It provides maximum relaxation, permitting maximum working space. Extraction should not be attempted without adequate armamentarium. More harm than good may result from only slight manipulation of the foreign body. Chemotherapy with sulfonamide compounds and penicillin has done away with the necessity for immediate external incision and drainage for esophageal perforations. Often surgical treatment is not necessary. The author cites cases which demonstrate that the popular temporary denture made to supply upper central teeth should be abandoned by the dental profession. The loose removable bridge should not be employed, as it jeopardizes its wearer. The risk of wearing a broken denture needs greater publicity. The complete upper denture should be redesigned.

Plaster of Paris as Source of Tetanus and Gas Gangrene.—Murray and Denton report fatal tetanus in a patient following an elective operation on a tuberculous knee. *Clostridium tetani* was found in the wound exudate, together with *Pseudomonas aeruginosa*, *Aerobacter aerogenes* and an anaerobic streptococcus. The strain of *Cl. tetani* isolated from the wound before death produced fatal tetanus in an unprotected guinea pig. Material from the surgical wound post mortem gave profuse growth of *Cl. tetani*, *Clostridium perfringens* and *Pseudomonas aeruginosa*. Although the plaster and dressings on the wound when the tetanus first developed had been discarded, other plaster bandages from the store room were examined and were found to contain various pathologic micro-organisms, including *Cl. tetani* and gas gangrene clostridia. The authors feel that plaster of paris as a source of infection of wounds has been overlooked. It is probably more common than has been realized. Difficulties are involved in the satisfactory sterilization of plaster of paris for surgical use.

Cutaneous Toxicity of Fungicide.—Gaul and Underwood cite the case of a man, who had severe dermatitis of the feet after he had applied to what he considered athlete's foot "a new twenty-four hour treatment that gives 5-way protection." This fungicide contained dihydroxydichlorodiphenylmethane. Attempts to find fungi on the lesions of the feet failed in repeated tests. Patch tests were made with the fungicide used and from the results obtained it was deduced that the dihydroxydichlorodiphenylmethane was the offender. Tests were made also with materials from the shoes. Patch tests with a rubber adhesive surface of the cloth lining, a coated or impregnated fabric and the insole packing produced positive reactions. It was concluded that this patient had a contact dermatitis of the feet from materials in a pair of shoes. It was complicated by a fungicide. This diagnosis was proved correct because the institution of care and management brought about a prompt involution. Patients who complain of their feet itching on removing their shoes at night should have patch tests performed with the shoes. Footwear is a common cause of conditions given the lay diagnosis of athlete's foot.

Formation of Artificial Urinary Bladder.—Rubin describes formation of an artificial bladder from a portion of the sigmoid. He performed this operation successfully in 7 dogs; the animals were continent and voided with good control. There is no reason why the procedure should not be attempted in man, especially when trying to cure infiltrating neoplasia of the bladder. With this procedure one can obtain a bladder which exhibits perfect control of the passage of urine through the urethra. The operation may be performed in man as a one stage procedure. It would be advisable to start with the bilateral implantation of the ureters into the desired area of the sigmoid colon. Following this, the necessary colon resections and anastomoses can be performed. Should the patient take a turn for the worse so that the rest of the procedure could not be carried to a successful termination, a colostomy should be made for the deviation of the feces. The rest of the procedure could then be completed at a second stage when the patient's condition is satisfactory.

Suprapubic Drainage in Bladder Paralysis.—In Boyd's experience treatment of disturbances of micturition accompanying acute injuries to the spinal cord is best accomplished by cystostomy except in patients having lesser injuries with transient disturbances of micturition. Suprapubic drainage can be temporary or permanent depending on the extent and duration of the disturbance of bladder function and, also, on whether or not adequate bladder function can be restored by transurethral resection of the bladder neck. Automatic micturition and most of the other types of abnormal micturition which occur in these patients are not satisfactory and rarely should be permitted to continue. Cystostomy should be performed at once in nearly all of the cases of paralysis in which it is likely that disturbances of micturition will continue for more than six or eight weeks. The benefits of cystostomy are: 1. There is adequate urinary drainage which avoids overdistention of the bladder and permits a bladder infection to be well controlled because of the adequate drainage by bladder irrigations and urinary antiseptics. 2. Traumatism of the urethra by a catheter does not occur, and urethral and periurethral infections, prostatitis, seminal vesiculitis and epididymitis are avoided. In the author's experience the patients' families and unskilled attendants find it much easier to care for cystostomy patients than they do for those having unsatisfactory types of abnormal micturition or intermittent or continuous catheter treatments.

Single Dose of Penicillin for Gonococcal Urethritis.—This communication by Loewe and his associates deals with a new treatment of acute uncomplicated gonococcal urethritis. Treatment consists of a single dose of 300,000 units of penicillin

in gelatin-dextrose mixture. The penicillin gel was administered to the first 52 patients of the series as a shallow intramuscular deposit in the thigh. The remaining 90 patients, because of ease of administration and as a time-saving device in the ambulatory subject, received the injection in the deep subcutaneous tissues of the posterior aspect of the upper arm. Of 128 patients available for statistical study, 123 were satisfactorily "cured" and 2 had reinfections.

Recurrent Ileus Due to Gallstones. L. E. Vin Zant and J. S. Hibbard.—p. 17.

Treatment of Acute Anterior Poliomyelitis.—Pusitz treated 104 consecutive cases of acute infantile paralysis in the epidemic of 1946. Twelve cases of mild disease were treated in the home. In this group neostigmine was used alone with fair effect in relieving pain and muscle spasm. Of the 92 hospitalized patients, 14 were treated with hot packs; 3 of these were effectively treated with hot packs alone; 2 had neostigmine added to obtain relief. In 3 cases of hot packs and neostigmine the relief was not adequate, but immediately became adequate when the patients were switched to curare therapy alone. In 6 cases hot packs were not effective enough and so the patients were immediately transferred to treatment with curare alone without neostigmine. All obtained immediate relief with curare. Curare was used in a total of 53 cases. The drug was administered intramuscularly three times daily, starting with a minimum dose of 0.9 unit of intocostin® per kilogram of body weight, and increasing gradually until an effective dose was reached, never more than 1.5 units. In no case did curare fail to relieve pain to the major extent, and the same was true for muscle spasm. There was absolutely no residual paralysis in 57 of the hospitalized and in 11 of the not hospitalized patients. There were 6 deaths. There were 6 cases of involvement of the upper extremities, and in only 1 of these was there residual paralysis of the deltoid. Of 17 patients with braces, 4 discarded the braces within four months. Thirteen were still using braces in November 1947. Two are seriously paralyzed with involvement of the upper and lower extremities. No true scoliosis has appeared and all contractures have so far been adequately taken care of.

*Diabetic Glomerulosclerosis: Clinical and Pathologic Observations with Special Reference to Doubly Refractile Fatty Cells and Casts in Urine. H. Rifkin, J. G. Parker, E. B. Polin and others.—p. 429.

Diabetic Glomerulosclerosis.—Rifkin and his associates point out that in 1936 Kimmelstiel and Wilson described a renal glomerular lesion, which they called intercapillary glomerulosclerosis. This was found in association with a previous history of diabetes, severe and widespread edema of the nephrotic type, gross albuminuria, frequently with hypertension and renal decompensation. In addition to the striking hyaline thickening of the intercapillary connective tissue of the glomerulus, they described a deposition of fat with focal areas of doubly refracting lipid in the tubules and in the interstitial tissues of the kidney. It was the contention of these authors that this lesion was essentially degenerative in nature. They suggested that arteriosclerosis and diabetes may play a part in its causation. Since this original description, a number of excellent reports have appeared in the literature expressing varied opinions concerning the relationship of the histologic lesion in the glomerulus to diabetes mellitus. The authors present observations on 45 patients in whom during life a diagnosis of diabetic glomerulosclerosis had been made. Twenty-two of these patients came to necropsy and 21 of

these revealed histologic evidence of the specific glomerular lesion. The authors conclude that a distinct clinical picture is associated with diabetic glomerulosclerosis. This picture includes diabetes, edema, hypertension, combined diabetic and hypertensive retinopathy, albuminuria and lipid cells in the urinary sediment. The development of the clinical syndrome is related to the combined effects of renal arteriolar and glomerular capillary lesions. The presence of doubly refractile fatty cells or casts in the urinary sediment establishes the diagnosis of diabetic glomerulosclerosis, provided it is properly related to other clinical data.

Hematoma of Broad Ligament and Sigmoid Mesentery.—p. 111.

Gastrojejunocolic Fistula.—According to Faxon and Schoch gastrojejunocolic fistula following gastrojejunostomy is one of the most serious complications of gastric surgery. The authors report 9 patients with this complication and review the literature. The symptoms are usually attributable to the secondary effects of diarrhea induced by the reflux of irritating contents of the large bowel into the upper jejunum and stomach. The treatment of gastrojejunocolic fistulas is surgical and consists of removing the fistula, restoring bowel continuity and correcting the ulcer diathesis. Preparation of the patient for excision of the fistula should include the institution of an ascending colostomy as recommended by Pfeiffer as a preliminary procedure in all patients whose general condition is unsatisfactory. The tendency in these patients for an ulcer to become reactivated after an excision of the fistula and restoration of intestinal continuity is so strong that unless corrective surgical measures have been carried out at the earlier operation they should be adopted before the patient is finally discharged from the hospital. A case is cited for the first time in which, after excision of the fistula, transthoracic vagotomy was used as the definitive treatment of the ulcer diathesis. This patient was asymptomatic a year after the vagus resection.

Cardiac Arrest for Thirty Minutes, Kidney Shutdown, Uremia and Recovery. C. P. Bailey and L. Rubenstein.—p. 60.

Decortication and Lobectomy for Tuberculosis.—Sarot reports 2 cases of uncontrolled lobar tuberculosis, one of which was complicated by a mild tuberculous empyema, the other by an unexpandable lung. Each was treated successfully by lobectomy (with extrapleural dissection) and decortication of the remaining lobe. It is suggested that when a pneumothorax has been unsuccessful in obtaining cavity closure despite a seemingly adequate anatomic collapse of the diseased lobe, one should proceed with lobectomy (and decortication, if necessary) if the lung is slow in reexpanding rather than expose the patient to the risk of spread of the disease during a prolonged period of reexpansion before thoracoplasty.

Painful Sequelae of Injuries to Peripheral Nerves.—In the 278 cases analyzed by Sunderland and Kelly, severe pain in the hand or foot persisted for at least five weeks after the receipt of an injury to a nerve trunk and the pain was not related to damage or to involvement of non-neural tissues. The term *causalgia* has been applied to this pain, which is primarily a sequel of gunshot lesions in which stretch of the nerve appears to play an important part. In the great majority of cases it follows damage to the main sensory pathways from the palm or the sole. The higher in this pathway the level of the lesion, the more likely is *causalgia* to ensue. Its incidence bears no relation either to neuroma formation or to the degree of visible damage to nerves or other tissues. Though sympathectomy has proved valuable, there is no other evidence to suggest that the sympathetic system is especially involved. The clinical evidence suggests that the painful sequelae of nerve injuries are the effect of the spread of damage to the central nervous system by retrograde and transneuronal changes. A center of abnormal spontaneous activity is thereby set up in the cord, which acts as a focal point for the dissemination of spreading disturbances involving wider and wider areas of the cord. These produce effects on the peripheral tissues via adjacent posterior roots (hyperalgesia), while a succession of abnormal impulses reaches the cerebrum, producing effects on the sensorium (spontaneous pain). Anatomic and physiologic evidence is produced which lends support to this interpretation. In most cases of *causalgia* there is spontaneous cure, and surgery should therefore be reserved for the cases of severe and stubborn *causalgia*.

*Fluctuating Atmospheric Pressures: Novel Environmental Variant Observed in Submarines. F. P. Ellis.—p. 24.
Health and Environmental Conditions in Brickworks. G. F. Keatinge and N. M. Potter.—p. 31.

Atmospheric Pressures in Submarines.—Ellis points out that in recent years the need has been stressed for relating the design of fighting equipment to the physiologic characteristics of the men who must operate such equipment. The changes in environment encountered in submarines, although of less violent degree than those experienced by airmen, nevertheless involve certain hardships. The importance of providing the submarine sailor with an optimal environment is still less generally appreciated than in the case of air crews. The introduction of the "snort" or "schnorkel" to British submarines led to a review of the human factors which are related to the design and operation of modern submarines. The German "schnorkel" or British "snort" consists of a hollow mast which can be raised or lowered and connects the interior of a submerged submarine with the ambient air above the surface of the sea. Flooding of the submarine is prevented by a float-operated valve at the upper end of the mast. The mast contains an induction pipe through which air is drawn into the submarine, and an exhaust pipe through which the exhaust gases pass to an outlet a few feet below the inlet to the schnorkel induction, where the gases bubble out below the surface of the sea. The "snort" permits the batteries to be charged in greater safety than previously. An opportunity for examining the nature of the pressure variations and certain related chemical changes in the atmosphere arose during an early "snorting" cruise in temperate waters in a British submarine, which proceeded on the main engines and the snort by day, and at greater depths on the motors with the snort lowered in the hours of darkness. The author describes

pressure measurements and chemical measurements that were made, and the effects of changes in these factors on the crew. There is no evidence to suggest that special conditions will occur in snort-fitted submarines to influence adversely the health or efficiency of the crews, provided that the provision of an optimal environment for the men is borne in mind at all times by those responsible for designing the submarines and for handling them after they are built.

"Gammexane" and Mosquito Control in Belgian Congo. G. Davidson.—p. 101.

Plasma Cell Mastitis.—According to Cutler, plasma cell mastitis is a clinical and pathologic entity of uncertain etiology. The onset is sudden, with pain, tenderness and redness of the skin. At first the whole breast is swollen and the axillary nodes are enlarged and tender. Usually there is some rise in temperature, and sometimes there are chills. A creamy discharge from the nipple is not uncommon. The acute symptoms soon subside, and the process enters the subacute stage. The pain and tenderness diminish and the swelling decreases, leaving a diffuse nodularity. After a relatively short period the subacute signs disappear and the disease enters a chronic stage. There remains a discrete, hard, solid residual mass with attachment to the overlying skin and often retraction of the nipple. The axillary nodes are usually enlarged and firm. The breast presents the picture of mammary cancer, rendering a diagnosis of cancer almost imperative, and it is only by eliciting from the patient the details of the initial inflammatory phases of the disease that an error in diagnosis is avoided and the patient saved from a radical mastectomy. After the diagnosis has been established by biopsy, treatment should consist of irradiation with bilateral involvement is reported in which irradiation during the acute or subacute stages followed by conservative surgical excision of the remnant. A case of plasma cell mastitis demonstrated the lesion to be highly radiosensitive.

*Clinical Observations on Treatment of Bouillaud's Disease with Sodium Salicylate and Acetyl Salicylic Acid. J. Roskam.—p. 305.
Indications for Surgical Treatment of Essential Arterial Hypertension: Some Results. L. Dumont and A. Divey.—p. 312.

Salicylates in Rheumatic Fever.—Roskam says that among 53 patients with acute polyarticular rheumatism treated at his clinic at the university of Liège between 1938 and 1948 there were 7 who did not respond to sodium salicylate. All of these were treated later with acetylsalicylic acid and responded favorably to this treatment. The author presents the histories of 4 patients which show the superiority of acetylsalicylic acid over sodium salicylate in certain cases of polyarticular rheumatism. The author demonstrates on the basis of a case history the importance of the determination of the sedimentation rate of the erythrocytes during the treatment of rheumatic fever.

*Intravenous Iron Therapy. K. Agner, N. S. E. Andersson and N. G. Nordenson.—p. 193.

Intravenous Iron Therapy.—Agner and his associates say that although iron deficiency anemias are usually most effectively treated by the oral administration of iron, in certain dyspeptic disturbances intravenous therapy might be desirable. An iron preparation made from spleens of horses proved to have an antigenic effect and sometimes caused severe secondary reactions when injected intravenously. The preparation now used by the authors for intravenous administration is a colloid. They report 20 cases in which they used this colloidal ferri-iron. Seventeen of the patients responded with an increase in hemoglobin, erythrocytes, reticulocytes and iron content of the serum. Subjective improvement was observed in 19 of the patients. There were no undesirable secondary effects in connection with the injections, but the authors stress that paravenous injection of the iron solution must be avoided.

Study of Cerebral Thrombo-angiitis Obliterans. J. E. Meyer.—p. 647.
Neurogenic Form of Sudeck's Syndrome. J. Hirschmann.—p. 681.

Neuritis After Typhoid-Paratyphoid Vaccination.—Bannwarth reports 8 soldiers with neuritis or polyneuritis after typhoid-paratyphoid vaccination. There was a definite causal relationship between the vaccination and the disease which occurred in 5 of the men after the second or third vaccination, and in 3 after the first vaccination. Three patients had acute neuritis of the brachial plexus, 1 had abortive polyneuritis and 1 bilateral neuritis of the lumbosacral plexus. The remaining 3 presented the classic picture of the Guillain-Barré syndrome. Great increase in the protein in the cerebrospinal fluid without corresponding increase in cells was particularly pronounced in these 3 patients. Milder changes in the cerebrospinal fluid were observed in the other patients. The polyneuritis or neuritis after typhoid-paratyphoid vaccination is a sequel of an allergic, or parallergic reaction to the parenteral introduction of antigens of dead bacilli, resulting in an allergic-hyperergic serous inflammation of the peripheral nervous system, particularly of its roots. Patients with this inflammation may present not only the syndrome of Erb's paralysis, but also the classic picture of Guillain-Barré syndrome. Inflammatory processes in the peripheral nervous system after typhoid-paratyphoid vaccination are rare.

*Clinical Contribution to Methyl Bromide Poisoning. G. Nager.—p. 1280.
*Acute Aniline Poisoning, Its Clinical-Hematologic Course and Its Treatment. B. Jasiński.—p. 1282.

Methyl Bromide Poisoning.—Nager reports 1 case of chronic methyl bromide poisoning in a man aged 24 who was working in a chemical laboratory in which ethyl bromide was produced with the aid of methyl alcohol. About 150 Gm. of the substance escaped into the air in gaseous form in six hours. After one month of work in this laboratory hyperexcitability, mild acoustic disturbances, garrulity and disturbances of memory were evidenced. A few days later a manic state with delusions of persecution developed. The latency of symptoms in methyl bromide poisoning may be explained by the slow occurrence of cerebral hemorrhages which lead to foci of softening, while, as a rule, ganglion cells are not destroyed. Methyl bromide should not be used without protective measures, particularly as a fire extinguishing substance or an insecticide. Methyl bromide should be used only in closed systems.

Acute Aniline Poisoning.—Jasiński reports a case of acute aniline poisoning in a man aged 50 who had been working for twenty-one years as a dyer in a dye plant. During the drawing off of aniline from a barrel under pressure, the aniline splashed over the patient's clothes. On admission to the hospital the patient presented severe cyanosis of the ears, the hands and the legs. The patient's blood had a dark brown color, but methemoglobin could not be demonstrated in the serum. Spectroscopic examination of the hemolyzed blood revealed an absorption band highly characteristic of methemoglobin. The methemoglobin content of the blood was about 60 per cent. The blood count revealed the presence of 68 per thousand of inner bodies. The maximum ratio of inner bodies (288 per thousand) was observed on the fourth day, when methemoglobin could no longer be demonstrated in the blood on spectroscopic examination. The inner bodies were present in the blood for about four weeks. Irreversible damage to the erythrocytes was manifested by the presence of the inner bodies. The patient was given large doses of ascorbic acid and made a complete recovery.

Neurosurgical Treatment of Little's Disease; Late Results. M. R. Klein and J. Lepintre.—p. 110.
*Leukotomy Performed on Children and Its Indications. M. R. Klein and G. Tardieu.—p. 113.

Leukotomy in Children.—Klein and Tardieu performed leukotomy on 8 idiotic children between the ages of 2 and 15 years, 5 of them aged less than 7 years. Bilateral section of the white matter was carried out with the aid of Cushing's trocar, on a plane corresponding to the coronal suture. There were no untoward reactions. The children seemed to feel comfortable immediately after the intervention. They remained quietly in bed, agitation subsided and they took notice of objects. They also acquired some automatisms. Institutionalization was no longer necessary. The children could be left alone with their toys; they were able to go around safely in the apartment and they could eat at the table. These results warrant leukotomy in idiotic children with an intelligence quotient of 20 to 30 or less, with generalized cerebral lesions demonstrated by electroencephalography or with a normal encephalogram but with diffuse lesions such as microhydrocephalus demonstrated by ventriculography—i. e., in those cases in which any other method of treatment does not offer any hope.

Book Notices

The Business Side of Medical Practice. By Theodore Wiprud, Executive Director and Secretary of the Medical Society of the District of Columbia, Washington, D. C. Second edition. Cloth. Price, \$3.50. Pp. 232, with 23 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London W.C. 2, 1949.

"The Business Side of Medical Practice" is far from being the stilted textbook which the title might indicate. On the contrary, it is a fascinating insight into a side of medicine that rarely receives attention or publicity. Mr. Wiprud points up the direction of his book when he states, "There is no substitute for personal efficiency, nor can it be acquired without effort. Whatever his feeling in the matter may be, the doctor must face the fact that the success of his practice lies in his being prepared to meet as nearly as possible all demands on him. Relying on the plea that only scientific knowledge is expected of him is merely evading the responsibility which present conditions have thrust upon the medical profession." To all doctors the author shows the ways to increase this personal efficiency. Sound methods are presented on matters of office management. Equally sound advice is offered in regard to the building of a private practice, the legal aspects of medical practice and the consideration of the doctor's own financial affairs, including investments, insurance and even wills and estates. Careful thought and consideration is given to the importance of self expression, both written and oral. "Satisfying progress in the practice of his profession," states the author, "is seldom made by the physician who can neither write for scientific publications nor speak acceptably before groups of his colleagues. There are occasions, too, when he is called upon to do one or the other or both for lay groups."

Even the more nebulous subjects of "Opportunities for Medical Leadership" and "Fair Competition Among Physicians" are deftly handled in two separate chapters. Finally, Mr. Wiprud draws from his sixteen years of experience as a medical society executive and helps the doctor look to the future. He concludes that only one thing is certain, "the physician in private practice has still to feel the impact of what has already taken place."

Clinical Aspects and Treatment of Surgical Infections. By Frank Lamont Meleney, M.D., F.A.C.S., Associate Professor of Clinical Surgery, College of Physicians and Surgeons, Columbia University, New York. With a foreword by Allen O. Whipple, M.D. Cloth. Price, \$12. Pp. 840, with 287 illustrations. W. B. Saunders Company, 218 W. Washington Sq., Philadelphia 5; 7 Grape St., Shaftesbury Ave., London W.C. 2, 1949.

This is a unique study from the surgeon's point of view of a field largely dominated by the bacteriologist. Those who read it will not be disappointed. The book is replete with illustrated case histories which are often classic descriptions. The method of approach to the treatment of surgical infections is always practical.

The advent of the antibiotics and chemotherapy has considerably lessened the incidence of serious infection in every general hospital. Interns, who in former days would have spent long hours with the dressing cart irrigating and dressing profusely discharging wounds, rarely encounter these problems in their brief experience. Yet the proper time for drainage, the recognition of a concealed abscess and the management of infections not responding to newer therapy will be recurring problems. Added to this is the ever present danger that the resistant bacterial strains may appear in large numbers. The chapters on peritonitis, mediastinitis, cholecystitis and appendicitis are especially good. The problem of the surgical management, the necessity of adequate drainage and other than routine use of one or another drug are emphasized. Cultures from wounds or body fluid are stressed. The role of the surgeon is still important and is not yet solved by injections, miraculous though they be. The author's long experience and his descriptions of the successful management of serious infections prior to the advent of chemotherapy are of educational importance. This book is especially recommended for the younger surgeon, for he is too apt to rely on the newer drugs instead of some thoroughly tested surgical principles.

Education for the Health Services. By George St. J. Perrott, Chief, Division of Public Health Methods, United States Public Health Service, and others. A Report to the Temporary Commission on the Need for a State University. New York State Legislative Document (1948) No. 32. Paper. Price, 40 cents. Pp. 170, with 17 illustrations. University of the State of New York, the State Education Department, Albany 1, N. Y., 1948.

This volume is one of a series of reports designed to explore the need for a state university including professional schools in New York State. A technical committee was appointed to survey the professional personnel and training situation in the state. Studies were undertaken in this connection of physicians and medical schools, dental personnel and schools, and nurses and schools of nursing, based largely on data for 1945-1946, but in appropriate instances including available 1946-1947 figures. Data compiled in earlier studies by various legislative commissions were also utilized in the report.

The committee has given consideration to the concept of medical centers in health service regions and has emphasized the important influence which the medical school may exert on the standards of medical practice throughout the section of the country in which it is located.

At the outset the committee points out that its data are insufficient to be considered more than suggestive, but that they are offered as a frame of reference within which further studies may be undertaken. In its conclusions, the committee asserts that present facilities in New York State are inadequate to provide professional education for qualified resident youth and that economic barriers further restrict opportunity. Student aid funds and graduate scholarships are suggested as a partial solution. In view of the favorable socioeconomic status of New York State, which is reflected in demand for health services, the committee maintains that present rate of personnel supply cannot effectively meet the demands of the people for professional health services. While the present rate of supply of physicians in New York State is adequate to meet current demands, the committee points out that much of the supply results from immigration of physicians trained in other states. The supply of dentists is labeled insufficient to meet the dental health needs of the people, and a serious deficiency in nursing personnel is remarked.

The Committee strongly advocates the development of the regional health service and medical center plan which was previously proposed by two state legislative commissions. The need for continuous and adequate financial support to activate such a plan is stressed and the broad precedent for New York in the assumption of state responsibility for education for the health professions is cited. While the document is applicable specifically to New York State, it will be of interest to all those broadly concerned with education for the health services and to those in situations where problems of education of such personnel may be somewhat similar.

The Filterable Viruses. By Francis O. Holmes. Supplement No. 2, Bergey's Manual of Determinative Bacteriology, Edition VI, 1948. Cloth. Price, \$2.50. Pp. 1127-1286. Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

In this book the viruses are treated as members of an order consisting of 13 families, 32 genera and 248 species. Bacteriophages constitute one subgroup, viruses causing diseases in seed plants are a second subgroup, and the third subgroup consists of viruses causing diseases in animals. The author points out that this subgrouping of viruses may have to be changed with advances in knowledge. Each species is discussed first from the standpoint of derivation of the name and is followed, where applicable, by the headings: common names, host, insusceptible species, geographic distribution, induced disease, transmission, serologic relationships, immunologic relationships, thermal inactivation, filterability, other properties and literature. The large number of viruses now recognized makes it imperative that they be named and classified. Some time will probably pass, however, before the average physician recognizes *Legio debilitans* as poliomyelitis virus and *Erro scelestus* as St. Louis encephalitis virus. The book is well indexed and contains an abundance of information about the viruses. It should prove of great value to the student of infectious diseases.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

DIPHTHERIA IMMUNIZATION IN ADULTS

To the Editor:—In adults receiving active immunization against diphtheria, are dosages of $\frac{1}{4}$ cc., $\frac{1}{2}$ cc. and $\frac{1}{2}$ cc. of fluid diphtheria toxoid administered at intervals of three weeks considered to be effective? If not, what are the smallest dosages and the fewest injections that can be considered as suitable in adults?

Daniel Haffron, M.D., Elgin, Ill.

ANSWER.—Although three doses of $\frac{1}{2}$ cc. each of fluid diphtheria toxoid are often recommended, the dosage that you mention would prove probably to be satisfactory. If fewer injections are desired, two doses (0.5 cc. each) of diphtheria toxoid alum precipitated could be administered, the interval between injections being about six weeks. With the highly refined diphtheria toxoid alum precipitated which is now available, unpleasant reactions are uncommon even when this product is used for adults.

ALKALINE SULFONAMIDE COMPOUNDS

To the Editor:—In administering sulfonamide drugs to infants and young children, is it necessary to give alkali concomitantly? If so, how can the alkali (sodium bicarbonate) be made palatable and acceptable to these children?

M.D., Illinois.

ANSWER.—Recent developments have indicated two satisfactory ways of administering sulfonamide drugs without giving sodium bicarbonate concomitantly. First, pharmaceutical firms have succeeded in incorporating the sulfonamide compound and the alkali in one preparation. Citrasulfas® (Upjohn) and sulfadiazine with sodium lactate (MRT) are such products.

Second, combinations of different sulfonamide drugs (sulfadiazine, sulfamerazine and sulfamethazine) can be given. It has been shown that when two or more sulfonamide drugs are administered together their therapeutic effectiveness is additive, and yet their solubilities are independent and equivalent to that of approximately half the dose of each if given alone. Thus, the total sulfonamide blood level will be well below that at which crystalluria usually develops.

NEW ANTIBIOTICS IN TUBERCULOSIS

To the Editor:—What is the effect of the new antibiotics chloromycetin and aureomycin against the tubercle bacillus?

M.D., New York.

ANSWER.—In vitro, chloromycetin has been found to produce complete inhibition of *Mycobacterium tuberculosis* (H37Rv) (human) in a concentration of 12.5 micrograms per cubic centimeter. Data on the effect of this antibiotic on tuberculosis in vivo are not available.

Aureomycin is also active in vitro against *M. tuberculosis* and has had limited trial in tuberculous sinuses. As yet, insufficient data have been accumulated to justify a statement as to the efficacy of this antibiotic in tuberculosis.

Work is in progress at a number of institutions on the problem of the effects of streptomycin, dihydrostreptomycin, other antibiotics and certain sulfones in various combinations on tuberculous infections. Preliminary work has not shown any decided advantage for any of the combinations thus far tried.

TETANUS IMMUNITY

To the Editor:—Does a person who has had tetanus have a permanent immunity to the disease if he has had 500,000 units of antitoxin? If not, would immunization with toxoid be apt to cause an exacerbation of the condition?

Edmund A. Flexman, M.D., Milledgeville, Ill.

ANSWER.—It is not possible to say definitely whether a patient who has recovered from tetanus under treatment with antitoxin will be permanently immune to tetanus. He may be regarded, however, as well protected against tetanus for several years after the infection. The injection of tetanus toxoid in such a patient might result in more or less violent reactions in the reintroduction of foreign protein.

HYPNOSIS IN DRAMATICS

To the Editor:—Recently a school "show" was put on for the young student. Taking part in the show was a hypnotist. He hypnotized young children and then put them through the usual tricks. Is it quite the right thing to hypnotize immature children, some of them more than once, for a show? What is the latest opinion as to such performances? One psychiatrist says that he thinks it is bad. The local superintendent of schools and teachers had no part whatsoever in making up this program. It was one of a lyceum course which was given throughout the state.

J. F. Norman, M.D., Crookston, Minn.

ANSWER.—A public performance, as stated, has the probability of doing great damage. Neurotic symptoms can be created readily by direct suggestion in the average adult. But, since children are more suggestible than adults, the potential harm is even greater. In competent hands hypnosis has no harmful effects, but where it is utilized for nonsensical and dramatic effects, and where removal of symptoms is attempted without some understanding of the dynamics of the subject's personality, hypnotized persons may be adversely influenced. Since many youngsters have a sense of insecurity and are therefore potentially neurotic, they have serious problems in interpersonal relationships. They are apt to mistrust people and constantly doubt their motives. When they are exposed to an injudiciously applied hypnotic trance, they may become acutely upset, and so the mistrust and resentment becomes exaggerated.

Most certainly, hypnosis should not be allowed outside of the medical profession, and laws are needed, forbidding the use of hypnosis for entertainment purposes.

The induction of hypnosis itself involves the passivity of the subject, and suggestions given to the subject are similar to those given in a child-parent relationship. The hypnotist therefore becomes a commanding authority, and, once a person has been hypnotized, he is seldom capable of liberating himself from this authority. Self growth and the ability to become an independent and assertive person are most effectively achieved in an environment where the person is capable of working out his problem through his own capacities and resources. In the circumstances mentioned above, there is grave danger that the children would be convinced that they are under the power of a stronger person, and they would comply because of their suggestibility and because they felt that compliance was expected of them. The mentally healthy person is one who can think for himself and who is not afraid to act in such a way that he not only is efficient, but also gets most enjoyment out of his activity. Thus anything that might handicap a person from attaining such free will should be prevented.

UNILATERAL CONJUNCTIVITIS

To the Editor:—A male patient has unilateral conjunctivitis. The tear sac and meibomian glands do not show evidence of infection. Smear of eye shows a *Staphylococcus aureus*. He has had sulfonamide drugs, penicillin, bacitracin, *Staphylococcus vaccine*, tear sac lavage and gland (meibomian) massage. The eye clears and then the condition recurs. What is the next procedure?

M.D., Michigan.

ANSWER.—The cause of the condition should be established before further therapy is indicated. The conjunctival secretion should be cultured under aerobic and anaerobic conditions. Conjunctival scrapings should be Giemsa stained and the findings should be interpreted according to Thygeson's suggestions (Thygeson, P.: *The Cytology of Conjunctival Exudates*, *Ann. J. Ophth.* 29:1499 [Dec.] 1946). Self-inflicted injury should be suspected in recurrent conjunctival inflammations without apparent cause particularly when the eye on the side of the dominant hand is involved. If the inflammation is associated with preauricular adenopathy, Parinaud's oculoglandular syndrome must be considered.

SYMPATHETIC OPHTHALMIA

To the Editor:—Is the accepted method of preventing sympathetic iritis the removal of the injured eye before even mild symptoms develop in the other eye? Is it known by what route the sympathizing eye becomes involved?

M.D., Virginia.

ANSWER.—Sympathetic ophthalmia is a specific bilateral inflammation of the entire uveal tract which almost invariably is preceded by a perforating injury involving uveal tissue. When irritation of the fellow eye develops the disease is already established and removal of the exciting eye does not alter the course usually. Ideally, a suspected eye should be enucleated within fourteen days of the injury before pathologic changes commence. Enucleation after this period does not absolutely prevent the occurrence of sympathetic inflammation. The causation is not known.

ARTHRITIS

Comments on Differential Diagnosis and New
Developments in Therapy

EDWARD F. ROSENBERG, M.D., Ph.D.
Chicago

Incidence of rheumatic diseases in this country is so high that only a small proportion of cases come to the attention of specialists. In most instances responsibility for diagnosis and treatment remains in the hands of family physicians. It is of utmost importance, therefore, for general practitioners to have an understanding of these diseases sufficient to aid in preventing the dreaded physical and mental crippling which often result in poorly handled or neglected cases.

In the past a cause of much confusion has been a complicated nomenclature and mysterious classifications employed for these diseases. Causes of the most important chronic rheumatic diseases still remain unknown, and consequently their designations and classification cannot be simplified. As a result of this confusion, roentgenologists report their observations in terms descriptive of altered appearances, but terms which they employ are often different from those which serve the practitioner in his daily work. Pathologists often report observations in terms which have a morphologic significance, describing alterations in gross and microscopic appearances of tissues, but these terms also frequently differ from those familiar to clinicians. European writers commonly discuss these diseases using designations which differ from those used in America.

To some extent, this confusion will probably continue until research has disclosed presently unknown causes for rheumatic diseases. Until that time, however, it would be very useful if uniform terms could be employed by all who deal with patients with rheumatic disease.

A committee on classification of the American Rheumatism Association has been laboring for a decade with this problem and, although still dissatisfied with results of its work, has recently prepared a classification recommended for inclusion in the "Standard Nomenclature of Disease" (outline). Only a small proportion of the hundred or more conditions which are included among "rheumatic" diseases are mentioned. However, as little can be gained by subclassification of many unknowns, subclassifications have been omitted. Many rare diseases are not mentioned. In its present form, the list provides usable terms for a majority of cases encountered during usual clinical work.

The following material reviews briefly some innovations in diagnostic and therapeutic aspects of several important rheumatic diseases.

SPECIFIC ARTHRITIS

From a numerical point of view, specific forms of arthritis constitute only a small proportion of "run of the mill" cases of arthritis. Most commonly encountered are gonorrheal arthritis, tuberculous arthritis and arthritis associated with streptococcic and staphylococcic infections. Arthritis of syphilis, pneumococcic infections, meningitis, brucellosis and typhoid are rare today. Articular disorders associated with coccidioidomycosis, although not often encountered, appear to be spreading in America.

Gonorrheal Arthritis.—Among the specific forms of arthritis, instances resulting from gonorrheal infection continue to hold an important place. The incidence of gonorrheal arthritis is decreasing significantly since discovery of sulfonamide drugs and penicillin but is still notable, and this must be kept in mind when one encounters acute arthritis in adults.

The laboratory may play only a supportive role in establishing this diagnosis in many instances. Prompt recognition more often depends on knowledge of the life history of gonorrheal arthritis than on laboratory reports. If this disease is not recognized promptly and if allowed to progress through its "normal" evolution, it ordinarily takes the form of acute polyarthritis. Less frequently arthralgias occur without actual synovial cartilaginous or osseous invasion. Affected patients are usually febrile at the onset, and the disease is often ushered in with a chill. The articular phenomena are generally migratory, as in rheumatic fever.

As a rule, a physician must be satisfied with a presumptive diagnosis of gonorrheal arthritis, a diagnosis based on analysis of behavior of the articular disease together with identification of *Neisseria* in genital secretions. Certification of the diagnosis in every instance by identification of *Neisseria* in articular exudates is impossible, since infection of intra-articular exudates occurs in only a fourth to a third of the cases. *Neisseria* are evidently excluded from synovial fluid in consequence of a barrier action of synovial lining membranes. If a diagnosis of gonorrheal arthritis has been correctly made, the disease should be cured promptly by adequate doses of penicillin. Supposed failures of penicillin therapy in gonorrheal arthritis often reflect merely a lack of appreciation of the effectiveness of gonorrheal infection in stirring up latent rheumatoid arthritis or provoking its onset. "Penicillin-resistant gonorrheal arthritis" often proves to be rheumatoid arthritis provoked to activity by the gonorrhea. Not even millions of units of penicillin will significantly

From the Department of Medicine, Michael Reese Hospital.
Read at the Interim Session of the American Medical Association, St. Louis, Nov. 30, 1948.

after the articular disease in such cases. Articular biopsies in these instances reveal changes characteristic of rheumatoid arthritis.

Tuberculous Arthritis.—The problem of tuberculous arthritis is important today despite a falling incidence of this disease since the beginning of the century. Among a series of 4,252 tuberculous patients reported recently were 160 (3.8 per cent)¹ with tuberculosis of bones or joints.

One should search carefully for tuberculosis elsewhere in each patient with articular tuberculosis. However, additional visceral lesions cannot be identified in approximately a third to a half of the cases. Tuberculosis of joints is classically a monoarticular disorder, but more than one articular or osseous region may be affected; thus the disease was polyarticular in 28 per cent of adult cases, and in 35 per cent of children in the series reported by Rosencrantz and his associates.

Classification of Arthritic Diseases

- | | |
|--|----------------------------|
| 1. Arthritis due to specific infection. Specify organism when known. | |
| 2. Arthritis due to rheumatic fever. | |
| 3. Arthritis, rheumatoid. Specify as multiple or of spine. | |
| 4. Degenerative joint disease, multiple due to unknown cause; osteoarthritis. | |
| 5. Arthritis due to direct trauma. | |
| 6. Arthritis due to gout. | |
| 7. Neurogenic arthropathy. | |
| 8. New growths of joints. | |
| 9. Hydrarthrosis, intermittent. | |
| 10. Periarticular fibrositis. | |
| 11. Diseases in which arthritis, arthropathy or arthralgia is frequently associated (diagnose disease, list joint manifestation as symptom): | |
| Acromegaly | Ochronosis |
| Acute disseminated lupus erythematosus | Osteochondritis dissecans |
| Cyst of meniscus of knee | Osteochondromatosis |
| Dermatomyositis | Periarteritis nodosa |
| Drug intoxication (specify) | Psoriasis |
| Erythema nodosum | Pulmonary osteoarthropathy |
| Erythema multiforme exudativum | Purpura, various types |
| Hemophilia | Raynaud's disease |
| Hysteria | Reiter's disease |
| | Scleroderma |
| | Serum sickness |

As many as seven regions were affected in a single patient.

The clinical picture which results when tuberculosis affects joints may be a nondescript one and may resemble notably the picture of rheumatoid arthritis. Pain and swelling together with stiffness and local heat may be observed. Atrophy of surrounding muscles may develop. The course may be indolent and may be associated with remissions and exacerbations, as in rheumatoid arthritis. Roentgenograms may not show characteristic changes, and absence of associated visceral lesions may add to the confusion. Cutaneous tests may be of little value in adults, especially among city dwellers, of whom large numbers show positive reactions with or without other signs of clinical tuberculosis. Negative cutaneous reactions have been observed in some proved cases.

To establish the diagnosis, fluid from affected joints should be obtained for bacteriologic studies

wherever possible. Unfortunately, considerable periods of time may be required before results of guinea pig tests can be determined, and even guinea pig inoculations may occasionally yield negative results in proved cases of tuberculous arthritis. Biopsy of regional lymph nodes was recommended recently for diagnosis of tuberculous arthritis.² Presumably this can be done when a patient fears to have a joint opened, but a normal observation may be inconclusive. By all odds, articular biopsy is the preferable procedure. Consideration should be given to articular biopsy in all cases of chronic progressive atrophic or destructive type of arthritis in which but one joint is affected, and consideration should be given to biopsies in cases of polyarticular arthritis when factors are present which raise a suspicion of tuberculosis. Presence of tuberculosis in other regions of the body, a strong family history of tuberculosis and involvement of tendovaginal sheaths are points which favor a possibility of articular tuberculosis.

The role which streptomycin may play in treatment of tuberculous arthritis is still uncertain. Earlier reports were pessimistic, but prolonged administration of streptomycin in doses of 1 Gm. every eight to twelve hours for three to four months favorably influenced the course of tuberculous arthritis in two thirds of the patients treated in this manner by Bickel and his associates.³ Toxic reactions were fairly common, although with these doses it was rarely necessary to discontinue administration of the drug.

Arthritis from Streptococcic or Staphylococcic Infections.—Suppurative arthritis resulting from pyogenic organisms must be considered in the differential diagnosis in all cases in which acute articular inflammation is found. Symptoms of suppurative arthritis are in general much severer than those of ordinary non-bacterial forms of arthritis, but the articular picture may be masked by the systemic reaction to suppuration.

Among instances of suppurative arthritis from all causes, staphylococci are responsible for the infection in approximately 50 per cent of cases, hemolytic streptococci in 25 per cent and miscellaneous other organisms in the remainder. In a majority of the cases, articulations are infected as a result of extension from an adjacent focus of osteomyelitis, although in some instances the organisms metastasize to joints from distant foci. Penetrating wounds are responsible in a few instances.

A prompt and complete evacuation of infective effusions by repeated aspirations and lavage, or if necessary by incisions and drainage, was the aim of treatment ten years ago. Today, the ideal treatment is daily intramuscular and intra-articular injections of penicillin, supplemented by arthrotomy only if destruction of the articulation is proceeding in spite of the antibiotic therapy. Early and adequate use of chemotherapy and antibiotics usually serves to avoid need for incisions and drainage.

Coccidioidal Arthritis.—Coccidioidal arthritis must now be given serious consideration in differential diagnosis of specific forms of arthritis encountered in this country. Though still a rare disease in most parts of the United States, coccidioidomycosis is being encoun-

tered with increasing frequency. It is no longer merely a California disease. I have seen coccidioidomycosis in Minnesota, Arkansas and Illinois.

The disease occurs in two stages, and in both articular symptoms are frequently found. The first stage usually appears as a nondescript illness with features of influenza or pneumonitis. The mortality rate in the first stage is extremely low. About 2 to 5 per cent of the patients during this phase have articular pains which may resemble those of rheumatic fever and may take the form of acutely reddened and swollen joints. Erythema nodosum occurs commonly in this phase of the disease.

In the vast majority of cases, nothing further develops, but 1 in several hundred patients who are infected with the organism have progressive involvement of viscera, bones or joints. The articular involvement is readily mistaken for tuberculosis. The diagnosis must be made by culture of fluid aspirated from suspected articulations or, in doubtful cases, by articular biopsy. Specific remedies for this disease have not been developed, and, as extension to other organs may result, amputation must be considered whenever necessary.

RHEUMATOID ARTHRITIS

Rheumatoid arthritis occurs at any age, being found in children, in mature adults and in the aged. The peak incidence is between the ages of 20 and 30. In usual cases, in which rheumatoid arthritis affects peripheral joints, it is not difficult to recognize. The affected articulations are often symmetrically involved. A degree of swelling of articular and periarticular tissues becomes apparent early. Muscle atrophy and some degree of constitutional debility tend to develop promptly. Characteristic complications include subcutaneous nodules, vasomotor disturbances of the extremities and uveitis.

The arthritis is characteristically polyarticular, and its course is generally marked by an insidious onset and slow, though sometimes irregular, progression. In atypical cases, however, one may have considerable difficulty in distinguishing rheumatoid arthritis from other forms of joint disease. The involvement of joints may be sudden or violent, as in pyogenic infections. In some cases, articular involvement may be monoarticular for a long time, thus presenting one with the problem of distinguishing rheumatoid arthritis from tuberculosis or from articular involvement by neoplasms.

The laboratory may contribute little positive evidence to aid in the diagnosis of rheumatoid arthritis. One may expect to encounter hypochromic anemia, and the sedimentation rates and Schilling differential counts are frequently abnormal. These tests, however, are more useful for following the progress of the disease than for differential diagnosis, as each may be similarly abnormal in other diseases associated with articular inflammation. Increased titers of agglutinins against hemolytic streptococci are found in 50 to 80 per cent of cases, but this test has not found a popular place among the diagnostic procedures used in studying arthritis in this country. The test is difficult to perform; interpretation of results is uncertain in some instances, and the result is not abnormal in a relatively high percentage of proved cases of rheumatoid arthritis.

The roentgenologist may aid in the diagnosis of rheumatoid arthritis, but changes which he finds in an individual joint may at times be interpreted

only in terms of the clinical situation. Early stages of rheumatoid arthritis may not be associated with any roentgenographic disturbances, or only soft tissue swellings may be observed. As the disease progresses, further invasion of joints is reflected in narrowing of joint spaces resulting from destruction of articular cartilage. Finally, destruction of subchondral bone may occur. These changes, however, are not specific for rheumatoid arthritis, as similar changes can be observed in other forms of articular disease, for example in tuberculosis.

When usual diagnostic procedures fail to clarify a diagnosis, the physician is justified in performing articular biopsy to establish the diagnosis of rheumatoid arthritis with certainty. Histologic changes encountered in synovial membranes and in subcutaneous nodules of patients with rheumatoid arthritis are so distinctive that these are not readily mistaken for other common or rare forms of joint disease.

The synovial membranes of rheumatoid arthritis are marked by hypertrophy of their elements, thickening of subsynovial tissues and proliferation and reduplication of the endothelial lining layer. Synovial villi become hypertrophied, and blood vessels throughout the lining and capsular tissues proliferate actively. In the immediate subendothelial layers, lymphocytes and other inflammatory cells proliferate actively, and in some regions lymphocytes collect in follicles.

Subcutaneous nodules of rheumatoid arthritis are distinguished by central necrotic zones surrounded by reticuloendothelial cells arranged in a curiously palisaded manner. Beyond this layer is a zone of inflammatory cellular reaction held together with a stroma of varying density. These features together create an appearance which is not found in subcutaneous nodules associated with other forms of articular disease.

Diagnostic importance may also attach to the presence of widespread inflammatory lesions in muscles of patients with rheumatoid arthritis. The significance of these lesions has been appreciated only recently.⁴ Muscle lesions are found not only adjoining affected articulations but also in sites far removed from joints. Similar inflammatory nodules may be encountered in other disease, as in rheumatic fever, glomerulonephritis, tuberculosis lupus erythematosus and perhaps many more. But this type of lesion is not found in the muscles of persons with primary fibrositis or in the psychoneurotic person who complains of articular pains. When it has been studied more extensively, this muscle lesion may prove of value in direct diagnosis of rheumatoid arthritis. At present, an observation of this type of inflammatory myositis appears to have contributory value in the establishment of a diagnosis of rheumatoid arthritis.

It would, indeed, be a great pleasure to me if I could at this point discuss a new and effective remedy for rheumatoid arthritis. Unfortunately, new developments in treatment of rheumatoid arthritis do not yet include a rapidly acting and specific remedy. Nevertheless, there can be no doubt that remedies have been evolved through years of patient clinical observation which suffice for many cases. The best results obtained are not by application of any single measure, but from continuing intelligent application of a program of measures directed against the many abnormalities produced by rheumatoid arthritis.

4. Freund, H. A.; Steiner, G.; Leichtentritt, B. and Price, A. E.: Nodular Polymyositis in Rheumatoid Arthritis, *Science* 101:202-203, 1945.

Since this paper was written and during the time that it was awaiting publication, Hench, Kendall, Slocumb and Polley^{4a} have announced their discovery of the effectiveness of "compound E" and of the adrenocorticotrophic hormone of the pituitary gland in relieving symptoms of rheumatoid arthritis. Sufficient time has not yet elapsed to permit an evaluation of this discovery in terms of everyday treatment. Prospects appear hopeful, however, that these measures may indeed be capable of practical clinical application within the near future.

The outlook is not dark for every person with rheumatoid arthritis. In fact, the outcome is satisfactory in a majority of cases. A physician who undertakes the treatment of patients with rheumatoid arthritis should therefore approach this problem with a spirit of encouragement and with a reasonable degree of optimism.

It is important for physicians who undertake the care of patients with chronic arthritis to acquire a knowledge of these diseases which suffices to provide a reasonable degree of therapeutic resourcefulness. Problems which arise in the course of rheumatoid arthritis, for example, the tendency toward flexion deformities, excessive loss of body weight and progressive loss of ability to use extremities, require frequent changes in details of a therapeutic program. These complications must be recognized early and counteracted.

Time is required of the physician who would care for these patients. A person with rheumatoid arthritis generally needs instruction regarding self treatment with physical therapy measures, and he must often have dietary supervision. These details may prove of great value in the determination of the quality of results obtained.

A patient with rheumatoid arthritis who does not obtain this service from his physician will often fall into the hands of quacks and irregular practitioners, and it is precisely in this group of arthritic travelers that one encounters the most extreme deformities and severe destruction of affected joints. Care of the arthritic patient is a challenge and a responsibility for the regular physician.

In addition to "common sense" measures, certain additional forms of therapy for rheumatoid arthritis require consideration. Among these, gold therapy is perhaps the most important at the moment. Today, after two decades of use of gold compounds in treatment of rheumatoid arthritis, opinions are still divided regarding its effectiveness. Certainly, many failures of gold therapy are encountered in each series of patients who are treated thereby. Unfortunately, it is in the most seriously affected persons, in those who are in greatest need of an ameliorating measure, that gold therapy often fails. Nevertheless, there is considerable evidence that gold can, in an unknown manner, lessen the progress of inflammatory lesions of rheumatoid arthritis in a considerable proportion of those who are treated. The situation does not permit of a more precise enumeration of the benefits which can be derived from gold therapy today. With few exceptions, experienced American rheumatologists are continuing the use of gold preparations in the belief that results obtained therewith are better than those obtainable with any other single remedy. Gold is not justifiably used in the treatment of any other joint disease, with the

possible exception of psoriatic arthritis. Gold should not be administered if there is doubt as to the diagnosis of rheumatoid arthritis.

A most important advance of the past few years in regard to rheumatoid arthritis has been discovery of the effectiveness of 2,3-dimercaptopropanol (BAL) in treatment of toxic reactions resulting from gold. Granulopenia, exfoliative dermatitis, nephritis and thrombopenic purpura have been successfully treated with this compound. It is still necessary to maintain a careful watch of patients who are being treated with gold preparations, but a physician may breathe somewhat more easily while administering gold with the knowledge that a remedy for toxicity is available if needed. Toxic reactions to gold have been the greatest barrier to its wider use, and, if further experience should bear out the apparent effectiveness of BAL, there may soon be a much more extensive use of gold.

A variety of remedies introduced during the past two decades have had the common property of inducing vasodilatation in the extremities. Among these remedies are included bee venom, acetylcholine, nicotinic acid, neostigmine and physostigmine. Without exception, these remedies have been discarded by a majority of experienced workers in this field. Copper salts, bismuth preparations and intravenously administered procaine hydrochloride are now being tested. None of these has shown great promise. Para-aminobenzoic acid and gentisic acid are also under study, but these cannot yet be appraised satisfactorily.

Attempts to reproduce the ameliorating effects of jaundice and pregnancy on rheumatoid arthritis are still being studied. Results of a startling experiment conducted in Great Britain were published recently.⁵ Under the direction of a committee of the British Research Council, 312 patients with rheumatoid arthritis were inoculated experimentally with exudates containing the virus of infectious hepatitis. The incidence of jaundice in the inoculated group was approximately 10 per cent, and, among those in whom jaundice developed, an ameliorating effect of notable proportions was observed in about 75 per cent. This procedure is not ready for everyday clinical use, but the observations of this study point toward the possibility of an early discovery of a quick-acting and effective remedy for rheumatoid arthritis.

Results of treatment with transfusions of blood from pregnant women are still inconclusive. It seems doubtful that this measure will prove effective. The ameliorating effect of pregnancy generally disappears within a few weeks or within a month or two following delivery, and it therefore seems doubtful that transfusion of small amounts of blood from pregnant women can influence permanently the course of this disease. However, the procedure is still being studied.

The future may be bright for arthritic patients if ameliorating effects observed during jaundice and pregnancy can be reproduced in some artificial manner.

OSTEOARTHRITIS

Osteoarthritis of the primary type is undoubtedly the most neglected of all serious chronic diseases. Its occurrence is widespread, and its results are often distressing. Although the deformities which result are not so extensive as those which occur in rheumatoid

arthritis, nevertheless, this disease can be a serious crippler and cause intense misery. Osteoarthritis has generally been ascribed to wear and tear, and the pathologic changes which appear in affected joints are said to be those expected from excessive use. However, a good many features of osteoarthritis indicate that so simple an explanation does not suffice. Localization of the disease in terminal interphalangeal joints, or in one or another of the hip joints, and appearance of severe advanced forms of the disease among persons whose joints have not been exposed to excessive use are features which cannot readily be explained with the hypothesis of overuse. Changes comparable with those encountered in osteoarthritis may be found in persons affected with a rare biochemical abnormality known as ochronosis, thus suggesting that a metabolic disturbance and not simply wear and tear, may be at fault in osteoarthritis.

In classic instances, distinction between osteoarthritis and rheumatoid arthritis is not difficult to make. A predilection for terminal joints of the fingers is characteristic of osteoarthritis, whereas proximal interphalangeal joints and the metacarpophalangeal joints are characteristically affected in rheumatoid arthritis.

Osteoarthritis affecting larger joints, as for example knees, is rarely associated with frank effusions, in contrast to the situation in rheumatoid arthritis wherein effusions are commonly present. Muscular spasms and atrophy are not often present in osteoarthritis, and a tendency to fusion of adjoining articulations is not observed. In vertebral osteoarthritis, despite formation of large spurs, fusion of adjoining vertebrae is not frequently seen; consequently, spinal ankylosis does not result. Systemic manifestations are rare in osteoarthritis; there is generally no loss of weight attributable to this disease, and constitutional symptoms, such as anemia, poor appetite, hypotension, tachycardia, hyperhidrosis and other vasomotor disturbances, characteristically present in rheumatoid arthritis do not appear unless complications are present to account for them.

Treatment of osteoarthritis will always be limited by the poor powers of cartilage to heal. Nevertheless, treatment for this disease should be planned carefully, with a view to sparing the remaining effectiveness of involved joints.

At present there is a renewal of interest in intraarticular injections for osteoarthritis. Crowe has recently recommended treatment of osteoarthritis by intra-articular injections of acid potassium phosphate.⁶ Injections of lactic acid and of benzyl salicylate were also recommended recently. Testosterone propionate has been used, presumably for its value in rejuvenating some tissue factors.⁷ These "new" measures have not been tested adequately and are not yet ready for general use.

The ability of orthopedic surgeons to bring a measure of relief to patients with osteoarthritis should not be overlooked in a discussion of new developments in treatment for this disease. Removal of loose bodies, cheilectomy, patellectomy, arthrodesis and arthroplasties have an application in individual cases and, when properly applied, may bring great relief.

Pain and stiffness resulting from osteoarthritis have been observed to disappear during jaundice, and it is therefore to be hoped that progress in application of the jaundice phenomenon to arthritis may bring relief, also to sufferers from osteoarthritis.

SUMMARY

The observations which are reviewed in this paper emphasize the role of the family physician as one of great importance in the diagnosis and treatment of chronic rheumatism in the average patient.

Included in chronic rheumatism are a great variety of disease processes, some of which result from recognizable bacterial infections, some from metabolic anomalies and some from the effects of trauma and excessive use. In addition, there are a large proportion in which causes remain unknown.

The prospects for the arthritic patient are no longer hopeless. Steady advances in many fields of science are almost yearly providing increased hope for the sufferer from rheumatism, new tools for the practitioner and for the research worker and specific cures for some forms of rheumatic disease.

RÉSUMÉ OF SKIN DISEASES MOST COMMONLY SEEN IN GENERAL PRACTICE

EVERETT C. FOX, M.D.

and

THOMAS L. SHIELDS, M.D.
Dallas, Texas

Crocker, Buckley, Pollitzer, Alderson and Reich, Gilman and other observers have presented interesting statistical studies of the incidence of common diseases of the skin. Goodman¹ and Sohrweide² have published statistical studies on more than 1,000,000 dermatologic diagnoses made in private and clinical practice. In these series of reports six common dermatoses have accounted for 44 to 64 per cent of all diagnoses. There have been some variations of the six most common dermatoses. Eczema and acne were the two most frequent diagnoses and usually represented about 30 per cent of the cases. In more recent years tinea (fungous infections) and dermatitis venenata (eczematous contact dermatitis) have become much more frequent diagnoses. These changes have occurred as more accurate diagnoses of the fungous infections were made and as atopic dermatitis, contact dermatitis and the occupational dermatoses were recognized and removed from the eczema group. Sulzberger and Baer³ stated, ". . . the ten dermatoses most commonly seen in our private practice are: acne vulgaris, eczematous contact type dermatitis and other eczemas, seborrheic dermatitis, epidermophytosis of the feet and groins, pruritus (ani, vulvae, generalized), urticaria, atopic dermatitis, drug eruptions, psoriasis and lichen chronicus simplex circumscriptus (circumscribed neurodermatitis)."

It is statistically proved and clinically observed that the ten most common skin diseases represent

approximately 75 per cent of all the dermatoses. Therefore, the practitioner who is diagnostically and therapeutically familiar with these ten common skin diseases would be able to prescribe adequately for the majority of dermatoses seen in his practice.

The ten most common skin diseases are: (1) acne, (2) seborrheic dermatitis, (3) tinea (fungal infection of the scalp, body, groin, hands, feet, nails), (4) eczema (eczematous dermatitis, nummular eczema, infectious eczematoid dermatitis and atopic dermatitis), (5) dermatitis venenata (eczematous contact type dermatitis, occupational dermatoses), (6) impetigo, (7) scabies, (8) urticaria, (9) psoriasis and (10) pityriasis rosea.

ACNE

Acne is primarily a physiologic overactivity of the pilosebaceous system which is manifest as an oversecretion of sebum by the oil glands with follicular cornification and plugging, seen predominantly in adolescence. The primary lesion is a comedo or milium, which becomes inflamed and produces a papule and may proceed to a pustular lesion, a deep nodule or a cystic lesion with scarring. Infection plays a very little part in the development of acne, and that only secondarily. The bacterial flora of the skin in patients with acne is the same as that of the skin in patients without acne and in similar numbers.

The clinical variations of the disease represent individual reactions to the basic cause and may be changed or aggravated by many factors. Heredity, glandular activity of puberty, endocrine disturbances, intercurrent infections, anemia, use of iodides or bromides, disturbance of water balance, digestive and intestinal dysfunctions, parasympathetic nervous hyperactivity and especially excessive fat intake may be of etiologic significance.

Treatment must be varied depending on the many factors mentioned. The most important therapeutic measure is frequent cleansing with a nongreasy detergent at least once daily. Avoidance of all fatty and greasy applications and elimination of greasy foods from the diet are important general measures.

Daily routine includes (1) soap and warm water cleansing twice daily, (2) removal of comedos, (3) use of resorcinol or sulfur lotion or paste at night, (4) low fat diet (eliminate chocolate), (5) intake of vitamin A, 50,000 units one to three times daily, and (6) administration of estrogens, thyroid or tuberculin, in special cases, with (7) roentgen therapy, 50 to 75 r once weekly for ten to twelve treatments, for the cases of severer disease with deep papules, pustules and cystic lesions, but preferably not until age 17, and (8) weekly shampoo.

SEBORRHEIC DERMATITIS

The term seborrhea is used to designate a type or variety of dermatoses associated with functional hyperactivity of the sebaceous glands. It is difficult accurately to evaluate the bacterial flora present in this type of oily skin, especially in the frequent secondary pyodermic infections. Many observers insist that the flask bacillus (*Pityrosporum ovalae*) is a causative factor. Seborrheic dermatitis may at times be aggravated by emotional disturbances.

The frequent manifestations of seborrheic dermatitis of the scalp are generalized scaling, itching, folliculitis and loss of hair. The external ears and ear canals are frequent sites of scaling, itching, crusting and secondary pyoderma. Seborrheic dermatitis is probably the most common cause of itching of the external ear

canal. Erythematous dermatitis of the eyebrows, eyelids, lid margins, nasolabial folds and at times about the hair line, cheeks, neck and center of the chest are often observed in seborrheic dermatitis.

More extensive cases involve the axillas, the folds beneath the breasts, the umbilicus, groin, vulva and anal area. The eruption may at times become generalized, with extensive areas of erythematous and exudative dermatitis.

The treatment in the acute phase consists of use of wet dressings and soothing emollients. Persistent lesions will usually respond to 3 per cent ammoniated mercury ointment or to combinations of sulfur, salicylic acid and tar ointments. Recalcitrant cases may respond to a few roentgen treatments of 50 to 75 r.

TINEA

The fungus infections of the skin considered are those more frequently observed and, therefore, of practical importance. They are largely superficial in character, affecting mostly local areas.

Trichophytosis (ringworm) manifests itself differently in certain part of the body, presenting distinctive features characteristic of the area of involvement. Treatment of the various types of fungous infections and the involvement of special locations demands considerable variation in therapy.

The more important dermatomycoses are: (1) tinea circinata (corpis), (2) dermatophytosis of the feet, (3) tinea cruris, (4) tinea capitis and (5) onychomycosis.

Tinea Circinata.—*Tinea circinata* is characterized by one or more pea-sized to 2 cm. or larger, circular, circumscribed, slightly erythematous, usually dry, scaling patches. The borders usually are slightly raised above the level of the normal skin and are studded with many small vesicles. The annular arrangement is produced as the lesion extends peripherally, and in some cases concentric circles develop. The majority of cases of tinea circinata are produced by *Microsporon lanosum*. Five to 10 per cent ammoniated mercury ointment, half-strength benzoic and salicylic acid ointment (Whitfield's ointment), undecylenic or propionic acid ointment or 2 to 5 per cent salicylic acid in alcohol usually suffices.

At times extensive lesions develop about the feet and ankles, groin, thighs and buttocks and on the body. These lesions are usually produced by *Trichophyton purpureum* and are very resistant to treatment.

Dermatophytosis of the feet is the most common of the fungous infections. On the feet the primary lesion usually consists of vesicles with patches of macerated epidermis and fissures between and under the toes. Any of the interdigital webs may be affected although the fourth and fifth interspaces are most often involved. Deep-seated multilocular vesicles are observed on the soles, from a single small vesicle to small or large groups, sometimes widely distributed. In chronic cases there may develop thickened hyperkeratotic lesions about the tips of the toes and the edges of the soles and heels. These lesions rarely become acutely inflamed, but frequently persist for long periods.

Absorption of fungous products (trichophytin) from the acute vesicular and bullous lesions of the toes and soles at times produce vesicular lesions elsewhere about the feet and frequently about the fingers and hands. Microscopic examination for fungi from the scaling borders or the vesicular tops of lesions on the feet should be made to prove that the process is actually a fungous infection. The more difficult cases may

require cultural examinations for identification of the organism.

It has been stated that 50 to 70 per cent of the male population have dermatophytosis of the feet. Examinations made during the war period on large groups of troops bore out this impression, and previous surveys made of groups of college students also confirm the frequency of this infection.

The acute infections of the feet should have soap and water cleansing, wet dressings or soaks with aluminum acetate solution (Burrow's solution) or dilute potassium permanganate solution, followed by the application of aqueous solution of merbromin (mercurochrome[®]), methylosaniline chloride (gentian violet) or 2 to 5 per cent ammoniated mercury ointment at night and a drying lotion or powder for use during the day. After the acute process has subsided, undecylenic and propionic acid ointments or half-strength benzoic and salicylic acid ointment may be used and should be continued for several weeks to prevent recurrence. A 1 per cent salicylic acid dusting powder is effective for daytime. A large majority of the complications are either from secondary pyogenic infection or from overtreatment. Roentgen therapy, 50 to 75 r, is effective in controlling the acute inflammatory process, and four to six such treatments are usually sufficient. Roentgen therapy should not be relied on for the major treatment, as it is impossible to destroy fungi by irradiation alone.

Tinea Cruris.—*Tinea cruris* occurs more frequently in men about the upper and inner surfaces of the thighs and is popularly referred to as jockey-strap itch or dhubie itch. The condition begins as a small erythematous scaling or vesicular area, which spreads peripherally with partial clearing in the center. The lesion becomes characterized by its irregular serpiginous, well defined border which has many small vesicles. The process frequently extends downward on the thighs or onto the perineum, about the anus and over the buttocks. At times several palm-sized or larger areas develop, with progression or recurrence for a period of years. These lesions usually are produced by *Epidermophyton inguinale* or *Tr. purpureum*.

If considerable care is not exercised in the treatment of ringworm of the groin an acute exudative dermatitis is produced which greatly increases the patient's discomfort. Undecylenic and propionic acid ointments are less likely to irritate and are very useful in the acute stage. In the more chronic infections, 5 per cent crude coal tar ointment, half-strength benzoic and salicylic acid ointment, 2 to 5 per cent salicylic acid or resorcinol in alcohol are useful. Two parts each of resorcinol and sulfur, 20 parts each of zinc oxide, talcum and glycerine, and sufficient 70 per cent alcohol and camphor water in equal parts to make 120 (Gm. or cc.) will frequently control itching, produce mild exfoliation and effect relief in a high percentage of cases.

Tinea Capitis.—Ringworm of the scalp is an infectious disease occurring principally in school children, occasionally in infants but rarely in adults. In recent years there have been widespread epidemics of ringworm infection of the scalp in many Eastern and Midwestern cities. In these cases 90 per cent of the infections were due to *Microsporum audouinii*. In the Southern states the majority of the infections are produced by *Microsporum lanosum*. The lesions produced by *M. lanosum* are usually contracted from children's pets (dogs and especially cats).

The suddenly appearing small 0.5 to 1 cm. lesion on the scalp more frequently is only slightly inflamed; broken stumps of hairs and scaling rapidly develop, and the area increases in size. There may be only a single lesion, but by careful search of the scalp multiple lesions may be found. In every case there should be careful inspection of the lesion and of the entire scalp with filtered ultraviolet rays, which produce the typical brilliant greenish fluorescence of the infected hairs. By this method infected hairs may be identified and specimens obtained for direct microscopic examination and cultural studies. The lesions produced by *M. lanosum* are much more amenable to local therapeutic measures than those produced by *M. audouinii*. Formerly it was considered essential to have roentgen epilation in every case of infection produced by *M. audouinii*. However, in recent years newer drugs have been introduced which give a high incidence of cure.

The treatment of ringworm of the scalp by topical methods requires detailed instructions: (1) clipping of the hair or shaving of the entire scalp, (2) once or twice daily shampoo with soap and water and the removal of all crusts and loose hairs, (3) manual epilation of all hairs in the involved lesions, and these hairs should be disposed of by burning, (4) the application of the topical medicinal agent to the entire scalp night and morning, (5) covering of the involved areas, or, better, the entire scalp, with disposable paper tissue or some similar material and (6) the wearing of a stocking top cap which should be boiled daily.

These patients should be examined by the physician at one to two week intervals with filtered ultraviolet rays to determine accurately improvement or progression. When manual epilation of the infected hairs is carried out under the Wood light, more rapid improvement may be obtained.

Medication: In past years 5 to 10 per cent ammoniated mercury ointment has been widely used, and combinations of mercury and sulfur, such as 6 parts each of mercuric sulfide and precipitated sulfur, 3 parts salicylic acid and sufficient water soluble ointment base to make 100 (Gm. or cc.) are useful. Schwartz has recently popularized the use of salicylanilide 5 per cent in carbowax 1500. This has been a very effective method, and a large per cent of patients with infections with *M. audouinii* have been cured in ninety to one hundred and twenty days. Cases which are resistant to salicylanilide and the fatty acids, such as undecylenic acid, zinc undecylenate, propionic acid and the propionic salts, will still require roentgen epilation, which must be carefully administered by the Kienbock-Adamson technic after the hair is clipped and the scalp properly marked.

Ringworm infection of the scalp offers much difficulty as an infectious disease. When the importance of diligent treatment is not stressed and in resistant cases, infections may continue for a year or more.

Onychomycosis.—Fungous infections of the nails are caused principally by *Trichophyton gypsum* and *T. purpureum*. Onychomycosis results in destruction of the nails, which become brittle, discolored, lusterless, grooved, pitted and thickened. The nail itself is gradually destroyed, usually from its free edge proximally so that its surface is irregular and has the appearance of being gouged or eaten away. The process may progress over many years, and at times paronychia reactions develop in the adjacent soft tissues. Ringworm infection of the nails is a frequent source of reinfection of dermatophytosis of the feet. Onychomy-

cosis does not respond readily to local medicinal agents, and infections of this type are usually resistant to irradiation. By careful paring and daily filing, followed by the application of benzoic and salicylic acid ointment, one may cure a single infected nail in a small percentage of cases. When several nails are involved, the best therapeutic measure is surgical avulsion of the individual nail. This is followed by daily treatment, first with 5 per cent ammoniated mercury ointment and later by gentle daily filing with an emery board and the application of half to full strength benzoic and salicylic acid ointment. Recurrence of infection will develop in the new nails in 10 to 25 per cent of cases and may require second or even third removal. Surgical removal offers the only high percentage of permanent cures.

ECZEMA

The term eczema is used to include a variety of scaling, papular erythematous, vesicular, exudative, itching or burning cutaneous eruptions which frequently cannot be readily relegated to a more definite category. These lesions may be acute, subacute or chronic, with the many associated secondary cutaneous changes.

A high percentage of eczematous skin diseases will be found to have been produced or aggravated by the topical medications previously used. Many early irritative reactions may be recognizable as contact dermatitis, but subsequently have no resemblance to the original disease. Many dermatoses result from sensitivity to oral medication, such as with sulfonamide drugs, penicillin and barbiturates. A few are related to focal infections of teeth, tonsils or other foci. There are still eczemas of undetermined origin which probably stem from combinations of systemic, infectious, allergic and local factors. A detailed history and observation of the individual lesion is helpful in evaluation of the process and in determination of the causative factors. There are many articles on eczema which clearly and adequately outline the various differential diagnoses and help the practitioner more accurately to evaluate eruptions that otherwise would be considered as types of eczema. Such diseases as fungous infections, seborrheic dermatitis, psoriasis, neurodermatitis, contact dermatitis and occupational dermatoses should be recognized and properly diagnosed. The disease in many of the complicated cases can be determined or proved only at some subsequent date after the process has subsided and appropriate tests carried out to prove the diagnosis. The more complicated cases will require detailed study by physicians trained in cutaneous diseases. It is readily seen that, in its broad sense, not only is eczema protean in its clinical manifestations but its causes are varied, numerous and frequently complex.

Diet plays very little part in the eczema type of disease, except in atopic dermatitis, especially the infantile eczemas which are due more frequently to milk, egg or wheat. Diet may play a part in a small number of the vesicular dermatoses of the hands.

Treatment usually can be initiated on a morphologic basis—mild and soothing applications, such as poultices and wet dressings, in acute dermatitis followed by emulsions and mild emollients. Five per cent bismuth tribromphenate or 3 to 5 per cent mercury ointment is useful for the infectious lesions. The wet dressings may be applied as local compresses or as oatmeal, soda and starch baths. Lotions may be applied several times daily and rarely require dressings. In the acute processes ointments and pastes, when used,

may best be spread on dressings. The more frequently used lotions are aqueous calamine lotion and the oily calamine emulsion, to either of which may be added camphor, menthol, resorcinol or coal tar solution. When the acute reaction has subsided, resorcinol paste or mild tar ointments may be used. Tar, sulfur, salicylic acid and resorcinol are useful in the cases of more chronic disease. Control of the acute eczematous process and pruritus may be relieved by the use of low voltage roentgen rays.

DERMATITIS VENENATA

Dermatitis venenata is the diagnostic term used for the many dermatoses resulting from a variety of irritating external contact substances. The skin is the only organ constantly exposed to external injuries from physical and chemical agents.

Dermatitis which develops as a sensitization phenomenon, after previous exposure to a contactant, is more accurately entitled eczematous contact dermatitis. Many cases develop in certain industries and come under the classification of occupational dermatoses.

Many cases in which the eruption is considered as dermatitis venenata result from contact with materials that are primary irritants. There may be no preceding contact or exposure, and these substances will produce dermatitis in the majority of persons. A number of materials may be primary irritants in high concentration and produce dermatitis in the majority of persons exposed. The same material in less concentration may produce dermatitis in a small number of persons, and then only after previous or continued exposure.

Lane has estimated that 10 to 12 per cent of all dermatoses are of industrial origin and that dermatoses comprise 65 per cent of industrial diseases, exclusive of accidents.

The most important problem in the eczematous dermatitis venenata type of dermatoses is to determine whether the dermatitis was caused by an external irritant, an epidermal sensitivity or some internal agent or other mechanism.

The substances to which the skin reacts and the occupations in which these substances are met are great in number. Weber listed all reported external causes of dermatitis. Five hundred and eighty-five occupations were included, along with the various substances which have been found responsible for cutaneous reactions. Shelmire has listed fifty-five weeds which he considers important in producing contact dermatitis. These and many other reports will give accurate lists of the substances and the occupations in which they are encountered.

A brief list of the more frequent materials producing eczematous contact dermatitis are: (1) hair dyes, fur dyes, hair tonics, hair lacquers, bleaches, creams, depilatories, deodorants, nail polish, perfumes, soap and hand lotions; (2) wool, silk, rayon, nylon and the aniline dyes; (3) flowers, plants, weeds, woods, insecticides, leather, silver, nickel, rubber, tobacco and matches, and (4) medicinal preparations: mercury; cresol, phenol, sulfur, resorcinol, quinine, sulfonamide drugs, local anesthetics, formaldehyde, picric acid and medicated soaps.

The most frequent causes of occupational dermatoses are: (1) acids and alkalis, including cement; (2) petroleum products: oils, greases and tar; (3) solvents: turpentine, carbon bisulfide, carbon tetrachloride, toluene, petroleum distillates and alcohol; (4) paints,

varnishes and lacquers; (5) rubber and rubber compounds; (6) metals and metal plating; (7) chromic acid, salts and picric acid; (8) resins and waxes, natural and synthetic; (9) dyes: aniline, anthracene, nitro compounds and paraphenyldiamine; (10) plants: primrose, ivy, hemp, dandelion, daisy, parthenium, ragweed, cocklebur, mahogany, boxwood, cocobolo wood, satinwood and mesquite wood; (11) insecticides: pyrethrum, creosote, fluorides, mercury, phenol, arsenic and dichlorodiphenyltrichloroethane (DDT); (12) soaps, excess alkali, antiseptics and perfume, and (13) photographic chemicals: methyl-amino-cresol-sulfate (metol[®]), bichromates, pyrogallol and hydroquinone.

IMPETIGO

Impetigo is an acute infectious disease characterized by the occurrence of discrete thin-walled vesicles and bullae which rapidly become pustular and then dry to form yellowish crusts. There are many clinical variations of the disease. The face and other exposed portions of the body are more frequently involved. The primary lesion is a small, thin-walled vesicle which becomes pustular, dries and develops a yellow crust. New vesicular borders continue to develop, which increase in size with the formation of variously shaped lesions. After a few days concentric lesions may be observed with a vesicular area at the periphery and varying degrees of drying and crusting in the central portion. Bullous lesions may occur, especially about the neck, axillas and groin.

The disease is produced by several pyogenic bacteria. Streptococci and staphylococci usually are found either singly or in combination. A majority of the cases probably are due to hemolytic streptococci.

The most important therapeutic measure is the thorough and frequent removal of the vesicular tops and crusts. This is accomplished by soap and water scrubbing, cleansing with one of the antiseptic detergents or by the use of hydrogen peroxide. After all of the crusts are removed, with debridement of the vesicular borders, topical medication may be applied. The more useful local applications are: (1) 2 to 5 per cent solution of merbromin (mercurochrome[®]), (2) 2 to 5 per cent solution of methylrosaline chloride, (3) alibour lotion, (4) 2 to 5 per cent ammoniated mercury ointment, (5) 5 per cent bismuth tribromphenate ointment, (6) penicillin ointment, (7) nitromersol (metaphen[®]), 1:500 in collodion, and (8) penicillin and the sulfonamide drugs, which may be used for their systemic effect in extensive and resistant infections. The sulfonamide drugs should not be used locally because of their high sensitizing factor and the many serious complications. Mercury and penicillin may produce sensitization dermatitis. Solution of silver nitrate may produce pigmentation or permanent tattooing.

SCABIES

Scabies is a contagious disease of the skin produced by *Acarus scabiei* and characterized by intense itching, which occurs chiefly at night. The typical primary lesion is the burrow. It is produced as the female *Acarus* invades the skin. The most frequent lesions are small papules, followed by the development of vesicles, pustules and excoriations.

The distribution follows a definite pattern, involving finger webs, thenar and hypothenar eminences, flexor surface of the wrists, elbows, axillary folds, abdomen, buttock, the breast in female patients and the penis and

scrotum in male patients. The extent of the eruption is directly proportional to the degree of hygiene. In children and unclean persons, the eruption may be widespread, whereas in scrupulously clean persons only a few scattered lesions may be found.

The diagnosis is made by recognition of the multi-forme eruption, in the sites of predilection associated with nocturnal itching. Observation of the adult parasite, nymphs or eggs in potassium hydroxide mounts establishes unequivocal diagnosis.

Treatment includes use of: (1) soap and water baths, (2) sulfur ointment (sulfur dermatitis is a frequent complication), (3) benzyl benzoate 25 per cent emulsion, (4) kwell[®] (hexachlorocyclohexane) ointment, (5) DDT, benzyl benzoate, ethyl aminobenzoate, tween 80[®] (tweens comprise a series of polyoxyalkylene derivatives of hexitol anhydride partial long-chain fatty acid esters) and water (Eddy's formula) (sensitivity to ethyl aminobenzoate may occur), (6) pyrethrum ointment 25 per cent and (7) clean personal and bed clothes after completion of treatment.

URTICARIA

Urticaria occurs in acute and chronic types. The acute type is common, and there may be only one attack or there may be several at regular or irregular intervals. The chronic type is fortunately rare, but it may last for months or years and prove refractory to all treatment unless definite causative factors can be determined. The ordinary lesions consist of wheals, white, pink or red, and papules, small to palm sized or larger. Itching usually is the presenting symptom and varies from a mild sensation to extreme distress with severe prolonged pruritus.

The cases of acute disease usually are of short duration, three days to three weeks. They frequently develop after a recent febrile illness or gastrointestinal upset, but may be related to drugs, focal infection or serum reaction. The majority of the cases of acute disease appear suddenly, following some indiscretion of food or drink with varying degree of intestinal upset, and are usually manageable with a single saline purge or administration of castor oil and an antihistaminic drug.

In former years, epinephrine, ephedrine, propadrine[®] hydrochloride (d 1-1-phenyl-2-aminopropanol hydrochloride) and similar drugs were fairly effective control measures. In the past three years, a new group of antihistaminic drugs have been introduced which give more accurate methods of treatment of the majority of the cases of acute urticaria and are extremely helpful in chronic urticaria. There are more than a dozen of these new drugs which have been fully discussed and evaluated in recent medical literature. There is, however, some difficulty in selection of these drugs because of their chemical similarity.

Frequently, it is advisable on the initial visit to give: (1) castor oil, (2) an adequate dose of epinephrine in oil (1:500) and (3) one of the antihistamines. In many of the cases of acute disease this suffices. Cases of severer disease may require antipruritic lotions and soda and starch baths to alleviate itching.

Few of the cases of acute disease have a definite food allergy basis, but often there is an allergic manifestation due to drugs. This has been particularly true with the use of penicillin and more frequently with the use of penicillin in oil and wax. The antihistamines have made the continued use of penicillin possible in

many cases that would otherwise require discontinuance of this drug.

In cases of chronic disease, which has been present for six months to several years, an exhaustive history is necessary in identifying the causative factors. Most of these cases will be found to be due to drugs taken over a considerable period of time, chronic focal infections, food allergies or psychosomatic disturbances.

In the management of these cases all drugs ingested during the period of the urticaria should be ascertained and, except where essential, immediately discontinued. Thus rapid evaluation of the effect of drugs can be obtained. When study of foods seems indicated, dietary restriction is necessary. It is frequently helpful to eliminate all foods except buttermilk and rye crisp® wafers for a week or more. After this period, one food may be added daily until a recurrence of the urticaria develops. Then the last three foods are discontinued, but additional foods may be added. Later foods to which there is an apparent reaction may be added at an interval of several days, and in this manner the foods may be identified. When drugs and foods have been eliminated as causative factors, determination, evaluation and eradication of foci of infection become important. The more frequent foci are the teeth, tonsils, sinuses, nasopharynx, gallbladder, appendix, cervix, gastrointestinal tract and genitourinary system. Surgical intervention for foci of infection should be the last of the investigative procedures in the evaluation of chronic urticaria.

PSORIASIS

Psoriasis is a chronic inflammatory disease, occasionally acute, characterized by formation of papules that have a dull red base and are covered by imbricated micaceous scales. The number and shape of the lesions vary from a few isolated papules to numerous thickened plaques forming gyrate and circinate configurations. The lesions are surrounded by normal skin. Subjective symptoms, such as itching and burning, are absent in most cases. The lesions heal without scarring.

The most common involved areas are the elbows, knees, scalp, trunk and sacral region. The nails, palms or soles may be affected without evidence of lesions elsewhere. Psoriasis of the nails gives characteristic stippling and accumulation of hyperkeratotic material beneath the nail that subsequently causes separation. In the scalp thickened plaques usually are limited to hairy areas, but may extend onto the face. Psoriasis at times involves primarily the moist folds, especially the groin, perineum, the area between the buttocks, the umbilicus and beneath the breasts. Lesions of this type are erythematous, exudative and much less characteristic. This type of psoriasis frequently is mistaken for infection due to *Monilia* organisms or seborrheic dermatitis.

Psoriasis is a disease of all ages but predominantly affects persons in the second and third decades. The course is unpredictable. It may remain localized in sites of predilection for years, with periods of quiescence and recurrence. The tendency to recurrence is the most prominent feature of the disease.

Psoriasis is incurable but does not affect the patient's general health. The lesions in many patients entirely disappear during the summer and recur in winter. The few cases seen in the tropics and the improvement in recalcitrant cases points to beneficial effects of ultraviolet rays. In general, psoriasis is a manageable disease, and most patients may remain free of lesions

a major portion of the time by diligent treatment of each exacerbation.

The cause of this disease is still unknown; however, present evidence points a disturbance in lipid metabolism. Most investigators recognize that heredity is a factor in about 25 per cent of cases.

Acute cases of psoriasis frequently are associated with recent febrile infections or other acute diseases. Treatment must not be energetic. Colloid baths, boric acid ointment, Lassar's paste or coal tar ointment should be used until the acute phase subsides. Otherwise, the disease may rapidly develop into generalized erythroderma or exfoliative dermatitis.

The chronic nummular lesions will usually respond to 5 to 10 per cent ammoniated mercury ointment or ammoniated mercury and sulfur, 5 per cent each, or 5 to 10 per cent crude coal tar ointment followed by ultraviolet rays as advised by Goeckerman. Chrysarobin ointment, 3 to 5 per cent, or chrysarobin in chloroform, 30 per cent crude coal tar paint is useful in resistant plaques. Chrysarobin must be used carefully and should not be applied about the face and scalp. A few irradiations of 75 r to individual lesions will usually produce prompt involution. However, a single area should not receive more than twelve 50 to 75 r treatments in a lifetime. Roentgen therapy should be used only for the more resistant lesions, because of recurrences and chronicity of the disease. After two or three roentgen treatments, ultraviolet rays and tar ointments are used for prolonged therapy.

Low fat diet, small doses of thyroid, pancreatic extracts, whole blood injections, tar or sulfur baths and sun baths are of general value.

PITYRIASIS ROSEA

Pityriasis rosea is an acute papulosquamous eruption characterized by round or oval lesions that have slightly raised borders and a cigaret-paper-like center. The lesions are dry and are covered by a fine fawn-colored scale. The disease is seasonal, occurring principally in the spring and fall. The eruptive nature and lack of recurrence of the disease suggests an infectious process.

The trunk, arms and thighs are the sites of predilection, with lesions developing along the lines of cleavage. Rarely does the eruption occur on the face. In half of the cases, the generalized eruption is preceded by a primary lesion or herald plaque, by four to seven days. The eruption may vary from a few 1 to 2 cm. lesions to an extensive generalized dermatitis with hundreds of 1 to 4 cm. oval and circinate lesions. Itching may be moderate to severe.

The disease is self limited and runs its course in three to twelve weeks. This period may be decreased by treatment with antipruritic lotions, starch baths and ½ erythema doses of ultraviolet rays every five to seven days for two or three treatments. Application of 8 parts each of resorcinol and glycerine and sufficient 70 per cent alcohol and camphor water in equal parts to total 240 (Gm. or cc.) twice daily relieves itching, produces mild exfoliation and speeds recovery.

SUMMARY

A review of the literature as to incidence of the most common cutaneous diseases is presented. The ten most common cutaneous diseases are named and treatment discussed. Physicians familiar with these ten diseases may care for the majority of cutaneous diseases seen in their practice.

RESECTION OF THE LEFT AURICULAR
APPENDIX

A Prophylaxis for Recurrent Arterial Emboli

JOHN L. MADDEN, M.D.
New York

A therapeutic problem which remains unsolved is the one pertaining to recurrent arterial emboli. Once a peripheral embolus has occurred there is a high incidence of recurrence. Unfortunately, all too frequently the recurrent embolus is fatal, commonly involving one of the cerebral arteries.¹ As Jefferson so aptly stated²: "In the nature of things a very high percentage of successes is unlikely ever to be attained, for emboli are apt to be multiple and further infarction will sometimes carry off the patient in whom a local success has been won."

Since a thrombus is the precursor of every arterial embolus, the ideal prophylaxis for recurrent arterial emboli should be the removal of the thrombus together with its site of origin. Rheumatic mitral stenosis is one of the commonest causes of a peripheral arterial embolus, an embolus occurring in approximately 45 per cent of the cases.^{1b} In this disease the embolus originates as a mural thrombus within the left auricle or its appendix, more commonly the latter.

In accordance with this fact, Dr. William Dock in 1946 suggested a resection of the left auricular appendix in cases of rheumatic heart disease with mitral stenosis, auricular fibrillation and recurrent arterial emboli. This suggestion provided a stimulus for a study which was recently culminated in the performance of the operation on 2 patients.

Hellerstein and his associates,³ and more recently Burdette,⁴ have reported the feasibility of resection of the atrial appendages in the dog. In a series of 8 experiments reported by Hellerstein, a left atrial appendectomy was performed in 5, a right atrial appendectomy in 2 and a bilateral atrial appendectomy in 1. All but 1 of the dogs survived the operation. A post-mortem study at varying intervals four to twelve weeks postoperatively revealed complete endothelialization at the site of the atrial scar. No subjacent mural thrombi were found. The operation was suggested as a possible therapeutic approach to the problem of peripheral arterial emboli in patients with rheumatic mitral valvular disease.

Two cases are herein reported in which a resection of the left auricular appendix was performed in the human being as a prophylaxis for recurrent arterial emboli.

REPORT OF CASES

CASE 1.—The patient, a 38 year old white woman, was admitted to the hospital on Sept. 9, 1946, complaining of pain, numbness and tingling in the left leg of thirteen hours' duration. The past history revealed the presence of chronic rheumatic heart disease with mitral stenosis and auricular fibrillation. Three months before the patient's admission symptoms of congestive heart failure occurred, which subsided with appropriate digitalis treatment. A maintenance dose of digitalis was prescribed.

From the Department of Surgery, Long Island College of Medicine, and the Surgical Service, Long Island College Division, Kings County Hospital, Brooklyn.

4. Burdette, W. C.: Personal communication to the author.

Examination disclosed an embolic occlusion of the left common iliac artery. The heart was not decompensated. Approximately twenty hours after the onset of symptoms a transperitoneal embolectomy was performed successfully.

The patient was admitted to the hospital for the second time on Jan. 11, 1948 (fifteen month interval), complaining of numbness and tingling in the right leg of two hours' duration. In the interval between admissions to the hospital manifestations of congestive heart failure occurred several times, but the symptoms abated after an increase in the maintenance dose of digitalis.

Examination showed an embolic occlusion of the right popliteal artery. About five hours after the onset of symptoms the embolus was removed successfully.

In view of the history of chronic rheumatic heart disease with mitral stenosis, auricular fibrillation and recurrent peripheral arterial emboli, a resection of the left auricular appendix was advised. On February 21, with intratracheal anesthesia (gas, oxygen and ether) a resection of the left auricular appendix was performed.

During the operation stoppage of the heart occurred. Immediate manual massage of the heart was begun concomitant with the maintenance of artificial respiration by a rhythmic compression of the breathing bag. The recovery of the patient was complete.

An examination immediately postoperative revealed a left hemiparesis, which was believed to be secondary to a right cerebral embolus. Subsequently, a decided personality change was observed, which persisted throughout the stay in the hospital.

The improvement in the general condition of the patient was continuous. There was a gradual restoration of function in the left lower but none in the left upper extremity. On discharge from the hospital, on May 13, eleven weeks after the operation, the patient was ambulatory with assistance.

A recent examination, in November 1948, eight months postoperatively, disclosed a continued improvement. The return of the personality to normal was apparent immediately. A spastic hemiplegic gait was present, but the patient walked well without support. In the left lower extremity the return of function approached the normal, whereas in the left upper extremity the movements were limited. Auricular fibrillation with a pulse rate deficit of 16 was present. There was no recurrence of peripheral arterial emboli.

*Results of Examination of Tissue (by Dr. Caspar G. Burn).—*Gross Observations: The specimen, a large auricular appendix (left), measured 3.0 cm. by 2.5 cm. by 2.0 cm. It was filled with an organizing red to white thrombus. The thrombus was firmly adherent to the endocardial surface of the appendix.

Microscopic Observations: Decided hypertrophy and fibrosis of the appendix were present. The myocardial cells contained large irregularly shaped hyperchromatic nuclei, which on cross section were stellate in shape. Vacuolization and fibrillary degeneration of the myocardial fibers were present. There was diffuse interstitial fibrosis and congestion of vascular channels. The endocardium was thickened and hyalinized. An ante-mortem thrombus, in which interlacing lines of Zahn were present, was attached to a denuded area of the endocardium. In the epicardial adipose tissue focal areas of hemorrhage were present.

Diagnosis: The diagnosis was (1) myocardial hypertrophy and fibrosis of the left auricular appendix and (2) mural thrombus of the left auricular appendix.

Comment.—In this patient the indication for the operation was supported by the pathologic observations. The auricular appendix was approximately three times its normal size, immobile, tense and distended. Mural thrombi were palpable within the auricula, and future embolic phenomena appeared inevitable.

It was assumed that the cerebral embolus occurred during the operation. It may have occurred when the clamp was applied to the base of the auricular appendix or when massage of the heart was performed. Because of the pathologic observations at the operation, the former view was considered the more probable. The personality change could not be explained solely on the basis of a cerebral embolus. The cerebral anoxia

concomitant with the cardiac stoppage was believed a contributory cause.

CASE 2.—The patient, a 52 year old white man, was admitted to the hospital on Dec. 21, 1947, complaining of pain in the lower extremities of one and one-half hour's duration.

In 1946 the diagnosis of chronic rheumatic heart disease with mitral stenosis, auricular fibrillation and congestive heart failure was made. Digitalis was prescribed, and treatment was maintained until the patient's admission to the hospital. There were no recurrent attacks of congestive heart failure.

Examination showed an embolic occlusion of the abdominal aorta at its bifurcation. Approximately five hours after the onset of symptoms a transperitoneal aortic embolectomy was performed successfully.

In this patient, because of the diagnosis of rheumatic heart disease with mitral stenosis, auricular fibrillation and a recent embolic occlusion of the abdominal aorta, a resection of the left auricular appendix was advised. On March 6, 1948, with intratracheal anesthesia (gas, oxygen and ether) the left auricular appendix was resected.

Hospital Course.—In the early postoperative period, oliguria, abdominal pain and distention were complicating features. Tenderness in the right upper quadrant of the abdomen was severe. With relief of the abdominal distention the tenderness was less severe and overlay an enlarged liver.

One week after the operation the patient was out of bed and apparently much improved. However, on the ninth postoperative day he complained of weakness and was apprehensive.

TABLE 1.—Site of Mural Thrombi in Coronary Thrombosis with Myocardial Infarction

Author	Number of Cases	Ventricular Thrombi	Auricular Thrombi	Auricular Thrombi Alone
Hay and Levine.....	37	37 (100%)	1 (2.7%)	0 (0.0%)
Garvin.....	89	78 (87.6%)	6 (6.7%)	0 (0.0%)
Total.....	126	115 (91.2%)	7 (5.5%)	0 (0.0%)

The heart beat, though irregular, was slow and forceful. The pulmonary observations were normal. Blood and urine values were relatively normal. The only positive clinical observation was the hepatomegaly. The subjective weakness and apprehension persisted. At 5 p. m. the same day, the patient sat up to take a drink of water and suddenly died. An immediate aspiration of the left pleural cavity showed no abnormality. Permission for a necropsy was not granted.

Results of Examination of Tissue (by Dr. Caspar G. Burn).—Gross Observations: The specimen, an auricular appendix (left) measured 3.0 cm. by 0.5 cm. A mural thrombus was present within the lumen of the appendix and conformed to the fossae formed by the musculi pectinati. The thrombus, a homogeneous pale brown, was "rubbery" in consistency.

Microscopic Observations: The muscular component was slightly hypertrophic, and cellular fibrosis was present. The epicardial fat was normal. The endocardial surface was covered in some areas by the remains of a thrombus composed of fibrin, red cells and debris.

Diagnosis: The diagnosis was mural thrombus of the left auricular appendix.

Comment.—In this patient, in contrast to the preceding, the left auricular appendix was normal in size and in appearance. Fibrillary auricular contractions were present. Because of the possibility that the prior aortic occlusion was the result of a complete detachment of a mural thrombus, a prophylactic resection of the auricular appendix was done. Although not palpated at operation, in the resected specimen an organized mural thrombus was found.

The diagnosis of an embolic occlusion of the aorta may be questioned. The thrombus at operation extended from a point just below the level of the renal arteries, downward beyond the bifurcation of the abdominal aorta into the common iliac

arteries on either side. Atherosclerotic changes in the aorta were present. The clot was unduly adherent to the intima. To dislodge the clot completely, a forceful "milking" action of the fingers was necessary. The "embolus" in this patient may have been a local thrombotic occlusion of the abdominal aorta.

The embolic theory was not without support. Microscopic examination of the resected auricular appendix revealed that the endocardial surface was covered in some areas by the remains of a thrombus composed of fibrin, red cells and debris. From this report it is conceivable that an embolus could have formed by a detachment of a portion of the mural thrombus.

The differential diagnosis between an autochthonous thrombus (a thrombus formed where found) and an embolus may be most difficult, if not impossible. In the older age groups, despite the increased incidence of mural thrombosis, the possibility that the existent arterial occlusion may be due to a local thrombus always must be considered.

GENERAL COMMENT

The first prerequisite to a resection of the left auricular appendix should be the establishment of a sound pathologic basis for the operation. Accordingly, several questions were proposed: (1) What is the mode of origin of peripheral arterial emboli? (2) what are the predisposing causes, if any, to the formation of such thrombi? (3) How frequently do mural thrombi form in the left auricle and its appendix? (4) What is the relationship between the presence of a thrombus in the left auricle and/or its appendix and the occurrence of peripheral arterial emboli?

Bull⁵ mentioned five different possible sites of origin of peripheral arterial emboli: (1) a central spot in an artery, especially the aorta; (2) the left side of the heart; (3) pulmonary veins; (4) the right side of the heart, and (5) systemic veins. The last two presuppose the presence of a patent foramen ovale (paradoxical embolus). The first two are the most frequent sites and merit particular study.

An ulceration overlying an atheromatous plaque in an artery, such as the aorta, may be the focus of origin of a thrombus. This thrombus may remain localized, increase in size and ultimately produce a thrombotic occlusion of the artery. On the contrary, the thrombus may become wholly or partially detached and form a peripheral arterial embolus. The differentiation between an autochthonous thrombus and a peripheral embolus is not always possible, even at operation or necropsy. Many conditions classified as embolic arterial occlusions are local thrombotic occlusions. The converse is also true.

The commonest mode of origin of a peripheral arterial embolus is the detachment, in whole or in part, of a mural thrombus located in one of the chambers of the left side of the heart. The exact mechanism of formation of a mural thrombus may not be ascertained in every case. However, there are predisposing factors which, whether alone or in combination, underlie the formation of cardiac mural thrombi, viz., (1) an underlying heart disease, (2) congestive heart failure, (3) disturbances in cardiac rhythm and (4) age of the patient.

A relationship exists between the type of heart disease and the location of a mural thrombus. In coronary thrombosis with myocardial infarction, mural thrombi are frequently present. Garvin⁶ has reported an inci-

5. Bull, P.: What Can More Than 6,000 Postmortem Examinations Teach Us about Emboli and Embolic Gangrene of the Extremities? *Acta chir. Scandinav.* 54: 315-338, 1921-1922.
6. Garvin, C. F.: Mural Thrombi in the Heart, *Am. Heart J.* 21: 713-720, 1941.

dence of 67 per cent. In approximately 90 per cent of the cases the mural thrombi are located within the ventricles, particularly the left ventricle (table 1).

In over 30 per cent of the cases of uncomplicated hypertensive heart disease, mural thrombi may be present.⁶ As in coronary thrombosis the thrombi are located predominantly in the ventricles.

In rheumatic heart disease with mitral stenosis the incidence of mural thrombus formation has been reported to vary from 13 per cent⁷ to 32 per cent.⁸ However, in contrast to coronary thrombosis and hypertensive heart disease, in about 90 per cent of the cases the mural thrombi are located in the auricles, mainly in the left auricle and its appendix.⁶ In an analysis of a composite study of 69 cases of rheumatic heart disease (table 2) with mural thrombus formation, a thrombus was found in the left ventricle alone only in 2 cases (2.9 per cent).

Congestive heart failure and auricular fibrillation predispose to the formation of cardiac mural thrombi and peripheral arterial emboli. Graef and his associates⁷ noted the presence of congestive heart failure in 21 of 24 cases in which mural thrombi were found at necropsy. In the remaining 3 a history of previous attacks of congestive heart failure was obtained.

In Garvin's⁶ series of 60 patients with auricular fibrillation, 26 (43.3 per cent) had mural thrombi, whereas in 51 patients without auricular fibrillation mural thrombi were present in only 9 (18 per cent). Weiss and Davis^{1b} studied a group of 28 patients with auricular thrombi. In 25 the rhythm had been determined, and in 22 (88 per cent) auricular fibrillation was present.

The final factor in the formation of mural thrombi is the age of the patient. Garvin⁶ and subsequently Hay and Levine⁸ demonstrated that mural thrombi occurred more frequently in the older age groups.

What is the relationship between the presence of a mural thrombus and the incidence of peripheral arterial emboli? In the study by Bull⁶ mural thrombi were present in one or more of the heart chambers in 86.6 per cent of the cases in which embolic gangrene of the extremities was present. A mural thrombus that occurs as a complication of rheumatic heart disease is the commonest mode of origin of a peripheral arterial embolus. Levine^{1a} found that thrombi in the auricles were the immediate cause of death in 20 per cent of all cases of rheumatic heart disease. Weiss and Davis^{1b} analyzed 164 cases of rheumatic heart disease in which the cardiac damage was the direct cause of death. In 73 (45.5 per cent) of the cases a peripheral arterial embolus had occurred. In 30 (41.1 per cent) the source of the embolus was demonstrated. In 28 (93.5 per cent) of the latter the auricles were the site of mural thrombi. Garvin⁶ showed that in the presence of mural thrombi in the right side of the heart, pulmonary infarcts occur three times more frequently than in their absence. Similarly, infarcts of the brain, kidney, spleen and extremities are more than twice as common in the presence of mural thrombi in the left side of the heart as in their absence. In the series reported by Harvey

and Levine,¹⁰ peripheral arterial emboli occurred in 56 per cent of the cases with auricular thrombi and in 43 per cent of the cases with ventricular thrombi.

The antemortem clinical diagnosis of a mural thrombus in one of the heart chambers may be most difficult. There is no one sign or symptom which is pathognomonic. However, the presence of a cardiac thrombus may be suspected in the following instances¹⁰: (1) in cases of coronary thrombosis with evidence of peripheral arterial embolism and (2) in cases of chronic valvular heart disease with auricular fibrillation and evidence of either pulmonary or peripheral arterial infarction. In the former, the mural thrombi are predominantly ventricular in location, whereas in the latter, the auricles, particularly the auricular appendices, are the site of thrombus formation.

In an analysis of the data presented, the one indication for a resection of the left auricular appendix is in a patient with rheumatic heart disease and mitral stenosis, with or without auricular fibrillation, who has had one or more recent peripheral arterial embolic occlusions.

The operation is not a standard one. Unfortunately, it is only by trial and error that a satisfactory

technic may be evolved. It is hoped that this report will serve as a stimulus to others who are interested in this field of surgery. Improvements in and refinements of surgical technic should be acquired as experience with the operation becomes general. The value of resection of the left auricular appendix as a prophylaxis for recurrent arterial emboli may be established only after a prolonged period of observation and a careful evaluation of the clinical results obtained.

SUMMARY AND CONCLUSIONS

The commonest mode of origin of a peripheral arterial embolus is the detachment in whole or in part of a mural thrombus located in one of the chambers of the heart. Mural thrombi occur most frequently in cases of coronary thrombosis with myocardial infarction and in rheumatic heart disease.

In approximately 90 per cent of the cases of myocardial infarction, the ventricles, particularly the left, are the site of thrombus formation. In over 90 per cent of the cases of rheumatic heart disease, the thrombi are located in the auricles, particularly in the auricular appendices.

Cardiac mural thrombosis varies in a direct ratio to the age of the patient, the presence of auricular fibrillation and/or congestive heart failure. Peripheral arterial emboli are associated most frequently with

rheumatic heart disease, occurring in approximately 45 per cent of the cases. In 15 to 20 per cent of the cases of rheumatic heart disease, a cerebral embolus is the immediate cause of death. The differentiation between an autochthonous thrombus and an arterial embolus may be impossible even at operation or necropsy.

Two cases are reported in which a resection of the left auricular appendix was done as a prophylaxis for recurrent arterial emboli. The first patient survived, and the second died.

Resection of the left auricular appendix is suggested as a prophylaxis for recurrent arterial emboli. The one indication for the operation is in a patient with rheumatic heart disease and mitral stenosis, with or without auricular fibrillation, who has had one or more recent peripheral arterial embolic occlusions.

SURGICAL TREATMENT OF THE "CARDIAC LUNG"

Ligation of the Inferior Vena Cava and/or Tricuspid Valvulotomy

PEDRO COSSIO, M.D.

and

ISIDRO PERIANES, M.D.
Buenos Aires, Argentina

Engorgement of the lung is the most important complication produced by left ventricular failure or mitral stenosis. Medical treatment is effective, but only during a period of months or years. Sooner or later life becomes intolerable for the patient, and the physician finds himself forced to resort to the use of morphine for the few days or months of life before fatal termination. The medical treatment of the "cardiac lung" is based on the reduction of the waterlogged blood in the lungs, either by improving the efficiency of the left ventricle by administration of digitalis or by reducing the output of the right ventricle by venesection, mercurial diuretics, low sodium diet and morphine (Fishberg¹).

Surgical treatment must likewise be directed toward the same objective, restoration of equilibrium between the two ventricles. Two types of operation were devised. One is intended to drain off blood from the pulmonary venous system toward some sector of the systemic circulation, by end to end anastomosis of a large pulmonary vein with the axillary artery, the splenic vein or the azygos vein. The second is directed to reduction of the right ventricular output either by tricuspid regurgitation following a tricuspid valvulotomy or by reduction of the return of venous blood to the right side of the heart by ligation of one of the main veins.

Anastomosis was performed in dogs between the distal portion of the upper left pulmonary vein and the distal segment of the left axillary artery, end to end with a high thoracotomy approach. The operation was well tolerated. The limb deprived of its normal circulation showed no discoloration or change in temperature, notwithstanding the absence of arterial pulsation. A month later the animal was able to walk and run about. However, the upper lobe of the left lung had become atelectatic, hydrothorax was present and an

incision in the left axillary artery failed to draw blood, signifying that the anastomosis had failed functionally, owing to the absence of pressure gradient, collateral circulation being responsible for the efficient blood supply to the limb.

Attempts at end to end anastomosis of the distal portion of the lower left pulmonary vein with the proximal portion of the splenic vein, via transpleuro-diaphragmatic approach, were performed after the removal of the spleen. Injection of sodium iodide or methylene blue enabled us to verify that the anastomosis was satisfactory. However, pressure was insufficient to secure hepatic parenchymal clearance. End to end anastomosis of the distal portion of the upper right pulmonary vein and the proximal portion of the azygos was also performed, but the gradient of the pressure was also inadequate.

Tricuspid insufficiency was produced in dogs by a valvulotomy. A specially designed hook was introduced into the right auricle, after thoracotomy, or into the right jugular vein. Equal results were attained with both approaches. The mortality rate, however, was high with the thoracotomy approach, and practically nil in the jugular vein approach. Therefore, all later investigations were carried out with the latter approach.

The instrument is a hollow metal rod, about 2 to 3 mm. in diameter and 30 cm. in length, with a shallow hook, or fish hook, at one end, with an opening roughly 2 mm. wide, and having a sharp concave edge. It is provided with a guide that enables the opening to be widened or narrowed during the operation (fig. 1).

A Hamilton manometer is attached to the opposite end when it is desired to make pressure readings, or a simple aneroid manometer is used to follow the variations in pressure of the pulsations, when only this is required. After the instrument is sterilized and filled with a sterile 3 per cent solution of sodium citrate, the outer surface is lubricated with sterile petrolatum. Aided by a slight rotatory movement and two traction threads, the hook is then inserted through a small incision in the jugular vein. The threads are so placed as to avoid a hemorrhage through the longitudinal incision. With the vein held taut over the instrument between the thumb and forefinger of the left hand, the lower thread is loosened, while the right hand advances the instrument toward the heart by gentle but firm pressure, with careful attention to the manometer, which will register very faint pulsations until the instrument reaches the auricle. To make sure that no air gets into the vein, this vessel may be adjusted over the instrument by a strip of rubber band. When the hook end of the instrument enters the auriculoventricular orifice, the pulsations registered by the manometer increase in amplitude and, as soon as it has passed through the orifice, there is a further sudden increase, while the systolic pressure rises in the dog, approximately 20 mm. of mercury or 26 cm. of water (fig. 2A). Once it has reached this position, the instrument must be gently advanced until resistance is encountered from the right ventricular wall; then, with the guiding sleeve drawn back, the instrument is turned outward and is drawn backward so as to engage the chordae of the external cusp. If they are successfully engaged, resistance will be experienced, associated with rhythmic tractions due to the heart's pulsation. At this point, the manometer may show a ventricular, auriculoventricular

1. Fishberg, A. M.: Heart Failure, Philadelphia, Lea & Febiger, 1940.

or even auricular type of pulsation with the corresponding pressures, revealing the position of the cusp involved.

Firm traction of the instrument will section whatever has been engaged by the hook. This will become evident by the freeing sensation felt by the hand that holds the instrument or by a sharp sound that may be heard on precordial auscultation or even at a distance. The same procedure is repeated two or three times until a systolic murmur is heard to the right of the sternum, often associated with fremitus caused by extensive valvulotomy. The hook is then covered by the protecting sleeve and the instrument carefully withdrawn.

Two mishaps may occur during the operation. Instead of the manometer pulsation increasing in amplitude as the instrument advances toward the auriculoventricular orifice, they disappear altogether. This is due to the hook's having been introduced into

Fig. 1.—The instruments used and the surgical approach in tricuspid valvulotomy.

the inferior vena cava. Careful withdrawal of the instrument will return it to the auricle, and manometer pulsations will reappear. A further attempt is then made to reach the ventricle by inclining the instrument toward the midline, when it will normally tend to advance toward the auriculoventricular orifice. The second complication, and a much more serious one, as it may cause death, is the appearance of extrasystoles, bundle branch block and even auriculoventricular block during the operation.

RESULTS

In our experiments intracardiac pressure readings demonstrated clearly the effect of the tricuspid incompetence on cardiac dynamics. When valvulotomy was satisfactory, systolic pressure in the right ventricle fell to approximately 50 per cent of the initial pressure, while it rose only 1 mm. of mercury in the right auricle and in the superior vena cava. These variations in the pulse did not exist before (fig. 2 *B* and *C*).

This sudden fall of systolic pressure in the right ventricle did not last, it rose some time later, but did not return to the original values, remaining about 20 per cent or 30 per cent lower.

We determined to attempt the operation in human beings after trials on cadavers under roentgenologic control.

Fig. 2.—*A*, behavior of the manometer, according to the position of the hook. *B*, Vena caval, right auricular and right ventricular pressures before tricuspid valvulotomy. *C*, Vena caval, right auricular and right ventricular pressures after tricuspid valvulotomy.

Our first patient was one with syphilitic aortic regurgitation and severe heart failure, no longer responding to absolute rest, low sodium diet, intravenous administration of strophanthine and mercurial diuretics.

The internal jugular vein was exposed with local anesthesia, and an incision was made in the tricuspid valve without difficulty. Heparin was administered immediately, to avoid formation of thrombi. That same night the patient was able to sleep comfortably with only one pillow—having previously been in permanent upright position. After six months his condition was

Fig. 3.—Teleroentgenograms before (*A*) and after (*B*) tricuspid valvulotomy, showing decrease of pulmonary congestion.

such that he experienced only slight dyspnea on fast walking. He presented no signs of pulmonary congestion (fig. 3).

We attempted the same approach in 4 other patients, 3 of these presenting permanent orthopnea and uncontrollable heart failure. The fourth, although relatively healthy, was suffering from recurrent attacks of pulmonary edema, despite intensive treatment. Valvulot-

omy failed in only 1 case, in which the attempt was abandoned because of sudden collapse while the instrument was in the heart. It was probably caused by protracted attempts to remove coaguli. Two hours later the patient completely recovered, but died a month later, during an attack of pulmonary edema.

In each of the other 3 patients the operation proved to be relatively simple, and venous pulse became positive and undulating in type (Cossio, Sotomayor and Marguery²). The patients were definitely improved, one of them surviving the operation by five months. Another, however, died two and a half months after the operation from a pulmonary infarct. Necropsy revealed that the incision in the external cusp had healed without thrombosis (fig. 4). The third patient died in collapse within eight hours of the operation, which was undertaken during an acute attack of pulmonary edema, brought on by tachycardia which developed the moment the jugular vein had been exposed. Notwithstanding, the operation was quickly completed. In this case ventricular pressure reached 70 cm. of water (54 mm. of mercury), while it never exceeded 35 cm. of water (27 mm. of mercury) in either of the others. Once the tricuspid valve had been extensively sectioned, the intraventricular pressure fell to 42 cm. of water (32 mm. of mercury) and dyspnea and tracheal stridor disappeared rapidly; however, tachycardia persisted and terminated in death.

Fig. 4.—A healed tricuspid valve (arrow) of a dog one year after valvulotomy. B, healed tricuspid valve (arrow) of a human being seventy-five days after valvulotomy.

LIGATION OF THE INFERIOR VENA CAVA

In our first experiments on ligation of the inferior vena cava, the ligature was applied immediately above the venae hepaticae, and all the animals died within one

to three days from infarctions in the bowels and in the liver. Ligation just below the renal veins gave satisfactory results. The blood pressure drop was evident both in the pulmonary artery and in the right ventricle, although somewhat different in each. It was sudden and pronounced when occlusion or pronounced narrowing was placed above the venae hepaticae and

Fig. 5.—Hypertensive heart disease, with enlargement of the heart and pulmonary congestion before ligation of the inferior vena cava.

gradual, representing only 35 per cent of the initial value, when the occlusion was placed below the renal veins. However, an abrupt return of pressure takes place once the vein is freed and blood flow is reestablished (fig. 6).

Fig. 6.—Right ventricular pressure before, during and after the inferior vena cava compression and decompression (arrows).

The first attempt in a human being met with failure, because of the patient's serious heart condition. In the following cases the operation was successfully performed with general anesthesia (ether-oxygen), morphine and scopolamine premedication and pentothal sodium® (sodium 5-ethyl-5-[1-methylbutyl] thiobarbiturate) induction.

The effect on the pulmonary circulation was evident as dyspnea decreased or disappeared altogether, to the extent that the patients were quite comfortable in the recumbent posture. Notwithstanding the fall in the venous pressure being less than had been antici-

2. Cossio, P.; Sotomayor Moreno, O., and Marguery, E.: Pulso venoso ventricular ondulante. *Medicina* 6:1. 1945.

pated, the quick and notable rise so constant when the patient's legs were raised before the operation was no longer present. Moreover, in hypertensive cardiopathy with high systolic values, the operation brought both systolic and diastolic pressures down to normal, and they remained so during a period of two months, the length of our observation.

COMMENT

Drainage of a large proportion of pulmonary venous blood into the systemic circuit represents a physiologic approach to surgical management of the "cardiac lung." Thereby the excessive blood discharged by the right ventricle reaches the general circulation directly from the lungs, and pulmonary stasis disappears. The stress on the left ventricle is reduced and allows for an increase in output once it has reached a point below the critical level.

Our investigations demonstrated that this procedure is not feasible because of the absence of pressure gradient, pulmonary vein pressure being lower than atmospheric pressure, while that of all vessels not contained within the thorax is higher. This, however, applies to normal circulatory conditions, such as those of our experimental investigations, but not so in the case of the "cardiac lung," where pressure within the

Fig. 7.—The same patient as in figure 6, with medically uncontrollable "cardiac lung." Roentgenogram taken after ligation of the inferior vena cava.

veins of the lungs is probably higher than the atmospheric pressure.

Another difficulty that precluded its being attempted in human beings, is the large thoracotomy wound and prolonged general anesthesia, intervention not being likely to be tolerated by patients in an advanced stage of cardiac disease.

On the other hand, both tricuspid valvulotomy and ligation of the inferior vena cava are relatively simple operations and are well tolerated. Animal experiments and tests made in human beings seem to bear evidence that both procedures attain the contemplated objectives: a reduction in the volume of right ventricle output, with subsequent decrease of the passive congestion of the lungs, and, consequently, improved left ventricle efficiency identical to the effect of venesection, but of more lasting results.

Ligation of the inferior vena cava is a much more serious operation than tricuspid valvulotomy, as it requires a general anesthetic and produces post-operative disorders; but it is more effective for the following reasons: the surgeon can see what he is doing; the operation is in itself a prophylactic measure against pulmonary embolism, which so often causes death, and it overcomes the 50 per cent increased output caused by supine posture (Bercovsky³).

Vast experience has been acquired in spontaneous tricuspid insufficiency. Half a century ago, Duroziez⁴ observed that lesions of the tricuspid valve, far from aggravating a mitral lesion, exerted a healthy effect thereon, and contrasted the cyanosis and edema with the patient's comfortable recumbent position over a period of years. Later Herrick,⁵ Barié,⁶ Crummer,⁷ Trevor Cook and White⁸ and Aceves and Carral⁹ expressed the same opinion. Furthermore, Smith and Levine¹⁰ demonstrated that survival time is doubled or even trebled once heart failure is established.

We believe that the surgical treatment of the medically uncontrollable "cardiac lung" should begin by ligation of the inferior vena cava and be followed by tricuspid valvulotomy, unless there are extensive vascular obstructions in the limbs that would render the first operation useless. The absence of a manifest increase in the venous pressure as a result of the lower limbs being raised may be considered as an indication for valvulotomy from the outset. In mitral stenosis it is probably most satisfactory to undertake valvulotomy from the beginning.

SUMMARY

Three operations were devised for the management of the "cardiac lung": anastomosis of a pulmonary vein with the subclavian artery, the splenic artery or its homonymous vein; tricuspid valvulotomy, and ligation of the inferior vena cava below the renal veins. These last procedures were attempted in patients suffering from

heart failure and permanent orthopnea and who were no longer responsive to medical treatment. An immediate and dramatic improvement has been the rule over a period of six months, which is our longest observation time. The technic for tricuspid valvulotomy is described in detail, and a preliminary attempt is made to postulate on the indications for the last two operations.

NOR-EPINEPHRINE (ARTERENOL,[®] SYMPATHIN N) AS A PRESSOR DRUG

MARCEL GOLDENBERG, M.D.
VIRGINIA APGAR, M.D.
RALPH DETERLING, M.D.
and
KERMIT L. PINES, M.D.
New York

Epinephrine and the corresponding primary amine 1-nor-epinephrine (nor-adrenaline, arterenol[®]) normally exist in the mammalian body. Nor-epinephrine was first shown to be present in significant amounts in postganglionic, adrenergic nerves of cattle by pharmacologic methods.¹ Recently its presence has been demonstrated in the adrenal medulla of cattle by paper chromatography² and in tumors of chromaffin tissue (pheochromocytomas) of human beings by pharmacologic and chemical methods.³ 1-Nor-epinephrine is believed to function as excitator sympathin in most of the investigated areas of the cardiovascular system with

Formula for nor-epinephrine.

the exception of cardiac muscle and the vessels of the skin. In these areas epinephrine appears to be the mediator of excitator functions.⁴ (Sympathin N [nor-epinephrine] and sympathin A [epinephrine], as suggested by von Euler, should be used rather than the term sympathin E, since at least two excitator sympathins seem to exist.⁵)

Recent investigations of the hemodynamics of epinephrine and nor-epinephrine in human beings, with the method of catheterization of the right side of the heart, have shown that epinephrine, within a physiologic and therapeutic range, acts as an over-all vasoconstrictor and causes hypertension only by increase of

cardiac output. Nor-epinephrine, on the other hand, functions as an over-all vasoconstrictor without change or only slight decrease of cardiac output. It may therefore be conceived as being the sympathetic mediator of over-all vasoconstriction in human beings.⁶ Its action is similar to that of the synthetic pressor amines phenylephrine hydrochloride—neo-synephrine[®] hydrochloride and paredrinol[®] (para-[2-methylaminopropyl]-phenol).

A schematic summary of the changes observed in certain cardiovascular functions during the continuous infusion of epinephrine (0.1 to 0.3 micrograms per kilogram of body weight per minute) and nor-epinephrine (0.1 to 0.4 micrograms per kilogram of body weight per minute) is given in table 1.

These observations may help to explain the clinical failure of epinephrine as a pressor drug in the past and suggest an investigation of the therapeutic potentialities of nor-epinephrine. The acute hypotension due to loss of vasomotor tone encountered during and after thoracolumbar sympathectomy in patients with hypertensive vascular disease was selected as the starting point for the study.

METHOD AND MATERIALS

In devising a technic of administration of nor-epinephrine, an attempt was made to simulate physiologic mechanisms and to overcome the failure of reflex vasomotor regulation by varying the speed of a continuous intravenous infusion of nor-epinephrine. Since the effect of nor-epinephrine on arterial pressure appears within a few seconds and subsides within three minutes after the infusion is stopped, a continuous intravenous infusion, and not single injections, was used to maintain a steady level of arterial pressure.

The solution employed in these studies was prepared by the addition of 4 cc. of a 1:1,000 1-nor-epinephrine hydrochloride⁷ solution to 1 liter of isotonic sodium chloride solution; hence each cubic centimeter contained 4 micrograms of 1-nor-epinephrine hydrochloride. This solution was given intravenously

TABLE 1.—Changes of Certain Cardiovascular Functions During the Infusion of Epinephrine and Nor-Epinephrine *⁶

Substance	Cardiac Output	Systemic Blood Pressure			Total Peripheral Resistance	Pulse Rate	Mean Pulmonary Pressure
		Systolic	Diastolic	Mean			
Epinephrine	+++	+++	⊕	+	—	+	++
Nor-Epinephrine	÷	+++	++	++	+++	—	++

* ⊕ Is no change or slight increase; ÷ Is no change or slight decrease.

The 1-nor-epinephrine was supplied by Dr. M. L. Tainter of the Sterling Winthrop Research Institute. From the Departments of Medicine, Anesthesia and Surgery, College of Physicians and Surgeons, Columbia University and the Presbyterian Hospital, New York.

1-Nor-epinephrine hydrochloride was used in these studies. The drug is now supplied as the bitartrate in vials containing 1.0 mg. of the base per cubic centimeter. Since the ratio of the molecular weights of the base to the hydrochloride is 0.83, the nor-epinephrine values given in the text multiplied by this ratio give equivalent values for the base.

through a previously calibrated Murphy drip bulb, thus permitting an accurate estimation of the dosage from the rate of flow in drops per minute. After observation of the response to an initial dose of 0.1 microgram per kilogram of body weight per minute, the rate of flow was adjusted to produce and maintain the desired level of blood pressure.

If, at the conclusion of the operation, a decrease in the rate of flow was followed by an excessive fall of blood pressure, the infusion was continued into the postoperative period. Otherwise, it was discontinued before the patient left the operating room. After second stage operations, it was occasionally necessary to con-

tinued the infusion at decreasing rates up to seventy-two hours postoperatively.

Nor-epinephrine was given, by the method described, during the course of 23 thoracolumbar sympathectomies, of which 11 were first and 12 were second stage operations. In all but 1 of the cases, the blood pressure level was maintained satisfactorily during the period of administration of the drug. Table 2 summarizes the data in 5 typical cases.

A variety of anesthetic agents was used, including thiopental sodium (pentothal® sodium), ether and nitrous oxide. As is shown in table 2, anesthesia alone

grams per kilogram of body weight per minute was required to maintain the blood pressure at a proper level.

RESULTS AND COMMENT

There was 1 operative death which occurred during a second stage sympathectomy in a hypertensive patient who had received thiopental sodium, nitrous oxide and curare. Irreversible cardiac arrest occurred after two and a half hours of anesthesia and two hours of nor-epinephrine infusion. Intra-arterial transfusion of whole blood, intracardiac administration of epinephrine and cardiac massage were ineffective. It is noteworthy

* After nor-epinephrine infusion was stopped.

lowered the blood pressure to normal and subnormal levels in most cases. Severance of the sympathetic chains and splanchnic trunks often was followed by a further drop in pressure of major degree. The depressor effect of anesthesia was noted particularly with thiopental sodium-nitrous oxide, but was also found with various combinations of ether and oxygen and ether-nitrous oxide mixtures. It seems to constitute a typical pattern of response to anesthesia in the hypertensive patient.

In most cases administration of the pressor agent was begun after the blood pressure had fallen to hypotensive levels, despite transfusion of whole blood. The data obtained indicate that increasing amounts of nor-epinephrine were often required as anesthesia and operation progressed, but not more than 0.36 micro-

grams per kilogram of body weight per minute was required to maintain the blood pressure at a proper level.

In view of the satisfactory maintenance of arterial pressure by nor-epinephrine in the acute hypotension associated with thoracolumbar sympathectomy, an effort was made to determine whether a pressor response could be obtained in acute hemorrhage, and in vasomotor collapse accompanying central depression. Comparable studies have been undertaken elsewhere.^{7a} Nor-epinephrine, in doses slightly higher than those required in thoracolumbar sympathectomy, was given by infusion to 2 patients in whom the blood pressure

7a. Page, I. H.: Personal communication to the author.

had fallen to shock levels during the course of acute hemorrhage into the gastrointestinal tract and into the peritoneum, respectively. In both cases, repeated transfusions of whole blood intravenously had failed to produce significant elevations of the arterial tension, which, however, rose to normal values during administration of nor-epinephrine given for one to four hours.

Three cases were selected as examples of central vasomotor depression. In the first respiratory failure and hypotension appeared suddenly following a longer operation; the patient was placed in a Drinker respirator for five days, during which time the blood pressure had to be maintained almost constantly by nor-epinephrine infusion. The second patient had unexplained coma and hypotension during the course of progressive hypertensive vascular disease; the blood pressure was readily maintained at desired levels by nor-epinephrine infusion during a three day period. Hypotension in the third case appeared in association with coma following an overdose of barbiturates. In addition to the usual measures, nor-epinephrine was given with a prompt and adequate pressor response.

Evaluation of nor-epinephrine as contrasted with other pressor agents will be the subject of a subsequent publication. It should be pointed out, however, that this substance—as sympathin N—plays an integral part in normal vascular function and possesses the necessary rapidity of action and inactivation to make it suitable for therapeutic use in acute hypotension. Its flexibility of control permits the closest approximation to the physiologic regulation of vasomotor tone.

The effect of nor-epinephrine on the coronary circulation is of vital concern. A recent study⁸ in dogs (blood flow in the cannulated left descending coronary artery measured by rotameter) showed consistent increases of coronary blood flow on intravenous injection of nor-epinephrine (2.5 to 30.0 micrograms per kilogram of body weight). The most striking increments—up to 20 times control value—occurred in animals with initial blood pressure at shock level. Improvement in the coronary circulation may therefore be anticipated in cases of hypotension treated with this compound.

The vasodilator component in shock is generally not recognized, partly because of the observed vasoconstriction of kidney and skin arterioles. In our opinion, this regional vasoconstriction does not exclude over-all vasodilatation, as evidenced by the hemodynamic pattern of epinephrine action in human beings.⁶ Furthermore, increases in the calculated total peripheral resistance which have been found in shock, at low mean pressure values, cannot be regarded as evidence of vasoconstriction. At mean pressures of less than 80 mm. of mercury the total peripheral resistance may vary inversely with pressure without change in diameter of the vessels.⁹

It is therefore of interest that a pressor response could be obtained in patients with acute hemorrhagic shock that was not reversed by blood transfusion alone. This suggests that decreased peripheral vascular tone may be an important factor in shock syndrome and that certain vasoconstrictor agents in conjunction with replacement of blood volume may be of value in its treatment.

The studies reported indicate that nor-epinephrine (sympathin N) is an effective agent in treatment in certain cases of acute hypotension. Its use in operative, hemorrhagic and traumatic shock, and in hypertensive patients undergoing thoracolumbar sympathectomy, is being continued and will be reported later in more detail.

Clinical Notes, Suggestions and New Instruments

WESTERN EQUINE ENCEPHALOMYELITIS IN CHICAGO

Report of a Patient Successfully Treated with Gamma Globulin

WILLIAM SAPHIR, M.D.

and

ALBERT MILZER, Ph.D.
Chicago

Shortly after the virus of Western equine encephalomyelitis was isolated from the central nervous system of affected horses in California by Meyer, Haring and Howitt,¹ infections were noted in persons who worked in close association with infected animals.² Howitt³ first recovered the virus from a human being in 1938. Since then outbreaks of the disease have occurred in several Western and Central states. The largest epidemic occurred in Manitoba, Minnesota and North Dakota in 1941⁴; over 3,000 cases were reported with a mortality rate of 8 to 15 per cent. At present an endemic focus of this disease is known to exist along the Pacific coast. Annual outbreaks occur in the Yakima valley (Washington)⁵ and in Kern and Fresno counties of California.⁶

Present epidemiologic and experimental evidence point to the spread of equine encephalomyelitis by an arthropod vector rather than by contact. *Culex tarsalis* mosquitoes⁷ and the cone nose bug (*Triatoma sanguisuga*)⁸ have been found infected in nature. Experimentally, several species of mosquitoes,⁹ the wood tick¹⁰ and the cone nose bug⁸ can be infected and transmit the virus to laboratory animals. In addition to infected horses, chickens and other birds are believed to be the natural reservoir of the virus.⁴

Practically all proved cases of Western equine encephalomyelitis to our knowledge have been encountered in rural or semirural districts. A unique exception to this epidemiologic rule was reported by Richter¹¹ involving an isolated case of

Western equine encephalomyelitis in the Chicago metropolitan area.

This report deals with another isolated case of Western equine encephalomyelitis in urban Chicago. Diagnosis was established by the demonstration of a significant rise in both complement-fixing and neutralizing antibody titers for the Western virus during convalescence. The patient was apparently treated successfully with gamma globulin, and evidence is presented concerning the presence of Western equine encephalomyelitis neutralizing antibodies in the gamma globulin used for therapy.

REPORT OF A CASE

Mrs. A. B., aged 38, was admitted to Michael Reese Hospital on May 19, 1948, with a history of general malaise, headaches, chills and fever for the previous ten days. Physical examination revealed a well developed, acutely ill patient with flushed face and mild cyanosis. There was considerable restlessness and agitation. The temperature was 102 F., respiratory rate 20 per minute and the pulse rate 112. The blood pressure was 100 mm. of mercury systolic and 60 mm. diastolic. There was slight nuchal rigidity and a bilateral positive Kernig sign. The tendon reflexes were moderately increased. The results of the remainder of the physical examination were normal. The blood cell count revealed an erythrocyte count of 4,200,000 per cubic millimeter, hemoglobin of 83 per cent and a white cell count of 9,800, of which 71 per cent were neutrophils, 9 per cent nonsegmented neutrophils, 4 per cent monocytes and 16 per cent lymphocytes. The urine was normal except for a faint trace of albumin.

During the next few days the patient's condition grew worse. The temperature was of a spiking nature, rising to 104 or 106 F. and falling to 99 F. within a twenty-four hour period and accompanied with chills and drenching sweats. Repeated malaria smears taken at different hours of the day were negative. A trial dose of quinine given for three days was ineffective. Roentgenograms of the chest were normal. Repeated blood cultures showed no growth. Results of agglutination tests for brucellosis, tularemia, typhoid and paratyphoid A and B were consistently negative, as were the Weil-Felix reaction and heterophil agglutination reaction for infectious mononucleosis. The Kahn and Wassermann reactions of the blood were negative.

A spinal tap was performed on May 20. The spinal fluid was under normal pressure. Examination of the spinal fluid disclosed a cell count of 6 erythrocytes and 1 leukocyte, a negative Pandy reaction, a glucose content of 63 mg. per hundred cubic centimeters and a chloride content of 691 mg. per hundred cubic centimeters.

Penicillin therapy, 75,000 units intramuscularly every three hours, was started. Chills and fever continued. The patient complained of severe headaches and thirst. Five per cent dextrose in isotonic sodium chloride solution was given intravenously without significant change in the clinical picture. There was transient mental confusion and disorientation, and the patient appeared more toxic and cyanotic. Symptoms of peripheral circulatory failure became manifest. The condition seemed rapidly to approach a critical state. At this point, on May 21, the patient's serum showed a positive reaction to the complement fixation test for Western equine encephalomyelitis virus antigen in a titer of 1:5. This is discussed later.

Gamma globulin therapy, in doses of 10 cc. intramuscularly, was started on May 24 and was continued daily for seven days. Gradual and distinct improvement took place. The temperature remained at 103 F. for two succeeding days and then fluctuated between 102 and 100 F. for the remainder of the week. Headaches, signs of meningeal irritation and peripheral circulatory failure subsided. Subsequent complement fixation tests on June 1 and September 20 showed significant rises in titer.

The patient was discharged on June 10 feeling very weak but afebrile and asymptomatic. Subsequent examination four weeks later revealed complete recovery and restoration of health.

VIRUS STUDIES

No attempt was made to isolate virus or other causative agents by animal or chick embryo inoculation because the patient was not seen until the tenth day after onset of illness.

Specimens of serum obtained from the patient during the acute stage, in convalescence and after complete recovery, were tested for the presence of both complement-fixing¹² and neutralizing antibodies for various neurotropic viruses. Serum collected on the twelfth day after onset of illness (May 21) had a complement-fixing antibody titer of 1:5 (serum dilution) for Western equine encephalomyelitis antigen. Results of complement fixation tests for Eastern equine encephalomyelitis, St. Louis encephalitis, lymphocytic choriomeningitis, mumps, Japanese B encephalitis and Q fever were negative. Serum obtained during early convalescence (June 1) showed a complement-fixing titer of 1:20 for Western equine encephalomyelitis but remained negative for the other virus and Q fever diagnostic antigens. Two and a half months after complete recovery (September 20) the complement-fixing titer was still 1:20 for the Western virus and negative for the rest.

Neutralization tests for Western and Eastern equine encephalomyelitis, St. Louis encephalitis and lymphocytic choriomeningitis viruses were performed in the manner described in a previous publication.¹³ Undiluted serum obtained during the acute stage (twelfth day after onset) failed to neutralize approximately 10 or 100 LD₅₀ units of the Eastern equine, St. Louis or choriomeningitis viruses. However, approximately 10 LD₅₀ units of Western equine virus were neutralized at that time. Serum collected during convalescence (June 1) neutralized approximately 10,000 LD₅₀ units of Western equine virus, but failed to neutralize the Eastern equine, St. Louis and choriomeningitis viruses. Two and a half months after complete recovery the patient's serum neutralized approximately 100,000 LD₅₀ units of the Western equine virus but still failed to neutralize the other three viruses.

A sample of the gamma globulin administered to the patient was tested in the same manner for the presence of Western equine neutralizing antibodies and was found to neutralize approximately 10,000 LD₅₀ units of virus when diluted 1:10 with isotonic sodium chloride solution.

COMMENT

The diagnosis of Western equine encephalomyelitis cannot be made by the clinical observations or results of a spinal fluid examination. The clinical picture in our patient was that of an overwhelming infection, chills and fever, meningeal irritation, transient mental confusion and peripheral circulatory failure. The spinal fluid was essentially normal. The observation of normal spinal fluid in the presence of signs and symptoms of central nervous system involvement, however, does not necessarily rule out a neurotropic virus infection. One of us (A. M.) has reported several proved cases of lymphocytic choriomeningitis¹⁴ with normal spinal fluid. There have been similar reports for poliomyelitis.¹⁵ Usually a specific diagnosis of Western equine encephalomyelitis and other virus encephalitis is readily made by demonstration of a significant rise in specific neutralizing or complement-fixing antibodies in serum obtained during the acute stage and later in convalescence or after recovery. This was done in our patient. Two and a half months after complete recovery, the patient's serum

12. Commercial virus and rickettsial complement-fixing diagnostic antigens obtained from The Markham and Lederle laboratories were employed. The patient's serum was inactivated by heating at 60 C. for 20 minutes prior to testing, and a modified Kolmer complement fixation test as recommended by the respective manufacturer was done.

neutralized approximately 100,000 LD₅₀ units of Western virus and showed a complement fixation titer of 1:20. Antibodies obtained from the gamma globulin therapy would have largely disappeared by this time.

No attempt was made to isolate the virus from this patient because she was not seen until the tenth day after onset of illness. Except for lymphocytic choriomeningitis, most of the encephalitis viruses are found in the blood stream for a very short time and only during the incubation period. Furthermore, the Western equine virus has been isolated from the blood and spinal fluid rarely.⁴

The work of Zichis and Shaughnessy¹⁶ on the successful treatment of experimental equine encephalomyelitis with hyperimmune rabbit serum prompted us to attempt serum therapy in our patient. Since no such serum was available for human use, and one of us (A. M.) had reported a case of recurrent lymphocytic choriomeningitis that was apparently successfully treated with pooled normal adult serum,^{14c} we administered gamma globulin on an empiric basis, with the hope that specific neutralizing antibodies might be present. Moreover, to our knowledge there have been no reports on the development of serum hepatitis from the use of gamma globulin. The clinical improvement following its use in large dosages in our case appeared pronounced and distinct. Subsequent studies confirmed the presence of a high titer of Western equine encephalomyelitis neutralizing antibodies in the lot of gamma globulin given. The presence of antibodies for a wide variety of viruses and pathogenic bacteria in gamma globulin has been reported by Enders.¹⁷ Obviously, different batches will vary in viricidal properties, depending on the source of the original blood. For this reason perhaps the gamma globulin fraction of hyperimmune rabbit serum as prepared by Zichis and Shaughnessy^{16a} would be more suitable for human use.

After completing the treatment of our patient, we learned of the paper by Gold and Hampil,¹⁸ in which a technician infected in the laboratory with equine encephalomyelitis (Western type) showed progressive improvement following the administration of large doses of horse antiserum (1,595 cc.) over a period of five days. On the other hand, inconclusive results were obtained in the Saskatchewan epidemic in 1941 with relatively small quantities of specific horse serum given to each patient.¹⁹ We feel that possibly better results might have been obtained in the Saskatchewan outbreak with larger dosages and more potent antiserum.

The manner in which our patient became infected is unknown. She resided in Chicago most of her life and had not left the city for several years. There was no history of contact with sick animals. The species of mosquitoes (*Culex tarsalis*) shown to be the vector of the Western type virus in California is known to occur in the suburbs of Chicago.²⁰ A few attempts to isolate virus from this species and *Culex pipiens* collected in the Chicago area in the past have been unsuccessful.²¹

SUMMARY AND CONCLUSIONS

An isolated case of Western equine encephalomyelitis in urban Chicago is reported. The diagnosis was made by demonstration of significant rise in titer of both complement-fixing and neutralizing antibodies for the virus of Western equine encephalomyelitis. Complete recovery followed the use of gamma globulin containing specific neutralizing antibodies in high titer.

SEVERE ERYTHEMA MULTIFORME WITH INTESTINAL INVOLVEMENT

G. MARSHALL CRAWFORD, M.D.
Brookline, Mass.

and

RALPH H. LUIKART II, M.D.
Los Angeles

Under various names (severe erythema multiforme, Stevens-Johnson's disease, erythema multiforme exudativum and ectodermosis erosiva pluriorificialis), the literature indicates infrequent involvement of the alimentary canal in the toxic eruption commonly known as erythema multiforme. In 1874 Hebra¹ reported a patient with "erythema gyratum" in whom the autopsy revealed ". . . in the small bowels similar red circles as on the skin." In 1895, 1900 and 1904, Osler² published groups of cases, totaling 29, the disease in which he first described as erythema multiforme. In several of these cases there were signs and symptoms referable to the alimentary canal. However, in 1914 Osler³ revised his view in an article referring to most of these cases as examples of Henoch's and Schönlein's purpura. Lever⁴ and Costello⁵ each published reviews and case studies in more recent years. Of Lever's 2 patients, neither had signs or symptoms of lesions in the gastrointestinal tract other than at the orifices. Of Costello's 33 patients, 2 had hematemesis and 2 had tarry stools. At autopsy 1 of Costello's patients revealed ". . . congestion more evident in the duodenum."

The patient reported here had an ulcerating process involving the proximal three fourths of the large bowel.

REPORT OF A CASE

J. M., a 26 year old white woman, had transient conjunctivitis accompanied with a lesion in her mouth in June 1947. A seven day episode of conjunctivitis, an oral lesion, diarrhea and an evanescent maculopapular eruption took place in March 1948. Three months later, on June 19, 1948, diarrhea without abdominal symptoms reappeared and persisted. Four days later a sore throat and lesions of the mouth were present, followed in three more days by an eruption on the trunk and vulva. The patient received a vitamin B mixture, penicillin troches, and penicillin intramuscularly intermittently from June 24 to July 3. She had been febrile and passed four or five loose brown stools a day for several days prior to hospitalization on July 3.

Physical Examination.—Examination revealed a moderately dehydrated uncomfortable woman with a temperature of 100 F. About forty discrete lesions were dispersed on the chest and back. These were flaccid vesicles and pustules, but most of them had been ruptured and were surrounded by a narrow rim of erythema. On the soft palate, tonsillar pillars, buccal mucosa and labia minora were several shallow erosions. Some were covered with a white membrane which was easily wiped off, leaving a bright red base. There was moderate conjunctivitis. Results of physical examination of the patient's lungs were normal, and no other abnormalities were noted in the balance of the examination.

Laboratory Procedures.—Results of frequent examinations of the urine were normal except for many leukocytes in the sediment. On her admission, the patient's blood was found to contain 14.3 Gm. of hemoglobin, 4,820,000 erythrocytes and

5. Costello, M. J.: Erythema Multiforme Exudativum, *J. Invest. Dermat.* **8**: 127, 1947.

6,800 leukocytes per cubic millimeter. A differential smear revealed 60 per cent polymorphonuclear leukocytes, 36 per cent lymphocytes, 4 per cent monocytes and no eosinophils. A blood cell count subsequent to hydration of the patient demonstrated a drop of the erythrocyte count to 4,350,000 and hemoglobin to 11.1 Gm. Results of numerous later examinations of the blood did not vary significantly. A culture of material taken from the pharynx on admission grew *Escherichia coli*, alpha hemolytic streptococci and coagulase-positive hemolytic *Staphylococcus aureus*. Pathogenic intestinal bacteria could not be found in cultures of the stool taken on the second and third days of hospitalization. Result of guaiac tests for blood in the stool were 4 plus on admission, but there was a negative reaction by the eighteenth hospital day. An electrocardiogram was normal on the seventeenth day after admission.

Therapy and Course.—Isotonic sodium chloride solution, dextrose and water were administered intravenously during the first three hospital days. Penicillin was injected in a dose of 100,000 units intramuscularly every six hours. One gram of bismuth subcarbonate was given orally after each stool. The lesions of the mouth, vulva and skin were painted daily with 2 per cent aqueous methylrosaniline chloride. From admission to the eleventh day of hospitalization the oral temperature varied between 104 F. and 99 F. On the third hospital day 30 cc. of crude liver extract and 5 cc. daily of vitamin B complex were added to the oral medication. Beginning the next day 4 cc. of camphorated opium tincture and 15 cc. of a suspension of kaolin and pectin were each given twice daily by mouth.

On the patient's fourth hospital day a roentgenogram of the chest revealed no significant abnormalities. On the ninth day results of roentgenologic and fluoroscopic examination with a barium sulfate enema were reported as follows: The entire bowel proximal to the midsigmoid was involved by a process which had produced swelling of the folds giving the appearance of islands of swollen mucosa with ulcerations both pyramidal and collar-button-like in outline. These appeared to stop abruptly at the ileocecal valve. Proctoscopy on the same day permitted observation of a few isolated ulcerations of 0.5 to 1.0 cm. in diameter in the rectal mucosa. At this time 1 Gm. of sulfadiazine was ordered every four hours with equal amounts of sodium bicarbonate and 0.26 Gm. three times daily of ferrous sulfate. The stools continued to be loose, brown and watery and numbered six to eight per day until the tenth hospital day. Thereafter the evacuations decreased and became normal by the nineteenth day. The sulfadiazine blood level on the eleventh day of hospitalization was 7.2 mg. per hundred cubic centimeters of blood; it was 7.8 on the sixteenth day. Striking clinical improvement was noted on the twelfth day, and the penicillin, liver, kaolin and pectin were omitted at that time. By the following day the anorexia had vanished and the patient appeared alert. The oral temperature dropped abruptly to normal on the nineteenth day, and sulfadiazine therapy was discontinued.

Further roentgen studies with barium sulfate enemas on the twenty-fourth hospital day showed improvement, but there were polyp-like small filling defects throughout the major length of the colon. Proctoscopic examination on the following day revealed a normal-appearing mucosa with a few localized areas of erythema, but no ulceration was seen. The patient was discharged after twenty-six days in the hospital and remained well to our knowledge for six months.

COMMENT

Erythema multiforme in its severest form often affects the alimentary tract at its orifices, but it is uncommon for the balance of the canal to be attacked. In the patient herein reported the colon appeared to be involved in the disease process.

Bifocal Glasses.—A notable American contribution to ophthalmology, although not by an ophthalmologist, was the invention of bifocal glasses in 1784 by Benjamin Franklin.—F. H. Verhoeff, *American Ophthalmology During the Past Century*, *Archives of Ophthalmology*, April 1948.

Council on Pharmacy and Chemistry

REPORT OF THE COUNCIL

The Council has authorized publication of the following report.

AUSTIN SMITH, M.D., *Secretary.*

PIT-THYROCAS (FORMERLY ANTI-OBESE) AND GLAN-OBESE (GERRITT COMPANY)

The Gerritt Company of Los Angeles, California, circularizes physicians with a form letter containing excerpts from "unsolicited" testimonials of other physicians to promote the sale of a tableted "shotgun" mixture of drugs for obesity under the name Pit-Thyrocas. This advertising makes it plain that the name of the product was formerly Anti-Obese and that the firm claims it to be "An Ethical Product, Sold Only in an Ethical Way." The firm proposes to send to the recipient as a special 30-day offer, five prescription labeled boxes of 100 tablets each at a net cost of \$3, for which the selling price of \$17.50 (\$3.50 per box) is quoted—leaving a profit of \$14.50! This remarkable offer to physicians also includes a free "diet schedule" sheet, in each box if desired, cleverly designed to oversimplify the management of patients who desire to reduce weight. The product is backed by the familiar guarantee, "Your Money Back If, After Trial, You Are Not Satisfied."

The firm's advertising leaves little to the judgment or, indeed, intelligence of the physician. It includes the following formula for Pit-Thyrocas: "Thyroid Des. $\frac{5}{8}$ gr.; Pituitary Whole Des., $\frac{1}{40}$ gr.; Powd. Ext. Phytolacca Berries, $\frac{1}{4}$ gr.; Phenolphthalein, $\frac{1}{4}$ gr.; Precip. Cal. Carbonate, 3 gr.; Extract Cascara Sagrada, $\frac{1}{4}$ gr." This is identical with the formula previously promoted under the name Anti-Obese and is subject to the same alteration: "Occasionally these tablets are too laxative, so we make them with and without Phenolphthalein—same price, color and size." This makes the formula identical with "Thyrop" of the Cole Chemical Company, which has been the subject of adverse comments in a previous Council Report.¹

Although also sold to pharmacies for filling prescriptions, an appeal to dispensing physicians is made as follows: "This is one tablet which many physicians prefer to dispense in order to observe the effect on the heart."—and then, there is a profit motive: \$2.90 per hundred at the special rate; \$1.75 to \$2.45 per hundred at regular list prices, "or any other price you may choose to charge!" The form letter further has this to say concerning the mixture:

"Pit-Thyrocas Tablets reduced weight because of the well-known action of Thyroid and Pituitary in hyperthyroidism. Poke Root lessens the desire for food. Calcium Carbonate partially alkalizes the HCl in the stomach. Phenolphthalein and Cascara Ext. make it the perfect eliminant for treating adiposity."

The foregoing quoted explanation of the mixture is an attempt to lend a "scientific" aspect to the product. Well trained physicians should not be "taken in" by this verdant verbiage! For the sake of the less wary, it may be stated that neither thyroid (which is active orally) nor whole pituitary (which is inert by mouth) is presently considered useful in the treatment of obesity except when this is secondary to hypothyroidism, in which cases thyroid alone would be sufficient and oral pituitary wholly ineffective. In fact, thyroid should be considered potentially harmful and dangerous in persons with a normal basal metabolism. Phytolacca-Poke (puke) berries or root, formerly employed as an antirheumatic of dubious value, should be relegated to folklore medicine, where it belongs. There are superior agents now available for depression of the appetite when this action is helpful in eliminating the habitual excessive intake of food that characterizes most cases of obesity. Just why it should be desirable to buffer the hydrochloric acid of the stomach in such cases, unless there is a definite hyperchlorhydria, is not explained by the firm. Possibly the idea is to interfere with protein digestion in the stomach and so enable the patient to eat more, but absorb less. In any case, 3 grains of calcium carbonate would do very little buffering. If it is

1. Drugs for Obesity. Report of the Council on Pharmacy and Chemistry, J. A. M. A. 134: 527-529 (June 7) 1947.

intended to reduce appetite, its effectiveness for this purpose is nil. Hurrying the passage of partially digested food through the intestinal tract by means of cathartics at most interferes a little with caloric intake at the level of the intestine instead of at the table. The increased elimination of water by the use of cathartics, if it is sufficiently severe, produces some temporary reduction of weight, but not of "fat." The formula thus represents an irrational approach to the treatment of obesity in which the importance of correction of habits of overeating is mostly ignored. The "diet schedule" offered also is unscientific in that it is based on a qualitative rather than a quantitative restriction of caloric intake.

The form letter does not stop with Pit-Thyrocas. The closing paragraphs promote what is described as a newer product designated "Glan-Obese Pluraglandular Solution." Concerning this mixture, it is stated "that an additional glandular product was necessary to satisfactorily treat such cases of obesity where Pit-Thyrocas Tablets alone would not produce the desired effect." This admission may come as somewhat of a shock to the gullible reader of the testimonials for the tablets! An accompanying leaflet titled, "Glan-Obese No. 1," states:

"Each 2 cc. of this formula contains the aqueous extractives of the highest quality Glandular substances as follows:

Ovarian Substance	40 gr.
Anterior Pituitary Substance	30 gr.
Suprarenal Cortex Substance	30 gr.
Thyroid Substance	3 gr.
Posterior Pituitary	3 I.U.
Chlorobutanol	0.5%

Net wholesale prices are also quoted for 30 and 60 cc. vials of this mixture. It is blatantly recommended by the firm for the parenteral treatment of obesity (to be administered alternately or in conjunction with the oral Pit-Thyrocas) and for "Multiple Glandular Deficiency Troubles in the Male and Female." The form letter concludes with the additional information that physicians "are using Glan-Obese solution for treating such painful uterine conditions as Amenorrhea and Dismenorrhea." Yet with the utmost candor, it is stated in the Glan-Obese No. 1 leaflet that "Hormone activity in this solution has not been investigated." This statement stands in curious contradiction to other statements in the leaflet that, "Most authorities agree that lack of gland functions is the direct cause of obesity in most cases" and that "Glan-Obese is a 100% gland stimulant." The claim that lack of gland function is the primary cause of most cases of obesity is absolutely false and not supported by any scientific authority.

The advertising for Glan-Obese goes on with the maze of contradictions in the statement, "It has become a well established fact that parenteral injections of glandular extracts are far more potent in reducing weight, than the same products are when taken orally." This of course means nothing when applied to the gland "substances" in the mixture which are not potent hormones. The physician might well ask why the firm offers the oral preparation Pit-Thyrocas Tablets if the last quoted statement has any significance. He may well ask why Glan-Obese solution, also glibly recommended for the treatment of multiple glandular deficiency, is of any value for this purpose or in obesity due to "lack of gland functions," when the product is said not to have been tested for hormone activity! Most physicians will realize that thyroid is active by mouth and is almost never injected even in the form of thyroxine for the treatment of severe hypothyroidism. It will also be realized that when one wishes to inject hormones, potent extracts or synthetic compounds, assayed for hormone activity, must be employed to obtain therapeutic results. A "shotgun" mixture of untested "substances" has no value given either by mouth or by injection.

It seems obvious that the Gerritt Company promotes the sale of Pit-Thyrocas and Glan-Obese for obesity wholly on a commercial appeal to profit. This is not new in the annals of questionable advertising for worthless remedies. In this particular instance it seems incredible that the manufacturer could induce well trained and thoughtful physicians to prescribe these products, but the protests which have been received at the Council office make it advisable to issue this statement so as to dispel any doubt concerning the character of these two "remedies" for obesity.

Council on Physical Medicine and Rehabilitation

REPORTS OF THE COUNCIL

The Council on Physical Medicine and Rehabilitation has authorized publication of the following report.

HOWARD A. CARTER, Secretary.

VACOLITE MODEL J HEARING AID ACCEPTABLE

Manufacturer: Vacolite Company, 3003 N. Henderson, Dallas 6.

The Vacolite Model J Hearing Aid contains microphone, amplifier and batteries in a single metal case 106 by 62 by 19 mm. (4 1/8 by 2 1/2 by 3/4 inch). The measurements are made exclusive of a small knob in the center of the microphone opening and the two control wheels at the upper corners. They are available with both crystal and magnetic types of receiver. The weights of the instruments are:

Vacolite Crystal J with batteries and receiver, 162.5 Gm. (5 3/4 ounces); without batteries, 99 Gm. (3 1/2 ounces).

Vacolite Magnetic J with batteries and receiver, 169.5 Gm. (6 ounces); without batteries, 106.5 Gm. (3 3/4 ounces).

The manufacturer provided electroacoustic characteristics and other pertinent information concerning the instrument. The manufacturer's data were confirmed.

Battery Drain:

	Voltage	Current
A battery.....	1.25 volts	38.0 ma.
B battery.....	22.0 volts	0.55 ma.

Two subjects, both veteran users of hearing aids, participated in performance tests of these instruments. Subject A, aged 37, suffers from a mixed deafness with considerable high tone hearing loss. His loss for speech is 42 decibels. Subject B, aged 39, has a pure conductive deafness with a nearly flat audiogram. Her loss for speech is 44 decibels.

Acoustic Gain.—Acoustic gain was measured by Auditory Test no. 9 (spondee words, recorded version) as follows:

Subject	Loss for Speech	Vacolite Model J					
		Settings	Crystal		Magnetic		
			Aided Gain	Threshold	Aided Gain	Threshold	Gain
A	42 decibels	1 full	2	40 decibels	6	36 decibels	
B	44 decibels	2 full	9	35 decibels	4	40 decibels	
			Average		37.5 decibels		28 decibels

Discrimination.—Discrimination tests with the same 2 subjects were conducted with two phonetically balanced lists of fifty monosyllables each (recorded version) delivered at 60 decibel or 65 decibel input to the microphone. The scores for Vacolite Crystal and Vacolite Magnetic are as follows:

Sub-ject	Amplifi-cation (No Aid)	Reference Instrument	Vacolite Crystal	Differ-ence	Vacolite Magnetic	Differ-ence
A	92	86 (43)	70 (36)	-16	90 (32)	+4
B	94	83 (37)	79 (34)	-4	86 (34)	+3
			Average		-10	
					+3.5	

The numbers in parentheses after each articulation score show the number of decibels above the subject's no. 9 threshold at which the test words reached him. Both subjects used full

Vacolite Model J Hearing Aid

volume to attain a comfortable listening level. Subject B preferred the "tone" of the magnetic to that of the crystal, and both made significantly better scores with the magnetic. Even the lower score is acceptable, however.

The acoustic gains are well above the minimum required and the articulation scores for the magnetic receiver are better than those obtained with the reference instrument.

The Council on Physical Medicine and Rehabilitation voted to include the Vacolite Model J Hearing Aid (Crystal and Magnetic) in its list of accepted devices.

TELEVOX MODEL E HEARING AID ACCEPTABLE

Manufacturer: Televox Manufacturing Company, 117 South Broad Street, Philadelphia 7.

The Televox Model E Hearing Aid is housed in a flat, rectangular-shaped case with rounded edges and contains microphone, amplifier and batteries. The microphone and the two wheel type controls are also in the conventional positions, and the socket for the receiver cord is in the center of the upper edge. The clothing clip is riveted to the upper back part of the case. The outside dimensions excluding the projecting controls and the clothing clip are 103 by 63 by 20 mm. ($4\frac{1}{10}$ by $2\frac{1}{2}$ by $\frac{3}{4}$ inch). The weight of the instrument, including receiver and cord, but without batteries, is 112 Gm. (4 ounces); with batteries, 159.5 Gm. ($5\frac{1}{2}$ ounces). It is equipped with a magnetic receiver only.

The manufacturer submitted data on the acoustical and electrical characteristics of the instrument which were confirmed by the Council.

Battery Drain Data:

	Voltage	Current
A battery.....	1.5 volts	39.0 ma.
B battery.....	22.5 volts	0.45 ma.

Two subjects, both veterans users of hearing aids, participated in performance tests of these instruments. Subject A, aged 37, suffered from a mixed deafness with considerable high tone hearing loss. His loss for speech was 42 decibels. Subject B, aged 39, had a pure conductive deafness with a nearly flat audiogram. Her loss for speech was 44 decibels.

Acoustic Gain.—The acoustic gain for these 2 subjects was measured with recorded spondee word lists (Test no. 9) with the following results:

Televox Model E
Hearing Aid

Subject	Loss for Speech	Tone Setting	Volume Setting	Aided Threshold	Gain
A	42 decibels	1	Full	-7	49
B	44 decibels	2	Full	-2	40
Average					47.5

The acoustic gain is sufficient to bring the subjects' aided thresholds below normal. The test, therefore, may not reveal the full acoustic gain of the instrument, but it is indirect evidence of absence of undue inherent noise.

Discrimination.—Discrimination tests with the same 2 subjects were conducted using two phonetically balanced lists of 50 monosyllables each (recorded version) delivered at 60 decibels. The scores are as follows:

Subject	Amplification (No Aid)	Reference Instrument	Televox Model E	Difference
A	92	86 (43)	83 (45)	-3
B	94	83 (37)	92 (40)	+9
Average				+3

The numbers in parentheses following the articulation scores indicate the number of decibels above the no. 9 threshold at

which the words reached the listener. The input to the instrument was 60 decibels in each case, and the volume control adjusted for a "loud but comfortable level."

The acoustic gain is beyond the minimum requirements and the discrimination very good.

The Council on Physical Medicine and Rehabilitation voted to include the Televox Model E Hearing Aid in its list of accepted devices.

Council on Foods and Nutrition

REPORT OF THE COUNCIL

The following statement has been accepted by the Council on Foods and Nutrition. JAMES R. WILSON, M.D., Secretary.

THE ADDITION OF SURFACE-ACTIVE COMPOUNDS TO FOODS

An increasing proportion of the nation's food supply is subjected to industrial processing. Accordingly, alterations in processing technics may have a direct bearing on the quality of the national diet and health. In general, the food industries are to be commended for their awareness of the responsibility which they carry for the protection of the nation's food supply. Improved methods of processing have been developed for preservation of nutrients in foodstuffs, and "fortification" and "enrichment" of foodstuffs have been developed as recommended by various official and nonofficial agencies.

At present, however, there is being introduced a new processing practice which the council views with considerable apprehension—namely, the widespread addition of certain surface-active compounds to a variety of foods, especially bread and other bakery products.

Among the most widely used surface-active agents are derivatives of polyoxyethylene, combined with fatty acids and, in some instances, with sorbitol. They are added to foodstuffs during processing in order to aid emulsification and for other purposes. Their use allows the production of a smooth-textured product, often of superior sales appeal, which contains less fat than one made without the emulsifying agent. In some instances the addition of the agent also permits the lowering of the proportions of other important food ingredients in the product—for example, the use in bread and cake imparts similar properties of "freshness" as does the use of nonfat milk solids.

Available knowledge of the possible toxicity of these substances is fragmentary; particularly is evidence lacking as to chronic toxicity. The employment of these agents in the processing of such basic foods as bread and bakery goods, as well as other foods (such as ice cream, candy and peanut butter) could lead to the ingestion of considerable quantities of these materials of uncertain toxicologic action. *Unless the complete harmlessness of these agents can be demonstrated beyond reasonable doubt, they should not, in the Council's opinion, be employed in basic foods.*

When these agents are used as extenders, particularly in making bread, cakes and pastries, the nutritive quality of the produce is usually diluted. This dilution results from the decrease in amounts of fat, milk solids and, in some cases, eggs required to produce an "acceptable" product. The caloric value of the extender itself is not completely defined, but is considerably less than the shortening which it may replace. Any reduction in content of milk and eggs in products would obviously reduce the quantity of a number of important nutrients in the food. Such a dilution is not desirable from a nutritional standpoint.

The Council's concern in reference to the use of these substances in foods resides in the inadequacy of knowledge concerning their toxicity and the deterioration in nutritive value of basic foods which their introduction allows.

SATURDAY, JULY 2, 1949

THE LYMPHOCYTE AND IMMUNITY

Although the leukocytes have long been regarded as important in defense against disease, only some twenty-five years have passed since the suggestion¹ was made that the lymphocytes, specifically, produce the antibodies. The arrangement and drainage of the vast system of lymphatic vessels would suggest that antigenic material might be carried to lymph nodes and other lymphoid tissue where its presence might stimulate formation of antibodies. The observation² that agglutinins appear in the lymph nodes before they are found in the serum supports such a view. Furthermore, the relatively high agglutinin and hemolysin titer of the washed cells of the lymph nodes of immunized mice indicate that antibodies are concentrated in the lymphocytes.³ The incubation of lymphocytes with one kind of antibody in plasma which contains another kind of antibody, indicates that the antibodies are formed by the lymphocytes and not absorbed by them from surrounding plasma.⁴

Efforts have been made to identify the antibodies with certain proteins. By chemical fractionation of human plasma,⁵ a large proportion of the antibodies were shown to react with a variety of pathogens and viruses and to reside in the alpha, beta and gamma globulins. Later gamma globulin was demonstrated in the human lymphocyte.⁶ A more complete separation of the proteins extracted from lymphoid tissue has been made recently by the method of electrophoresis,⁷ and three main components have been identified, i. e., alpha, beta and gamma globulin. From these observations the antibodies either are or are associated with the globulin fractions of the serum proteins.

The probable mechanism of the production of the immune proteins has been elucidated by injecting pituitary adrenotrophic hormone. A decrease in the weight of the lymphoid tissue, decrease in number of lymphocytes therein, lymphopenia and an increase in plasma proteins and antibody titer⁸ follow. Whereas serum albumin is formed in the liver, at least a part of the globulins are apparently formed from lymphocytes in lymphoid tissue and are there endowed with immune properties.

USE OF ISOTOPES IN STUDIES OF HEMOGLOBIN FORMATION

Isotopes of a number of chemical elements are now used as "tracers" for studying the mechanism and site of formation of substances in the animal organism. Investigations over the past five years which have elucidated the biosynthesis of creatine may be cited as an example. Recent work in the biosynthesis of hemoglobin is further evidence of the value of this experimental approach. The iron of the hemoglobin molecule is derived from either dietary iron or, apparently preferentially, from the destroyed red cell itself. The question of the formation of the porphyrin and the globin portions has remained unanswered until recently. The fact that the porphyrins may be synthesized in the body was clearly demonstrated in 1939 in rats fed porphyrin-low diets.¹ The globin moiety has been generally assumed to be derived from dietary protein. Using isotopic nitrogen (nitrogen 15) investigators at Columbia University² have found that the simple amino acid glycine serves as a precursor of protoporphyrin in both man and the rat. Under comparable conditions, glutamic acid, leucine and ammonia did not contribute to this synthesis, thus suggesting some degree of specificity of glycine as a porphyrin precursor. Other studies by this group³ using labeled deuterioacetate indicated that acetic acid was also used in the biosynthesis of protoporphyrin. Further recent studies⁴ with glycine labeled with radioactive carbon (carbon 14) have confirmed the earlier studies and have shown, in addition, that the alpha carbon atom of glycine,^{4a} but not the carboxylcarbon,^{4b} is incorporated into the protoporphyrin molecule. These investigators also observed that the radioactive carbon of the glycine appeared in the globin portion of the molecule, thus confirming the older belief that amino acids from dietary protein were used in the synthesis of globin. Further observations on the possible incorporation of other amino acids in globin will be awaited with interest.

Studies on the site of the biosynthesis of hemoglobin have also been made by the use of isotopes. Again

using glycine labeled with nitrogen 15, the Columbia University workers⁶ have found that the synthesis of the glycine into protoporphyrin can occur in nucleated red blood cells (duck) and, curiously enough, in the blood cells of human patients with sickle cell anemia.⁶ This work has been confirmed using glycine labeled with radioactive carbon, which was incubated with bone marrow homogenates from rabbits.⁷ Confirmation was also obtained with "radioautographs" of blood smears made from rats given injections of the labeled glycine.⁸

The isotopic studies thus indicate that hemoglobin is formed in the body from such substances as glycine, acetic acid and undoubtedly other amino acids and that this process may occur primarily in the primitive nucleated erythrocyte in the bone marrow of man and other mammals. The utilization of such simple and abundant units for the biosynthesis of the vital pigment hemoglobin may be cited as another outstanding example of "the wisdom of the body" and one which undoubtedly has played a major role in the evolutionary survival of species whose blood contains hemoglobin as the respiratory pigment.

HOME CARE AS AN EXTRAMURAL HOSPITAL FUNCTION

Home care¹ of patients was inaugurated by the Montefiore Hospital of New York City in 1947. The program was limited to 50 patients who could not afford the services of a private physician. Ward patients who can do as well in their own homes as they can in the hospital, as determined by specially trained doctors and social workers, are returned there with a promise of complete hospital care, either in their own homes entirely or by a return to the hospital as necessary. At a later date the patient who can afford the services of a private physician but not the more expensive services which his condition demands will be included. This should result in a form of cooperation between hospital and practitioner in which the practitioner will have the diagnostic and therapeutic facilities at his disposal in the patient's home.

Extramural service provides for carefully selected patients the kind of care thus far available only to intramural patients. These patients secure consultations through participation in the teaching program. Clinical research is aided because it is under continuous observation over longer periods of time. Nursing is done by the Visiting Nurse Service of New York through a contractual arrangement. The cost of home care is about one fourth the cost of maintaining the same patient in a hospital bed.

A similar experiment was begun by Bellevue Hospital, New York, in 1948. Unterman and co-workers² stress the importance in this program of a careful evaluation of the patient's home situation by the social worker in determining his eligibility for home care. The decision to accept a patient to home care is made jointly by the physician and the medical social worker. Nursing care is provided by the Visiting Nurse Service of New York on a fee for service basis, at the request of the home care physician. The cost of treating patients at home amounted to \$2.83 per patient day, or approximately one fourth of the cost of hospital care.

Home care is a practical means of extending continuous medical service to indigent patients. The method results in economy of hospital beds.

PARATHYROID ACTIVITY AND THE KIDNEY

The relation of the activity of the parathyroid gland to calcium metabolism has been demonstrated repeatedly in the laboratory. Clinically, the syndrome known as osteitis fibrosa cystica and the latent and manifest tetany following the removal of too large a proportion of the gland are recognized as hyperparathyroidism and hypoparathyroidism, respectively. Clear as this relationship is, the precise mechanism whereby the hormone exerts its influence on mineral metabolism has not been elucidated. One view¹ considers that the change in blood calcium after the injection of parathyroid extract represents an adjustment due to alteration of phosphate concentration; another theory² relates the action of the hormone directly to the removal of calcium from the bones with the consequent elevation of this element in the plasma.

Any final explanation of the effect of the parathyroids on calcium and phosphorus metabolism might involve the control of blood levels by the kidney through tubular reabsorption and excretion. A recent study³ has been directed to this point; the glomerular filtration of calcium and phosphorus, the tubular reabsorption of these elements and their concomitant excretion in the urine have been determined in dogs in which some stress has been induced by the injections of saline solutions containing various concentrations of sodium phosphate. In part of the experiments, parathyroid extract was administered prior to the infusion. Over a range of induced plasma inorganic phosphate concentrations of 0.9 to 5.48 millimols per liter, the rate of reabsorption of phosphate in the renal tubules was essentially uninfluenced by the parathyroid extract injection. Under the same experimental conditions, the administration of the hormones was accompanied by

hypercalcemia, increased tubular reabsorption of calcium and hypercalcuria. Apparently, therefore, the changes in the calcium level of the blood and increased loss in the urine are not closely associated with any pronounced alterations in the way in which the kidney handles phosphate under the influence of parathyroid hormone. The changes in calcium are no doubt produced by the hormone through extrarenal mobilization of calcium from body stores.

Current Comment

CHEMICAL CONTAMINANTS OF FOODS

A food, to be regarded as wholesome, must make its expected contribution to human nutrition and must be clean and free from harmful bacteria or poisonous substances such as harmful chemical contaminants. Since the recent war many new chemical technologic aids have been developed for use in the growth, storage or processing of foods. Some have been pretested and shown to be harmless; others have not. The potential health hazards of chemicals of little known or unknown toxicity is obvious. Safety can be assured only if there is adequate pretesting of materials prior to their use in foods. Information concerning the contaminant's fate in the body, a knowledge of chronic as well as acute toxicity, and practical analytic methods are essential. Elsewhere in this issue of *THE JOURNAL* (page 783), the Council on Foods and Nutrition calls attention to the necessity of a careful consideration of the use of surface-active agents in foods. Thus far, the use of these substances is limited, but their possible range of application includes almost all foods containing starch or fat. When a chemical technologic aid may find its way into the daily diet of nearly everyone from infancy to the grave, the necessity for being assured of its safety becomes significantly increased. A problem of these dimensions is difficult to solve and requires the expert opinion of a group of specialists whose independence of thought and action is unquestioned. Physicians are not opposed to the development of new chemical technologic aids which may be useful in the growth, storage or processing of foods. However, past experience forces them to call attention to the necessity of an orderly development of essential information concerning chemical contaminants of foods so that safe methods of use may be developed before these chemicals are offered for general use on food crops or for use in food storage or processing. Failure to recognize the necessity of adequate preliminary study is an invitation to trouble.

PRIMARY AMYLOIDOSIS

Primary or systemic amyloidosis is a comparatively rare disease, less than 60 cases having thus far been reported, according to the review by Dahlin.¹ Probably, however, additional examples have been recorded under such names as atypical amyloidosis, paramyloidosis and idiopathic amyloid disease and still other cases have been overlooked. The condition differs from secondary

amyloidosis in that such etiologic factors as tuberculosis or chronic suppuration are absent; involvement of the liver, spleen, kidneys and adrenal glands is minimal; amyloid is deposited in such unusual situations as the heart, lungs, skin and striated muscles; reactions to specific stains for amyloid material, are atypical and sometimes there are tumor-like collections of amyloid. In 57 recorded cases the average age was 55 years; the oldest patient was 80 and the youngest 15 years of age. No significant sex predilection has been noted, 30 of the patients having been males and 25 females. A most remarkable feature of the disease is involvement of the heart muscle. It was specifically mentioned in 46 of 54 instances that were investigated at necropsy. In 25 of this series myocardial insufficiency was believed to have been the cause of death. In the same number of cases involvement of the gastrointestinal tract was noted in 33 and pulmonary changes in 24. Deposits in the skin are present in about one fourth of all cases and are an important diagnostic feature. Changes in the bones and joints have been recorded occasionally. Involvement of the small arteries and veins of many different organs is commonly observed. Of 44 cases of amyloid disease in which necropsy was made at the Mayo Clinic during a period of about twenty-six years, 8 were examples of primary systemic amyloidosis.¹

ABNORMAL HEART RHYTHMS IN DIGITOXIN THERAPY

Aspects of toxicity associated with digitoxin therapy have been studied recently by Levine¹ at the Peter Bent Brigham Hospital. Among 338 patients with heart disease who received digitoxin therapy, 7 patients experienced abnormally rapid cardiac rhythms, including idioventricular rhythms, paroxysmal ventricular tachycardia or interference and dissociation phenomena. The incidence of toxicity resulting in rapid rhythms was greater in the group that received digitoxin therapy than in a control group treated with digitalis leaf, even though significant statistical difference could not be shown. Toxic rhythms that did occur from therapy with digitalis leaf were much less insidious in onset than were those caused by digitoxin. A rising ventricular rate or a sudden regularization of a totally irregular rhythm was considered a clue to imminence of onset of toxicity. The problem of toxicity from digitalis preparations will probably remain unsolved until a practical chemical test to determine blood level of digitalis bodies is developed. In the 7 patients described, dosage of digitoxin was believed to be excessive in 3 and not excessive in 3. Dosage in the seventh case may have been excessive. Levine's observations were not intended as a deprecation of digitoxin therapy. The uniform potency of this glycoside is considered a boon to both patient and physician, since toxic side effects noted with other forms of digitalis therapy do not occur. However, lack of the warning signs of the usual toxic side effects demands that the physician be more alert to the possible insidious development of other evidences of toxicity.

ORGANIZATION SECTION

PROCEEDINGS of the ATLANTIC CITY SESSION

MINUTES OF THE ANNUAL SESSION OF THE HOUSE OF DELEGATES OF
THE AMERICAN MEDICAL ASSOCIATION, HELD IN
ATLANTIC CITY, JUNE 6-10, 1949

HOUSE OF DELEGATES

Second Meeting—Tuesday Afternoon, June 7

The House of Delegates was called to order at 2:15 p. m. by the Speaker, Dr. F. F. Borzell.

Report of Reference Committee on Credentials

Dr. H. B. Everett, Chairman, stated that 183 delegates had filed credentials with the reference committee.

Presentation of Minutes

It was moved by Dr. Mather Pfeiffenberger, Illinois, seconded by Dr. Thomas P. Murdock, Connecticut, and carried, that the House dispense with the reading of the minutes.

Report of Reference Committee on Executive Session

Dr. John W. Cline, Chairman, presented the following report: Your Reference Committee on Executive Session has met and examined the three items referred to it. It is the unanimous opinion of the committee that there is no cause to consider these items in Executive Session.

Resolutions on the Confidential Nature of Birth Records and Resolution on Child Health Programs on the State and Local Levels: Two of the resolutions referred to the committee have been returned to the Speaker for re-reference inasmuch as the committee believes they are in a category better handled by other committees.

Resolution on Membership in the American Medical Association: The one item with which this committee has dealt is the resolution introduced by Dr. Stephen R. Monteith, New York. This resolution calls for the appointment of a committee to study certain conditions supposedly involved in membership in the American Medical Association.

After consideration of the resolution and discussion with those interested in it, the committee is of the unanimous opinion that the fundamental basis of organization of the American Medical Association is the component county society. The Constitution and By-Laws of the Association clearly express this intent. The manner of admission to membership is entirely a county society function, and unless the Constitution and By-Laws were amended, the appointment of such a committee would serve no useful purpose. The committee unanimously recommends that this resolution be rejected.

Respectfully submitted,

JOHN W. CLINE, Chairman.
R. H. HAYES.
THOMAS P. MURDOCK.
HOWARD K. PETRY.
HUGH P. SMITH.

The report of the reference committee contained in the second section was adopted on motion of Dr. Cline, seconded by Dr. Thomas P. Murdock, Connecticut, and carried.

The Speaker requested Dr. Cline to read the two resolutions referred to in Section 1 of the report of the reference committee. After Dr. Cline read them the Speaker referred both resolutions to the Reference Committee on Legislation and Public Relations.

Report of Reference Committee on Miscellaneous Business

Dr. Mather Pfeiffenberger, Chairman, presented the following report:

1. Resolution on Establishment of Committee on General Practice: Your reference committee recommends that the appointed committee be reactivated and allowed to work.

2. Resolution on Single Membership Classification: Your committee recommends acceptance of this resolution.

3. Resolution on American Medical Association Assessment and Dues: Your committee approves this in principle but advises delay of action until the interim session.

4. Resolution on General Practice Sections in Hospitals: Your committee approves the principle of the resolution but does not believe it should be made mandatory.

5. Resolution on Supporting the American Medical Association: Your committee disapproves the resolution on the grounds that it feels that every effort is being expended to accomplish the purpose of the resolution.

6. Resolution on Displaced Physicians: Your committee approves this resolution if it is feasible.

7. Resolution on Affiliation of Medical Students with the American Medical Association: Your committee approves this resolution.

8. Resolution on General Practitioner's Award: Your committee approves the Resolution on General Practitioner's Award effective Jan. 1, 1950.

9. Resolutions on Suggested Educational Device: Your committee approves these resolutions and recommends they be referred to the Public Relations Committee to be used as they see fit.

Respectfully submitted,

MATHER PFEIFFENBERGER, Chairman.
GEORGE BRAUNLICH.
WILLIAM R. BROOKSHER.
ANDREW A. EGGSTON.
HOYT B. WOOLLEY.

Dr. Pfeiffenberger moved adoption of the report of the reference committee on the Resolution on Establishment of Committee on General Practice (Section 1) and the motion was seconded by Dr. George W. Kosmak, New York, and carried.

It was moved by Dr. Pfeiffenberger that the report of the reference committee dealing with the Resolution on Single Membership Classification (Section 2) be adopted. After discussion by the Speaker, Dr. Walter E. Vest, West Virginia, and Dr. George F. Lull, Secretary, Dr. Vest moved that the resolution be referred to the Board of Trustees for study and report at the interim session and the motion was seconded by Dr. T. K. Gruber, Michigan, and carried.

On motion of Dr. Pfeiffenberger, seconded by Dr. Charles H. Phifer, Illinois, and carried, the report of the reference committee on the Resolution on American Medical Association Assessment and Dues (Section 3) was adopted.

Dr. Pfeiffenberger moved adoption of the report of the reference committee referring to the Resolution on General Practice Sections in Hospitals (Section 4) and the motion was seconded by Dr. Val H. Fuchs, Louisiana, and carried after discussion by Dr. James R. Reuling, New York, and Dr. Pfeiffenberger.

Dr. Pfeiffenberger moved that the report of the reference committee dealing with the Resolution on Supporting the American Medical Association (Section 5) be adopted, and the motion was seconded by Dr. Charles H. Phifer, Illinois. After discussion by Dr. Val H. Fuchs, Louisiana, Dr. Pfeiffenberger and the Speaker, Dr. John W. Cline, California, moved an

amendment that the House heartily endorse the resolution as introduced and this motion was seconded by Dr. Thomas P. Murdock, Connecticut, and adopted after discussion by Dr. Val H. Fuchs, Louisiana; Dr. G. Henry Mundt, Illinois, Dr. T. K. Gruber, Michigan; Dr. Lowell S. Goin, California, the Speaker and Dr. Cline. The report of the committee on this resolution, as amended, was then adopted.

It was moved by Dr. Pfeiffenberger that the portion of the report of the reference committee approving the Resolution on Displaced Physicians if feasible (Section 6) be adopted, and the motion was regularly seconded and carried after discussion by the Speaker, Dr. Walter E. Vest, West Virginia, and Dr. Pfeiffenberger.

On motion of Dr. Pfeiffenberger, regularly seconded and carried, the report of the reference committee approving the Resolution on Affiliation of Medical Students with the American Medical Association (Section 7) was adopted.

A motion of Dr. Pfeiffenberger to approve the report of the reference committee approving the Resolution on General Practitioner's Award (Section 8), was lost after discussion by the Speaker; Dr. Pfeiffenberger; Dr. E. L. Henderson, Chairman, Board of Trustees; Dr. Thomas P. Murdock, Connecticut; Dr. Walter E. Vest, West Virginia, and Dr. Charles H. Phifer, Illinois.

Dr. Pfeiffenberger moved that the report of the reference committee approving of the Resolutions on Suggested Educational Device (Section 9) and recommending its reference to the Public Relations Committee, be adopted. After discussion by the Speaker and Dr. Pfeiffenberger, Dr. James R. Reuling, New York, offered an amendment that the House heartily approve the suggestion and use it in every way possible and this was seconded by Dr. Walter E. Vest, West Virginia, and discussed by Dr. Pfeiffenberger and the Speaker, who suggested that it be referred to the Coordinating Committee rather than to the Public Relations Committee, which was accepted by Dr. Pfeiffenberger, who then moved adoption of this section of the report, as amended. The motion was seconded by Dr. Charles H. Phifer, Illinois, and carried.

On motion of Dr. Pfeiffenberger, seconded by Dr. Thomas P. Murdock, Connecticut, and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Emergency Medical Service

Dr. Leland S. McKittrick, Chairman, presented the following report, which on motions of Dr. McKittrick, duly seconded and carried after discussion, was adopted section by section:

REPORT OF COUNCIL ON NATIONAL EMERGENCY MEDICAL SERVICE

1. Elevation of Position of Surgeon General: Your reference committee considered the portion of the Report of the Council on National Emergency Medical Service dealing with the elevation of the position of Surgeon General, shares the satisfaction of the Council in its report and commends the Council for its excellent work in helping to bring about this change.

2. Division of Medical Services in Office of Secretary of Defense: Your reference committee considered that portion of the Report of the Council on National Emergency Medical Service relative to the directive establishing in the Office of the Secretary of Defense a Division of Medical Services to be headed by a Director of Medical Services of the Armed Forces, notes with satisfaction this directive and later will report on the subsequent developments in the medical services of the Armed Forces. Your committee recommends that a proper note of commendation be forwarded to the President of the United States and the Secretary of Defense in recognition of this constructive and forward-looking action.

3. Proposed Establishment of a Section on Military Medicine and Surgery: Your committee has also reviewed the background leading up to its approval of the establishment of a Section on Military Medicine and Surgery. It recommends that the question of the establishment of such a Section be referred to the Council on Scientific Assembly for definite recommendation.

4. Action Favoring Passage of H. R. 3039 and S. 1698: This pertains to the impossibility of reserve officers in Army, Navy and Air Force Medical Corps obtaining credit points necessary to complete a satisfactory year of federal service during the first year of operation of Public Law 810 of the 80th Congress. S. 1698 and H. R. 3039 have been introduced to make satisfactory changes in the present law. Your committee recommends that the American Medical Association go on record as favoring the passage of S. 1698 and H. R. 3039 and/or other suitable legislation looking toward the deferment for one year of the basis on which the point requirements in such law shall become effective and that copies of this action be forwarded to the President of the United States, to the Secretary of Defense, to the Secretary of the Army, Navy and Air Force, to the Chairman of the Armed Services committees of the Senate and House and to Senator Johnson and Representative Ford.

Respectfully submitted,

LELAND S. MCKITTRICK, Chairman.
KARL S. J. HOHLEN.
GEORGE S. KLUMP.
ROLAND W. STAHR.
ROBERTSON WARD.

Report of Reference Committee on Reports of Officers

Dr. F. J. Pinkerton, Chairman, presented the following report, which on motions of Dr. Pinkerton, duly seconded and carried, was adopted section by section and as a whole:

1. Address of President: Your reference committee finds itself in complete accord with the views of our President as expressed in his report. However, there are observations of special significance which it feels should be emphasized. His address is divided into four parts. Your committee will comment briefly on each.

(1) Medical education, hospitals and medical schools, students and teaching facilities, teacher and endowment shortages, specialization boards, etc., are problems that have already been referred to appropriate reference committees. Complex as they are in solution, your committee feels that every means should be exhausted to solve them, and that this should be the obligation of the profession in cooperation with the proper authorities concerned.

(2) Your committee notes with approval the President's comments relative to the problems of securing adequate personnel for the Armed Forces. He has made a studied analysis of the current situation and has offered many constructive suggestions. These matters will undoubtedly be the concern of the Council on National Emergency Medical Service, and policies which will be developed will be presented by this body. Your committee recommends that the Council give the President's remarks serious consideration.

(3) The President has expressed tersely and with great clarity the philosophy behind the drive for compulsory sickness insurance, and the false tenets on which it is founded. He has emphasized particularly the technics of the protagonists of this movement and the pressure on our national legislators which in his words is "ghastly and unending. Bureaucracy degrades the individual and destroys personal service and freedom." Your committee is wholeheartedly in accord with this.

(4) The President points out our willingness to cooperate wherever possible in an effort to reduce misunderstandings, but in such cooperation we must recognize the basic principles and moral issues involved and not yield to compromise where the dignity and welfare of the human being is at stake.

In conclusion, your committee senses deeply the spirit of confidence and determination which is so evident in the reports of the officers and in the discussions by the members of this House. This augurs well for the future.

2. Address of Speaker: In reviewing and studying the report of the Speaker, your committee commends him for his excellent observations, actions and recommendations. It agrees especially with that portion suggesting that the delegates invite selected members from their state societies to attend at least one meeting of the House. It believes that in this manner the mem-

bership at large can and will learn that the meetings of the House of Delegates are conducted in a truly democratic manner.

Your committee commends the Speaker's action in appointing the special Committee on Publicity to transmit to the press a proper interpretation of the deliberations of the House.

Your committee notes with approval the Speaker's comments of appreciation to the delegates for their letters and personal communications expressing a desire and willingness to serve and to fulfil their important duties. Delegates must be ever alert and must accept the responsibility of keeping the officers constantly informed as to happenings in their respective localities.

Your committee feels it important to reiterate and emphasize the remarks of the Speaker when he says: "We, then, must lead and not be led. As long as we hold to a course of dignity, singleness of purpose and unwavering solidarity we can win."

Respectfully submitted,

F. J. PINKERTON, Chairman.
J. B. LUKINS.
GEORGE E. EARL.
J. STANLEY KENNEY.
CHARLES J. KICKHAM.

Report of Reference Committee on Sections and Section Work

Dr. Edward L. Compere, Chairman, presented the following report, which on motions of Dr. Compere, duly seconded and carried, was adopted section by section and as a whole:

1. Request for Section on Military Medicine and Surgery: The request of the Council on National Emergency Medical Service that the Council on Scientific Assembly recommend to the House of Delegates that a Section on Military Medicine and Surgery be created was referred by the Speaker of the House to the Reference Committee on Sections and Section Work. The arguments favoring the creation of this new section were presented in a letter from Rear Admiral Joel T. Boone and in person by Lt. Col. Harold W. Glascock.

Your committee recognizes merit in the proposal that this new section be created and recommends, in accordance with Article 9, Section 3 of the Constitution, that this request for the creation of a Section on Military Medicine and Surgery be referred by the House of Delegates to the Council on Scientific Assembly for study and recommendation to the House of Delegates.

2. Increase in Membership of Council on Scientific Assembly. The request of the Council on Scientific Assembly that the membership of this Council be increased to seven in number was referred, at the interim session held in St. Louis in 1948, to the Reference Committee on Sections and Section Work. That committee reported that "The advisability of granting an increase in the membership of the Council from five to seven in number was clearly apparent for reasons adequately expressed."

Your committee approves the enlargement of the Council as set forth in the proposed amendment to the By-Laws, Division Three, Chapter X, Section 4 (b) submitted by the Council on Scientific Assembly.

Respectfully submitted,

EDWARD L. COMPERE, Chairman.
J. W. BIRD.
CHARLES H. PHIFER.
JOHN M. PORTER.
CHARLES T. STONE.

Resolution on Board of Trustees

Dr. Floyd S. Winslow, New York, presented the following resolution and moved its adoption:

Resolved, That this House of Delegates of the American Medical Association has full confidence in the Board of Trustees to carry on the duties imposed on it by the Constitution and By-Laws.

The motion was seconded by Dr. F. J. Pinkerton, Hawaii, who moved that the resolution be adopted by acclamation. The motion was adopted unanimously.

Resolution on Special Committee on Displaced Physicians

Dr. Charles L. Farrell, Rhode Island, presented the following resolution, which was referred to the Reference Committee on Miscellaneous Business.

WHEREAS, It is generally admitted that there is a need for more qualified physicians than are now available in this country; and

WHEREAS, There is at present a large group of physicians who, with their countrymen, have been rendered homeless and are now living as displaced persons under the care of the International Refugee Organization in Western Germany and elsewhere; and

WHEREAS, Many of the physicians are known to be highly trained specialists and practitioners; and

WHEREAS, Many of these physicians have entered and many more will be resettled throughout the civilized world, including the United States; therefore be it now

Resolved, That a Special Committee on Displaced Physicians be appointed by the President of the American Medical Association, to consist of six members, whose duty it shall be to study the problems of displaced physicians generally and as far as possible to cooperate with the International Refugee Organization and the various state authorities in furthering the resettlement of these individuals in a spirit of friendly cooperation with unfortunate colleagues.

Resolution on Questionnaire on Medical Care

Dr. Warren W. Furey, Illinois, presented the following resolution, which was referred to the Reference Committee on Legislation and Public Relations:

WHEREAS, The Board of Trustees of the American Medical Association may not presently have completely accurate information on the consensus of the American medical profession as to the most effective solution of the over-all problem of medical care; and

WHEREAS, Information coming from officers and councils of county and state medical societies to the American Medical Association may not always have incorporated the "grass roots" opinions of some of the members of these groups; and

WHEREAS, With the information which would be made available by a comprehensive questionnaire sent to all Fellows and members of the American Medical Association in order to learn in extenso their attitude relative to the various facets of medical care problems, the American Medical Association will be able to formulate a comprehensive medical care plan which will be more efficient, more effective and more preservative of individual initiative than the compulsory health insurance proposal before the Congress; now, therefore, be it

Resolved, That the House of Delegates instruct the Board of Trustees to have such a questionnaire prepared and sent to all Fellows and members of the American Medical Association, the individual questionnaires to be confidential and the questionnaire results to be categorized and ultimately made known to the Fellows and members of the American Medical Association.

Resolution on Veterans Administration

Dr. James C. Sargent, Wisconsin, presented the following resolution, which was referred to the Reference Committee on Emergency Medical Service.

WHEREAS, The American Medical Association has supported the professional medical program of the Veterans Administration and has noted with great satisfaction the high quality of medical care made available to the veterans of our country through the cooperation of the medical service of the Veterans Administration, the teaching hospitals, the university faculties and the medical consultants to the Director of the Department of Medicine and Surgery of the Veterans Administration; and

WHEREAS, A most fundamental principle of sound medical care dictates that the professional, domiciliary and rehabilitation programs must be coordinated under professional guidance if the best interest of the patient is to be served; and

WHEREAS, The present administration of the Veterans Administration medical facilities and services under the direct control of the Director of Medicine and Surgery has resulted in the highest type of veteran patient care yet obtained in this country; now, therefore, be it

Resolved, That it is the opinion of the House of Delegates that it is essential that complete responsibility and authority for the medical care and hospital services program of the Veterans Administration must be vested in the Chief Medical Director of that Administration.

Introduction and Address of Surgeon General Raymond W. Bliss of the U. S. Army

Dr. James C. Sargent, Wisconsin, introduced Surgeon General Raymond W. Bliss of the U. S. Army, who spoke as follows:

Dr. Sargent and Delegates: I am honored to be here again this year, to say just a word. I think the year past, as far as the Army is concerned, has been one of the utmost cooperation from your groups in the American Medical Association, particularly with the Council on National Emergency Medical Service, and the group in my office has worked constantly and continuously during the year with all of the bodies of the American Medical Association. I think it is beginning to show in our results that we are and you are a part of the same thing, that is, American medicine. I think we are back in the field of American medicine, and there we intend to stay. Thank you very much!

Introduction and Address of Surgeon General Clifford A. Swanson of the U. S. Navy

Dr. Sargent presented Surgeon General Clifford A. Swanson of the U. S. Navy, who spoke as follows:

Mr. Chairman, Dr. Sargent, Members of the House of Delegates and Guests: Military medicine in the early days was folk medicine. With the acceptance of Greek medicine by the Romans, organized medical departments were incorporated in the Empire armies. Personnel losses from disease were great, and when Hannibal crossed the Alps two hundred and eighteen years before Christ, with 112,000 troops, he had but 26,000 left when he arrived in Italy. In the Punic Wars, when Carthage was destroyed, 146 B. C., the city of 700,000 was reduced to a city of 50,000.

With the dissolution of the Roman Empire came a wave of military medicine, as well as a high order of medicine established by Hippocrates, by Galen and by Celcus. Surgery fell into the hands of the barbers and bath keepers, and venesection and cupping was the order of the day.

Medicine in the Middle Ages was dogmatic. Science was dormant and many fallacies regarding the practice of medicine persisted. The main medical-technical advances of the recent era may be summarized. New operative technics and methods of antisepsis were created which allowed surgeons to operate safely on internal organs. The microscope came into being and the x-ray. Drugs were discovered which acted as specifics in the treatment of disease, so that by the year 1900, Oliver Wendell Holmes, physician and poet, could no longer have said that "if all the *Materia Medica*s were sunk in the bottom of the ocean, it would be all the better for mankind and all the worse for the fishes."

The French failed to build a transisthmian canal because of the depredations of yellow fever. As many Frenchmen are said to have died of this fever as there are railroad ties on the Trans-Isthmian Railroad connecting the two oceans. America succeeded where the French failed, because of the work of Dr. Walter Reed and his colleagues in the arrest of yellow fever.

American medicine made great progress also between World War I and World War II because of the standards made and enforced by this great medical association. In World War I, 11 per cent of the wounded died. In World War II, less than 3 per cent of the wounded died, and it was the first world war in which we participated in which the mortality from wounds was greater than from disease. This record is indeed a high tribute to American medicine.

Although the war is over, we have found it necessary to maintain a very formidable military machine. Your American Army today is ten times larger than before World War II, and your Navy is five times larger than before World War II. We have our men on all the continents of this earth excepting one, and many of the islands throughout the world. We in the Navy have 25 hospitals in this country and 3 overseas, as well as 2 hospital ships in the oceans to carry out our medical duties. In the Navy today, we have 2,100 nurses, 2,900 doctors, 2,000 dentists, 800 medical administrators and 16,500 corpsmen.

Your Association, the American Medical Association, in consonance with other experts, has enabled us to procure the bare minimum of doctors to perform our medical mission in the implementation of the foreign policy of our country. I want to thank publicly Dr. Sensenich and Dr. Irons for their work in aiding us in our procurement problem.

We of the Medical Department have spearheaded unification, which you hear so much about. At the present time, in the Army and Navy and the Air Force, we have joint staffing of our hospitals; we have joint medical procurement; we are soon to have a single armed force medical bulletin; and we also have a committee formed on medical facilities, so in the case of another holocaust, we shall not be building hospitals side by side.

We also have a group that has looked into the mistakes of World War II, so that, if we get into another holocaust, these same mistakes, we hope, will not be repeated. We of the Navy and the Army are going to try to rectify the situation and then permit our reserves to be able to make their fifty

points a year. I want to commend this Association for the forward steps that it has taken toward establishing a military medicine section of this Association.

Now, I want to speak a few words on behalf of our sister services. They are in the order of 2,000 doctors short. Where should these young doctors come from?

We have already had in the Army and in the Navy and in the Air Force, 10,000 young doctors that have served two years, who have been educated in part or in whole at government expense. There are still in our country 8,000 young doctors who have been educated in whole or in part at government expense, who have not served a single day. There are also 7,000 young doctors who have received their education without having served. Now, if 10,000 of the former V-12 and ASTP's can serve, there is no reason why we should not get doctors from this group of 15,000 which I have just mentioned. They should serve, as many of you here in the House of Delegates served during the war, and if these young doctors serve, they will not only be better doctors, but, something infinitely more important, after a tour of two years in either the Army or the Navy or the Air Force, they will be better citizens.

I plead with you members of the House of Delegates to persuade these young doctors to perform a great duty, a duty as citizens of this country. We want a volunteer medical department in the Armed Forces, and I know that this great American Medical Association will help us to procure the needed medical men today.

World Medical Association

Dr. Henderson, Chairman, Board of Trustees, addressed the House as follows:

At the last interim session in St. Louis, there was a report made from the United States Committee of the World Medical Association, and that committee urged every member of the House of Delegates to become a member of the United States Committee.

I am sorry to say there are at least sixty members of the House of Delegates who are not members of the United States Committee of the World Medical Association. Gentlemen, this is a great cause and we are very anxious that you support it. I would say that there are quite a few new members of the House of Delegates who were not present at that time. If there are any of you who are willing to join the United States Committee for the World Medical Association, you will find application blanks at the booth in the exhibit hall. You may sign your blank there and pay your fee if you want to. The fee is not great. It is \$10. I might say it is \$10 up to whatever you want to give. It is all right if you want to give \$1,000. We have no objections. Thank you.

Report of Reference Committee on Industrial Health

Dr. William L. Estes, Chairman, presented the following report, which was adopted on motion of Dr. Estes, seconded by Dr. Mather Pfeifferberger, Illinois, and carried:

The meeting of your committee consisted largely of a conference with the able director of the Council on Industrial Health, Dr. Peterson, and its distinguished chairman, Dr. A. J. Lanza. Referred to our committee was a supplemental report of the Council implementing the eleventh plank of the American Medical Association's platform for the advancement of medicine and public health. The Council on Industrial Health represents an important bulwark in the Association's armamentarium. Its proposal of a constructive program, placing primary emphasis on preventive medicine and positive health promotion, together with all out efforts to increase safeguards against industrial hazard and the prevention of accidents occurring on the highway, in the home and on the farm, is highly to be commended. To offer the services of the Council to aid those interested in decreasing the mounting incidence of highway, home and farm casualties is an important gesture. Certainly the Annual Congress on Industrial Health sponsored by the Council serves to spearhead the extension of the usefulness and influence of industrial physicians and hygienists in developing patterns of community health and medical service.

The establishment at the national level of a permanent conference group with labor and management instead of irregular and informal contacts is to be highly desired. This will permit not only discussion of the extension of industrial medicine and hygiene, accident prevention, and health education of workers, but also will serve to clarify the status of physicians and medical organizations in relation to industrial health activities, as well as to provide another medium of understanding concerning the ideals of service and responsibility prompting these efforts.

It is surely to be anticipated that similar permanent conference groups at the state and community level will in due time follow.

Likewise may be underlined: (1) The Council's efforts to revitalize where indicated committees on industrial health in the principal industrial state and local medical societies to promote the most effective professional treatment; (2) The formation of a liaison committee with other professional groups, such as nurses, dentists, engineers and hygienists to establish better integration and cooperation with their efforts in the industrial field.

The suggestion that as industrial medicine expands so must facilities for professional training keep pace would seem of special and paramount importance. The development of an appropriate educational program and facilities for obtaining it at this time is imperatively needed. Consultation with the Council on Medical Education and Hospitals or other appropriate bureaus or councils of the American Medical Association, with the American College of Surgeons and its Committee on Trauma, and other interested groups would seem advisable in order to establish standard criteria for this program. Likewise, efforts in professional education should include ways and means to bring to the profession in general the important advances in industrial medicine.

The proposal to have as consulting committees to the Council on Industrial Health panels of experts on atmospheric pollution, toxic chemicals, hazardous physical agents and harmful biologic exposures set up by the Congress on Industrial Health seems highly desirable and is definitely approved, subject to the budgetary provisions of the Council.

Liaison with the Council on Medical Service for consideration of the employment phases of rehabilitation in industry and study of medical care plans industrial in origin have been important activities of the Council. We would certainly agree that as good medical standards and resources in industry improve they can be of great service in maintaining independence and self determination and in counteracting tendencies toward centralization and control.

The Council on Industrial Health is in able hands. We can be proud of its accomplishments.

Respectfully submitted,

WILLIAM L. ESTES, Chairman.
WYMAN D. BARRETT.
WARREN W. FUREY.
W. W. BAUM.
CARL A. GROTE.

Report of Reference Committee on Sections and Section Work

Dr. Edward L. Compere, Chairman, presented the following report, which on motion of Dr. Compere, seconded by Dr. Mather Pfeifferberger, Illinois, and carried was adopted.

The recommendation of the Council on Scientific Assembly for the establishment of a Section on Physical Medicine and Rehabilitation is supported by this committee. The proposed amendment to Division Two, Chapter VII, Section 1, which establishes this new section is also recommended for acceptance by the House of Delegates.

Respectfully submitted,

EDWARD L. COMPERE, Chairman.
CHARLES H. PHIFER.
JOHN M. PORTER.
CHARLES T. STONE.

Report of Reference Committee on Legislation and Public Relations

Dr. William Bates, Chairman, presented the following report:

1. Resolution on Compulsory Health Measures: Your Reference Committee on Legislation and Public Relations has studied the Resolution on Compulsory Health Measures and feels that the House of Delegates should be grateful for having this matter called to its attention. It is the understanding of this committee that the bill referred to in this resolution has already passed the United States Senate without committee hearings, but has not yet been considered by the House of Representatives.

Your committee recommends that the House of Delegates not only register and publicize its disapproval, but that it instruct the Board of Trustees to order all possible steps taken to prevent the enactment of this legislation.

2. Resolutions on Amendment to Constitution of United States: Your reference committee has studied the resolutions concerning the limitation of the Government of the United States' activities in engaging in any business, professional, commercial or industrial enterprises, in competition with its citizens, except as specified in the Constitution. The committee approves the resolution in spirit, but realizes the difficulties of its accomplishment. In spite of these facts, it recommends the adoption of these resolutions.

3. Resolution on Diabetes Detection Drive: Your reference committee has considered the resolution introduced for the Medical Society of the State of New York requesting the approval of the House of Delegates of the American Diabetes Association's Detection Drive and requesting the Board of Trustees of the American Medical Association to implement cooperation between the American Medical Association and the American Diabetes Association in furtherance of the Diabetes Detection Drive. It heard several proposals for this resolution and recommends its adoption.

4. Resolution on Social Security: Your reference committee has considered the resolution concerned with the extension of social security and suggests a change of wording in the resolution as presented, so that it shall read:

"Resolved, That the House of Delegates of the American Medical Association express its disapproval of the extension of so-called 'Social Security' to self-employed individuals, including physicians and surgeons."

Your committee agrees with distribution of this resolution as recommended, and therefore recommends the adoption of this resolution as amended.

5. Resolution on Establishment of Committee to Confer with Congress: Your reference committee has considered the Resolution on Establishment of Committee to Confer with Congress and recommends its approval with certain changes in its wording, which have the approval of its sponsors, to read: *Resolved*, That the Board of Trustees of the American Medical Association be empowered to create a special committee, to be composed of representatives of the Board of Trustees, representatives of the House of Delegates and other Fellows of the Association. This committee shall arrange a conference with members of Congress, with a view of developing legislation that would meet the objective of the American Medical Association program in its efforts to solve the problem of making medical care more readily accessible to the American people. This committee is to work in cooperation with other existing committees and to make its report from time to time to the Board of Trustees.

Your committee recommends the adoption of this resolution as amended.

6. Resolution on Free Choice of Physicians for Federal Employees: The resolution requesting the American Medical Association to seek amendment to the federal law on workmen's compensation, to the effect that all covered federal employees be granted free choice of physicians for injuries sustained in line of duty, was carefully considered. The committee approves this resolution and recommends its adoption.

7. Addresses of Whitaker and Baxter: Your reference committee has studied the addresses of Whitaker and Baxter and endorses the point of view presented.

Not having received a report from the Coordinating Committee, it was expected that, in addition to the addresses given, a more detailed list of accomplishments and plans would be presented. It is our understanding that such may be presented later at this session. Your committee believes that such a presentation is in order.

It is the feeling of your committee that a deliberate effort should be made on the part of the Coordinating Committee to see that the name of the American Medical Association is featured as the sponsor in the public relations program.

8. Resolution on Hospital and Medical Care of Veterans for Non-Service-Connected Disabilities: Your reference committee has carefully considered the history and content of the resolution pertaining to care of veterans for non-service-connected disabilities.

This resolution was approved by the House of Delegates of the Tennessee State Medical Association, and by the Tennessee Hospital Association and endorsed by the Advisory Committee for the Hill-Burton Bill.

There are many facets in this resolution, and many were so controversial that your committee heard eighteen witnesses in an hour and fifty-five minutes devoted to the discussion of this one resolution.

Your committee recommends that the first exception under 1 (b) be enlarged from "Disabilities covered by compensation laws" to "Compensation laws and public liability."

Your committee further recommends that in the next to last line, the present wording be deleted after "best efforts" and that there be added the words "working with allied groups to implement this resolution."

With these corrections, your committee recommends the adoption of this resolution.

9. Proposed Code of Ethics of World Medical Association: Your reference committee has considered the Proposed Code of Ethics of the World Medical Association presented by Dr. George Lull, requesting its endorsement by this House of Delegates. Endorsement by this House of Delegates as a member organization of the World Medical Association is necessary before this Code can be formally adopted.

Your committee recommends that the Code of Ethics be endorsed.

10. Resolution on Child Health Programs on the State and Local Level: Your reference committee has studied the resolution pertaining to Child Health Programs on the State and Local Level and recommends its adoption.

11. Resolutions on Confidential Nature of Birth Records: Your reference committee has studied the resolutions pertaining to the confidential nature of the birth certificate and is in full accord with the spirit of the resolutions and recommends their adoption.

Respectfully submitted,

WILLIAM BATES, Chairman.
F. J. L. BLASINGAME.
LEO G. CHRISTIAN.
WALTER G. PHIPPEN.
H. GORDON MACLEAN.

The first seven sections of the report of the reference committee were adopted on motions of Dr. Bates, duly seconded and carried.

Dr. Bates moved adoption of the report of the reference committee on the Resolution on Hospital and Medical Care of Veterans for Non-Service-Connected Disabilities and the motion was regularly seconded and lost by a standing vote of 59 for and 61 against, after discussion.

Sections 9, 10 and 11 of the report of the reference committee were adopted after discussion on motions of Dr. Bates, duly seconded and carried.

On motion of Dr. Bates, seconded by Dr. George W. Kosmak, New York, and carried, the report of the reference committee as amended was adopted as a whole.

Report of Reference Committee on Rules and Order of Business

Dr. A. F. R. Andresen, Chairman, presented the following report, which was adopted on motion of Dr. Andresen, seconded by Dr. Mather Pfeifferberger, Illinois, and carried:

Mr. Speaker and Members of the House: Your committee recommends that on completion of business this afternoon, the House recess until Thursday at 10 o'clock and that every effort be made to complete all other business of the House on Thursday morning, leaving the early afternoon, starting at 1:00 p. m., for election of officers.

Report of Reference Committee on Amendments to Constitution and By-Laws

Dr. William D. Stovall, Chairman, presented the following report, which was adopted section by section and as a whole and the Speaker called for a rising vote on the adoption of the amendments and declared that there had been a two-thirds vote, that the amendments had been adopted with the exception of the amendment to the Constitution, which must lie over until the next annual session:

1. Proposed Amendment to Article 3 of the Constitution of the American Medical Association: This proposed amendment is suggested on the basis that at present no constituent state association has any formal recognition that it is an integral part of the American Medical Association, and requests that there be added to Article 3 the following clause "and such constituent associations shall receive a charter from the American Medical Association." In view of the fact that the American Medical Association is a federation of state and territorial medical associations, your reference committee felt that the American Medical Association cannot give a charter to any constituent association. The reference committee disapproves this resolution, with the recommendation that the Oklahoma Council consider a more feasible means by which they may solve their problems. The resolution is not recommended.

2. Report of Council on Scientific Assembly Suggesting Increase in Its Membership: In a supplementary report at St. Louis in 1948 the Council on Scientific Assembly recommended a change in the number of members of the Council on Scientific Assembly from five to seven, suggesting that if this change is granted, when feasible, one of the additional members be a general practitioner or a Fellow who has intimate knowledge of the needs of general practitioners in relation to arranging the programs for the Scientific Assembly at the Annual Sessions and at the Interim Sessions.

This resolution was referred to the Reference Committee on Sections and Section Work which approved it and recommended that the indicated change in the By-Laws be presented at the next meeting of the House of Delegates (this meeting). Your reference committee recommends the approval of this resolution.

The By-Laws Division Three, Chapter 10, Section 4 (b) Standing Committees, will now read:

"The Council on Scientific Assembly shall consist of seven Member or Service Fellows, one of whom shall be a general practitioner elected by the House of Delegates on nomination by the Board of Trustees for terms of seven years, so arranged that at each annual session the term of one member expires, except that at the 1949 annual session, one member shall be elected for a term of five years, one for a term of six years and one for a term of seven years." Your reference committee recommends the acceptance of this amendment.

3. Report of the Council on Scientific Assembly recommending a change in the By-Laws to create a new section to be designated "Section on Physical Medicine and Rehabilitation." This amends Division Two, Chapter VIII, Section 1, which enumerates the Sections of the Association. No. 19, now "Miscellaneous Topics" is changed to "Physical Medicine and Rehabilitation" and no. 20 "Miscellaneous Topics" is added. This proposed change creates a new Section on Physical Medicine and Rehabilitation, numbering it Section 19, and transfers "Miscellaneous Topics" to no. 20. Your committee recommends this amendment.

4. Proposed Amendment to By-Laws, Division Three, Chapter XII, Section 6: This amendment proposes the addition of the Judicial Council to this subsection. In discussing this matter your reference committee found a discrepancy which also seemed

to need correction in that part referring to the Council on Scientific Assembly. The word "Council" does not now appear. At present the subsection reads as follows: "Keep minutes of the proceedings of the House of Delegates and of the meetings of the Scientific Assembly." Your Reference Committee recommends that it read as follows: "Keep the minutes of the proceedings of the House of Delegates and of the Judicial Council and of the Council on Scientific Assembly." Your committee recommends this change in the By-Laws.

5. Proposed Amendment to By-Laws, Division One, Chapter II: This is a proposed amendment to the By-Laws, Division One, Chapter II. It recommends striking out the words "one year" occurring in line 3 on page 10 of the Constitution and By-Laws and substituting the words "eight months." After some discussion and consultation with a delegate from the California Medical Association, your committee feels that instead of making the change for eight months it should be six months, and that portion of the By-Laws would then read "unless he has transferred his membership within six months after such change of practice, the Secretary shall remove his name from the roster of members." Your committee approves this proposed amendment as recommended by the delegate from California.

6. Proposed Amendment to Constitution, Article 11: The proposed amendment suggests the following in addition to the present first sentence: "Funds may be raised by an equal annual levy of dues or by an equal special assessment, or both, levied or assessed on each of the active members on recommendation by the Board of Trustees after approval by the House of Delegates" and the balance of the Article as at present.

Your committee feels that in view of the present assessment of \$25, this proposed amendment providing authority for unlimited dues or assessments be not recommended. Your committee disapproves of this resolution.

7. Proposed Amendment to Constitution and By-Laws concerning the Armed Forces: This provides for a change in the Constitution and By-Laws, giving the medical officers of the newly formed Medical Service of the United States Air Force the same privileges and responsibilities within the American Medical Association as their colleagues in other government services now have.

Article 6, Section 2 of the Constitution would be changed to insert after the word "the United States Navy" the words "the United States Air Force." That part of the section would then read "and of Delegates from the Medical Departments of the U. S. Army, the U. S. Navy, the U. S. Air Force, the U. S. Public Health Service and the Veterans Administration appointed by the Surgeon General or the Chief Medical Director," as the case may be of the respective services. Your committee recommends this change and further recommends that the change needed in the By-Laws, Division Three, Chapter IX, Section 1 (B) be presented at the next interim meeting of the House of Delegates for consideration at that time.

Respectfully submitted,

WILLIAM D. STOVALL, Chairman.
IVAN FAWCETT.
PAUL K. FRENCH.
WILLIAM A. HYLAND.
B. E. PICKETT SR.

The House recessed at 3:30 p. m. to meet Thursday, June 9, at 10 a. m.

Third Meeting—Thursday Morning, June 9

The House was called to order by the Speaker, Dr. F. F. Borzell, at 10 a. m.

Report of Reference Committee on Medical Education

Dr. B. R. Kirklin, Chairman, presented the following report, which on motions of Dr. Kirklin, duly seconded and carried, was adopted section by section and as a whole:

1. Report of the Council on Medical Education and Hospitals: Your Reference Committee on Medical Education met on Tuesday morning for a consideration of the material referred to

it. A rather large number of interested members appeared to present their views to the committee and the committee is truly grateful to these members for their advice and counsel.

Your committee wishes to express its appreciation of the great amount of work done by the Council on Medical Education and Hospitals, a work which is of enormous benefit to the medical profession of America. Your committee recommends the adoption of the report of the Council on Medical Education and Hospitals.

2. Resolutions on Medical Specialty Boards: It is the opinion of your committee that the various things requested in the body of these resolutions are, in fact, already in effect and your committee sees no need for the adoption of the resolutions and recommends that they be not adopted.

3. Resolution on the General Practitioner: Your committee was much impressed with the arguments set forth by the proponents of this resolution and is of the unanimous opinion that the general practitioner, who is in fact the very backbone of American medicine, should be assisted in every way possible to advance himself. Your committee is of the unanimous opinion that better training facilities should be arranged as promptly as may be found feasible and that the American Medical Association should most urgently insist that hospitals make freely available to qualified general practitioners all of their facilities for the care of the sick. Your committee believes that it is the opinion of this House of Delegates that the reason for the existence of hospitals is for the better care of the sick and for the promotion of the health of the American people. Your committee believes that it is the opinion of this House that these ends will be best served by the existence of a large number of well trained thoroughly qualified general practitioners able to admit their patients to the hospitals in order that they may give them the very best medical care that may be provided. To this end, your committee has rewritten the resolution introduced by Dr. DiNatale and submits it to the House of Delegates as a substitute resolution:

WHEREAS, For the best interests of his patients the general practitioner at this time deserves particular consideration; therefore be it

Resolved, That (1) graduate and postgraduate education for general practitioners should be made more widely available and (2) two year rotating internships especially designed for those who wish to train for general practice be set up as rapidly as may be possible.

Your committee recommends the adoption of this revised resolution.

4. Resolution on Training of Interns: It seemed to your reference committee that this resolution has its intent closely bound with the resolution which has just been considered and for the same reasons just stated, the committee views this resolution with favor. The resolution begins with the words "Whereas, most hospitals are unable to procure an adequate complement of interns." Your committee doubts that this is actually the case but believes that many hospitals are unable to procure a sufficient number of interns and your committee has therefore changed the word "most" to "many."

The intent of the resolution is to provide a committee of five members of the House of Delegates, two of whom shall be general practitioners, to study the whole internship problem and especially to study the advisability of recommending the inauguration of a two year rotating internship which shall include the main branches of medicine, surgery, obstetrics and gynecology. It is obvious that such an internship would be an excellent training for a young physician who meant to become a general practitioner. May the committee remark parenthetically that it hopes and trusts that there will be an increasing number of young men who entertain such entirely praiseworthy intentions.

The resolution closes with an intimation that the program set forth in the resolution shall be regarded as a prerequisite for licensure in the various states. It is the opinion of your reference committee that the House of Delegates should not attempt to regulate the standards of licensure in the various states since the licensing of physicians and other professional persons is a

police power of the state and not a matter to be governed by the opinion of the medical profession. Your committee has therefore eliminated the words "as a prerequisite for licensure in the various states." With these changes your reference committee recommends the adoption of the resolution.

5. Resolution on Hospital Standardization: The intent of this resolution is to amend the action previously taken by this House which stated that "the American Medical Association shall be the evaluating agent in the following fields: (1) Medical Education, (2) Hospital Standardization, (3) Intern Training and (4) Resident Training, and that no other medical society or organization as such should be represented in this work." After conference with members of the Council on Medical Education and Hospitals it became apparent to your reference committee that the difficulty lay in the use of the words "Hospital Standardization." Both the Council on Medical Education and Hospitals and your Reference Committee on Medical Education recognize the admirable work which has been done by the American College of Surgeons in the standardization of hospitals and the highly valued cooperation of the Association of American Medical Colleges, with both of which the Council has long cooperated and which cooperation it is most anxious to continue for the general benefit of medical education, hospital standards and the public welfare. Your committee does not believe that this House of Delegates wishes to interfere with that work which has in fact been a notable service to medicine. In order that there may be no misunderstanding, the Reference Committee on Medical Education now offers to the House of Delegates substitute resolutions which it believes will clarify the situation.

Resolved, That the American Medical Association highly commends the American College of Surgeons for its long-sustained efforts in the field of hospital standardization and endorses its continued activity in this important field; and be it further

Resolved, That the Secretary of the American Medical Association transmit a copy of this resolution to the Board of Regents of the American College of Surgeons.

6. Resolution on Inspection of Hospitals: The intent of this resolution is that the Council on Medical Education and Hospitals shall extend its inspection service to all hospitals. Your reference committee recognizes the desirability of this objective. It also recognizes the physical limitations of the Council on Medical Education and Hospitals and is rather doubtful that the Council would be actually able to inspect adequately all hospitals within the United States. However, because your reference committee believes that the intent is good and because it is not sure that the Council would be unable to carry out these duties, the committee recommends the adoption of this resolution.

Respectfully submitted,

B. R. KIRKLIN, Chairman.
WALTER P. ANDERTON.
LOWELL S. GOIN.
H. G. HAMER.
CHARLES L. SHAFER.

Report of Reference Committee on Amendments to Constitution and By-Laws

Dr. William D. Stovall, Chairman, presented the following report, which was adopted by a rising vote that was unanimous, and the Speaker declared the By-Laws so amended:

Amendment to By-Laws, Division Two, Chapter IV, Section 2A(2): This amendment would admit medical officers of the United States Air Force as Service Fellows of the American Medical Association. It adds the words "United States Air Force" following the words "the United States Navy." This section of the By-Laws will then read: "On approval of the Judicial Council commissioned medical officers of the United States Army, the United States Navy, the United States Air Force or the United States Public Health Service who have been nominated by the Surgeons General of the respective services and the permanent medical officers of the Veterans

Administration who have been nominated by the Chief Medical Director may become Service Fellows." The rest of the by-law is unchanged.

Your Committee recommends approval of this resolution.

Respectfully submitted,

WILLIAM D. STOVALL, Chairman.
IVAN FAWCETT.
PAUL K. FRENCH.
WILLIAM A. HYLAND.
B. E. PICKETT SR.

On motion of Dr. Stovall, seconded by Dr. H. B. Everett, Tennessee, and carried, the report of the reference committee was adopted as a whole.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Thomas A. Foster, Chairman, presented the following report, which on motions of Dr. Foster, duly seconded, and carried was adopted section by section and as a whole:

REPORT OF BOARD OF TRUSTEES

1. Report of Board of Trustees as Printed in Handbook: Your reference committee has studied the report of the Board of Trustees as printed in the Handbook and the supplemental reports introduced at the current session. It has scrutinized the official report of the Treasurer and the Association's auditors as they appear in the Handbook, and notes with satisfaction the secure financial position of the Association. Your committee recommends adoption of the report as published in the Handbook.

2. Report of the Bureau of Medical Economic Research: Your reference committee commends the survey by Dr. Frank Dickinson of the Bureau of Medical Economic Research on the subject of revision of insurance examination fees, and the committee has learned that there is no national agency with which this question may be negotiated. Your reference committee recommends, therefore, that a copy of Dr. Dickinson's report be forwarded to the secretaries of each constituent association for study.

3. Report of Committee on Rural Health: Your reference committee wishes to commend the Committee on Rural Health for its work in the field of rural health, and recommends adoption of the report as printed in the Handbook.

4. Report of Committee on Liaison with Red Cross Blood Bank Program: Your reference committee has studied this report and wishes to commend the work of the blood bank committee and recommends at this time that the name be changed to the Committee on Blood Banks as requested by the chairman of the present committee and that the activities of the committee be continued.

5. Report of Committee on Nursing Problems: Your committee has studied this report, commends the members of this special committee for their work and is impressed with the accomplishments. Your reference committee recommends the adoption of the report as published in the Handbook.

6. Recommendation Regarding Advisory Board for Medical Specialties: Your reference committee has studied this report and the recommendation of the Council on Medical Education and Hospitals to the Board of Trustees, and recommends that the House concur with the wishes of the Council that the present relationship with the Advisory Board be continued.

7. Activities of Editor: Your Reference Committee on Reports of Board of Trustees and Secretary has considered the memorandum from the Board of Trustees on Activities of the Editor and recommends its adoption by the House of Delegates. The By-Laws provide that the functions of the Editor are a responsibility of the Board of Trustees. Your reference committee feels that this organization, together with the whole civilized world, owes Dr. Fishbein a debt of gratitude. His contributions to the advancement of medical science as Editor of THE JOURNAL have earned him international acclaim. THE JOURNAL OF THE AMERICAN MEDICAL ASSOCIATION is an enduring monument to his genius and devotion.

8. Report of Committee on Hospitals and the Practice of Medicine: Your reference committee has spent considerable time studying the report of the Committee on Hospitals and the Practice of Medicine presented by Dr. Elmer Hess and his committee. This report has created widespread interest and many members of the Association appeared to discuss the report. As a result of this discussion changes were recommended and many of these changes were approved by your committee. The report does not appear in the Handbook, but a copy has been given to every member of the House. In order to expedite the consideration of this report, the delegates are requested to refer to their copies. Your committee felt that the recommendations of the special committee would be effective if the report could be condensed, and therefore suggests that the report, amended and revised as follows, be adopted:

The corporate practice of medicine is distinctly illegal in all of the states in the Union with some exceptions. There has been statutory legislation in several states permitting certain modifications in these general laws.

In order to support this statement the Principles of Medical Ethics of the American Medical Association are quoted as follows:

Chapter I, Section 3
Chapter III, Article V, Section 1
Chapter III, Article VI, Section 2
Chapter III, Article VI, Section 3
Chapter III, Article VI, Section 6

After consideration of these Principles, it must be concluded that the over-all policy of the American Medical Association shall be that it is illegal, with the exceptions noted, and unethical for any lay corporation to practice medicine and to furnish medical services for a professional fee which shall be so divided as to produce profit for a lay employer, either individual or institutional, including hospitals and medical schools.

The ethical principles governing all groups and clinics are exactly the same as those governing the individual.

In insurance programs, hospital service plans shall provide payment for hospital services only. Medical service plans should supply payment for all of the medical services, including pathologic, roentgenologic, anesthesiologic and physical therapeutic services. The licensed physician is the only person legally qualified at the present time to render any individual medical service.

This being so, then the medical profession should be dominant in the physician-hospital relationship in all circumstances, but since the physician and the hospital are interdependent, it is incumbent on both to be completely interested in all phases of their scientific and financial relationships. This means that the professional staff of the hospital has very definite responsibilities toward not only other members of the professional staff, whether active or courtesy, but also toward hospital management. The finances of an institution in which a physician does his professional work are definitely of importance to him and to the professional staff, and the proper consideration must be given to these finances if the hospital is to work efficiently and remain the workshop of the physician.

The recommendations of the staff are usually accepted by the management of the hospital through its boards of managers or trustees. It must also be remembered that to be approved for residencies in specialties by the American Medical Association and the American College of Surgeons, certain requirements are mandatory to the institution, namely, adequate pathologic and radiologic coverage. As a rule, the staff of a hospital elects an executive committee or works under an appointed executive committee to advise the lay officers of the institution on purely professional matters, and recommends who may or may not use the institution for their professional work. Unfortunately, in many instances, the financial matters of the lay hospital management have been no affair of the staff or of its professional executive committee. This is wrong and probably the cause of most of the differences of opinion. Every professional man on the appointed staff should have a voice in the professional management of the institution. The patholo-

gist, roentgenologist, anesthesiologist and physiatrist, as well as the other professional staff members, should have equal standing as active members of the staff, and the executive committee or physicians of the active staff should be empowered to recommend the physicians heading these departments in any hospital where they exist. That the finances of the hospital are of grave importance to the staff goes without saying. Without proper facilities the services rendered to the public are in jeopardy and these public services are the all-important function of both hospital and staff.

It is therefore the opinion of the committee that most controversies between management and the professional staff, either individually or collectively, should be settled on local levels in accordance with clearly established national policy. To implement the settlement of such controversies, the House of Delegates recommends to each of its constituent state and territorial societies that it appoint a committee on hospital and professional relations. This committee shall be available to receive complaints from any physician, hospital, medical organization or any other interested person or group with reference to professional or economic relations existing between doctors of medicine and hospitals or medical schools. On receipt of such complaint by such committee, the matter shall be investigated and acted on in such manner as that committee may decide and in accordance with regular and existing modes of procedure.

There can be no exploitation of the doctor or of the hospital if everyone concerned in both management and on the professional staff will work together to supply the greatest possible good quality medical and hospital services to the public.

Most of these matters could be settled at the hospital or county level. Therefore it is recommended that after all efforts at the local and state levels have been exhausted, the charges of unethical conduct by either members of the professional staff or by hospital management should be brought to the Judicial Council for examination. If the Judicial Council, working with similar committees of hospital agencies, cannot adjudicate the specific matter and finds ethical and legal compromise impossible, then suitable action should be taken against the physician or institution found guilty. The authority for this is found in the Constitution and By-Laws of the American Medical Association as follows: Division One, Chapter III, relating to Disciplinary Action, and Division Three, Chapter X, Section 4, relating to Standing Committees.

If a hospital or other lay group is found guilty and will not cooperate within ethical and legal limits, it is recommended that the Judicial Council shall order the withdrawal of the Association's approval of that institution.

This committee can find no better recommendations to establish principles governing proper relations between physicians and hospitals than those adopted by the Massachusetts Medical Society, which read as follows:

1. That the medical costs of hospital care be separated from the non-medical costs, as can be done by existing and accepted methods of cost accounting, and that they appear thus separated on the statement submitted to the patient.
2. That a basic principle in the establishment of charges should be that each department be self supporting. This principle should be so applied that neither the hospital nor the physician rendering the service shall exploit the patient or each other.
3. That fees for medical services which are collected by the hospital be established by joint action of a representative committee of the staff, to include the head of the department, and the administrator and the governing body of the hospital.
4. That the basis of financial arrangement between hospital and physician may be salary, commission, fees or such other method as will best meet the local situation, with due regard to the needs of the patient, the community, the hospital and the physician.

It is the opinion of your committee that acceptance and practice of these principles will effect the separation of hospital services and medical care rendered in hospitals, as well as the responsibility for the payment of medical services and nonmedical hospital services as defined above, including prepayment and

other insurance plans, and should become the basis of policy to be followed in all activities of the headquarters staff.

9. The American Medical Association Program: Your reference committee has received from the Board of Trustees a report entitled The American Medical Association Program. Your committee has studied this report, discussed it with many members of the Association, and wishes to compliment the Board of Trustees on the elaboration of the twelve points in the 12 point program for the advancement of medicine and public health, and recommends adoption of this report.

Respectfully submitted,

THOMAS A. FOSTER, Chairman.
WARREN L. ALLEE.
ALLEN H. BUNCE.
WILLIAM F. COSTELLO.
WILLIAM M. SKIPP.

Presentation and Address of Major General Malcolm C. Grow

Dr. Louis H. Bauer, member of the Board of Trustees, presented Major General Malcolm C. Grow, Surgeon General of the United States Air Force, who spoke as follows:

Dr. Bauer, Mr. Speaker, Members of the House of Delegates, Ladies and Gentlemen: It is a great honor to be permitted to appear before you this morning. I am going to be brief.

First of all, I want to thank you, the House of Delegates, for your splendid action on the report of the committee in adding the new Air Force Medical Service to the American Medical Association. I think I can speak for all of the men when I say that I think that was a very fine act.

We are new, just starting off, and we need lots of help to get this thing on its feet, but I think with patience and with cooperation from this great Association we will be able to have a very fine medical service in another few years.

Introduction and Address of Dr. Richard L. Meiling

Dr. James Paullin, Past President, presented Dr. Richard L. Meiling, Deputy Director of National Medical Services, who spoke as follows:

Dr. Paullin, Mr. Speaker, Members of the House of Delegates of the American Medical Association, Friends: Dr. Allen, the first Director of Medical Services of the Armed Forces of the United States, has asked me to express both his and my feeling to you about our desire and our intention of providing the soundest medical advice, counsel and direction at this high level of our Government. We have only one yardstick. We feel that our responsibility is to assure you and our fellow citizens of the United States that the medical services of the armed forces are prepared at all times to support the armed forces in the mission established by Congress, and to assure all that our national security is first, foremost and always safeguarded. It is indeed a pleasure to have appeared before you.

Report of Reference Committee on Miscellaneous Business

Dr. Mather Pfeifferberger, chairman, presented the following report, which was adopted on motion of Dr. Pfeifferberger, seconded by Dr. Walter E. Vest, West Virginia, and carried:

Resolution on Displaced Physicians: Your committee met with Dr. Peter P. Chase, president of the Rhode Island Medical Society and editor of the *Rhode Island Medical Journal*; Dr. Alex M. Burgess, recently returned from Munich where he gave a course of instruction to the displaced physicians, and Dr. Charles Farrell, delegate of the Rhode Island Medical Society, who spoke in behalf of the resolution.

Your committee has carefully considered this resolution and finds that it is very similar to one introduced previously to this House of Delegates due to the fact that it involves investigation as to whether the different state boards can cooperate and also to the fact that the immigration authorities must be consulted and also that someone must be responsible for these physicians in a financial way.

Your committee thinks it is a matter to be handled and passed on by our Board of Trustees. Therefore we recommend its reference to the Board of Trustees for disposition.

Respectfully submitted,

MATHER PFEIFFENBERGER, Chairman.
GEORGE BRAUNLICH.
WILLIAM R. BROOKSHER.
ANDREW A. EGGSTON.
HOYT B. WOOLLEY.

Report of Reference Committee on Legislation and Public Relations

The Speaker announced that any new business to be considered had to be in his hands by 9 a. m. of the final day of the session of the House and referred to a reference committee for determination as to whether or not it was an emergency matter. He added that a resolution had been presented to him and had been referred to the Reference Committee on Legislation and Public Relations. He called on Dr. William Bates, Chairman of the Reference Committee on Legislation and Public Relations to report on the matter and Dr. Bates asked if he could first report on a resolution held over from Tuesday and was directed to do so. Dr. Bates then reported as follows:

1. Resolution on Questionnaire on Medical Care: Your committee on Legislation and Public Relations has reviewed this resolution and after carefully considering it and realizing the enormity and cost of such a survey, recommends that the House of Delegates refer this resolution to the Board of Trustees for its consideration, and, if desirable in its opinion, for implementation.

2. Resolutions on Hill Bill and Taft Bill: Your Reference Committee on Legislation and Public Relations has reviewed these resolutions. In the first place, your committee approves of their being admitted for consideration at this late hour as an emergency, according to our rules and regulations, and, meeting in advance of the acceptance of the House to consider it, it was agreed by the committee that if the House of Delegates agreed to act on them, your committee is in favor of their adoption.

Respectfully submitted,

WILLIAM BATES, Chairman.
F. J. L. BLASINGAME.
LEO G. CHRISTIAN.
WALTER G. PHIPPEN.
H. GORDON MACLEAN.

On motion of Dr. Bates, seconded by Dr. Walter E. Vest, West Virginia, and carried, the report of the reference committee dealing with the Resolution on Questionnaire on Medical Care (section 1) was adopted.

The Speaker announced that the Pennsylvania delegation would present the resolutions on the Hill Bill and the Taft Bill under New Business.

Introduction and Address of Dr. A. Lawrence Abel

Dr. Louis A. Buie, Section on Gastro-Enterology and Pathology, presented Dr. A. Lawrence Abel, London, England, who addressed the House as follows:

Mr. Speaker, Members of the House of Delegates of the American Medical Association: May I first express to you my great appreciation of the great honor conferred on me by being invited to attend this meeting. Secondly, I want to say how deeply I realize the honor of being asked to say a few words to you.

I have been instructed to bring to you the friendly, fraternal and affectionate greetings of the Council of the British Medical Association, and also from the London Division, which, situated as it is, is the largest division of the British Medical Association and numbers over one thousand consultants and specialists, in addition to many family doctors.

Your Board of Trustees has graciously asked me to leave with them a full statement of the present state of socialized

medicine in England, which I made last week at the American Proctologic Association. Time does not permit me to do more than read a few paragraphs.

First of all, about the effect on the public, there is no doubt that there is a certain portion of the public which favors socialized medicine with the thoughtlessness and greed which characterizes the man or woman not astute enough to realize that because they are paying nothing at the time, they are actually not getting anything free. There are certain people who delight in thinking they are getting something for nothing, especially if it comes out of the government. This situation has to be seen to be believed. The most serious aspect, I believe, sir, from the public's angle, is that the material benefits which they get at exorbitant cost cloak the real loss of true medicine.

The public must realize, and must be made to realize, true medicine means early diagnosis and early and good treatment. What they had under the old system was good, and increasingly better, doctoring. I sincerely warned the people not to be fooled by a few so-called free material things to the exclusion of that intangible thing, good medical care.

One of the good points about our system is that the state has assumed responsibility for seeing that hospital beds are where they are needed and are properly equipped. But those of us who have had experience with bureaucracies know what a difference there is between promises and what actually comes about. Today it is more difficult for a patient to get into a hospital than ever before. In some places there are waiting lists of from twelve to eighteen months. Therefore, although I say that it is good for the state, to assume responsibility, this is true only if the promises are fulfilled.

On the other hand, for the state to have become the owner of all hospitals is unnecessary and wicked. There should be no state monopoly of hospital beds. Healthy competition is good for any business.

The specialist has gone on with his work in spite of a sense of grievance and frustration. He is now paid for his hospital work. It must, however, be realized that the specialist is now a paid servant of the hospital and no longer the voluntary partner, and, as we all know, a paid servant is soon made to feel it. Even now, after more than nine months of working, there is still no fixed rule with regard to the salary payable to either family doctor or specialist. The government has still not promised us the right to arbitrate, which we all feel should be a condition.

As an independent profession, the government listens to you, although it seldom takes your advice. No party that might come into power would dare recommend the termination of socialized medicine, and no party would dare to alter it very substantially.

The tragedy of the whole thing is that the doctors have been brought into the service by a form of blackmail. Many are in the service with ill will. With tact, careful negotiation and reasonable compromise, their help could have been obtained with good will, because the main principle of the profession was that we were out to help the government to establish the best possible health service for the nation.

We must realize the necessity for some form of insurance for medical service. But whatever you do here, I hope you will leave state insurance for those who need that type of insurance, and leave it to those who can afford to do so to provide it for themselves. But do not forget that it appears to be the principle of our present government not to trust anyone to spend his own money, and they therefore collect it and spend it for him.

In spite of what I have said about the present health service in Great Britain being here to stay, do not forget that the British have the reputation of losing all battles except the last. We have partly lost the first battle, but governments come and governments go, and I heard someone say in back of me here, "Thank God!" The spirit of medicine in the service of humanity goes on forever, so the last battle is not yet fought between our profession and bureaucracy.

America also has the reputation, after we have suffered for months or years, of beginning to take an interest, beginning to understand, developing new lines of thought and learning from our mistakes. Also, America comes to our aid before it is too late. This time it will not be with planes, guns, men and food, but perhaps with the moral example of a really sound health service for the nation, based on freedom for the patient and the doctor and not on the slavery of the bureaucrat. The building up of a proper type of medical service should come by evolution and not by revolution. The patient should have the right to contract outside of the service. With the service covering even 90 per cent of the population, you are safe and free, but when the contract covers 100 per cent, you are slaves.

One of Lincoln's most famous speeches began with the words, "A house divided against itself cannot stand." I believe that he would have continued, "This profession cannot endure half slave and half free." I think of Abraham Lincoln, and if he were here today, he might have used words something like those he used at Gettysburg, "It is for us to be here dedicated to the great task remaining before us, that we here highly resolve that this profession under God shall have a new birth of freedom, and that freedom of medical care and treatment of the people, by the people, for the people, shall not perish from the earth."

Report of Board of Trustees

Dr. Louis H. Bauer, Trustee, presented the following report, the first section of which was referred to the Reference Committee on Reports of Board of Trustees and Secretary and the second section was adopted, by unanimous consent, on motion of Dr. Gerald V. Caughlan, Iowa, seconded by Dr. Val H. Fuchs, Louisiana, and carried.

1. Resolution on Compulsory Health Measures: The Board of Trustees recommends clarification of the action of the House of Delegates on the Report of the Reference Committee on Legislation and Public Relations pertaining to Resolution on Compulsory Health Measures. The House has instructed the Board to oppose this bill without qualification. The Board recommends that this instruction be changed to support such sections of this bill as are in conformity with principle previously laid down by the House of Delegates.

2. Report of Coordinating Committee: The Coordinating Committee, immediately after organizing, decided to employ Whitaker and Baxter as campaign managers. They were employed not only because of their general reputation, but because they were familiar with our problem. They have established offices at 1 North La Salle Street, Chicago.

The committee then decided to organize a Committee of 53, representing each state and territorial medical association.

Whitaker and Baxter now report that over one thousand organizations are on record against compulsory health insurance. These organizations include:

- The American Federation of Women's Clubs
- The American Bar Association
- The American Farm Bureau
- The National Fraternal Congress of America, including over 200 Lodges
- Two of the Small Business Organizations
- The National Catholic Welfare Conference
- The National Conference of Catholic Charities
- The Catholic Hospital Association
- The American Protestant Hospital Association
- The American Legion,

and many others.

Twenty-five million pieces of literature have been mailed out. It is important that the states see to it that this literature actually reaches the people.

Two million five hundred thousand pieces of literature have been mailed direct from Whitaker and Baxter, and not to state associations.

For the information of our members, let it be known that there is no limit to the amount of material which will be mailed to any state association or individual so long as it can be used effectively. Besides state associations and individual physicians, all endorsing organizations receive the literature.

To give an example of a typical week in Whitaker and Baxter's office, the following represents the organizations contacted in that period of time:

12,000 Trade associations
2,700 Chambers of commerce
500 Prominent clubs with civic influence
120 Advertising clubs
1,500 Kiwanis clubs
4,500 Lion's clubs
2,300 Rotary clubs
1,300 Carnegie libraries
900 College libraries
8,000 Public libraries
14,000 School principals and superintendents
9,000 Y.M.C.A. city associations
200 Y.W.C.A. city associations
130,000 Dentists and druggists

After the notice about the poster "The Doctor" was sent out, 40,000 orders were received in five weeks, and the orders are now coming in at the rate of 1,000 a week. A wide distribution of this poster is essential.

One hundred and sixty-three thousand doctors are now on the mailing list. A letter goes to each doctor not less often than once in two months. It is intended that each doctor on the list will receive a limited supply of all literature hereafter published, with an order card so that he may order what he desires.

The voluntary medical care plans have been assisted by the preparation and distribution of literature.

In order to take the financial load off the states, Whitaker and Baxter will make original mailings direct to doctors of 50 copies of each pamphlet, except where every doctor has been supplied from his own state.

A letter has been sent to each member of Congress explaining the program of the American Medical Association and enclosing a blueprint of the campaign.

Seventy-six hundred interns are on the mailing list and receive the same literature as practicing physicians.

Whitaker and Baxter report that 500 drug stores in Oklahoma will use the picture "The Doctor" as their main window display during one week.

Monroe County, New York, reports that through the "Tell 20 Plan" 15,000 letters were sent to the President and Congress in one week.

One hospital in Denver, Colo., is getting from 150 to 160 signatures a day to a letter prepared by the hospital, to be sent by friends and relatives of patients in the hospital.

Whitaker and Baxter report that one third of the states are doing an excellent job in the campaign; one third are doing a fair job, and one third are doing a poor job. It is important that all states do an excellent job. The states not doing a good job are not always the poorly organized states. One state, with no full time office has turned in a tremendous record.

The Woman's Auxiliary has been of tremendous assistance in the campaign and great credit is due this organization. State and county associations should give their auxiliaries explicit directions and make use of them. They are not only willing but anxious to help.

With reference to the resolution introduced by the New York delegation and referred by the House to the Board of Trustees, the House will be interested to know that some of the actions desired have been anticipated.

Ten million envelop and stationery stickers have been printed. These stickers read as follows:

As Your Personal Physician

I Oppose Compulsory Health Insurance Because—

It would bring you inferior medical care at high cost—

Invade your medical privacy—Put both of us under political control.

If you agree, please write your U. S. Senators and Representatives.

For more information, ask me.

When these are reprinted, there is no objection to printing them in the form of the poster, but it should be remembered that reduction of the picture to the size of a stamp, plus the words "Keep Politics Out of This Picture," may make the picture too small to be decipherable.

Mats for newspapers have already been prepared and are available.

Literature for the drug stores has already been distributed. It has been offered to 55,256 stores. Through the state and county societies they should be offered the poster.

Literature has also been sent to 83,335 dentists.

The campaign is in full swing and will be kept there. A great deal has been accomplished, but more activity is necessary and will be carried on.

The Coordinating Committee at its last meeting passed unanimously a vote of full confidence in Whitaker and Baxter.

Respectfully submitted,

ELMER L. HENDERSON, Chairman.

WILLIAM BATES.

LOUIS H. BAUER.

R. L. SENSENICH.

Report of Reference Committee on Insurance Plans and Medical Service

Dr. E. Vincent Askey, Chairman, presented the following report, which on motions of Dr. Askey, duly seconded and carried, was adopted section by section and as a whole as amended after discussion:

Your reference committee has had a number of resolutions presented to it as you all well know. It has listened to your advice and has attempted to bring to you its best judgment and opinion regarding the subjects involved.

1. Resolution on Blue Shield Coverage of American Medical Association Employees: Your reference committee has found that the plan employed for servicing the employees of the American Medical Association is one of several approved by the Illinois State Medical Society. While this plan is not a Blue Shield plan, it was recommended to the Board of Trustees by a committee of the employees after due consideration. There has been no evidence presented to your committee of any dissatisfaction among the employees affected. Your committee believes that in a choice between two approved plans the decision of the local parties involved should be upheld. It further believes that every sincere effort was made to carry out the directive of the House of Delegates. It therefore recommends that the House of Delegates hereby rescind its action of June 23, 1948, wherein it said: "Your committee recommends because of the above stated opinions that at the expiration of the present contract of hospital and medical health coverage, the American Medical Association, through its proper officials, make every sincere effort to procure this coverage for its employees through Blue Cross-Blue Shield local organization." Your committee understands that this coverage is and will be available by substituting for the words, "Blue Cross-Blue Shield local organization" the words "any approved voluntary health insurance plan."

2. Resolutions on Associated Medical Care Plans and National Enrolment Agency: Your committee recommends the approval of these resolutions as presented. It is the understanding of your reference committee that any insurance company that might be set up under this organization would come up in regular order and in the same manner as any other plan seeking approval of the Council on Medical Service.

3. Resolutions on Voluntary Health Insurance: Your reference committee believes that its recommendation regarding

the Resolutions on Associated Medical Care Plans and National Enrolment Agency, which was just presented to you, has disposed of these resolutions.

4. Supplementary Report of Council on Medical Service (a) Approve Complete and Absolute Separation of A. M. C. P. from A. M. A.: Your reference committee recommends that we approve complete and absolute separation of A. M. C. P. from the American Medical Association, and that we adopt the joint statement of the Board of Trustees and the Council on Medical Service as printed in the Handbook. Your committee approves this and recommends that you approve it.

4 (b). Approval of Tentative Principles Set Up to Guarantee Good Medical Service to Subscribers of Lay Sponsored Voluntary Health Plans: Your reference committee recognizes the forward step taken by the House of Delegates in its previous action asking for a set of principles relating to lay sponsored voluntary health plans. The twenty principles suggested by the Council on Medical Service are offered to the House of Delegates by the Council in response to that request. Your reference committee recommends that these points be forwarded by the House of Delegates to all state and county medical societies, which societies should use them as a guide in determining the eligibility of any such plans for approval by those state or county societies. These twenty points have been tentatively initiated by representatives of the Council on Medical Service and the Cooperative Health Federation of America. It should be recognized that local areas may find it necessary to make minor modifications without changing the fundamental intent involved. Your committee recommends that any lay sponsored plan desiring approval by a proper accrediting body of the American Medical Association shall come bearing the endorsement of the state or county medical association involved.

4 (c). Approval of Arrangements Made at the Suggestion of the Council with Whitaker and Baxter that the Council Develop the Positive Phases of the Educational Campaign, Principally the Nationwide Promotion of the Voluntary Health Campaign on All Fronts: Your committee agrees with this and recommends its approval.

4 (d). Approval of the Plan of Action of This Overall Campaign: Your committee gives its approval to this.

4 (e). Recommendations to Further the Effectiveness of the Council's Correlating Committees: Your committee finds that these committees have all been authorized previously. Your committee would suggest a change of name of the committee now called "Medical Care of Children" to "Maternal and Child Care."

4 (f). Increase in Staff Personnel of Council on Medical Service: In regard to the request for approval of and necessary increase in the Council's staff personnel, your committee approves the suggestion of the Council and recommends that it be referred to the Board of Trustees for its appropriate action and implementation.

5. Resolutions on Associated Medical Care Plans: Your reference committee believes that these resolutions were covered and disposed of by its report just presented in regard to the report of the Council on Medical Service and need no further action.

6. Resolution on Medical Care and Health Plans: Your reference committee believes that this resolution has been covered in its recommendations on the preceding resolutions; however, it recommends a substitute resolution which it presents to you: "Resolved, That the American Medical Association initiate through its Council on Medical Service a conference of representatives of various groups, medical and lay, for the purpose of considering the formation of a joint planning committee for the study and preparation of more comprehensive plans of medical care for the nation."

7. Resolutions on Health Plan for the United States: This could be accomplished by further study by our Council on Medical Service. Some of these suggested principles have

been approved and are already in force. Other subjects are yet under study and are not yet ready for decision. Your committee believes, therefore, that these resolutions should be referred to the Council on Medical Service for further study without prejudice.

Respectfully submitted,

E. VINCENT ASKEY, Chairman.
PAUL A. DAVIS.
JAMES Q. GRAVES.
WILLIAM H. HALLEY.
LOUIS M. ORR II.
HERBERT P. RAMSEY.

The House recessed at 12 noon on motion of Dr. Val H. Fuchs, Louisiana, seconded by Dr. Walter E. Vest, West Virginia, and carried.

Thursday Afternoon, June 9

The House of Delegates reconvened at 1:30 p. m., with Dr. F. F. Borzell, Speaker, presiding.

Minutes

On motion of Dr. Val H. Fuchs, Louisiana, seconded by Dr. Walter E. Vest, West Virginia, and carried, the House dispensed with the reading of the minutes.

Report of Reference Committee on Legislation and Public Relations

Resolutions on Hospital and Medical Care of Veterans for Non-Service-Connected Disabilities: On motion of Dr. Lloyd Noland, Alabama, seconded by Dr. Walter E. Vest, West Virginia, and carried after discussion, the House decided to reconsider the Resolutions on Hospital and Medical Care of Veterans for Non-Service-Connected Disabilities.

It was moved by Dr. Mather Pfeifferberger, Illinois, seconded by Dr. Walter E. Vest, West Virginia, and carried, that the House hear from Dr. H. H. Shoulders, Past President, on this matter.

Dr. Shoulders asked first to hear the report of the reference committee on this matter, which Dr. William Bates, Chairman, presented, recommending its adoption. Dr. Shoulders then addressed the House and was followed by Dr. Thomas K. Lewis, New Jersey, who moved that the resolution be amended so that 1. (a) reads "That the administrator of Veterans Affairs be authorized and directed to issue to or purchase for each veteran eligible to receive such benefits, a medical, surgical and hospital service insurance contract with benefit provisions sufficient to cover the costs of (1) necessary hospitalization in a civilian hospital that is approved for service to veterans by the Veterans Administration and/or is approved according to recognized medical standards, and (2) necessary medical and surgical services rendered in such hospitals on the basis of a fee schedule not less than the minimum applicable to," the rest of the resolution to be as introduced. The motion was seconded by Dr. H. B. Everett, Tennessee, and carried, after discussion during which a motion of Robertson Ward, California, to recommit to the Board of Trustees, seconded by several, was lost.

A motion to amend the last part of the resolutions under discussion was tabled, after discussion, on motion of Dr. Robert B. Wood, Tennessee, seconded by Dr. Allen H. Bunce, Georgia, and carried by a rising vote of 74 to 69.

Dr. Thomas K. Lewis, New Jersey, moved that the original motion as amended be referred to the Board of Trustees for further consideration, and the motion was seconded by Dr. Val H. Fuchs, Louisiana, and carried after discussion.

Resolutions on Hill Bill and Taft Bill

On motion of Dr. Lowell S. Goin, California, seconded by Dr. H. B. Everett, Tennessee, and carried, the resolutions mentioned in the report of the Reference Committee on Legislation and Public Relations submitted during the morning, were

committed to the Board of Trustees, with the request that it fix a day on which it will have hearings on the resolutions at which any interested person may appear to present his views.

Report of Reference Committee on Emergency Medical Service

Dr. Leland S. McKittrick, Chairman, presented the following report, which was adopted, section by section and as a whole, on motions of Dr. McKittrick, duly seconded and carried:

1. Resolution on Veterans Administration: Your reference committee has considered this resolution reviewing the high quality of medical care now being received by the veterans of this country under the Director of the Department of Medicine and Surgery of the Veterans Administration, and approves the following resolution:

Resolved, That it is the opinion of the House of Delegates that it is essential that complete responsibility and authority for the medical care and hospital services program of the Veterans Administration must be vested in the Chief Medical Director of that Administration.

Your committee noted with approval this expression of the high quality of medical care which our veterans have received since World War II, and of the mechanism which has made it possible. It recommends approval of the resolution cited above and requests that a copy of it be sent to the President of the United States and to the Administrator for Veterans Affairs.

2. Resolution on Medical Personnel Requirements of the Armed Forces, Resolution on Recruitment of Physicians Educated in Part or in Whole at Government Expense and Resolution on Need of Physicians for Armed Forces: In considering these proposals, your committee had the benefit of the able statements of delegates from the Armed Forces, the Veterans Administration and other interested individuals.

The first resolution would give power of action to the National Security Resources Board. This Board is fundamentally a planning agency and its conversion to an operational agency may not be in conformity with overall government organization.

The second resolution would advise the Secretary of Defense on action which he should take regarding recruitment of medical officers. The Secretary of Defense has a Medical Advisory Committee composed of eminent civilian physicians and dentists in being and actively functioning which is continuously considering the medical problems of the Armed Forces. It would appear, therefore, that the Medical Advisory Committee is now in a position to recommend appropriate measures to the Secretary of Defense and is prepared to carry out the purposes of this proposal from the Medical Society of New Jersey.

The third resolution recognizes the close coordination now existing between the Council on National Emergency Medical Service of the American Medical Association and the National Military Establishment and serves to formalize and extend that coordination.

The reference committee believes that this is a sound basis of procedure. It recommends the adoption of the following substitute resolutions which summarize present developments in the Medical Services of the Armed Forces, and embodies the principles expressed in the District of Columbia resolution:

WHEREAS, The Medical Departments of the Armed Forces are setting the pace in unification within the military establishment by continuous cooperation and coordination of the three medical services, as evidenced by

(1) The establishment of a Medical Services Division within the Office of the Secretary of Defense headed by a medical director; (2) The joint utilization by Army, Navy and Air Force of medical installations both in the United States and abroad by joint staffing and utilization in common of both civilian consultants and military specialists and by the cooperation of all components of medical services within the military establishment with civilian medical agencies in furthering their programs in the best public interest; and

WHEREAS, Constructive and definite measures have been and are now being taken by the Armed Forces to improve medical officer utilization and to reduce professional workloads, thereby reducing previously stated requirements; and

WHEREAS, Even with these measures present voluntary enrolment is proceeding at a rate threatening to leave the Armed Forces in serious need of physicians; therefore be it

Resolved, That if and when it becomes clear to the Council on National Emergency Medical Service that essential requirements of the Armed

Forces cannot be met in any other way it be authorized to develop a method of equitable selection from among V-12 and ASTP trained physicians and those deferred from military service to complete their medical education, and that the method proposed be submitted to the House of Delegates for its approval, except in an emergency when the Board of Trustees shall act on the proposal; and be it further

Resolved, That the mechanism approved be submitted to the federal government for its consideration.

Respectfully submitted,

LELAND S. MCKITTRICK, Chairman.
KARL S. J. HOHLEN.
GEORGE S. KLUMP.
ROLAND W. STAHR.
ROBERTSON WARD.

Report of Reference Committee on Reports of Board of Trustees and Secretary

Dr. Thomas A. Foster, Chairman, presented the following report, which was adopted on motion of Dr. Foster, seconded by Dr. H. B. Everett, Tennessee, and carried after discussion during which a substitute motion to adopt the recommendation of the Board of Trustees was lost:

Resolution on Compulsory Health Measures: After a review of the report and recommendation of the Reference Committee on Legislation and Public Relations regarding the Resolution from the Arkansas State Medical Society pertaining to the National School Health Service Act of 1949, your reference committee concurs in the report of the Reference Committee on Legislation and Public Relations as submitted and adopted by this House. Your committee believes that the Board of Trustees, in its opposition, should point out specifically the provisions of this bill which do not agree with our 12 point program.

Respectfully submitted,

THOMAS A. FOSTER, Chairman.
WARREN L. ALLEE.
ALLEN H. BUNCE.
WILLIAM F. COSTELLO.
WILLIAM M. SKIPP.

Resolution on Study of Operating Room Deaths from Section on Anesthesiology

Dr. Henry S. Ruth, Section on Anesthesiology, presented the following resolution, which on motion of Dr. Ruth, seconded by Dr. Allen H. Bunce, Georgia, and carried after discussion by Dr. William Bates, was adopted:

WHEREAS, At the present time machinery does not exist for the purpose of gathering information on operating room deaths; and

WHEREAS, The organization of Study Commissions to gather such statistics has been approved by the House of Delegates of this Association; and

WHEREAS, Several local study commissions have been organized that have developed forms for the recording of such information; and

WHEREAS, The Section on Anesthesiology has created a Committee on Operating Room Mortality which is anxious to obtain such data on a nation wide basis; and

WHEREAS, That committee is without funds to print and distribute forms for that purpose; now, therefore, be it

Resolved, That the House of Delegates recommend to the Board of Trustees the study of operating room deaths and that funds be provided to print and distribute forms for that purpose.

Resolution on Endorsing the International and Fourth American Congress on Obstetrics and Gynecology from Section on Obstetrics and Gynecology

Dr. J. P. Pratt, Section on Obstetrics and Gynecology, presented the following resolution, which was adopted on motion of Dr. Pratt, seconded by Dr. George W. Kosmak, New York, and carried:

The following resolution was adopted by the Section on Obstetrics and Gynecology on June 8, 1949, and is now presented to the House of Delegates for consideration:

WHEREAS, The American Committee on Maternal Welfare Inc., is sponsoring the International and Fourth American Congress on Obstetrics and Gynecology to be held in New York City, May 14 through May 19, 1950; and

WHEREAS, The Section on Obstetrics and Gynecology of the American Medical Association is one of the component organizations of the American Committee on Maternal Welfare, Inc.; and

WHEREAS, The members and officers of the Section on Obstetrics and Gynecology of the American Medical Association are in complete accord with the aims and purposes of the International and Fourth American Congress on Obstetrics and Gynecology; now, therefore, be it

Resolved, That the Section on Obstetrics and Gynecology of the American Medical Association endorses as a body the holding of this Congress on Obstetrics and Gynecology and urges its individual members to support it in every way possible, by becoming members of the American Committee on Maternal Welfare, Inc., by attending the meeting of the Congress, if possible, and by working individually for its success.

Roll Call and Motion Picture

The Secretary called the roll, a quorum being present, and a motion picture of the House in action was taken for inclusion in the motion picture of the American Medical Association.

ELECTION OF OFFICERS

Election of President-Elect

The Speaker called for nominations for President-Elect of the Association and Dr. J. B. Lukins, Kentucky, nominated Dr. Elmer L. Henderson, Louisville, Ky., for that office. The nomination was seconded by the delegates from Tennessee, West Virginia, Texas, Connecticut, Maine, New York, Pennsylvania, New Jersey, Missouri, Alabama, Ohio and many others.

Nominations were closed and the Secretary instructed to cast one ballot on motion of Dr. Walter E. Vest, West Virginia, seconded by Dr. H. B. Everett, Tennessee, and carried. The Secretary cast the ballot as directed and the Speaker announced that Dr. Elmer L. Henderson, Louisville, Ky., had been elected President-Elect of the American Medical Association. He requested the two delegates from Kentucky to find Dr. Henderson and present him to the House.

Election of Vice President

Dr. Thomas K. Lewis, New Jersey, nominated for Vice President Dr. James Francis Norton, Jersey City, N. J. The nomination was seconded by the delegates from New York, Tennessee, Texas, West Virginia and many others. Dr. George W. Kosmak, New York, moved that nominations be closed and the Secretary be instructed to cast the ballot for Dr. Norton as Vice President. The motion was seconded by Dr. Allen H. Bunce, Georgia, and carried. The Secretary did as directed and the Speaker announced that Dr. James Francis Norton had been elected Vice President for the ensuing year.

Election of Secretary

Dr. Robert E. Schluter, Missouri, nominated for Secretary Dr. George F. Lull, Chicago, and the nomination was seconded by delegates from Illinois, Tennessee, Kentucky and many others, after which on motion of Dr. H. B. Everett, Tennessee, seconded by Dr. Mather Pfeifferberger, Illinois, and carried, nominations were closed and the Speaker cast the ballot of the House for Dr. George F. Lull, Chicago, as Secretary of the American Medical Association for the ensuing year and announced that Dr. Lull was so elected.

Election of Treasurer

Dr. Louis H. Bauer, Trustee, nominated Dr. Josiah J. Moore, Chicago, to succeed himself as Treasurer of the American Medical Association and the nomination was seconded by Dr. Val H. Fuchs, Louisiana, and carried.

Election of Speaker of House of Delegates

Dr. James R. Reuling, Vice Speaker, assumed the Chair and called for nominations for Speaker of the House of Delegates.

Dr. William L. Estes Jr., Pennsylvania, nominated Dr. F. F. Borzell, Philadelphia, to succeed himself as Speaker of the House of Delegates. Nominations were closed and the Secretary instructed to cast the ballot of the House for Dr. Borzell, on motion of Dr. H. B. Everett, Tennessee, seconded by Dr. Walter E. Vest, West Virginia, and carried. The Secretary announced that the ballot had been cast and Dr. Reuling presented the Speaker, Dr. F. F. Borzell, who resumed the chair.

Election of Vice Speaker of House of Delegates

Dr. Walter P. Anderton, New York, nominated as his successor as Vice Speaker of the House of Delegates Dr. James R. Reuling, Bayside, N. Y.

The nomination was seconded by several and nominations were closed and the Secretary instructed to cast the ballot for Dr. James R. Reuling as Vice Speaker of the House on motion of Dr. Robert B. Wood, Tennessee, seconded by several and carried. The Secretary declared that the ballot had been cast and Dr. Reuling elected Vice Speaker of the House of Delegates of the American Medical Association for the ensuing year.

Election of Trustees

ELECTION OF TRUSTEE TO SUCCEED DR. LOUIS H. BAUER

Dr. Floyd S. Winslow, New York, nominated to succeed himself as Trustee, Dr. Louis H. Bauer, Hempstead, L. I., N. Y., and the nomination was seconded by several. On motion of Dr. Mather Pfeifferberger, Illinois, seconded by Dr. Walter E. Vest, West Virginia, and carried, the nominations were closed and the Secretary cast the ballot of the House for Dr. Louis H. Bauer for Trustee for five years to succeed himself, and the Speaker declared him so elected.

ELECTION OF TRUSTEE TO SUCCEED DR. ELMER L. HENDERSON

Dr. Robert B. Homan Jr., Texas, nominated as Trustee to succeed Dr. Elmer L. Henderson, Dr. F. J. L. Blasingame, Wharton, Texas, and the nomination was seconded from various parts of the House.

Nominations were closed and the Secretary instructed to cast the ballot of the House for Dr. F. J. L. Blasingame, Wharton, Texas, as a Trustee for five years to succeed Dr. Elmer L. Henderson, on motion of Dr. Mather Pfeifferberger, Illinois, seconded by Dr. James C. Sargent, Wisconsin, and carried. The Secretary cast the ballot and the Speaker declared Dr. Blasingame so elected.

Place of 1952 Annual Session

Dr. Warren W. Furey, Illinois, invited the House to meet in Chicago in 1952, and Dr. Louis H. Bauer, Trustee, announced that the Board of Trustees recommended that Chicago be selected as the place of the 1952 Annual Session. Dr. Bauer added that the Interim Session in 1949 will be held in Washington, D. C., the 1950 Interim Session in Denver and the 1951 Interim Session in Houston, Texas, if facilities are available at that time.

The Speaker announced that since there was no opposition, the House by acclamation accepts the invitation to meet in Chicago in Annual Session in 1952.

Election of Members of Judicial Council

ELECTION OF DR. E. R. CUNNIFFE

Dr. Ernest E. Irons, President, nominated Dr. Edward R. Cunniffe, New York, to succeed himself for a five year term. Dr. Robertson Ward, California, moved that the nomination of Dr. E. R. Cunniffe, New York, to succeed himself for five years be confirmed and the motion was seconded by Dr. George W. Kosmak, New York, and carried.

ELECTION OF DR. THOMAS P. MURDOCK

Dr. Irons nominated Dr. Thomas P. Murdock, Meriden, Conn., to fill the unexpired term of Dr. John H. O'Shea, Spokane, resigned, ending in 1953. The nomination was confirmed on motion of Dr. Walter E. Vest, West Virginia, seconded by several and carried.

Election of Member of Council on Medical Education and Hospitals

Dr. Louis H. Bauer, Trustee, announced that the term of Dr. Reginald Fitz, Boston, expires at this session and that much to the regret of the Board, Dr. Fitz has declined to have his name placed in nomination again. The Board, therefore, nominates Dr. Leland S. McKittrick, Boston, and Dr. Guy C. Caldwell, New Orleans, for a term of seven years. Dr. McKittrick regretted that his commitments would prevent him from accepting if elected and he requested his name be with-

drawn. The nomination of Dr. Guy C. Caldwell, New Orleans, as a member of the Council on Medical Education and Hospitals for a term of seven years was then accepted by acclamation.

Election of Members of Council on Scientific Assembly

Dr. Louis H. Bauer, Trustee, announced that the Board of Trustees, in accordance with the new By-Law increasing the membership of the Council on Scientific Assembly from five to seven, offered the following nominations: Dr. Charles H. Phifer, Chicago, to succeed himself for a term of five years; Dr. Carl A. Lincke, Carrollton, Ohio, for a term of six years, and Dr. Michael E. DeBakey, Houston, Texas, for a term of seven years.

These nominations were confirmed on motion of Dr. H. B. Everett, Tennessee, seconded by Dr. George W. Kosmak, New York, and carried.

Election of Members of Council on Medical Service

Dr. Louis H. Bauer, Trustee, announced that the names of three nominees must be submitted for each member whose term expires. The Board nominated to succeed Dr. Thomas A. McGoldrick: Dr. Thomas A. McGoldrick, Brooklyn; Dr. Deering G. Smith, Nashua, N. H., and Dr. William F. Costello, Dover, N. J.

To fill the vacancy caused by the expiration of the term of Dr. Elmer Hess, the Board nominated Dr. Elmer Hess, Erie, Pa.; Dr. A. A. Brindley, Toledo, Ohio, and Dr. H. G. Hamer, Indianapolis. The tellers distributed the ballots during which time Drs. Costello and Smith withdrew their names. It was then voted on motion of Dr. J. Stanley Kenney, New York, seconded by Dr. Walter E. Vest, West Virginia, and carried, that Dr. McGoldrick's nomination be confirmed by acclamation.

Election of Honorary Fellows

The Secretary announced that Lord Horder of London, England, had been nominated for Honorary Fellowship by the Section on Internal Medicine and Dr. A. Lawrence Abel of London, England, by the Section on Gastro-Enterology and Proctology.

Lord Horder and Dr. Abel, both in attendance at this session, were elected as Honorary Fellows by acclamation on motion of Dr. C. B. Conklin, District of Columbia, seconded by Dr. J. Stanley Kenney, New York, and carried.

Election of Associate Fellows

Dr. Lull presented the list of applications for Associate Fellowship, nominated by the respective constituent state medical associations and approved by the Council on Scientific Assembly:

Election of Affiliate Fellows

PHYSICIAN FROM ADJACENT COUNTRY

The Secretary presented the nomination of Dr. John A. MacMillan, Montreal, Canada, for Affiliate Fellowship, the nomination having been approved by the Judicial Council. The official records of the Association show that the House elected Dr. MacMillan to Affiliate Fellowship at its session in Chicago in 1948.

On motion of Dr. C. B. Conklin, District of Columbia, seconded by Dr. Mather Pfeifferberger, Illinois, and carried, the following nominees for Affiliate Fellowship approved by the sections indicated were elected:

NOMINATED BY SECTION ON LARYNGOLOGY, OTOLOGY AND RHINOLOGY

Largeman, Howard C., Brooklyn.
Obst, Joseph J. Brooklyn.

NOMINATED BY SECTION ON EXPERIMENTAL MEDICINE AND THERAPEUTICS

Arnow, Leslie E., Glenolden, Pa.
Craver, Bradford N., Westfield, N. J.
Gardner, Weston D., Wauwatosa, Wis.
Schroeder, Henry A., St. Louis.
Woodbury, Robert A., Memphis, Tenn

NOMINATED BY SECTION ON PATHOLOGY AND PHYSIOLOGY

Houck, C. R., Memphis, Tenn.
Overman, Richard R., Memphis, Tenn.

NOMINATED BY SECTION ON NERVOUS AND MENTAL DISEASES

Whieldon, J. A., Pasadena, Calif.

NOMINATED BY SECTION ON PREVENTIVE AND INDUSTRIAL MEDICINE AND PUBLIC HEALTH

Condon, Frank J., Evanston, Ill.
Naegele, Charles F., Staten Island, N. Y.

Telegram from State of Texas

Dr. Louis H. Bauer, Trustee, read the following telegram just received:

House passed resolution against socialized medicine this morning with only one dissenting vote. Hope for Senate action today.

Presentation and Address of President-Elect Elmer L. Henderson

Mr. Speaker and Members of the House of Delegates, Ladies and Gentlemen: This has been a very difficult week for me for more reasons than one. At noon, I slipped away and went to my room to get some long needed sleep and I was awakened a few minutes ago to be told that you had chosen me as your President-Elect. It is needless to say that this was a great awakening. I feel very humble and somewhat emotional. I am indeed very grateful for the confidence that you have expressed in me, but, more than that, I am grateful for the confidence that you have expressed in the Board of Trustees and the leadership of this great organization, for I accept this honor not personally but as a tribute to the Board of Trustees and the leadership of this organization.

I am sure that every one of you in this room has heard us referred to as "The Nine Old Men." I want to deny that. They are neither old nor are they reactionary. They are an outstanding group of sincere men attempting to do your bidding, and that is what we have tried to do. I have never known a more sincere group, and it has been a great honor and a great pleasure to me to have been associated with them.

Today, American Medicine stands at the crossroads. We either go forward or we go backward. There is no standing still. If we are to endure as a free medical profession we must stand united and present a solid front. The people of the United States have the best medical service of any nation in the world. Yet there are those who would change that for political expediency as Bismarck did in 1884. Since that time, medical service has been on the downgrade in that country. Doctors of political medicine in that country became Nazis first and doctors second. Otherwise there could not have been the war crimes that we had during World War II.

In England, the profession was divided, and today they have complete socialization of medicine or whatever you want to call it.

There are some in our profession today who feel that we should compromise and accept compulsion or political medicine. This, I can never agree to.

The medical profession has been called the first line of defense against the socialistic state. On us falls the responsibility to protect free enterprise and the health of the American people. The American Medical Association for the past 102

years has stood for free enterprise and for the promotion of the health of this great nation. Only men in a free state could have made the great progress that has been made in the health of this country, and only as long as we can live in a free state can we progress.

Ladies and gentlemen, we have just begun to fight, and with the aid of Almighty God I pledge you a fight to the finish and to a successful finish.

Election of Member of Council on Medical Service

The Secretary announced the report of the Tellers and the result of the vote on a member of the Council on Medical Service to succeed Dr. Elmer Hess as follows: Dr. Elmer Hess 93; Dr. A. A. Brindley 10, and Dr. H. G. Hamer 19. The Speaker declared Dr. Hess, having received the majority of the votes cast, elected a member of the Council on Medical Service to succeed himself for a term of three years.

Expression of Appreciation

On motion of Dr. Robert E. Schlueter, Missouri, seconded by Dr. George W. Kosmak, New York, and carried, the Speaker extended the official recognition of the House as follows: I feel that the House should take recognition officially of the efficient and very delightful manner in which the General Chairman of the Local Committee on Arrangements, Dr. David B. Allman, of New Jersey, the Atlantic County Medical Society, and the Medical Society of New Jersey, the local governing body of New Jersey, the Convention Manager, Mr. Skean, and particularly the hotel management of the Traymore, have entertained the Association. The American Medical Association has been coming to Atlantic City almost every other year so there is a sort of feeling of coming back home, but that should not make us forget the responsibilities that the local organizations have in entertaining as hosts while we are here.

Dr. Thomas K. Lewis, New Jersey, remarked: Mr. Speaker and Members of the House: I have been requested by the Medical Society of New Jersey, in behalf of the Atlantic County Medical Society, the management of the Convention Bureau of Atlantic City, and particularly the management of the Traymore Hotel, to express their appreciation of your having been guests with us during this week and to assure you that any time you come here in the future, there will be an increasing effort to make the services more efficient. You will return again in 1951, and while it is still a little premature, you have an invitation which is a standing invitation to appear here again in 1953.

Presentation and Address of Vice President James Francis Norton

Dr. Thomas K. Lewis, New Jersey, presented the Vice President, Dr. James Francis Norton, who addressed the House as follows: Mr. Speaker, Members of the House of Delegates: Just one word to tell you that I am very conscious of the honor that came my way today and to tell you that I pledge myself unreservedly behind your President, Dr. Henderson, to do everything and anything that lies within my power to aid and abet his program and to see it to the fulfillment which I am sure it will attain under the leadership of his administration.

Announcements

Several announcements were made including that of Dr. John W. Cline, California, about the 1950 Annual Session in San Francisco.

Recognition of Work of Dr. Reginald Fitz

On motion of Dr. Mather Pfeifferberger, Illinois, seconded by Dr. C. B. Conklin, District of Columbia, and carried by a rising vote, the House officially recognized the work that Dr. Reginald Fitz has done for so many years on the Council on Medical Education and Hospitals.

On motion of Dr. Mather Pfeifferberger, Illinois, seconded by Dr. Walter E. Vest, West Virginia, and carried, the House adjourned sine die, at 4:00 p. m.

THE SCIENTIFIC EXHIBIT

The Fiftieth Anniversary of the founding of the Scientific Exhibit was observed at the Atlantic City Session with one of the most outstanding groups of exhibits in the history of the institution. The total number of exhibits was somewhat less than has been shown at an Atlantic City Session in previous years, but what was lacking in quantity was compensated for in quality. The care with which the exhibit material in the various booths was selected and presented, together with the patience and the perseverance of the numerous demonstrators, resulted in a most valuable contribution to graduate medical instruction.

A feature of the meeting was a group of exhibits, sponsored by the Board of Trustees, commemorating the Fiftieth Anniversary. A committee from the Indiana State Medical Association, of which Dr. Thurman B. Rice was chairman, presented an exhibit on Dr. Frank B. Wynn, founder of the Scientific Exhibit, and showed some of the original pathologic specimens from the meeting in 1899. Another committee, headed by Dr. Peter A. Herbut, Philadelphia; Dr. Frank W. Konzelmann, Atlantic City, and Dr. William P. Belk, Philadelphia, showed advances in pathology during fifty years, with practical applications of modern methods. Clinical lectures were given in conjunction with the exhibit in an adjacent lecture room.

The Special Exhibit on Fractures, which has been a feature of the Scientific Exhibit since 1926, stressed elementary points in treatment based on the pathologic aspects of each type of fracture. The large and attentive audiences at each of the six booths attested to the value of this kind of instruction for the general practitioner. The committee, consisting of Dr. Kellogg Speed, Chicago, chairman; Dr. Frederick A. Jostes, St. Louis, and Dr. Gordon M. Morrison, Boston, was assisted by more than fifty demonstrators. Dr. Wilson S. Rise, Atlantic City, served as local chairman of the committee. Special mention should be made of the excellent assistance rendered by the Atlantic City Hospital as well as the Presbyterian Hospital, Chicago.

Three exhibit symposiums were extremely popular. The exhibit symposium on diabetes included four carefully selected exhibits, with clinical lectures in a nearby lecture room, presented under a committee of which Dr. Howard F. Root, Boston, was chairman. The group received special commendation from the Committee on Awards.

The exhibit symposium on arthritis, under the direction of Dr. W. Paul Holbrook, Tucson, Arizona, included twelve exhibits. The group received special commendation.

The exhibit symposium on physical medicine and rehabilitation was sponsored by the Baruch Committee on Physical Medicine under a committee consisting of Dr. Frank H. Krusen, Rochester, Minn., chairman; Dr. Winfred Overholser, Washington, D. C., and Dr. Howard A. Rusk, New York. There were fifteen booths in the group which received special commendation. The exhibits on speech rehabilitation were very spectacular and attracted large audiences.

Other features included a group of nine exhibits by the United States Army and the United States Navy depicting the recent advances in medicine as applied to those two branches of the government. The group received special mention by the Committee on Awards.

Various other miscellaneous exhibits attracted studious audiences.

Motion pictures in two theaters adjoining the exhibit hall attracted audiences of 10,117 persons during the week. Thirty-four films were shown on definite schedules, each film being presented once each day.

The eighteen sections of the Scientific Assembly sponsored groups of exhibits dealing with the various branches of medicine.

The Section on Internal Medicine presented a group of twelve exhibits, one of which received a Certificate of Merit and one

an Honorable Mention. The section representative was Dr. Thomas C. Garrett, Sarasota, Fla.

The Section on Surgery, General and Abdominal, had eighteen exhibits. There were four awards, consisting of a Bronze Medal and three Certificates of Merit. Dr. Walter G. Maddock, Chicago, was the section representative.

The Section on Obstetrics and Gynecology presented a group of six exhibits. The section representative was Dr. Frederick H. Falls, Chicago.

The Section on Ophthalmology had eight exhibits, one of which received a Silver Medal and one a Certificate of Merit. The section exhibit committee consisted of Dr. Georgiana D. Theobald, Oak Park, Ill.; Dr. Edwin B. Dunphy, Boston, and Dr. Phillips Thygeson, San Jose, Calif.

The Section on Laryngology, Otology and Rhinology had a group of five exhibits, one of which received a Gold Medal. Dr. James B. Costen, St. Louis, was the section representative.

The Section on Pediatrics presented eight exhibits. Dr. Albert V. Stoesser, Minneapolis, was the section representative.

The Section on Experimental Medicine and Therapeutics presented a group of eleven exhibits. There were three awards, consisting of a Certificate of Merit, an Honorable Mention and a Special Mention. The section representative was Dr. Robert W. Wilkins, Boston.

The Section on Pathology and Physiology had eleven exhibits, with two awards, consisting of a Certificate of Merit and an Honorable Mention. Dr. Alvin G. Foord, Pasadena, Calif., was the section representative.

The Section on Nervous and Mental Diseases had six exhibits, one of which received an Honorable Mention. Dr. A. B. Baker, Minneapolis, was the section representative.

The Section on Dermatology and Syphilology presented a group of nine exhibits. Dr. Francis W. Lynch, St. Paul, was the section representative.

The Section on Preventive and Industrial Medicine and Public Health had a group of ten exhibits. There was one award, consisting of a Certificate of Merit. The section representative was Dr. Paul A. Davis, Akron, Ohio.

The Section on Urology presented a group of eight exhibits. The section exhibit committee consisted of Dr. John H. Morrissey, New York; Dr. Roger W. Barnes, Los Angeles; Dr. Earl Ewert, Cambridge, Mass., and Dr. John Dees, Durham, N. C.

The Section on Orthopedic Surgery had seven exhibits. Dr. Tom Outland, Elizabethtown, Pa., was the section representative.

The Section on Gastro-Enterology and Proctology presented a group of eight exhibits. The section representatives were Dr. Donovan C. Browne, New Orleans, and Dr. J. P. Nesselrod, Evanston, Ill. Special Mention was given to one of the exhibits.

The Section on Radiology presented a group of nine exhibits. There were two awards, consisting of a Gold Medal and a Silver Medal. Dr. S. W. Donaldson, Ann Arbor, Mich., was the section representative.

The Section on Anesthesiology had ten exhibits, one of which received a Certificate of Appreciation. Dr. Harold F. Bishop, Valhalla, N. Y., was the section representative.

The Section on General Practice of Medicine presented a group of nine exhibits. The section representative was Dr. M. B. Casebolt, Kansas City, Mo.

The Section on Diseases of the Chest had nine exhibits, one of which received a Bronze Medal. Dr. Edwin R. Levine, Chicago, was the section representative.

There were 365 applications for space for exhibits at the Atlantic City Session, of which 210 were accepted by the Committee on Scientific Exhibit.

REPORT OF THE COMMITTEE ON AWARDS

The Committee on Awards made the following report:

GROUP I

(Awards in Group I are made for exhibits of individual investigations, which are judged on the basis of originality and excellence of presentation.)

The GOLD MEDAL to Julius Lempert and Dorothy Wolff, Lempert Institute of Otolaryngology, New York, for the exhibit on Modern Temporal Bone Surgery.

The SILVER MEDAL to Wendell G. Scott, Sherwood Moore, Thomas Burford and Merl J. Carson, Washington University School of Medicine, St. Louis, for the exhibit on Angiography with the Rapidograph Utilizing 9-Inch Roll Film in Diagnosis of Congenital Heart Disease.

The BRONZE MEDAL to Orvar Swenson and Edward B. D. Neuhauser, Children's Medical Center, Boston, for the exhibit on New Concepts of Etiology and Treatment of Hirschsprung's Disease.

Certificates of Merit, Group I, are awarded to the following (alphabetically arranged):

J. Scott Butterworth, Charles A. Poindexter, Clarence E. Peterson, Charles Rehnke and Arnold L. Wagner, New York University-Bellevue Medical Center, Post-Graduate Medical School, New York, for the exhibit on Visual and Auditory Teaching Aids in Cardiology.

Clarence E. Gardner Jr. and Thomas Ray Broadbent, Duke Hospital, Durham, N. C., for the exhibit on Anomalies of Intestinal Rotation.

Sidney A. Gladstone, New York Polyclinic Hospital, New York, for the exhibit on Sponge Biopsy—A New Method in Cancer Diagnosis.

Arthur E. MacNeill, Alan Mather and William L. McLaughlin, Dartmouth Medical School, Hanover, N. H., for the exhibit on A Dialyzer of Great Adaptability.

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged):

That of Joseph M. Hill, Sol Haberman, Allen F. Reid and Kenneth P. Wittstruck, William Buchanan Blood Center, Baylor Hospital, Dallas, Texas, on Physical Chemical Studies on Rh Antibodies.

That of Joseph T. Roberts, University of Buffalo School of Medicine and Veterans Administration Hospital, Batavia, N. Y., on A New Blood Supply for Ischemic Hearts and the Role of Small Blood Vessels in the Heart and Nerves.

GROUP II

(Awards in Group II are made for exhibits which do not exemplify purely experimental studies but are judged on the basis of excellence of correlating facts and excellence of presentation.)

The GOLD MEDAL to C. A. Stevenson, R. D. Moreton and E. E. Seedorf, Scott and White Clinic, Temple, Texas, for the exhibit on The Roentgenologic Examination of the Colon—Special Reference to Obscure Carcinomas.

The SILVER MEDAL to A. L. Kornzweig, Home for Aged and Infirm Hebrews of New York City, New York, for the exhibit on Pathology of the Eye in Old Age.

The BRONZE MEDAL to J. R. McDonald, L. B. Woolner and A. H. Bulbulian, Mayo Clinic, Rochester, Minn., for the exhibit on Tumors of the Lung—A Pathologic Study of Surgical Lesions.

Certificates of Merit, Group II, are awarded to the following (alphabetically arranged):

John Fallon, James T. Brosnan, John Meyers and John J. Manning, Fallon Clinic, Worcester, Mass., for the exhibit on Endometriosis and the General Surgeon.

Peter C. Kronfeld, Roy O. Riser and John T. Parker, University of Illinois College of Medicine, Chicago, for the exhibit on Glaucomatous Excavations.

Joseph L. Posch, Wayne University College of Medicine and the Detroit Receiving Hospital, Detroit, for the exhibit on the Care of the Injured Hand.

O. A. Sander, Milwaukee, for the exhibit on Siderosis—Benign Pneumoconiosis Due to Iron Fumes and Dusts.

In addition, the following exhibits are deemed worthy of Honorable Mention (alphabetically arranged):

That of Virginia Kneeland Frantz, Sidney C. Werner and Edith H. Quimby, Presbyterian Hospital and Columbia University College of Physicians and Surgeons, New York, on Radioactive Iodine—Its Use in the Diagnosis and Treatment of Thyroid Disease.

That of Lewis J. Pollock, Benjamin Boshes, Herman Chor, Isidore Finkelman, Meyer Brown, Alex J. Arief, Joseph G. Kostrubula and Louis B. Newman, U. S. Veterans Administration Hospital, Hines, Ill., on Injuries to Spinal Cord and Cauda Equina.

CERTIFICATE OF APPRECIATION

A Certificate of Appreciation is awarded to C. R. Stephen and H. M. Slater, Children's Memorial Hospital, Montreal, Quebec, Canada, for their contribution on Hypobaric Pontocaine Spinal Analgesia for Children.

SPECIAL COMMENDATIONS

Special Commendation is given to the group of exhibits on diabetes, as well as the clinics and conferences on diabetes by members of the George F. Baker Clinic and the American Diabetes Association which are presented in conjunction with the exhibits under the chairmanship of Dr. Howard F. Root, Boston.

Special Commendation is given to the group of exhibits on arthritis which is presented in cooperation with the Arthritis and Rheumatism Foundation, New York.

Special Commendation is given to the group of exhibits on physical medicine and rehabilitation which is sponsored by the Baruch Committee on Physical Medicine under the chairmanship of Dr. Frank H. Krusen, Rochester, Minn. The Committee is impressed with the excellent demonstrations, especially those on speech rehabilitation.

SUBSIDIZED EXHIBITS

The Committee on Awards commends highly the Special Exhibits on Fractures and the Fiftieth Anniversary Exhibits, which include the Historical Exhibit and the Clinical Laboratory Exhibit, as well as the clinics and conferences on laboratory methods.

SPECIAL MENTION

Special Mention is made of the historical exhibits presented by Richard Kovacs, Samuel Swerdlik and G. F. Frederick, New York Polyclinic Medical School, New York, on From Amber to Radar—The Evolution of Electrotherapy and Light Therapy; and Curtice Rosser, Tom E. Smith and Lewis Waters, American Proctologic Society, Dallas, Texas, on Fifty Years of Proctology.

Special Mention is also made of the exhibits presented by the U. S. Army and the U. S. Navy depicting some of the recent advances in medicine.

COMMENTS

The sincere and hearty cooperation of the representatives of the eighteen sections of the Scientific Assembly is largely responsible for maintaining the Scientific Exhibit as a most important educational feature of the American Medical Association Convention.

The Committee is impressed with the excellence of the motion pictures presented in the theaters adjacent to the Scientific Exhibit.

The Committee on Awards wishes to express its deep appreciation to Dr. Thomas G. Hull, Director of the Scientific Exhibit, for his unflagging and continuous efforts for nineteen years in the development and success of the Scientific Exhibit.

Respectfully submitted,

ROGER I. LEE, Boston, Chairman.
L. H. GARLAND, San Francisco.
J. DUFFY HANCOCK, Louisville.
JOHN E. RAUSCHKOLB, Cleveland.
DERRICK VAIL, Chicago.

Hearings On Health Insurance

MAY 25, 1949

United States Senate, Subcommittee on Health of the
Committee on Labor and Public Welfare

SENATOR JAMES E. MURRAY, presiding

Present: SENATORS MURRAY, TAFT and DONNELL

Statement of Seymour E. Harris of Americans for Democratic Action

MR. HARRIS: I am appearing this morning on behalf of Americans for Democratic Action, an organization of progressives dedicated to the achievement of freedom and economic security through education and democratic political action.

I have been on the faculties of Princeton and Harvard Universities since 1920 and am now professor of economics at Harvard. I am the author of twenty-one books, the latest, "Saving American Capitalism." Related to the problems under discussion, I have written a book on the "Economics of Social Security" (1941—out of print); "How Shall We Pay for Education?" (1948); "The Market for College Graduates" (in press), and, in preparation, "The Economics of Medical Care." These are all relevant to the problem. For many years I have been responsible for the teaching of social security at Harvard. I am the editor of the *Review of Economics and Statistics*, and in the years 1945 to 1948 was a member of the Executive Committee of the American Economic Association. I was in charge of the ADA Domestic Platform at the National ADA Convention of 1949.

I shall discuss the reasons for increased interest in national health insurance, the costs, the relevance of restrictionism and pricing, and the capacity of the country inclusive of government to bear the burden.

I shall not deal with significant aspects of the problem on which I am not particularly qualified to speak; e.g., the effect of the program on incentives, on regimentation, on the relations of doctors and patients. For thirty years as a teacher, I have been subject to a kind of "regimentation," to which doctors are now being asked to submit. For in education there is government and university responsibility for pricing. It seems to me that the system has worked well, and even better than if our rewards were determined primarily by student interest and choice and purely market considerations.

I. THE PROBLEM

In recent years, the pressure for health insurance has greatly increased. First, this is an age when the people look increasingly to the government for security. Protection against illness is one manifestation of the desire for security. Second, the public is becoming increasingly aware of the application of the insurance principle; the costs of serious illness are reduced for the population as a whole if they can be apportioned over the whole population. ("An unlucky sixth of our people . . . pays in one year half the total sickness bills paid by everybody.")

Voluntary insurance makes an important contribution. In June 1947 the minimum medical cost for a family of four in thirty-four cities was \$132 in Mobile; the maximum, \$222 in Los Angeles (5 to 7 per cent of consumption outlays is the usual amount). Should we allow for the rise in prices since then, the minimum and maximum figures for a modest budget would be at least \$140 and \$240. Clearly, these expenditures would be an intolerable burden on the 12.8 per cent of the nation's families with gross cash income of \$1,000 or less, a severe burden on the 15.4 per cent with incomes of \$1,000 to \$2,000, and a serious burden for those (19.5 per cent) with incomes of \$2,000 to \$3,000. Yet these are the families that especially need medical care.

The aging of the population is a relevant consideration. In 1900 this country had but 3,000,000 or 4 per cent of the population aged 65 and over; in 1948, 11,000,000 or 7 to 8 per cent; by 1975, 18,000,000 or 11 per cent. I might say that by the year 2000 the figure will be 21,000,000 or 18 per cent. Medical expenditures are a substantial part of all outlays by the old. As the population ages, the need for medical services will rise greatly; and particularly for those with limited resources.

On the average, persons 65 years of age and over spend about four times as many days in disabling illness as the rest of the population. Therefore it is quite conceivable that within a reasonable period you will need 50 per cent more health facilities to take care of the old.

The inadequacy of medical service has put pressure on the Government to do something. This inadequacy arises in part

from the high level of employment in recent years, in part from the diversions of man power to the military, in part from the improved standard of living which is reflected in a desire for more and better medical standards, in part from the failure of medical facilities to expand adequately and in part from the uneconomical organization of medicine.

The development of programs abroad, the British program, the beginning of a Canadian program, the publicity given to the medical deficiencies of draftees—all of these have aroused public interest.

The new economics of the last twenty years has gradually percolated to those who mold policy. This theory puts emphasis on the importance of finding a "corrective" for the results of man's high productivity. More consumption or (and) more leisure is the manner of absorbing the gains of progress. In the last hundred and fifty years, we have raised our standard of living by eight to ten times and cut the hours of work from 60-70 to 40. More and more, as we have learned to produce farm and factory products with less and less labor, we have turned to the tertiary industries (distribution, transportation, education, medicine, etc.) as the outlets for our released energies. Unless we find employment for our released workers through increased expenditures for services, the country will have to acquiesce to large amounts of unemployment (or corresponding rise in leisure), or to spending largely for war, or to rising expenditures for recreation, religion, education, health, etc.

II. COSTS OF MEDICAL CARE

1. *Importance.*—Even at the bottom of the depression, the Committee on the Cost of Medical Care for the American People estimated that outlays of \$100 to \$200 would be required for a family of five. The average family of five earning \$1,500 could not afford an outlay of 7 to 13 per cent of their income even though the country could afford it. Hospitalized illness then cost \$150 per case on the average, and was a serious burden on the less than 10 per cent of the middle and lower income group thus affected in any one year.

The prevailing methods of purchasing medical care have unsatisfactory consequences. They lead to unwise and undirected expenditures, to unequal and unpredictable financial burdens for the individual and the family, to neglect of health and of illness, to inadequate expenditures for medical care, and often to inequitable remuneration of practitioners. There needs to be some plan whereby the unequal and sometimes crushing burden of medical expenses can be distributed.

In 1947, private disbursements on medical care and death expenses were \$7,400,000,000 or 3½ per cent of the national income, and 4½ per cent of all consumption expenditures. Outlays of Government were \$2,000,000,000 additional. Government outlays were largely for hospitals (\$1,400,000,000), community health protection (\$3,600,000), medical care of the needy, noninstitutional (\$150,000,000).

2. *Disappointing Outlays for Medical Care.*—In 1933, the public disbursed \$2,400,000,000 or 6 per cent of the national income on medical care; in 1947 the respective expenditures were \$7,400,000,000 or more than 3 per cent. Surely if the country could pay 6 per cent of its income for medical expenses in 1933 (4½ per cent in 1929), the country can afford more than 3 per cent in 1947-1948. In an advancing society, the country is supposed to spend an increasing percentage of its income on services. That we have failed to follow this pattern in medicine is explicable in part by the unavailability of facilities, in part by the unequal distribution of services, in part by the methods of finance. What is required is more help for the poor and an insurance program which covers everybody.

III. THE RELEVANCE OF RESTRICTIONISM

1. *The Need of More Services.*—Once the government subsidizes low income groups adequately and through insurance assures larger disbursements for medical care, then the pressure on medical facilities will rise. This will result in part because much needed medical care will now be demanded and in part because once the expenses are pooled, there is a tendency to be wasteful of use of medical facilities.

(a) The response of trained personnel is a slow process. It has been altogether too slow in the professional medical field. Vigorous legislation is required to increase the personnel. By the way, the response of all engaged in medical and health services (1929 to 1947) has been much more satisfactory than that of doctors. The total number engaged in industry rose by 27 per cent; the numbers engaged in medical and health services by 36 per cent; the rise of physicians and surgeons about 10 per cent. I might say that from 1933 to 1947 the figure was 5 per cent.

(b) It follows that any rise of outlays in the short run will merely increase the rewards of those already entrenched in the industry or profession (as has largely happened since 1932), unless vigorous measures are taken to improve the organization and make more effective use of trained personnel and physical facilities. For this reason, it would be wise to expand outlays slowly—perhaps \$1,000,000,000 to \$2,000,000,000 annually in the first five years; and then \$2,000,000,000 to \$4,000,000,000 in the next five years. Beyond five and ten years, we may expect large expansion of facilities and the possibility of much larger outlays.

(c) Much better use could be made of existing personnel and facilities, thus assuring a rise in services corresponding to the suggested increase in outlays. Furthermore, the training of subsidiary personnel could be accelerated much more quickly and with more immediate results than that of the doctor or dentist. The country would profit from better organization of medicine inclusive of up-grading of the work of technicians, thus conserving the doctors' or dentists' time for the work requiring high skills. Why should my dentist clean my teeth, or my doctor get information from me which a good stenographer could obtain.

(d) The American Medical Association figures on the rise in the cost of medical services quoted elsewhere in this statement are of some significance. The increase in unit costs of services of doctors of all kinds is 36 per cent; but since the average doctor receives at least 100 per cent more than from 1935 to 1939, this suggests that he does on the average 50 per cent more business.

SENATOR TAFT: Where does that figure come from?

MR. HARRIS: Senator Taft, that figure comes from the Survey of Current Business, the total expenditures on consumption, which are itemized by different kinds of medical expenditures. In July 1948, these figures were itemized and the increase is more than 100 per cent.

SENATOR TAFT: You mean paid to each doctor, to all doctors?

MR. HARRIS: Each doctor. We have a total figure and also the number of doctors.

SENATOR TAFT: That is taking the total sum and dividing it by the number of doctors?

MR. HARRIS: That is right. It might also suggest that he has 50 per cent more callers, more operations, etc., but is harassed sufficiently so that the quality per unit is less satisfactory than before the war. Then his charge is up by much more than 36 per cent for identical service. Incidentally, the increase in hospital charges by 112 per cent also points to an increase in charges by doctors of more than 36 per cent.

I have a few figures which I put together since having this paper mimeographed. I have taken figures from 1900 to 1960. The population from 1900 to 1960 will have increased by two thirds, the national income by ten times, the real income by five times, the number of old by four times, the number of doctors by one half. It seems to me that this country, in view of these figures and in view of the possibility of getting a better distribution of medical facilities, this country could easily afford and make good use of 400,000 doctors as against an estimated supply in 1960 of 210,000 or 220,000. The expansion of medical facilities has been disappointing.

2. *Past Growth Disappointing.*—It is, however, important to provide additional doctors, dentists and facilities. In the past the expansion of medical facilities has been disappointing. For about forty years the enrolment (around 20,000) and the output of graduates (about 5,000) in medical schools has remained roughly unchanged. Yet in this period the population has increased by more than two thirds, the money national income by ten times, and the national income in stable dollars by about five times. Indeed, the stabilization of enrolment has partly been a process of raising standards, but there are also signs of restrictionism, of protecting the interests of the present members of the trade union.

The response of doctors has been disappointing in relation to other professions also. In 1870, about 1 in every 6 college graduates became a physician; in 1946, the proportion was 1 to 186. From 1870 to 1940, the percentage of physicians to population remained unchanged at 0.13 per cent; of dentists the rise was from 0.02 to 0.06, and the proportion of engineers doubled from 1910 to 1940, whilst that of physicians declined from 0.16 to 0.13. From 1910 to 1940 the number of physicians rose by but 13 per cent although population increased by 43 per cent and real income per capita by 21 per cent. From 1933 to 1946, medical expenditures rose by 200 per cent, but the accompanying expansion of practitioners was less than 5 per cent.

It is no wonder that *Medical Economics* can report gross incomes of \$17,000 for physicians in a recent year (net incomes are substantially less), or that the National Bureau of Economic Research finds that independent medical practitioners earn from 80 to 180 per cent in excess of what can be explained by additional costs of training. In the years 1933 to 1946, the rise of outlays per physician was more than 150 per cent as compared with an increase in the cost of living of but 70 per cent. Teachers have encountered great difficulties in obtaining a rise in their incomes equal to that in prices. College professors average a rise since 1939 of about 25 to 30 per cent as compared with one of about 100 per cent for physicians. A failure to expand medical training with the growth of population and income has resulted in disproportionate gains for those fortunate enough to obtain licenses, in containing total outlays.

That means on the average the average doctor has improved his real standard of living from 1939 by something on the order of 25 or 30 per cent, while the average professor has reduced his by 25 or 30 per cent.

SENATOR MURRAY: How do you explain the failure to expand training of doctors during this period?

MR. HARRIS: There has been a serious shortage of medical schools, and I think in the past there was a great dependence on philanthropic resources.

SENATOR MURRAY: Has there been any effort on the part of the American Medical Association or other organizations to try to bring about an expansion of educational institutions for medical training?

MR. HARRIS: It has been disappointing to me. The American Medical Association is a well organized group, and they certainly make their influence felt in these matters. Perhaps I am somewhat ignorant of the situation, but I am unaware of any really significant effort made by the American Medical Association to get more medical schools and the corresponding amount of hospital training facilities for those medical schools.

SENATOR MURRAY: I remember what a great scarcity of doctors there was in the country when we were preparing to enter into the late war, and hearings were held here, and there was testimony to the effect that it was going to be a difficult thing to get the doctors necessary to take part in the war; yet nothing has been done since that time to try to bring about an expansion of training for the medical profession.

MR. HARRIS: I agree with that absolutely.

SENATOR TAFT: That is largely due to the great cost of teaching doctors, is it not?

MR. HARRIS: That is true.

SENATOR TAFT: Is not that the primary reason?

MR. HARRIS: It costs \$2,500, it is said by medical schools, to turn out a doctor, \$2,500 per year to train them. The student generally pays about \$500 on the average. That means you require a subsidy of \$2,000. That is not very serious in a way because the medical schools at the present time, as I understand it, pay out about \$50,000,000 a year for training, so that if you could double that amount, you could increase the total output per year by 5,000. I think in the long run that would give you an adequate supply of doctors.

SENATOR TAFT: Also you would increase the equipment and the buildings and possibly hospitals even to go with the new medical schools.

MR. HARRIS: That is right, Senator Taft, and I gather some provision in your own bill would help achieve that.

SENATOR TAFT: I am on the Board of Yale University, and the medical school is, of course, a constant drag on the general funds of the University. We have no endowment anything like sufficient to make this up. I think our tuition is higher than \$500. I think it is \$700, but that still makes around \$1,800 per year per student, and there is no great inducement to increase the facilities to get more students to lose more money.

MR. HARRIS: That is quite true, and the philanthropic money is not coming in the way it used to.

SENATOR MURRAY: Yet the polls show there is a greater and greater desire on the part of young people to enter the profession.

MR. HARRIS: Oh, yes. As a matter of fact, I understand from some surveys made in New York state by the state commissioner of education that there are about three times as many people willing and able to go to medical schools and college as can actually be admitted.

SENATOR MURRAY: This is a serious defect in our economic system, because as you point out, our economy is developing to

that state where more and more persons have to go into services and we are failing to provide opportunities along that line.

MR. HARRIS: Yes, sir.

SENATOR MURRAY: And this profession is the profession that should be expanded more than any other.

MR. HARRIS: Yes, sir, I agree with that.

SENATOR DONNELL: Professor, on page 7 of your statement you say: "It is no wonder that *Medical Economics* can report gross incomes of \$17,000 for physicians in a recent year (net incomes are substantially less)." Do you mean that is the reported average gross income of all doctors in the United States, \$17,000 per year?

MR. HARRIS: The arithmetic mean.

SENATOR DONNELL: Does that mean if you take all the doctors in the United States, every one of them, that the average gross income of all those is \$17,000?

MR. HARRIS: Yes, sir.

SENATOR DONNELL: What is the date of the issue of *Medical Economics*?

MR. HARRIS: I can send it to you.

SENATOR DONNELL: Do you remember how many of these doctors were over \$17,000 and how many were under?

MR. HARRIS: There was one who earned \$186,000. That was the peak pay.

SENATOR DONNELL: So those very large ones entered into the computation?

MR. HARRIS: Yes, sir.

SENATOR DONNELL: You do not mean to say that in the average community, we will say a town of 20,000 such as in my home state, for instance, that the doctors there on the average are making \$17,000 a year gross?

MR. HARRIS: I would say probably the doctors in the rural and small towns are making substantially less than \$17,000.

SENATOR MURRAY: In many places they do not make more than \$2,000 or \$3,000; is that right?

MR. HARRIS: I am sure of that, and it means in the big cities they frequently make much more.

SENATOR TAFT: Have you the figures on the relative number of doctors in the United States per person as compared to other countries?

MR. HARRIS: I have had those. On the whole, the United States has the largest number in relation to population of any important country. I think we average about 1 to 750 in the population. In the Scandinavian countries it is 1 to 2,000. In China it is much less.

SENATOR TAFT: If there is a lack of doctors in the United States, then there is a much worse lack of doctors in every other country in the world; is that correct?

MR. HARRIS: Yes, sir, I would agree.

3. *The Problem of Pricing.*—My object is not to belittle the important service contributed by the medical profession. They have worked hard, put in many more hours and carried a tremendous responsibility in the last fifteen years. According to figures released by the American Medical Association the charge for physicians' services (general, surgeon, specialist) was up by but 36 per cent in 1948 as compared with a rise in the consumers' price index of 71 per cent. This indeed shows restraint on the part of the medical profession. But undoubtedly physicians have had to reduce demand on their services by raising prices; and even these figures may understate the rise, for allowance must be made for increased collections. A disturbing element in the medical picture is the rise of hospital rates by 112 per cent from 1935-1939 to 1948. This is a rise beyond that of prices in general. It underlines a point that is important; namely, that physicians and dentists account for but one third of medical expenditures; and any reduction in costs and prices must extend to drugs (with the highest advertising costs in any industry), hospitals, etc.

The real issue is one of pricing and service. An improved method of financing will make it possible to employ more doctors and dentists. What is required is more business and lower fees per visit.

4. *The Market for Doctors and the Problem of Outlets for the Educated.*—At the present time the country has about 200,000 doctors. This country should be able to support 400,000 doctors at our income levels—in part through making more funds available and in part through a reduction of prices charged.

It is important that the country find an outlet for increased numbers of physicians, dentists and other trained medical personnel for another reason. By 1968 this country will have from

10,000,000 to 15,000,000 college graduates as compared with 3,000,000 in 1940 and 4,500,000 in 1948. We are heading toward a college graduate population of 30,000,000, 25 per cent of our adult population. An outlet must be found for these graduates commensurate with their abilities and training. Medicine offers one possible outlet. In 1940 medicine accounted for about 8 per cent and in 1947-1948, 7 per cent of the living college graduates. Should the proportion of doctors and dentists to living college graduates remain unchanged from 1940 to 1968, there would be from 1,200,000 to 1,600,000 doctors, dentists, etc. Obviously, the country could not support medical men and women in such large numbers. But it would do well to support as many as it can afford.

SENATOR TAFT: That suggests that the whole thesis is wrong. After all, we are educating more people in college on the theory that all our businessmen and everybody else ought to have a college education. There was a time when everybody went to college only if they were going into a profession, but the purpose of increasing college graduates is to have a college education for everybody, whether they are in the professions or not; so I do not see the relation between the number of college graduates and the number of doctors.

MR. HARRIS: You have a problem now which, of course, has been a great problem in Europe, the problem of the proletariat of the Ph.D. You turn out an intellectual who expects a certain kind of job. As a matter of fact, you have available in this country roughly 5,000,000 to 6,000,000 high class jobs which a college graduate would like to have. Half of those are in the professions and half are in business.

When you are confronted with 15,000,000 college graduates seeking 6,000,000 jobs they would like to have and who will be frustrated if they do not get these 6,000,000 jobs, then you are encountering a bad situation.

SENATOR TAFT: You had better not have so many people going to college. I thought the theory was that everybody should go to college, every mechanic and everybody else should have a college education. I do not see why they should be frustrated if they cannot get a certain kind of job.

MR. HARRIS: I have been teaching for thirty years, and my impression is from talking to these students that they go to college because they want a high class job.

SENATOR TAFT: Everybody in the country cannot have a high class job. You have got to have 60,000,000 people working, and they have to cover the whole field of all the jobs you have.

MR. HARRIS: Here is one solution. It is to find as many high class jobs as you can. Do not let the American Medical Association or anybody else restrict the number of jobs.

SENATOR TAFT: I agree as to the lack of restriction. Everybody who wants to go into it should go into it if he can qualify. I agree on that.

MR. HARRIS: The second solution is: Do not go in just to get jobs. It is the job of the government and the universities to tell students that this is the market situation and your chances are thus and so. That is, to get these jobs.

SENATOR MURRAY: I often run into a taxi driver who tells me he is a graduate of some university with a degree.

SENATOR TAFT: Do you find him frustrated?

SENATOR MURRAY: He is apparently satisfied with the situation.

MR. HARRIS: Senator Taft, you know there was a study made of the members of the House of Representatives of the Nazi party and their study showed conclusively that there was a disproportionate number of well educated members and a disproportionate number of intellectuals who had failed to receive the kind of job they would have liked to have had.

SENATOR MURRAY: I remember in the depression years a situation in Montana where the professional men were having a difficult time making a living, and they were complaining about it, and one of the miners out there said to this doctor or this lawyer, "Why don't you go and get a job?" He said, "What can I do? I haven't got any education."

MR. HARRIS: Well, Senator Taft, you know at Yale Dean Clark suggested restrictionist measures in the depression with regard to the law profession.

SENATOR TAFT: There are times when the average lawyer got a very low income indeed.

MR. HARRIS: That is true. Even today the applications accepted in New York Medical College are but one third of the total applying. We could easily support 2,000,000 in the medical and health area as compared with 1,000,000 today.

5. *The Prospects for More Doctors.*—Both in terms of the desire of potential doctors to enter the medical profession and

in terms of needs, there is a great unfilled demand for medical services. Thus in 1939-1940, 38.5 per cent of the males received medical care when ill; for disabling illness which confined to bed the proportion was only 70.3 per cent.

Under health insurance, it will be possible to obtain increased services by improved organization. Nevertheless, at the outset, it will be necessary to limit the services available. In the longer run, there will be an increase in the number of hospitals, medical students and doctors. Even if within five to ten years we could raise the annual output of physicians from 5,000 to 10,000, it would still require at least a generation before we had increased the number of physicians to 400,000. According to The Nation's Health, the country will have to take vigorous measures to raise the total of physicians by 1960 to 227,000—12,000 in excess of the numbers needed—and dentists to 95,000—5,000 in excess of expected numbers. It is clear that it will be at least forty years before we could have 400,000 physicians. Even the Ewing program will require a rise from \$15,000,000 for man power training in 1947 to \$127,000,000 in 1960.

IV. CAN WE AFFORD IT?

A national health insurance program involves for the most part a conversion of payments for medical services from private to public sources. In this sense they are not additional. They will involve, of course, a redistribution of services. To some extent, the Administration program also calls for additional outlay. That is besides the insurance program.

1. *Who Pays?* The financing of the program is likely to be largely by payroll taxes, and secondarily from general taxes, although I gather the Administration suggests \$4,200,000,000 to be payroll taxes and one third additional through general taxes. So far as the financing is by payroll taxes, the costs will be largely borne by the workers. It is the accepted theory of classic economics that a payroll tax, whether paid by workers or employers, is ultimately borne by the worker. His pay is determined by what he produces: he now receives part in wages and part in social security benefits. The workers will also bear some part of the general tax burden. Hence the financial burden on the general taxpayer should not rise greatly. Incidentally, the British Chancellor of the Exchequer, Sir Stafford Cripps, in introducing his last budget speech said that the taxpayer would have to pay for the additional costs of the social security program, and that a large part of the burden now rests on the recipients of the benefits.

2. *Relation to the Budget.*—Much is made of the fact that with a \$40,000,000,000 budget, with commitments to veterans, public debt payments, international aid and the military of \$30,000,000,000, the country cannot afford to expand its social services, however meritorious the programs are.

But this is not a decisive argument. First because it might be possible to finance worth while new expenditures by eliminating some present wasteful government expenditures. The President estimated total expenditures for social welfare, health, education and housing for fiscal year 1950 at but \$3,200,000,000, and the additions for 1950 under proposed legislation at only \$600,000,000, out of \$6,200,000,000 proposed under new legislation.

Second, the possibility of depression conditions underlines the need for this program. The current situation, and notably the decline in output, the rise of unemployment, the reduction of investment inclusive of inventories (little more than 1,000,000 auto batteries were released by manufacturers in two months, February and March 1949, for 40,000,000 cars), the failure of recovery in April, all suggest a recession in 1949—and one that might snowball unless strong measures are taken. The correct policy seems to me to be a reduction in excise taxes and a rise in expenditures. It is indeed true, as Senator Douglas says, that we must not deploy our reserves too early; but also we must not allow a break-through which might cause substantial damage. The danger of a small depression is that it easily snowballs into a larger one.

I mention this battery example just as an illustration of what businessmen are doing. It indicates a tendency to disinvest.

Third, it is well to emphasize that these are transfer expenditures. What one pays out another (generally the same person) receives. They largely mean using resources that would otherwise be used anyway. But to some extent they mean discouraging excessive savings and therefore stimulating total spending. When you are protected against the vicissitudes of illness, you save less.

Fourth, the charge on the national income is large but easily bearable. A tax bill of \$40,000,000,000 seems large, but only \$20,000,000,000 are direct taxes that are relevant for the net national income. In a period in which national income rose by

\$180,000,000,000, direct taxes rose by but \$20,000,000,000 and the debt charge by but \$4,500,000,000.

SENATOR MURRAY: What happens in that situation? Too large an amount of income being stored away?

MR. HARRIS: You mean in case you do not provide for health insurance? I think there is a tendency for people to save too much. In other words, if you are protected, if you agree to my general thesis that in a normal peacetime economy with the population not growing too rapidly, there is a danger of oversaving. Then the difficulty is that people are encouraged to save by virtue of the fact that they are afraid of illness.

If their illness is taken care of by the government, that will to some extent discourage excessive saving.

SENATOR DONNELL: You think it is dangerous to have saving beyond a certain amount?

MR. HARRIS: Yes, sir, it depends on the conditions. In the nineteenth century we needed saving badly. The British need it now. Our economy does not. We invested in business equipment and plant in the three years, 1946, 1947 and 1948 at such a rate that in ten years we could have had a completely new plant for business. You cannot go on investing at the rate which was in effect in 1946, 1947 and 1948, and that simply means you cannot go on saving at that rate.

SENATOR DONNELL: Do you not think it is a pretty good general policy for the individual to lay aside quite a substantial amount for a rainy day in the future?

MR. HARRIS: That is one of the great difficulties, and it is unfortunate. There is a conflict, in my opinion, between the interest of the individual—and I myself act in an antisocial way because I do save, but at the same time I do have bad dreams about the fact that I save because in saving I do something that is antisocial in the sense that we have too much savings.

SENATOR DONNELL: You think that although you save and try to lay up something for yourself for a rainy day, you are committing a social inequity and a social injustice by saving for yourself and your family?

MR. HARRIS: My view is it is antisocial for me to save too much.

SENATOR DONNELL: What is too much? I do not mean personally, but how would you decide how much is too much for a person to save?

MR. HARRIS: This is all a rough estimate, but I will put it this way: In 1948 this country was investing \$40,000,000,000. I say that is too much because we cannot maintain it, and it is bound to bring a depression.

I would say if the country were saving \$20,000,000,000 of it and I were doing my share, I would not be saving too much. If you make \$20,000,000,000 available for plant, you are reconciling your behavior with society. But if your behavior is such as to make the figure \$40,000,000,000, you are acting in an antisocial way.

SENATOR DONNELL: You should spend your income liberally?

MR. HARRIS: Yes, sir.

SENATOR MURRAY: What you are saying applies more to business and industry than to individuals, does it not? As I understand it, during the last ten years the corporations of this country have been earning so much that they have been able to set aside for their treasuries such enormous amounts that they do not have to go any more to the banks to borrow money to expand plant or enter into new fields.

MR. HARRIS: Yes, sir.

SENATOR MURRAY: You think that that tremendous saving and setting aside in industry is not a good thing?

MR. HARRIS: Well, you know, Senator Murray, the arguments, and I did testify on the profit hearings, and an argument was used a good deal that business needed profits and the only way to get capital was to get it through profits. I argued that that is not a valid argument, although it is perfectly true you have to have large profits to have adequate savings, but we have come to the point where profits were too high and savings were too high. In other words, with business spending all that money in these three years, they are getting to the point where they would not find any outlets for their savings.

SENATOR DONNELL: Professor, it is certainly a decided departure from all of the traditional ideas, that saving may be excessive as applied to the individual.

I mean to say with the exception of a miserly saving in the case of a man who never spends anything and lives in grime and dirt and disease in order to save money, there may be an

evil there, but I am talking about the normal saving that you as the head of a family would want to make for yourself and your children and your wife and to have something in your old age to provide against eventualities, I say it is a very striking change from the principles of a hundred and fifty years or more in this country to advocate that people better not adopt that policy of saving to the extent previously considered. Do you agree with that?

MR. HARRIS: I am afraid I do not. I agree it is shocking.

SENATOR DONNELL: It is a shock?

MR. HARRIS: Yes, sir, but I still maintain my position.

SENATOR DONNELL: I do not want to interrupt you except to make this clear. What I was trying to get at is: You do agree that the doctrine you are advocating here this morning is a shocking doctrine as compared with the previous conception in our country? Do you agree with that?

MR. HARRIS: I would not say it that way. It seems shocking when presented in that way, but one should not withhold a statement merely because it may shock people if the person who makes it thinks it is correct.

In its drain of resources, the government still accounts for one eighth of the total output just as it did in 1933. It is well to compare the \$40,000,000,000 of income in 1932 and the \$225,000,000,000 in 1948 and consider the important contributions of the rise of government spending.

From a long run viewpoint, it is imperative to increase the outlays on medicine. This is an important outlet for spending; and unless means are found to cut savings and increase spending, there are serious dangers of deficiency of demand, wasted resources and unemployment.

SENATOR DONNELL: I would like to have noted that the Professor says that unless means are found to cut savings and increase spending, there are serious dangers of deficiency of demand, wasted resources, and unemployment.

MR. HARRIS: Yes, sir.

SENATOR MURRAY: We could save ourselves into a depression very easily?

MR. HARRIS: Yes, sir.

SENATOR MURRAY: And that is beginning to appear at the present time?

MR. HARRIS: Yes, sir.

SENATOR DONNELL: You think that generally speaking the people in this country are too saving at this time?

MR. HARRIS: Yes, sir, I am inclined to think so. Senator Donnell, may I say this: We would have had a depression a long time ago had it not been for the war and the wartime expenditures. That is the spending that has kept us out of a depression.

That is one of the penalties you pay for being too rich, because as you become rich, you save. A man with a \$10,000 income saves more than a man with \$2,000 income. As I say, the only other alternative is large outlays for war. And should World War III come, we shall not be sorry for increased medical facilities.

Those who say we cannot afford these outlays should compare the British budget. Their taxes account for 40 per cent of their income, ours but 25 per cent; their defense expenditures 7½ per cent of their income, ours 6½ per cent; their social services require \$3,400,000,000 or 8½ per cent of their income (\$5,400,000,000 or 13½ per cent inclusive of food subsidies) and ours only \$7,000,000,000 or 4 per cent of our income. Yet the British per capita income is \$800, ours \$1,600. And despite these heavy charges, the British have made a truly remarkable recovery.

SENATOR DONNELL: Somewhat assisted by America in that recovery; is that right?

MR. HARRIS: Yes, sir, but still they have done a remarkable job if you consider the fact that they are producing more than they did in 1939, having lost the equivalent of two years' income as a result of war damage, and have virtually wiped out their deficit in the balance of payments, I think they have done a wonderful job.

V. COMMENTS ON PROPOSED LEGISLATION

The Senate has under consideration three bills: 1. The National Health and Insurance Bill (S. 1679; H.R. 4312, 4313) is a comprehensive health program. This is the Administration bill. 2. The Voluntary Health Bill (S. 1456) sponsored by Senator Hill and others. 3. The National Health Bill (S. 1581) sponsored by Senator Taft and, I believe, Senator Donnell, and others.

SENATOR DONNELL: Also Senator Smith.

MR. HARRIS: Yes. I compare these bills below.

1. *Comprehensiveness*.—The Administration bill (S. 1679) is much to be preferred on these grounds, for it not only offers wide coverage, but it also deals adequately with additional training facilities, rise of personnel, hospitals, aid to rural areas, preventive measures, public health and research. The Taft bill also makes some provision for improving health services, liberalizing the Hospital Survey and Construction Act, and increasing man power.

I read the Taft bill after I wrote this. I must say it does make important contributions, although my preference is for the Administration bill.

2. *Coverage and Costs*.—The Administration bill (S. 1679) provides coverage for about 85 per cent of the population, inclusive of the employed, self employed and their dependents, beneficiaries under old age insurance and provides aid for others short of resources through governmental participation. The Taft bill proposes help for the indigent.

It is not clear how many would be covered under the Taft bill, but an ultimate appropriation of \$300,000,000 is suggested. Inclusive of state participation, this might cover 10,000,000 to 12,000,000 persons. In 1947, there were 13 per cent (17,000,000) of the population with incomes less than \$1,000, and 31 per cent (44,000,000) with incomes of less than \$2,000. At the time the cost of a modest budget for a family of four was estimated at around \$3,300. It would be no exaggeration to assume that the costs of the Taft program for subsidies to the poor alone would be \$2,000,000,000. Of course, the appropriation is not anywhere near that large. (All those with incomes less than \$2,000 might receive help.) Actually in 1939 the American Medical Association estimated that families with incomes under \$3,000 could not afford a serious illness. This is the equivalent of \$5,000 today and, therefore, the American Medical Association estimate suggests help for 80 per cent of all families. The Hill program provides help for those who cannot afford to join voluntary agencies. Perhaps the costs would equal those of the Taft program. The Administration program would, however, according to an estimate of the Social Security Board reconsidered by Soule, cost little more than \$1,000,000,000 over current outlays for the services offered under the Administration bill. S. 1679 would have the advantage of making the resources available on an insurance principle to virtually the whole population. This would be especially important for the 80 per cent of the families with incomes of less than \$5,000.

3. *Who Should Benefit?*—The major issue between the Administration bill on the one hand and the Taft and Hill bills on the other is that of coverage and the insurance versus the charity principle. It has been a cornerstone of social security in this country that the beneficiaries contribute and receive benefits as a right. It is their fund that finances the benefits. It has also been a fundamental principle that coverage should be as complete as is administratively possible. The Administration is dealing with this problem in other parts of the Social Security Program. The Taft and Hill bills mark an important departure from social security as an insurance program, to social security as a handout. Indeed, the Taft and Hill proposals would concentrate their help on those who need it most, the indigent. But in so doing they deprive the vast part of the population of the benefits of a national health insurance.

SENATOR MURRAY: If that system were to be expanded and put into effect, do you not think it would gradually result in the expansion of that into a total program for the whole country?

MR. HARRIS: You mean the Taft bill?

SENATOR MURRAY: Yes, sir.

MR. HARRIS: Yes, sir. I think the tendency would be to extend help much further than the appropriation suggested on the bill would make possible.

SENATOR MURRAY: Yes.

MR. HARRIS: 4. *Control*.—These bills also raise some questions concerning control. The control should rest largely with the public, that is the consumers, not with the organized medical profession. No one has yet suggested that the teachers should control the educational system, and bankers are not supposed to control our monetary machine. Nor, for that matter, are the public utility people supposed to control their own rates. Indeed the medical profession should play an important part in all technical matters and even in general administration.

5. *In General*.—Even the Administration bill might be considered only a beginning. It will be a long time before the country has the medical personnel, hospitals and other facilities

that this country can afford. Total expenditures for medical care, both private and public, are today less than \$10,000,000,000, or about 4 per cent of the national income. We can certainly look forward, if we are spared a major war and experience good management, to a national income of \$300,000,000,000 by 1965. (That is a rate of growth less than normal.) With an income of \$300,000,000,000, this country could afford to spend at least 6 per cent of its income for medical care, and offer a large outlet for our surplus energies. But we shall spend wisely only if we train personnel vigorously, and improve our financing methods.

Summary.—1. The Administration bill is much to be preferred to the Taft and Hill bills. For it offers close to complete coverage, deals adequately with the crucial problem of expansion of facilities and personnel and proposes much needed organizational improvement. The control rests, moreover, with the public, not with those who sell the services. As in education where the control is not by the teachers, so in medicine the control should not be with the sellers of the services.

2. The crucial issue is whether we are to have systems under which the 80 per cent with incomes of less than \$5,000 are to be protected against the accidents of sickness by a contributory insurance plan or whether (as under the Taft and Hill bills) the money is to be spent on a charitable basis for the benefit of those who claim need. Our social security program rests on the self-respecting principle that those who contribute receive benefits as a right.

3. In the past, the training of doctors and dentists has been inadequate. The medical schools have been turning out about 5,000 graduates per year over a period during which our population almost doubled and our money national income rose by ten times and the income in goods by five times. In fact, as a result of the small increase in practitioners, the country spent a much smaller proportion of its income on medicine in 1948 than in 1929 or 1933.

SENATOR MURRAY: That is notwithstanding the fact that medical fees have been greatly increased?

MR. HARRIS: Yes, sir, they have.

SENATOR MURRAY: So that there is a lack of real medical care?

MR. HARRIS: Yes, sir. A further result is large windfall gains for those in this profession. Over a recent period of seventeen to eighteen years, the income of physicians was up about 150 per cent and the rise in numbers but 5 per cent. The charge per unit of services since 1935-1939 is up by about 35 per cent; and the amount of business has greatly expanded. It is imperative to increase the facilities and personnel and to improve organization. This the Administration proposes to do.

4. Both from the immediate and long run economic prospects, it is imperative that the public spend more on services, and especially worth while services. In this manner, the energies released by increased productivity will be absorbed. The alternatives are wastage in war or in unemployment. This country can afford to increase total expenditures on medicine and health by \$2,000,000,000—that is, from \$10,000,000,000 to \$12,000,000,000 in one to five years and from \$12,000,000,000 to \$14,000,000,000 in five to ten years.

5. It is also necessary to find outlets for the 10,000,000 to 15,000,000 college graduates we expect by 1968. Medicine and health now offers employment to 1,000,000; it might well increase the market for college graduates by 500,000 and thus make an important contribution toward solving one of the most important political and sociologic problems facing the country.

6. What we ask is more total income for medicine; better distribution of services; a diversion of expenditures and employment into this important service area. This is partly a medical problem and particularly one of organization; but it is also part of the great economic problem of finding ways to keep our *economic machine from collapsing because of its highly productive efficiency.*

SENATOR MURRAY: This program advocated by the Administration would result in a great increase in the income of the medical profession?

MR. HARRIS: Yes, sir, I am sure it would.

SENATOR MURRAY: And it would distribute the profession around the country to places where the people are not adequately served at the present time?

MR. HARRIS: Yes, sir.

SENATOR MURRAY: So you do not find in this bill anything designed to injure the medical profession?

MR. HARRIS: No, sir, I do not. I find it a little difficult to understand the opposition of the medical profession. I think in general—before I came over here I read the last series of

articles in the *Saturday Evening Post* on medical economics, and this gentleman on the whole does not like this program, but he does say the American Medical Association is to be criticized for having been altogether too inflexible on those matters in the past.

* * *

SENATOR DONNELL: You spoke of the authorship of twenty-one books, the latest being "Saving American Capitalism." Have you expressed yourself on the subject of socialism?

MR. HARRIS: Yes, sir, and I am against socialism. I would not write a book on "Saving American Capitalism" if I were for socialism.

SENATOR DONNELL: I understand that. And you have written this book, "Saving American Capitalism," in which you advocate doing certain things you think should be done for the preservation of the capitalistic system?

MR. HARRIS: Yes, sir.

SENATOR DONNELL: You speak of having in preparation a book entitled "Economics of Medical Care."

MR. HARRIS: Yes, sir.

SENATOR DONNELL: Have you been over to England personally?

MR. HARRIS: No, sir, I have not visited any foreign country on medicine.

SENATOR DONNELL: Have you studied the regulations issued by the British authorities in regard to the administration of the medical plan?

MR. HARRIS: I have done quite a bit of reading on the British episode.

SENATOR DONNELL: Do you remember a volume possibly 2½ to 3 inches thick, a bound volume, containing various regulations which are used in the carrying out of the British system of medical insurance?

MR. HARRIS: No, I have never seen that.

SENATOR DONNELL: You have never seen it?

MR. HARRIS: No, but I have been through an awful lot of stuff on *British medical insurance.*

SENATOR DONNELL: But you have never seen the official book of regulations issued in England?

MR. HARRIS: I will do that before I finish my book. I wish you would give me an exact reference.

SENATOR DONNELL: We can give it from the previously published hearings before this committee. In fact, we had the book here, and I would judge it weighed conservatively a pound and a half or maybe more than that in actual weight, and it is official, as I understand it.

MR. HARRIS: I still have not written my chapter on British medical insurance, but I will send you a copy of my book because I would like to convert you.

SENATOR DONNELL: I would be glad to have it.

SENATOR MURRAY: As I understand it, that book of regulations had reference to the Act that was in operation prior to the present Act that was put into effect in England just last year.

SENATOR DONNELL: I think that is certainly true, but I have no doubt they have regulations at this time. I cannot conceive that they have abandoned their regulations. I wanted to find out how familiar the professor is with the English system, and I take it you will agree that in order to have real familiarity, you would have to see the regulations under which it operates, would you not?

MR. HARRIS: Yes, sir, I would agree. May I make a further comment?

SENATOR DONNELL: Yes.

MR. HARRIS: I read some pamphlets the American Medical Association put out on British health insurance. Those articles were done by a former student of mine, a Ph.D. in economics. I vouch that I know much more about medical economics in Britain than these articles show. There are a great many people who know more about British medical economics than I do, but I would say I do know more than all but perhaps a very few in this country about that subject.

* * *

SENATOR DONNELL: Now, as I understand it, you think that \$12,000,000,000 to \$14,000,000,000 is a reasonable figure to anticipate to carry out those promises. Is that your opinion?

MR. HARRIS: No, sir.

SENATOR MURRAY: He did not say that.

SENATOR DONNELL: Let the witness answer that.

SENATOR MURRAY: You are trying to misrepresent his testimony.

SENATOR DONNELL: I certainly am not. I am asking him if he says that.

MR. HARRIS: I am not speaking for the Administration. I am not speaking for anybody except the Americans for Democratic Action. I am a college professor with views of my own. I have consulted the Americans for Democratic Action about my views. The Administration, as far as it appropriates money, et cetera, as the Administration representatives said, the amount involved at the present time is only \$1,000,000,000 or \$1,500,000,000 more of government money, and the rest is a substitution of payroll taxes as one means of financing this as against private expenditures.

SENATOR DONNELL: Let me ask you this. Have you made any estimate at all as to how much it is going to cost per year, regardless of where the money comes from, to carry out the promises contained in S. 1679 to the people of this country? Have you made any estimates?

MR. HARRIS: Why should I?

SENATOR DONNELL: Have you made any?

MR. HARRIS: I have made estimates of my own.

SENATOR DONNELL: What have you estimated would be necessary in order to carry out the promises made in S. 1679 by the year 1960?

MR. HARRIS: Why don't you go back to the estimates made by Mr. Ewing in the Nation's Health?

SENATOR DONNELL: Professor, you asked me why I don't do it. I want to get your ideas, not Mr. Ewing's.

MR. HARRIS: I am being more liberal with the government's money than the Administration is.

SENATOR DONNELL: I will admit you are pretty liberal, that is true, but what I am trying to get at is this: This is the last time I am going to ask you. Have you made any estimate at all as to how much is going to be necessary for the government to spend, regardless of where the money comes from, taxes, imposts, duties, whatever and wherever it comes from, in order to comply in the year 1960 with the promises in S. 1679? Have you or not?

MR. HARRIS: I would say this particular bill does not involve larger expenditures in the next few years than you have.

SENATOR DONNELL: Have you made an estimate?

MR. HARRIS: I have made my own estimate.

SENATOR DONNELL: What is it for 1960 for S. 1679?

MR. HARRIS: If you will let me explain it—

SENATOR DONNELL: Can you tell us how much would be required, in your opinion, for the United States Government to expend from all sources, taxes or whatever the source may be, in the year 1960 in order to comply with the promises made in S. 1679?

MR. HARRIS: My honest estimate is that in five years you need \$1,000,000,000 to \$2,000,000,000 more and five years after that \$1,000,000,000 to \$2,000,000,000 additional and \$1,000,000,000 to \$2,000,000,000 on burial expenditures, which is a very important matter.

Statement of Dr. Carl O. Flagstad, Minneapolis, on Behalf of The American Dental Association

DR. FLAGSTAD: My name is Dr. Carl O. Flagstad. I have been engaged in the private practice of dentistry in the City of Minneapolis, Minn., for thirty-eight years, during which period I also have been a professor in the School of Dentistry at the University of Minnesota, where I have served as chairman of the department of denture prosthesis for many years.

The dental profession believes it is the rightful guardian of the people's dental health and that the profession is best qualified by training and experience to judge the value of a dental health program for the United States.

The dental profession believes it would be derelict in its duty if it did not oppose health legislation which in its judgment is detrimental to the health and welfare of our people.

The American Dental Association believes this committee and the Congress of the United States will understand that the Association, in its opposition to the philosophy of compulsory health insurance, is motivated by the sincerest desire to protect the nation against a system which the Association believes will deteriorate the health services afforded to our people.

The proposed legislation is termed "National Health Insurance" but it is not actually insurance, because there is no sound actuarial basis to serve as the foundation of the program. nor

is there any relationship between the proposed benefits and the ratio of premiums to be collected. Actually, even the proponents of the bill cannot give a clear estimate of the amount of funds which the proposed appropriation would provide in relation to the probable costs of offering the various health services; nor do they present a convincing forecast as to the probable immediate demand for various types of services proposed to be paid for in relation to the probable cost of these services.

The proposed legislation will eventually, if enacted, develop into a system of state medicine, which means it will be absolutely controlled by the government and its administrators. A third party who is directly responsible to the government and only indirectly responsible to the patient is interposed between the patient and his dentist or physician.

Although a number of plans are proposed in the bill, which indicate that a practitioner could participate in the system on either a fee for service basis, under the panel system, or on a salary basis, nevertheless, considering the great size and population of our country and the necessary complexities of administration involved, it does not seem reasonable that any of these systems could be continued in effect very long. The fact that the bill provides for three different methods of payment to practitioners only serves to emphasize the increased administrative costs which would be incurred. In a relatively short time it would be necessary for the government to abandon alternative methods of payment and to insist on a salaried service and mass clinical service in health centers.

The bills are not specific: It is impossible to examine this bill carefully without being continually impressed with the fact that there is very little that is specific in the bill. Actually it amounts to little more than an appropriation coupled with a license to experiment along certain lines until such time as a firm base line can be determined. Yet, if this is to be insurance why is this necessary? Congress has on at least two occasions passed laws which were specific and definite insurance policies containing generally within themselves the benefits to which the policy holders were entitled. I refer, of course, to the War Risk Insurance Act and to the National Service Life Insurance Act.

It has been a principle of government in this country since the time of the founding fathers that ours is a government of laws, not of men, and that to accomplish that end all statutes must be definite and specific. For this reason the courts have frequently held that broad, general language might constitute a delegation of legislative authority which is reserved to the Congress alone. Yet under the pending bill nothing definite will be known until such time as administrative regulations are promulgated, revised, re-revised and possibly at some distant future date crystallized into such form that the Congress can adopt them as a statute. The American people are entitled to know at the time of enactment of a law its probable effect and its proposed cost. Neither of these can be ascertained under the pending bills.

The association believes that dental care should be available to all, regardless of income or geographic location, and that programs developed for dental care should be based on the prevention and control of dental diseases. It has recommended the following program as an immediate planned action to accomplish this objective: 1. The prevention of dental diseases through the application of preventive technics as soon as they are demonstrated to be scientifically valid; the support of intensified dental research with adequate funds, personnel and facilities. 2. The control of dental diseases by the expansion of community dental programs, integrated in the general health program to make dental care and dental health education available to every child. 3. The provision of additional facilities and uniform standards for dental care by making dental services available in hospitals and health centers for inpatients and outpatients. 4. The recruitment of an annual enrolment of dental students equal to the capacity of all dental schools to increase the number of qualified dentists. 5. The adoption of measures to make dental practice in smaller cities and rural areas more attractive and more rewarding in order to procure a better distribution of dentists. 6. The employment of dental hygienists as auxiliary aids to the dentist; the provision of additional courses for those who desire to qualify for positions in public health departments and schools.

Summary: The dental profession is opposed to the philosophy of compulsory health insurance legislation for the following reasons: 1. It is not good legislation for the government because: (a) it is too tremendous a task for the government to administer; (b) there is a misconception by the people of what the government can and will deliver in health services; (c) it will create an unwieldy government bureau; (d) it is an

uncertain financial burden for the government; (e) it is contrary to democracy in government, since it stifles private enterprise.

2. It is not good legislation for the people because: (a) it promises more than it can deliver; (b) it will cause deterioration of dental service and lower the level of health; (c) the necessary administrative procedures will delay treatment; (d) it will become a tax burden; (e) it will eventually require regimentation, which is not the American way of life.

3. It is not good legislation for the profession because: (a) it will destroy competition, inhibit ambition and industry; (b) it will result in mediocrity in the profession; (c) excessive paper work will reduce the number of chairside hours which a dentist may devote to his patients.

The profession needs ethical competition, the private relation to and direct responsibility for the health of the patient to attain its highest achievements.

Conclusion: The American Dental Association (and the dental profession) always have been and always will be interested in the health, and particularly the dental health and welfare of the American people. It will conscientiously scrutinize any programs offered which relate to its legitimate field of interest, and it will comment fairly and without prejudice or selfish motives on such programs.

The dental profession opposes the enactment of the National Health Insurance and Public Health Act because it is not good health legislation for the people of the United States of America.

**Statement of Dr. Louis H. Bauer, Hempstead, N. Y.,
on Behalf of the American Medical Association,
Accompanied by Dr. Roscoe Sensenich,
South Bend, Ind.**

DR. BAUER: My name is Dr. Louis H. Bauer. I am a physician and appear as a member of the Board of Trustees of the American Medical Association which had a membership as of May 1, 1949, of 142,882 physicians. My home is in Rockville Center, N. Y., and my office is in Hempstead, N. Y.

There is little disagreement as to the desirability of the widest possible distribution and availability of the best quality of medical care. The differences of opinion arise as to the best way to attain this objective. It is the belief of the medical profession generally that the primary responsibility for the health of individual citizens rests on the individual citizen and on his immediate family. Where the requirements of a particular situation exceed the ability of the individual or his family to meet them, the local community, by the American tradition, comes to his aid. Should the resources of the local community prove inadequate to deal with the volume of demand for assistance in the health field, the problem then becomes the responsibility of the state.

It is only when the state in its turn is unable to cope with these demands that there should be recourse to federal assistance. We believe that this procedure is in accordance with sound American tradition, with the intent of our political principles and with the maintenance of self reliance and independence of each of these levels of relationship, from the citizen to the national government.

It follows that the local community or the state should make provision for the supplying of medical care to those of its citizens who find themselves financially unable to procure needed services. It is customary to speak of such economic groups as the indigent or medically indigent. It is believed that a simple system can be set up by which those falling into these groups may seek the services of any reputable physician and that such physician may be recompensed from public funds in accordance with an established fee schedule.

Perhaps it would be necessary in order to prevent abuse that a welfare department or some other investigating agency of the political unit should certify to the propriety of covering the specific case under the provisions of the system. Such a system is not merely a theoretical proposal. It is already in practical operation and is proving generally satisfactory.

There may, of course, be other types of organization and wide diversity in detail in the methods adopted to meet the health problem at the local and state level. The point of importance is that the responsibility lies here and should be recognized and so far as possible met at the local and state level. Only when these political subdivisions have made full effort and fall short of accomplishment should recourse be had to federal assistance.

Under such circumstances it may become incumbent on the federal government to support the state effort. This support may take the form of supplying advice, experience, expert personnel on a loan basis, or financial aid. Before financial aid is granted, it should be established that the individual

state has made genuine efforts to solve its own problems, that its health program is soundly conceived and efficiently operated, and that only lack of funds as evidenced by the general economic condition of the state is the reason for the need of federal financial assistance. Nothing in the relations set forth, however, should imply that the federal government should assume the right to dictate a single system of medical care for all states, or to attempt to control the appointment of personnel in the state plans or otherwise to exercise improper interference. There should perhaps be a recognized percentage limit, as relative to the total cost of a state plan, beyond which federal financial aid could not be extended.

It will be seen that this conception of the relation of the federal government to the provision of medical care to the least favored economic groups is that of a stand-by support of the state programs. It would place primary responsibility and initiative on the state and local governmental divisions. It would prevent dominance of the local authorities from Washington. It would limit interference in state plans to the approval of their adequacy and efficiency. It would make the need for financial assistance and the amount of such assistance dependent on the economic status of each particular state.

From what I have said, it will be obvious that any plan for federal participation in the handling of the problems of medical care that lodges primary initiative and control in Washington, that contains uniform and compulsory features on a nationwide basis and that lays a direct federal tax on citizens generally to finance the program is unacceptable in principle. Such plans concentrate further power in the central government; they absorb in Washington functions much better retained at the local level, and they greatly enhance the overall cost of providing health services. Most important of all, they would lead to a widespread and serious deterioration of the quality of medical care.

The provision of medical services to the indigent is not all of the problem that faces us in the matter of general adequate medical care. There is a large group, above the level of medical indigents, who yet find the professional service cost of a serious illness a grave financial problem. These people need security against such calamities and it is the accepted idea that the insurance principle is the answer to the problem, but it should be voluntary insurance. There is no justifiable reason for assuming that these people are minors or incompetents and compelling them by federal law to participate in a nationwide system of prepayment for so-called health insurance. Leaving aside any questions as to the government's being able at this time to deliver the services promised and paid for under such a scheme, it constitutes an extreme example of compulsory paternalism, wrong in principle, impossible of practical operation and contrary to our established ways and habits of life and political principles.

This is not meant to imply that effort is not needed to stimulate the widespread development of voluntary prepayment plans for insurance against the professional costs of serious illness. Such plans already have an extensive existence and are spreading rapidly. They deserve the wholehearted support of all who are honestly interested in this problem. Such plans are actuarially sound, are well managed and are backed by a medical profession ready to accept some financial sacrifices, if necessary, for a large public good. There is no reason, after the experimental period has passed, why such plans should not be self supporting. The only question of governmental aid, either state or federal, might concern certain marginal financial groups and certain short initial developmental periods.

The Council on Medical Service of the Association, created by the House of Delegates in 1943, has conducted a continuing study of proposed programs pertaining to the economic, social or other similar aspects of medical care, has suggested improvements in such programs and has made available all information that it has been able to assemble. The Council has taken the initiative in assisting in the promotion of voluntary prepayment programs. The term "assisting" is used advisedly because much of the actual promotion must be done at the state and local levels, by the plans themselves, by the medical societies and by physicians.

I would like to leave with the committee a copy of a brochure prepared by the Council, revised as of 1948, which contains detailed information with respect to the various medical care voluntary programs that are in existence at the present time in some forty-three states. If, during the course of these hearings, members of the committee wish further testimony with respect to the plans themselves, the Association will be only too glad to make that information available. Suffice it to say here that approximately 57,000,000 people have hospitalization coverage and approximately 30,000,000 have surgical coverage, both as a result of voluntary action on their part.

The Association has now completed over one hundred years of organized existence. During these years it has developed an ever expanding program with a view to charting a safe and sure road toward the advancement of the nation's health. It has directed continuing study and experiment to improve methods of undergraduate education in medicine, the organization of opportunities for postgraduate study and the creation of facilities for the provision of the best medical care, including service to the indigent and those of low income.

The direction of these efforts throughout the whole field of study and the improvement of standards and methods have been characterized by close contact and cooperation with the health activities of governmental agencies, federal, state and local; educational and research institutions; voluntary groups, and philanthropic health agencies. It has observed closely the standards and methods of distribution of medical care of other nations and has had the benefit of the experience and advice of unselfish investigators trained in the direction of health activities throughout the world.

These broad considerations of the problem of the best possible health for all the people has led the Association to prepare a basic outline for continuing development and action. This is known as the Program of the American Medical Association for the Advancement of Medicine and Public Health. This program embraces twelve major points or planks, some of which have been advocated by the Association for many, many years. This program follows: [Dr. Baur presented the twelve point program.]

Is the health of the American people in such a low state as to necessitate revolutionary remedies, or proposed remedies, to be made available by the federal government as contemplated by the legislation pending before your committee? What actually is the record of our health progress under the system that prevails in the United States? [Dr. Bauer presented comparative statistical data.]

Much has been said about the alleged shortage of physicians. Those who contend that there is a shortage base their contention on the fact that the twelve states that have the largest number of physicians per hundred thousand population—one hundred and fifty physicians—represent the desirable norm and that all states should measure up to this norm. On the basis of this mechanistic formula, it is forecast that in 1960 there will be a shortage of some 42,000 physicians. It is predicted, by those who advance these contentions, that at the present rates of production of physicians there will be 212,000 active physicians by 1960 and to meet the standard percentage obtaining in the twelve best states, there will be needed by that year 254,000 physicians.

The formula that forms the basis of these estimates assumes that the same percentage of physicians per hundred thousand population is desirable and necessary in every state and leaves out of consideration that in the so-called twelve best states a large number of interns and residents in teaching centers may unduly increase the physician population. Even if 42,000 more physicians could be trained by 1960, and assuming that such an increase is necessary, there could be no assurance that the excess number of physicians would locate in states that do not measure up to the average physician population obtaining in the twelve best states. It is true that although the construction of hospital facilities and diagnostic clinics authorized by the Federal Hospital Survey and Construction Act may make the less remote areas attractive to more physicians, there are many more factors that influence the location of physicians than hospital and diagnostic facilities, such as schools and opportunities to maintain professional contacts so necessary in the practice of medicine.

Furthermore, since 1940 the population has increased 13 per cent and the number of physicians has increased 15 per cent, so the relative number of physicians to the population has increased rather than decreased. The number of physicians practicing in a given area does not necessarily represent the supply of medical care available. Where once the physician carried on alone, much of the routine work today is assumed by technical assistants, nurses and research workers. This situation automatically enables a physician to do a greater volume of practice and the conveniences of transportation enables him to cover a much wider territory.

It has been said, too, that 80 per cent of the American people are unable to afford all of the medical care they need. This statement by implication assumes that the only type of economic goods or services purchased by the American people is medical care and overlooks the fact that the purchase of medical care is a matter of free choice for the majority of the people.

The fact is that we live in a free society where the consumers are the dictators so far as the commodities that they choose to purchase and the commodities that they do not purchase are concerned. In the past, the decision of the consumers

has been to spend 96 per cent of their income for items other than medical care. They have decided that they can afford one and one-half times as much for alcoholic beverages as for medical care and another one and one-half times as much for recreation.

SENATOR MURRAY: You say that in the past the decision of the consumers has been to spend 96 per cent of their income for items other than medical care. Of course, many people have gotten into the habit of feeling that medical care is something that is not necessary and, therefore, they do not want to spend any money on it. If we could all be healthy and free from disease, we would not have to waste our money on medical care.

DR. BAUER: I think it is true, Senator, that people have not become used to budgeting for medical care as they budget for many other things.

SENATOR MURRAY: That is true, but a lot of people look on medical care as an unnecessary luxury that they should not be bothered with.

DR. BAUER: Yes, sir. They have decided that they can afford twice as much for tobacco as for the services of physicians. They have decided they can afford considerably more for personal care than for doctors' care. They have decided they can afford about as much for jewelry and repairs of watches and clocks as for physicians.

These were not the decisions of the medical profession or of any other group offering medical or allied services, but they were the decisions of 147,000,000 people. If we must be frank, the American people spent only 4 per cent of their income on medical care, not because they did not have more to spend, but because they preferred to spend 96 per cent for other purposes.

I shall not undertake to explore in detail the cost of a comprehensive system of medical care as contemplated by the pending legislation. I believe that it is anticipated that initially the system will be financed by payroll deductions plus appropriations from the general funds. Estimates by competent actuaries place the cost at from \$10,000,000,000 to \$15,000,000,000 annually. The assumption has been made that there is a financial barrier between a large part of the public and the medical service they need, but this barrier in the main relates to ability to pay for large and unexpected expenditures incurred for medical needs. This is a situation that is being overcome progressively by the rapid development of private health insurance plans. Although the provisions of these insurance policies vary greatly, in general they do permit the family to budget the major costs of medical care.

It is true that all types of medical care coverage are not available throughout the United States and that some are available only to members of employed groups, but progress is being made toward complete coverage. The cost of such coverage varies, of course, with the benefits made available. A family may, for instance, purchase a typical Blue Cross-Blue Shield membership which will pay the bulk of hospital and in-hospital medical bills for 20 cents a day, the price of a package of cigarettes or a bottle of beer a day.

In return for the money spent on medical care, the American people have received a truly phenomenal measure of health. During the 1940's the medical profession delivered an extraordinarily high quality and great quantity of medical care at an extremely low cost. While the cost of living index of the United States Bureau of Labor Statistics in 1948 was 171.2, the index of medical care prices was 141. In other words, the combined average prices charged by physicians, dentists and hospitals has not risen as fast as the cost of living.

It is abundantly clear that the cost of medical care has risen during the 1940's in terms of dollars, but the percentage of the consumer budget taken by medical care has not risen. Meanwhile life expectancy at birth and at every age has risen. This triumph of medical economics, steadily increasing life expectancy at the same percentage cost of the consumer budget, may well be the major contribution of medicine in the 1940's. The four years of life expectancy at birth gained in the last decade alone mean many millions of dollars earned and the chance of a good life for many more people than ever before.

Yet in the midst of all this health progress, it must be remembered that medical care can never be wholly adequate as long as pain comes too often and death too soon.

The American Medical Association can inform you that there are nine new medical schools within the last few years. There is the University of Alabama, which has been increased from a two to a four year school; the University of Utah, from two to four; the University of North Carolina, from two to four; and then new schools: the University of Washington, the University of California in Los Angeles and the Southwestern Medical School at Dallas, Texas, and there are others in the making.

SENATOR MURRAY: They have increased their course from a two year course to a four year course?

DR. BAUER: Yes, some of these schools at the time did not have the facilities for a four year course. They gave the first two years and then their students had to be transferred to another school. Now, they have been made four year schools, so not only will you have the enrolment of these schools, but the vacancies that would ordinarily be filled by these transfer students can now be filled by other schools in an original enrolment. We are getting more doctors all the time.

At present we are graduating between 5,500 and 6,000 a year. I think the average rate of death among the doctors is somewhere about 3,500 a year, and the doctors are increasing at a faster rate than the population is increasing.

I think it is a question of where are you going to set the limit on how many doctors you need.

SENATOR MURRAY: You do not think the problem of medical education is a serious problem?

DR. BAUER: No, sir, I think it is being taken care of. Of course, these new schools, you have not got the results from them yet because they have just been started, and it takes four years to start getting results, even longer than that, but the problem of producing more doctors, I think, is being taken care of satisfactorily because we are turning out more now than we ever have, with prospects of still more.

We have now, as was said this morning, one doctor for every 740 persons in the United States. Unfortunately, that is not true all over the country. It will vary from 1 to 450 in New York City to 1 to 1,500 or 1,800 in some of the rural areas; so the problem is how to get a better distribution of doctors; it is more that than it is how to get more doctors.

SENATOR MURRAY: The general impression in the country is that there is a great deficiency in the number of doctors, and it has been contended by some of those who criticize the Administration's program that if it was put into effect, there would not be enough doctors in the country to begin to carry it out and, therefore, that we should begin to greatly expand medical education and increase the number of doctors in the country.

As the population grows and our economy expands, it will become more necessary than ever to have more people engaged in the services, and the medical service is a place where a lot of people, a lot of the young people are looking to now to enter.

DR. BAUER: I do not mean to imply that we do not need more doctors, I think we do need more, but I say we are getting them steadily and we are going to have still more because there are still other schools in the process of establishment which will still further increase it.

Also you must remember that illness is diminishing; the actual morbidity rate in many diseases is fast disappearing; fewer people get sick, and the diseases which disabled them for a long period are now disabling them for a short period.

For example, typhoid; when I was an intern we had whole wards with typhoid patients. Now, when a typhoid case comes in the hospital, doctors flock in from miles around to see the case, because they have never seen one. Pneumonia used to incapacitate a man for two or three weeks. Now pneumonia has almost arrived at the status of a minor disease. The death rate is about 2 per cent now, and patients are disabled only a few days.

Illness is decreasing. During the war we had 50 per cent of our doctors in the military services and yet the health of the people went along pretty well.

SENATOR MURRAY: Is it not true that we are finding an expansion of the number of persons who are infected by some diseases and that the diseases are becoming more deadly? For instance, take tuberculosis. I noticed an article in the paper that there is a serious situation developing in regard to that disease.

DR. BAUER: In this country the tuberculosis death rate has been gradually declining. In certain European countries since the war it has been steadily mounting, but there the tuberculosis has reached the stage where people are even optimistic enough to believe tuberculosis can be wiped off the map as typhoid has been.

SENATOR MURRAY: That is true, but I read in the paper that tuberculosis cases they are getting recently are much more serious than the ones they had in the past.

DR. BAUER: Well, of course, the minute you eliminate any disease to a certain extent, when cases develop they are apt to be serious.

SENATOR MURRAY: That may be an indication that the disease is being taken care of.

DR. BAUER: Yes. You take in the South Pacific, for example, I remember years ago I was on an Army transport. They

would not let us land because we had a case of measles on board. Measles was considered a greater scourge than smallpox because the population was not used to it.

SENATOR DONNELL: Doctor, on page 4 of your statement you refer to the view that the plans which you mention, namely, the plan for federal participation, the plan that contains uniform features, et cetera, would lead to a widespread and serious deterioration of the quality of medical care. Do you think that opinion is generally shared by the members of the medical profession?

DR. BAUER: Yes, sir, I do. I think it has been more or less evidenced in other nations that you get a stereotyped type of medical care.

SENATOR DONNELL: Would you mind telling us why you get such a stereotyped type of medical care and what the fundamental reason is for the conclusion at which you arrive that these plans would lead to serious deterioration of the quality of medical care?

DR. BAUER: I think there is more than one reason. First of all, I think you eliminate the factor of competition entirely, because the poor doctor can do just as well as a good one. In fact, it has been stated many times that compulsory health insurance is a great leveler. It does not bring the poor doctor up to the level of the good one, but it drags the good one down to the level of the poor doctor.

At present, if a doctor is called by a patient, he knows he has to deliver the goods or else the patient will get somebody else, whereas, under a controlled system of any character, a doctor does not care very much because he gets paid whether he delivers good medical care or whether he does not.

That is not an incentive to the right type of man to go into medicine, and it results, I think, in a deterioration in the type of person who goes into medicine.

Then, doctors are overloaded with trivial complaints because of the system's being so-called free, and they go to the doctor for conditions which they ordinarily would not go to him for if they had to pay for it. Under the system, for example, the ordinary person has a casual headache, he will buy a bottle of aspirin. Under the other system he would not because by getting a prescription he would not have to pay for the aspirin. That is an illustration.

The doctors are apt to be overloaded with trivial complaints, so they do not have the time to devote to people who are really ill. We know what we have seen abroad, and I have been in many of the countries in Europe.

SENATOR DONNELL: You say you have been personally?

DR. BAUER: I have been in many of the countries of Europe, and the doctor has to see a great many patients in the course of a day to make a living or to get through his list, and he cannot devote the time to them which he should.

Of course, there is a lot of certificate work, certificate writing involved with these things. How this Administration bill would work out, I do not know, but I do not see how a great deal of paper work can be avoided. It seems to depend to a great deal on the system as to the amount of paper work, but if it is on a fee for service basis, there would be a tremendous amount of paper work.

SENATOR DONNELL: Have you seen the regulations in force in England as of a year or so ago?

DR. BAUER: I think the volume containing the laws is something like 1,300 pages and the volume the doctors were supposed to use every day was somewhere around 600 pages. That is from memory.

SENATOR DONNELL: What countries have you personally visited in Europe?

DR. BAUER: England, France, Switzerland, Spain, and before the war I was in Germany and in Italy.

SENATOR DONNELL: In which of those countries have you made observations with respect to the operation of health insurance plans of the type that you described?

DR. BAUER: In all of them to a certain extent, except Italy. I did not make any there.

SENATOR DONNELL: And your net conclusion is that there has been or has not been a deterioration in the quality of medical care in the countries in which you have visited?

DR. BAUER: I do not know that I could answer that question by saying there has been a deterioration because I was not familiar with what it was before they got it, but I can say that the level of medical care is distinctly lower than it is in the United States under our system.

SENATOR MURRAY: When did you visit England, Doctor?

DR. BAUER: I have been in England three times in the last year and a half.

SENATOR MURRAY: When was your last visit?

DR. BAUER: My last visit was last September. However, at that time I was there for such a short period I did not have an opportunity to make any personal investigation of the new health act.

SENATOR MURRAY: And the present health service program had just recently been put in effect?

DR. BAUER: Just two months previous.

SENATOR MURRAY: It would have been impossible for you to make—

DR. BAUER: —any personal observation on that, that is correct.

SENATOR DONNELL: But you did observe the operation of the health act immediately preceding the new act?

DR. BAUER: Yes, sir.

SENATOR DONNELL: The point has been made with respect to S. 1581 that inasmuch as it confines its grants-in-aid to the states for the purpose of aiding those who are in need of medical assistance and cannot provide it for themselves, at least in full, that a certain humiliation would attach to the recipients who would avail themselves of the service. What is your judgment in regard to that point?

DR. BAUER: I cannot see that myself. I have read a lot about the means test. It seems every one of us has to go through a means test. Every time you put in an income tax you are going through a means test. I cannot see anything very humiliating about it.

SENATOR MURRAY: I would like to see a law abandoning the income tax.

DR. BAUER: I would be in favor of it.

SENATOR MURRAY: We would not have so many headaches.

SENATOR DONNELL: Is it your judgment that S. 1581 is properly to be condemned on the theory that the administration of aid to persons who need it, as distinguished from those who do not, would be humiliating?

DR. BAUER: The so-called Taft bill?

SENATOR DONNELL: Yes, sir.

DR. BAUER: No, sir, I do not think it is to be condemned on that at all.

SENATOR MURRAY: Doctor, I would like to call your attention to some analysis of the twelve points that you have presented here.

DR. BAUER: Yes, sir.

SENATOR MURRAY: Dr. Channing Frothingham, Chairman of the Committee for the Nation's Health, a member of the American Medical Association, and twice President of the Massachusetts Medical Society, has this criticism to make. He says: [Senator Murray read a release issued by Dr. Frothingham.]

AFTERNOON SESSION

SENATOR PEPPER: The Committee will come to order.

Statement of Lowell S. Goin, M.D., President, California Physicians' Service, Los Angeles

DR. GOIN: I am Lowell S. Goin, M.D., of Los Angeles. I am a practicing physician and I happen to be President of California Physicians' Service; the voluntary health care plan of California. I might as well say at once that I am in complete opposition to this legislation, and I speak now of the so-called "Health Insurance Bill," S. 1679. I oppose it as a physician because I am persuaded that its enactment would result in great and continuing decrease in the quality of medical care available to our people. I oppose it as an American because I am persuaded that this type of legislation is one of the final steps on the road to State Socialism. In this opposition, I am confident that I am supported by the overwhelming majority of American physicians.

Specifically, my opposition is based upon five premises which I propose to state briefly, thereafter developing each one. 1. The assumption that the health of the American people is bad is a false assumption. 2. The assumption that the enactment of compulsory sickness tax legislation would be in the interest of the public health is totally unfounded. 3. Medical care is not the sole factor in the problem of health, and there are many other things that government could properly do which would benefit the health of the public far more than the proposed legislation. 4. The cost of such plans, rather lightly passed over by the

President and Social Security Administrator, are totally unpredictable and almost certain to be extremely high. 5. Voluntary health care plans, which are truly in the American tradition, are giving good medical and hospital care to our people, and must be allowed to develop unhampered by bureaucracy.

The health of the American people is bad, perhaps, but it isn't just because someone in the Social Security Administration says it is. Fortunately, it is a matter which may be investigated, and in which conclusions can be based on known facts rather than on emotional statements. The life expectancy at birth is steadily increasing, being now about 65 years for a male and 69 years for a female. It is materially less in Great Britain, and was still less in pre-war Germany. Both of these countries have long enjoyed the blessing of compulsory sickness insurance.

The death rate from diphtheria per hundred thousand of population, in the last year for which comparative figures were available, was 11.6 for Great Britain, 11.4 for Germany, but in the United States, with free enterprise system of medical care, it was less than 6.0. Why? Diphtheria is both preventable and curable; why didn't the government-operated medical systems produce a death rate lower than ours?

In the *Public Health Reports* for August 1946, the United States Public Health Service presents a table showing the death rate from tuberculosis in all countries. In the United States the rate was 47 per hundred thousand. In England and Wales it was 62. In France it was 137, and in Russia, 160. All of those except the United States have national medical care plans, but they seem to have been quite unable to equal the performance of the United States.

Some of the most lucid statements which are used to document our bad state of national health are found in Mr. Oscar Ewing's Report to the President entitled "The Nation's Health." Perhaps I may be permitted to digress for a moment, and to wonder what magical powers are inherent with civil servants of the Federal Security Agency, which makes them so omniscient in the problems of medical care, and why their opinions so greatly outweigh those of the 197,000 physicians of America whose entire lives have been spent in acquiring professional training to cope with these problems and in the actual coping with them. Mr. Ewing begins with a dramatic statement; a statement made to order for headlines—

SENATOR DONNELL: Doctor, according to my copy, it reads "breadlines."

DR. GOIN: Yes. It should be "headlines." Mr. Ewing begins with a dramatic statement; a statement made to order for headlines: "Every year 325,000 people die whom we have the knowledge and the skills to save." Of these, he says, 170,000 die of communicable disease, and that we should be able to save 120,000 of them. This last figure seems to have been chosen at random, and no documentation is offered. As is not uncommonly the case, the figures are not exactly accurate. In 1945, 177,000 persons actually did die of communicable disease, but in 1947 the figure had been reduced to 137,000. That the figure of 40,000 saved by our present system of medical care does not particularly bolster the case against that system is not mentioned. Perhaps this is purely coincidental. It is a fact that the death rate from communicable disease is the lowest in our entire history.

Mr. Ewing also says that we should be able to prevent 115,000 of the more than 600,000 annual deaths from cancer and heart disease. I am unable to ascertain the reason for the selection of the figure 115,000, and I suspect that it is a purely arbitrary selection. I don't know how many of the deaths were due to heart disease, but it is probably fair to assume that about two thirds were. Is the implication that these people died because of lack of medical care a fair one? Of course it isn't. Actually, both heart disease and cancer are diseases of the latter decades of life. People eventually die of something, and the more people who live into these decades, the more will die of these diseases. If medical care is the problem, it is curious that the six states with the lowest death rate from heart disease were in the deep South, and that seven of the nine states with the highest rate were in New England. New England has more physicians, more hospital beds, more research centers and more teaching institutions than the entire deep South. I repeat that it is most curious that the death rates should not fit the amount of medical care available.

Mr. Ewing complains of the shortage of physicians. One wonders why he believes that the enactment of a law bitterly opposed by physicians (physicians' sons are a substantial part of the annual crop of new physicians), and one which experience in other countries has shown to degrade physicians, could possibly increase the number of physicians. I predict confidently that the enactment of this legislation will decrease the number

of physicians produced annually and that it will very materially lower the quality of the young men who enter medicine.

Another ill to be cured by compulsory sickness tax legislation is the inequitable distribution of doctors. There seems to be a vague and hopeful feeling that some magic inherent in this so-called social legislation will persuade doctors to leave cities, where medical schools and libraries are located; where hospital and consultants can be found; and most of all, where a man can have the society of his peers, and go to remote hamlets where none of these things are available and where he can stagnate in intellectual loneliness. Doctors, like other people, locate themselves where they think they are most likely to succeed, and where they will be happiest.

Why anyone should believe that enactment of a law will change these elementals is something of a mystery, but one which would be solved promptly if a paternal government were to direct physicians in choosing their fields of activity. Any such intent is vigorously denied, of course, but the government of Great Britain has already assumed this right and has announced that more medical care in rural areas would be provided by paying a somewhat larger capitation fee in such areas and—note well—by forbidding doctors to locate in more populous zones.

The assumption that enactment of this legislation would be in the interest of the public health is unfounded. Fortunately for my argument (although unfortunately by other standards) we have a system of so-called compulsory health insurance in actual operation in the city of San Francisco. Set up by ordinance several years ago, it embraces more than 20,000 employees of the city and county of San Francisco. As a public duty, and as a noble experiment, the medical profession of San Francisco consented, almost to a man, to cooperate with the plan which is called "Health Service System."

I see no reason to believe that a like system on a national level would function much differently than this "pilot" plan, and this is how it really works; this is what we may reasonably expect to happen once the plan begins to operate nationally.

On May 28, 1947, Dr. A. S. Keenan, Medical Director of the "Health Service Plan," found it necessary to address himself to the physicians of San Francisco. He complains of over-use of the system, and urges great curtailment of the care given. I have a copy of this entire letter which I would be glad to file with the committee. The following are his words:

People in general have more knowledge now on medical subjects. . . . It has brought about many unnecessary visits to the doctor to get treatment for trivial things. Such minor ailments could be treated as well by their home remedies as by their doctor.

There, gentlemen, is a panel system in operation. The earliest, indeed the only early symptom of lung cancer is a trifling cough. Go home and take some cough medicine. The only early symptom of gastric cancer is a trifling indigestion. Take some soda. Next, the medical director complains of clinical laboratory and x-ray expense, and again I quote his words:

The people in general know little about the results that can be obtained from the help of laboratory tests or the x-ray examination. Please, doctor, turn such requests aside. . . . It would seem that any physician, after taking a short history of his patient's case and making a routine examination will find that he can make a diagnosis without leaning so much upon the laboratories and the x-ray departments.

Please note, gentlemen, that early recognition of brain tumors requires laboratory study of the cerebrospinal fluid, and that early diabetes is recognized by the amount of sugar in blood. After complaining that it cost too much to hospitalize these unfortunate people whose pay checks were subject to compulsory deduction for the service, he says:

"The members of the Health Service System, except in a few obscure cases, do not need any such extensive work." As is easily possible under the compulsory system, the director solves the problem neatly, thus: "Hereafter no patient, except in an emergency case, will be entitled to hospital benefits under Health Service System coverage until authorization has been given by the medical director."

There you have the panel system which our planners would like to institute; there you have medical care under compulsory health insurance.

Personal interviews with British physicians who have been so revolted by the system that they have actually fled to the United States to start all over again, and correspondence with others who wish that they could flee, indicates that this is a completely fair picture of so-called compulsory health insurance benefiting the health of the public.

If further evidence is needed, we might let Dr. Nathan Sinai furnish it. Remember that he is an able and ardent proponent

of compulsory sickness tax legislation. I quote from his book "The Way of Health Insurance," pages 157, 158—these are his words:

Contrary to all predictions, the most startling fact about the vital statistics of insurance companies is the steady and fairly rapid rate of increase in the number of days the average person is sick annually, and the continuously increasing duration of such sickness.

Various studies in the United States seem to show that the average recorded sickness per individual is from seven to nine days per year. It is nearly twice that amount among the insured population of Great Britain and Germany and has practically doubled in both countries since the installation of insurance. . . . It seems to be a safe conclusion that insurance has certainly not reduced the amount of sickness.

This surprises me, since I had naively assumed that the proponents believed that it would reduce the amount of sickness. Certainly, the words quoted comprise an excellent argument against this sort of medical care, although I doubt that Dr. Sinai meant them to be.

A sort of current custom is to use the terms "medical care" and "health" as if they were interchangeable—as though one were synonym of the other. As a matter of fact, medical care is only a small part of the health problem—not even the most important part. Health consists largely in not being sick; medical care consists largely in an attempt to cure or alleviate disease. Nearly all—perhaps all—of the health legislation which has been proposed from time to time has been written by social planners, seldom, if ever, in consultation with physicians. Consequently nearly all it contains is wishful thinking and not too much reality. Too much confidence is placed in preventive medicine, too much earnest belief that periodic health examinations will prevent disease, and all the legislation evidences a complete failure to understand that preventive medicine simply has not yet attained the goals wished for.

To cite a few of the problems: How shall heart disease (except that due to rheumatic fever) be prevented? What sort of health examination will be efficient in its control? How shall we prevent, or even recognize, early brain tumors? Shall everyone with a headache have encephalographic or ventriculographic studies? Shall we do gastrointestinal roentgen studies on everyone with indigestion, and, if so, where shall we obtain the skilled personnel? How are bone tumors prevented, and what periodic examination makes one aware of the pneumonia of next week?

Medical care is, and will for a long time continue to be, the care of the sick, and this, I repeat, is only a fraction of the health problem. Some other fractions to which government might well turn its attention are sanitation, hygiene, health education, adequate diet, good housing, adequate clothing, good working conditions and "patent medicine" control. And there are many others.

If government is sincerely interested in the health of the citizen, why should it not suppress "patent medicine" advertising? Why should it not regulate the cults and require that all who wish to practice the healing arts pass the same tests? Why should it not control radio publicity of nostrums, vitamins and the like? This current legislation is attacking only a small segment of the health problem, and even if it were to accomplish all that its proponents claim, it still would not solve our health problems.

* * *

Voluntary health plans will, if given the opportunity, do the job, and do it better than government-controlled plans can do. These plans, which already include a very large number of persons, are in accord with our traditional emphasis on personal responsibility, prudence, foresight and thrift. They have an American dignity which is lacking in the regimentation of compulsory health insurance. They can be and are more economically administered; they can and do give better medical care, and they will be and are supported by thousands of physicians who are bitterly and unalterably opposed to government-controlled medicine.

In California we have made a good start. Our California Physicians' Service offers medical care at modest costs. Nearly 800,000 of our people have availed themselves of it, and appear to be quite satisfied with it. The Farm Security Administration had a medical care program for the rural indigent. California Physicians' Service took it over and gave better medical care for less money and to the satisfaction of those giving and receiving the care.

California Physicians' Service has a contract with the State Grange providing medical care for nearly 100,000 farm people. These activities, which are duplicated in most of our states, are indications of how voluntary plans can meet the challenge, how they are meeting it, and how they will continue to do so with a steady and health growth if they are not crushed by the monster of bureaucratic control.

Now, Mr. Chairman, I have a supplemental statement which I would like to read in relation to the activities of the American Medical Association.

During recent weeks and months the American medical profession has been subjected to maliciously unfair abuse from certain advocates of compulsory health insurance, some of whom are office holders in the federal government. Through vicious innuendo, false implication and outright distortion of fact, deliberate attempts have been made to undermine public confidence in the nation's doctors, and to make it appear that the American Medical Association is engaged in devious, unethical tactics in its opposition to national compulsory health insurance.

Very few members of Congress have been a party to this attempted smear. However, you gentlemen probably have heard or read some of the false charges. I believe that you know in your hearts that American doctors, by their very nature and training, would not take part in the questionable activities which have been implied in this scurrilous propaganda. Nevertheless, we need to clear the record with respect to these trumped-up charges.

The American Medical Association—openly, frankly and honestly—is engaged in a National Education Campaign to give the people the facts about compulsory health insurance and the facts about voluntary health insurance. We frankly oppose the first and we enthusiastically favor the second. We hope and believe that the American people, given the facts, will agree with us.

In the best American tradition we are taking our case before the forum of public opinion. We are asking for a vote of confidence in the American medical profession and in the American medical system, the finest in the world. We are doing exactly what you gentlemen do at election time. We are using the same avenues of approach—the press, the radio, the speaking platform, pamphlets and leaflets, and all other accepted, ethical means of submitting our case to the people.

The Committee for the Nation's Health, the Physicians Forum and other groups favoring compulsory health insurance are conducting a constant propaganda in behalf of it. For ten years or more, the Federal Security Agency and other government agencies have been spending unauthorized tax funds to thump the drum for socialized medicine. Now, however, when the American Medical Association finally strikes back at the distorted propaganda of the socializers and government pay-rollers, we suddenly hear unfounded and intemperate charges that the American Medical Association is invading Washington with a high-powered lobby and a huge slush fund.

These charges are absolutely false, and those who have been making them know they are false. As you gentlemen undoubtedly know, the Washington Office of the American Medical Association is one of the smallest, most conservative legislative offices maintained by any of the national associations in the capital. It is staffed by men of unquestioned integrity, who are highly respected in Washington. Whitaker and Baxter, the public relations organization which is directing our National Education Campaign, has only one representative in Washington, and he is a press representative, not a legislative lobbyist.

The American Medical Association, in its National Education Campaign, is carrying its case directly to the American people in a grass roots crusade which we hope will reach every citizen in this country. By so doing, we doctors are simply exercising one of the greatest rights which Americans have as a free people—the right of petition as set forth in the United States Constitution. We are exercising that right not simply to protect the medical profession from degradation, but to protect the health of the nation.

The people have a right to know that government-controlled medicine means inferior medical care doled out according to bureaucratic regulations and rule books, ever increasing payroll taxes, invasion of privacy and freedom of action, and destruction of the voluntary health insurance plans which provide good medical care at a lower cost than government ever could provide it.

In the final analysis, the American people, through their representatives here in Congress, will decide this issue. The objective of the American Medical Association National Education Campaign is to get the facts to the people. We want them to make their opinions known to the United States Senators and Representatives. We believe you want it that way.

If that is lobbying, it is lobbying in the finest American tradition, and every doctor is proud of his part in the program.

There is nothing secret or devious about this campaign. It is an open and above board public campaign on a vital public issue. The plan of campaign explaining the program has been distributed by the thousands throughout the country—not only to doctors and medical societies but also to a wide variety of interested parties, including newspapermen and magazine writers.

A newspaper commentator referred to this as a secret plan of the American Medical Association. For your information, I am filing a copy of the plan of campaign with your Committee.

Nearly 14,000 copies of this have been distributed all over the United States. There is nothing in our program which is secret—and you may have copies of any material we are issuing simply by requesting it.

Yet, at least one radio commentator and one congressman, in recent public utterances, have quoted from these widely publicized materials, have attempted to give the impression that they were revealing "shocking" information from "secret" documents. Apparently depending on the same unreliable source for their information, both men referred to the fact that American doctors intended to present their case in newspapers and magazines, and that doctors were urged to write letters to any Senators or Representatives who were their personal patients. These alleged "revelations," gentlemen, are nothing short of ridiculous. Since when is it a crime to submit material to newspapers and magazines? And since when are doctors deprived of the ordinary right of any citizen to write to the men who represent them in Washington?

If there is any need for a Congressional investigation of lobbying, it is for an investigation of the government lobby which has forced the American medical profession to strike back in defense of its good name. The Harness Committee reported to the House of Representatives in 1947 that at least six agencies in the executive branch of the federal government were using government funds in an improper manner for propaganda activities supporting compulsory health insurance. The Federal Security Agency alone has become a tremendous propaganda agency for government medicine.

It seems very strange that when I appear anywhere to speak on this subject, some representative of the Federal Security Agency often shows up in the same town, speaking in favor of government medicine. Who pays for this? Has Congress authorized the use of federal funds for these propaganda lecture tours? Is the Federal Security Agency usurping the rights of Congress, the regularly established legislative branch of the government?

As mentioned a moment ago, government agencies lobbying for compulsory health insurance—some of them for ten years or more—have forced the American Medical Association to embark on its National Education Campaign. Although the great bulk of these campaign activities and expenditures do not constitute lobbying under the terms of the Federal Lobbying Act, Public Law 601 by the 79th Congress, in the opinion of our legal counsel, the campaign directors have registered according to the letter of that law. A report of expenditures for the first quarter of 1949 already has been filed, listing separately every item over \$10. We invite the closest possible scrutiny of all reports and records.

More than half of the time, effort and money in this campaign will be used in affirmative, positive action, designed to aid in the development of the voluntary prepaid health systems. American medicine is far more concerned with solving a problem than with simply defeating a bill for compulsory health insurance.

The ultimate, long range objective of this campaign is to make the American people more and more health insurance conscious. We want them to know that sound protection against the costs of illness is available under existing voluntary health insurance plans, at reasonable rates far below the inevitable high cost of a compulsory, tax-supported program.

We want the people to know that the many different hospital, surgical and medical insurance plans are working constantly to extend their benefits. Already there is a tremendous demand in this country for voluntary health insurance. The greater that demand can be made, the quicker this problem will be resolved. The great need in America is not for compulsion but for a general realization by the people that health protection is an essential item which should be given its proper priority in the family budget and which can be so budgeted without undue financial burden.

I think I am correct in saying that several members of this committee feel the same way. A number of you gentlemen have shown a definite interest in the great progress of voluntary health insurance, and you are sponsoring legislation embodying principles which we fervently support. We think you are on the right track to an American solution of this problem.

The American Medical Association National Education Campaign, by alerting the people to the wisdom and necessity of handling this problem themselves, is making a contribution toward the further improvement of our national health. We believe it also is performing a service of value to Congress, by making it unnecessary for you to levy new payroll taxes

and launch this nation into a dangerous experiment in government medicine. Such an adventure would impair or destroy not only the American medical system but also our national financial stability. There are other, more sensible ways to solve our problem in medical economics.

(To Be Continued)

Official Notes

DR. FLEMING ON AMA RADIO PROGRAM

Sir Alexander Fleming, of England, one of the pioneers in development of penicillin, will be the guest speaker on today's (July 2) program of the weekly AMA-NBC radio series. The dramatized show, which will be part of exercises marking dedication of a multimillion dollar Oklahoma Medical Research Foundation in Oklahoma City, will originate from Oklahoma City and can be heard on most stations of the NBC network from 2:30 to 3:00 o'clock Central Daylight Saving Time (3:30-4:00 Eastern DST, 1:30-2:00 Mountain DST, 12:30-1:00 Pacific DST). Dr. Fleming will speak at the close of the dramatized portion of the program.

NEW RADIO TRANSCRIPTION SERIES AVAILABLE

Now available from the Bureau of Health Education is the latest series of transcriptions for use on local radio stations. The series of 13 recordings deals with a subject of great current interest, antivivisection, and provides forceful arguments in favor of controlled animal experimentation.

Presented in dramatized form, with the scripts written by trained radio specialists, the platters have the following titles:

- | | |
|--------------------------------|----------------------------|
| 1. Your Life's Blood | 7. The Perfect Specimen |
| 2. The Sheep at Melun | 8. The Dog He Never Had |
| 3. The Invisible Enemy | 9. The Cow and the Bell |
| 4. The Cat and the Mouse | 10. A Blow to the Heart |
| 5. Almost Human | 11. The Lucky Accident |
| 6. The Gangster and the Rodent | 12. Two Mad Dogs |
| | 13. The Bright Red Miracle |

An innovation has been inclusion of brief statements by prominent personages in defense of laboratory studies in which various animals play such a significant part. Those who participated are:

- Dr. Louis Mann, Rabbi of Sinai Temple, Chicago.
Mr. Ned Dearborn, president of the National Safety Council, Chicago.
Mr. Morton Gould, composer and conductor.
Mr. Anton Rost, president, National Canine Research Foundation.
Mr. Harold Stassen, president of the University of Pennsylvania.
Dr. George D. Stoddard, president of the University of Illinois.
Dr. George D. Curtis, director of surgical research, Ohio State University.
Mrs. Frank J. Lausche, first lady of Ohio.

Dr. W. W. Bauer, Director of the Bureau of Health Education, who conceived and developed the series, also is a participant.

Important cooperation in the project was provided by the National Society for Medical Research.

As is the case with all such sets produced by the Bureau of Health Education, this series, titled "The Story Behind the Discovery," is available without charge to local medical societies. Requests directed to the Bureau will receive prompt attention. Societies in Florida, Louisiana, New Jersey, New Mexico, Oregon, Pennsylvania, Tennessee, Texas and Washington can obtain the platters direct from their state headquarters.

Coming Medical Meetings

- International Congress of Biochemistry, Cambridge, England, Aug. 19-25.
Lt. Col. Francis J. Griffin, 56 Victoria St., London, W.C.1, Organizer.
Montana State Medical Association, Butte, Aug. 1-4. Dr. Herbert T. Caraway, 115 N. 28th St., Billings, Secretary.
West Virginia State Medical Association, White Sulphur Springs, The Greenbrier, Aug. 4-6. Mr. Charles Lively, 1031 Quarrier St., Charleston, Executive Secretary.

Washington Letter

(From a Special Correspondent)

June 27, 1949.

Health Insurance Hearings

Compulsory health insurance continued to have its opponents and supporters as congressional sessions, now approaching their close, heard additional witnesses during the week ended June 25. Proponents appearing before the health subcommittee of the Senate, chairman, Senator James E. Murray (Democrat, Montana), included Dr. Bernard Meyer, of New York City, speaking for Physicians Forum; Joseph Anderson, executive secretary of American Association of Social Workers; Dr. Theodore Sanders, of New York City, representing National Consumers League, and Dr. Charles M. Thompson, representing National Dental Association (Negro). Opposition to the compulsory health insurance provision of the Thomas-Murray-Dingell bill (S. 1679) was expressed by Dr. George Baehr and Dr. Howard Craig, representing New York Academy of Medicine, and H. E. Slusher, American Farm Bureau Federation.

Concurrent hearings by the health subcommittee of the House Interstate Committee were devoted to taking of testimony on the feasibility of greater federal appropriations for medical research in arthritis, multiple sclerosis, cerebral palsy, epilepsy and leprosy. Among witnesses who recommended expansion of the government program were Drs. William G. Lennox of Boston, Arthur A. Morris and Robert Stolar, of Washington, Herman Kabat (filed statement) of Oakland, Calif., Winthrop M. Phelps (filed statement) of Baltimore, Tracy J. Putnam of Los Angeles and Currier McEwen, C. H. Traeger, H. Houston Merritt, Edward H. Hartung and Ralph H. Boots, all of New York City. The House health subcommittee, whose chairman is Rep. J. Percy Priest, has adjourned the hearings until June 29, when it will begin taking testimony on proposed enlargement of the federal hospital expansion program.

Chiropractors and Optometrists Protest Exclusion

Spokesmen for the country's organized chiropractors and optometrists went before the Murray subcommittee to demand that these practitioners be named, as prospective beneficiaries, in any broad health legislation which may be enacted by Congress. They were free in their denunciation of medicine as a profession which, they implied, is attempting to stifle their activities.

"The avowed purpose of medicine is to monopolize the health care field," said Joseph M. Babcock, vice president of American Optometric Association. "The optometrist and medical eye man are economic competitors."

John J. Nugent, appearing in behalf of National Chiropractic Association, said the Thomas-Murray-Dingell bill is misleading in its declaration that there shall be free choice of doctors, as long as chiropractors are not included among those practitioners eligible to give patient services under the proposed program.

"If the American Medical Association had written this bill (S. 1679) it could not have drawn more effectively or with greater finesse a measure to destroy the professions of chiropractic and osteopathy," the witness stated.

New York Physicians Take Opposite Sides

Drs. George Baehr and Howard Craig testified that the New York Academy of Medicine endorses, in principle, the Hill (S. 1456), Taft-Smith-Donnell (S. 1581), Humphrey (S. 1805) and the Flanders-Herter (S. 1970) national health bills. They advanced the opinion that passage of the Thomas-Murray-Dingell bill, because of its title VII on compulsory health insurance, "would result in most detrimental changes in medical practice and would harm the public." They added: "We are also convinced that the objectives which the proponents of this bill have in mind, and which we share, can be achieved more effectively by procedures which are more orderly, progressive and far less hazardous."

Voluntary prepayment plans "simply do not include all those who need protection and they never will," the Senate subcommittee was told by Dr. Theodore Sanders, who described himself as a physician practicing internal medicine. He rejected

the Hill and Taft bills but gave qualified approval to S. 1970 because it would require no means test and "it is designed to prevent medical domination of the voluntary health agencies." Dr. Bernard Meyer likewise disapproved of the Taft and Hill bills and denied claims that compulsory health insurance would result in impairment of the patient-doctor relationship.

Industrial Hygiene Advisory Committee Appointed

Appointment of a national advisory committee on industrial hygiene has been announced by the U. S. Public Health Service. Nine of its ten members have been named. The first meeting of the new group is expected to be held in September. Appointees are as follows: Dr. R. H. Hutcheson, Tennessee State Commissioner of Public Health; Dr. Harold A. Vonachen, medical director of Caterpillar Tractor Co.; Dr. Leo Price, director of Union Health Center, New York; Andrew Fletcher, president of St. Joseph Lead Co.; Vincent P. Ahearn, National Sand and Gravel Association; Nelson H. Cruikshank, American Federation of Labor; Harry Read, Congress of Industrial Organizations; Theodore F. Hatch, Industrial Hygiene Foundation, and Mrs. Margaret Lucal, American Association of Industrial Nurses.

Senator Thomas Sponsors United Medical Administration

A bill that would establish a United Medical Administration in the federal government to administer all federal hospitals—including military and naval—and perform other amalgamated functions was introduced June 7 by Senator Elbert D. Thomas of Utah. He filed S. 2008 at the request of his Democratic colleague, Senator John L. McClellan. The latter was a member of the Hoover Commission, which strongly recommended such a merger.

Incidentally, the address delivered in Atlantic City on June 5 by Senator McClellan before the National Conference of County Medical Society Officers is printed in the Congressional Record for June 8 (page A3732).

Department of Welfare Proposed by President

Establishment of a new Department of Welfare in the executive branch of government, its component units to include the U. S. Public Health Service, Food and Drug Administration and Children's Bureau, is proposed in Reorganization Plan no. 1, which President Truman sent to Congress on June 20 under authority of the new reorganization act. Unless the recommendation is vetoed by either branch of Congress, the Federal Security Agency will be reconstituted as the Department of Welfare, with Oscar R. Ewing—present head of FSA—virtually certain to become the first Secretary of Welfare.

Medical Legislation

STATE LEGISLATION

Alabama

Bills Enacted.—H. J. Res. 21 has become Governor's No. 10 of the Laws of 1949. It memorializes the Congress of the United States to actively support the purposes of the Toby bill providing for the setting up of a National Foundation for the Study of Multiple Sclerosis. H. 2 has become Governor's No. 28 of the Laws of 1949. It provides that every inhabitant of the state over the age of 21 years and of sound mind may, by an instrument in writing executed as a deed and filed for record in the office of the judge of the probate court of the county of his residence or of the county in which he is confined in a hospital, arrange for or prescribe for the disposition to be made after death of his body or any organ, member or part thereof, provided that the disposition of said body or parts thereof is made for the purpose of advancement of medical science or for the replacement of diseased or worn out parts of other human beings or for the rehabilitation of human parts or other organs.

California

Bills Enacted.—A. 770 has become Chapter 457 of the Laws of 1949. It provides that no person, association or corporation shall establish or keep for compensation or hire an establishment for the care, custody or treatment of the insane, alleged insane, mentally ill or other incompetent persons without first obtaining a license therefor from the Department of Mental Hygiene. A. 1270 has become chapter 500 of the Laws of 1949. It provides that no blind person shall be denied

admission into any college or school of chiropractic or denied the right to take any examination or obtain a diploma or denied admission into an examination for a state license to practice chiropractic on the ground that he is blind. A. 1287 has become chapter 233 of the Laws of 1949. It amends the business and professions code by eliminating the provisions for the issuance of a drugless practitioner's certificate. A. 3099 has become chapter 287 of the Laws of 1949. It provides that the required physical examination of school teachers shall include a roentgenogram of the lungs every three years and that the results of such examination must indicate that the applicant is free from active tuberculosis. S. 796 has become chapter 308 of the Laws of 1949. It amends the business and professions code by making it a misdemeanor for any person licensed under such code to conspire with any person not so licensed to violate any of the code provisions or to allow his license to be used by such person or to act as such person's agent or partner. S. 1162 has become chapter 311 of the Laws of 1949. It amends the Welfare and Institutions Code relating to the licensing of hospitals by exempting therefrom county hospitals except that the Department of Welfare and Institutions shall investigate, examine and make reports on such hospitals and such hospitals shall submit plans of any additions or alterations to the department before their adoption.

Connecticut

Bill Enacted.—S. 600 has become Public Act No. 88 of the Acts of 1949. It authorizes the medical examiner along with the coroner to order an autopsy and requires that such autopsy whether ordered by the coroner or the medical examiner shall be performed only by a certified pathologist.

Delaware

Bills Enacted.—H. Res. 42 was adopted May 12, 1949. It memorializes the Congress of the United States to refrain from imposing on the citizens of this nation any form of compulsory insurance or any system of medical care designed for national bureaucratic control. S. Res. 45 was adopted May 2, 1949. It memorializes the Congress of the United States to refrain from imposing on the citizens of this nation any form of compulsory insurance or any system of medical care designed for national bureaucratic control. S. 282 was approved June 8, 1949. It appropriates the sum of \$50,000 each year for the next two years for the detection of cancer, for research in cancer and for other purposes related to cancer prevention and control.

Florida

Bills Enacted.—S. 180 was approved May 16, 1949. It authorizes the Board of Examiners in the Basic Sciences to examine and license applicants desiring to practice medical technology which is defined as the science, art or technique of performing any laboratory tests or examination on or of the blood, blood serum, feces, urine, sputum, exudates, transudates, organ contents or any by-products thereof, from the human body, living or deceased, the results of which are used or interpreted by a practitioner of the healing arts in the practice of his profession. S. 329 was approved June 7, 1949. It provides for the creation of a school of medicine and nursing at the University of Florida campus at Gainesville. S. 413 was approved June 7, 1949. It amends the food and drug act by including amphetamine and penicillin within the list of drugs which must be labeled in a certain manner unless sold on the written prescription of a member of the medical, dental or veterinary profession.

Maine

Bill Enacted.—H. 1582 was approved April 26, 1949. It amends the chiropractic practice act by requiring applicants to be examined in the additional subjects of electrotherapy, hydrotherapy, dietetics and bacteriology.

Massachusetts

Bill Enacted.—S. 606 has become chapter 183 of the Laws of 1949. It provides that a statement of fact or opinion on a subject of science or art contained in a published treatise, periodical, book or pamphlet shall, in the discretion of the court, and if the court finds that it is relevant and that the writer of such statement is recognized in his profession or calling as an expert on the subject, be admissible in actions of contract or tort for malpractice, error or mistake against physicians, surgeons, dentists, optometrists, hospitals and sanatoriums, as evidence tending to prove said fact or as opinion evidence; provided that the party intending to offer as evidence any such statement shall, not less than three days before the trial of the action, give the adverse party notice of such intention, stating the name of the writer of the statement and the title of the treatise, periodical, book or pamphlet in which it is contained.

Ohio

Bills Enacted.—S. 134 was approved May 26, 1949. It provides for the establishment of a commission to study the problem created by temporary unemployment due to disability or sickness. S. 222 was approved June 8, 1949. It amends the narcotic act by including isonitrophenol, amideone, isomidone and keto-bemidone within the meaning of the words "narcotic drugs."

Wisconsin

Bill Enacted.—A. 215 has become chapter 130 of the Laws of 1949. It limits the practice of a chiropodist by providing that nothing contained in the act shall be construed to permit major surgical operations on the foot, or minor operations on the foot involving vascular diseases or diabetes except on the advice of one licensed under the medical practice act, or the treatment of conditions of the feet involving osteomyelitis, malignant diseases or syphilis, or the therapeutic use of roentgen rays and radium, or cutting operations involving the bones, ligaments, muscles, nerves or tendons of the feet.

GOVERNMENT SERVICES

ARMY

ADDITIONAL BENEFITS FOR MEDICAL OFFICERS

The Department of the Army announces that medical and dental officers will be given priority of consideration in assignment of quarters and their families will be allowed to accompany them on overseas tours of foreign duty. This policy recognizes the fact that medical and dental officers, as a result of the present shortage, are required to be on duty more hours per day than is normal, as well as to perform more than normally arduous duties. This policy is the latest step in a continuing campaign designed to relieve the shortage of medical and dental officers in the Army by making their military careers more attractive. Previous action in this direction includes: providing such officers with an extra \$100 per month in pay, giving them every opportunity to pursue their specialties, assigning rank on the basis of civilian accomplishment and emphasizing stability of their assignments by making only an essential minimum number of transfers of these officers.

REINSTATEMENT OF INTERN PROGRAM AT PERCY JONES HOSPITAL

In a recent issue of the *Bulletin of the U. S. Army Medical Department*, announcement is made of the reinstatement of the intern training program at Percy Jones General Hospital, Battle Creek, Mich. This program has been inactive for the past two years and accordingly was not included in the approved list published in the Internship and Residency Number of THE JOURNAL (May 14, 1949). The Surgeon General's Office has stated that the training to be offered will be of the same high caliber as that conducted in other approved army hospitals. Applicants interested in this internship should refer to the Educational Number of THE JOURNAL, to be published in September, for confirmation of its approved status.

Further announcement was made that the residency programs at Percy Jones General and at Madigan General hospitals are being temporarily inactivated, due primarily to a shortage of personnel. When residents become available for assignment to these hospitals, reinstatement of these programs to an approved status is contemplated.

MEDICAL INDEXING

The Consultant Committee on Medical Indexing, Office of the Surgeon General, held its fifth meeting May 1, at which Dr. Raymond L. Zwemer, executive secretary, National Research Council, gave an over-all picture of UNESCO in relation to the indexing problem. The Medical Indexing Committee adopted the following resolution to be transmitted to the UNESCO Interim Co-ordinating Committee: "Resolved that indexing is a matter of primary importance in the management of medical literature." In the afternoon, Ralph R. Shaw explained the principle of the Bush Rapid Selector. In a practical demonstration, selections were made from films running at the rate of 60,000 entries per minute.

The Surgeon General of the Army, at the invitation of UNESCO, sent Dr. Sanford V. Larkey as an observer to the meeting of the Interim Co-ordinating Committee on Medical and Biological Abstracting held in Paris, June 1-4. Dr. Henry R. Viets, Boston, is the observer for the American Medical Association on this Interim Co-ordinating Committee.

MONTHLY MEDICAL MEETING

At the Surgeon's General monthly medical meeting at Walter Reed Hospital, Washington, D. C., June 16, Dr. Brian Blades, of George Washington University Medical School, discussed arteriovenous fistulas of the lung, and Colonel James H. Forsee, of Fitzsimons General Hospital, Denver, "Estimation of Pulmonary Function in Thoracic Surgery."

VISITING PHYSICIANS FROM GERMANY AND AUSTRIA

The Office of the Military Government of the United States Zone in Germany sent seven German physicians to the United States in March of this year for three months of study and travel, including visits to outstanding public health and medical centers in this country.

Following are the German physicians who participated:

- Dr. Kurt Felix, professor of physiology and physiologic chemistry, University of Frankfurt.
- Dr. Rudolph Geissendoerfer, chief of the surgical clinic, University of Frankfurt.
- Dr. Wolfgang Luther, chief of the radiobiological department, University of Marburg.
- Dr. Walter von Baeyer, chief of the Neurological and Psychiatric Clinic of Nuremberg and professor at the University of Erlangen.
- Dr. Werner K. Wagner, professor of neurology and psychiatry, University of Munich.
- Dr. Herbert Wendel, research assistant at the Pharmacological Institute of Berlin.
- Wilhelm A. Wiskott, professor of pediatrics, University of Munich, and director of the Children's Hospital.

The Military Government of Austria made similar arrangements for the following Austrian physicians:

- Dr. Hermann Chiari, director of the Institute for Pathological Anatomy, University of Vienna.
- Dr. Otto Kauders, director of the Clinic for Psychiatry and Neurology, University of Vienna.
- Dr. Herbert Kraus, assistant to the director, First Surgical Clinic, University of Vienna.
- Dr. Leopold Arzt, chief, Clinic for Skin and Venereal Diseases, University of Vienna.
- Dr. Camillo Wiethe, professor in the University of Vienna and chief of the University Clinic for Ear, Nose and Throat Diseases.
- Dr. Otto Schumann, director of the Pharmacological Institute, University of Innsbruck.
- Dr. Erich Zdansky, Medical Radiology, University of Vienna, and head physician of the Central-Roentgeninstitute, General Hospital.
- Dr. Tassilo Antoin, professor of obstetrics and gynecology and director of the First Clinic for Obstetrics and Gynecology of Vienna.

ACCEPTED FOR COURSES IN CIVILIAN INSTITUTIONS

The following Medical Department officers have been accepted for courses in the civilian institutions indicated:

- | | | |
|----------------------------------|--|---------------------------|
| Col. E. L. Olson | Gill Memorial Eye, Ear and Throat Hospital, Roanoke, Va. | Otolaryngology |
| Col. Arnold A. Albright | University of Michigan, Ann Arbor, and; later, State University of Iowa, Iowa City | Ophthalmology |
| Col. Wilford F. Hall | Johns Hopkins University, Baltimore | Otorhinolaryngology |
| Col. Vernon J. Erkenbeck | Indiana University Medical Center, Indianapolis | Otorhinolaryngology |
| Lieut. Col. Byron G. McKibben | Indiana University Medical Center, Indianapolis | Otorhinolaryngology |
| Lieut. Col. Oscar P. Moffitt Jr. | Indiana University Medical Center, Indianapolis | Otorhinolaryngology |
| Lieut. Col. Lucio E. Gatto | Philadelphia Psychanalytic Institute, Philadelphia | Psychoanalysis |
| Capt. Si F. Moorehead | Columbia University College of Physicians and Surgeons, New York | Orthopedic surgery |
| Capt. Thomas R. Plowright | Fresno General Hospital, Fresno, Calif. | Pediatrics |
| First Lieut. Paul C. Olfelt | Minneapolis General Hospital, Minneapolis | Intern training |
| First Lieut. Jack W. Passmore | Sacred Heart Hospital, Spokane, Wash. | Intern training |
| First Lieut. Joel H. Richert | West Suburban Hospital Assn., Oak Park, Ill. | Intern training |
| First Lieut. Charles W. Hanford | St. Mary's Group Hospitals, St. Louis | Obstetrics and gynecology |
| First Lieut. Merlin H. Johnson | Iowa State Psychopathic Hospital, Iowa City | Psychiatry |
| First Lieut. Edward O. Bierman | Firmin Desloge Hospital, St. Louis | Ophthalmology |
| First Lieut. James C. Bell | Colorado General Hospital, Denver | Medicine |
| First Lieut. Albin J. Sowka | St. Mary of Nazareth Hospital, Chicago | General surgery |

NAVY

CERTIFIED BY BOARDS

The following additional Naval medical officers have recently been certified by American boards: American Board of Preventive Medicine and Public Health, Capt. Richard H. Fletcher and Capt. Thomas J. Carter; American Board of Dermatology and Syphilology, Capt. Charles D. Bell; American Board of Pathology, Commanders William W. Ayers and William O. Umiker and Lieut. Comdr. Carl M. McCandless.

DUTY UNDER INSTRUCTION

The following medical officers have been nominated for duty under instruction in the Navy's Postgraduate Training Program: Commanders Oscar T. McDonough Jr., Washington, Pa., to a residency in surgery at the Naval Hospital, Philadelphia; Nelse O. Olson, San Francisco, to a residency in ophthalmology at the Naval Hospital, Long Beach, Calif.; Edward P. Slosek of Nashua, N. H., to a fellowship in surgery at the Lahey Clinic, Boston; Phillips L. Claud of Portsmouth, Va., to instruction in radiology at the University of Pennsylvania Graduate School of Medicine, Philadelphia; Evan C. Stone Jr., of Minot, N. D., to a residency in surgery at the Naval Hospital, Chelsea, Mass. Lieutenant Commanders Robert F. Christoph, Des Moines, Iowa, to a fellowship in surgery at Northwestern University Medical School, Chicago; Watson B. Larkin, Denver, to a residency in otolaryngology at the Naval Hospital, NMMC, Bethesda, Md.; Earl C. Wolf, Naperville, Ill., to a residency in otolaryngology at the Naval Hospital, Philadelphia; Lieut. Vorris M. Reist, Oberlin, Kan., to a residency in obstetrics and gynecology at the Naval Hospital, Long Beach, Calif.; Lieutenants (jg) James M. Cole, Cuba, N. Y., to a residency in otolaryngology at the Naval Hospital, Philadelphia; Paul A. Jarand of Farina, Ill., for duty under instruction in aviation medicine at the School of Aviation Medicine and Research, NAS, Pensacola, Fla. Raymond J. Leffler, Sayre, Pa., to a residency in pathology, Naval Medical School, NMMC, Bethesda, Md.; Gerald A. Martin of Wilmore, Ky., for duty under instruction in internal medicine at the University of Maryland Hospital, Baltimore, Md.; Delmar W. Ruthig of Saginaw, Mich., for duty under instruction in preventive medicine at the Johns Hopkins University School of Hygiene and Public Health, Baltimore; Robert C. Trout, Columbus, Ohio, to a residency in surgery at the Naval Hospital, Philadelphia; James H. Watts of Ansley, Neb., for duty under instruction in otolaryngology at the University of Illinois College of Medicine, Chicago; Paul D. Doolan of Hamden, Conn., to a residency in internal medicine at Georgetown University Hospital, Washington, D. C.; Alfred K. Hawkes, Goulds, Fla., to a residency in otolaryngology at the Eye, Ear, Nose and Throat Hospital, New Orleans, and Frank Ostapowicz, West Nanticoke, Pa., to a residency in obstetrics and gynecology at the Naval Hospital, Philadelphia.

DEDICATE NEW RESEARCH
LABORATORIES

The new laboratories of Naval Medical Research Unit 4 at Great Lakes, Ill., were dedicated on June 13, at which time Rear Admiral Clifford A. Swanson, Surgeon General of the Navy, gave the principal address. This research unit, which was formerly at the Naval Hospital, Dublin, Ga., is one of several Naval research units located in the United States and other parts of the world. With the transfer of the Naval hospital at Dublin to the Veterans Administration, it was decided to relocate this research unit at Great Lakes, where there is a large Naval training center, thus making available unique opportunities for research on diseases of the respiratory tract. This unit is under the command of Lieut. Comdr. John R. Seal, M.C., and has already gained recognition for contributions on rheumatic fever.

FIRST ACTIVE DUTY

Lieutenants (junior grade) in the Medical Corps Reserve recently nominated for their first active duty as interns are as follows:

Eugene R. Baker	Memphis, Tenn.	Naval Hospital, Oakland, Calif.
William J. Collier	Albany, Mo.	Naval Hospital, NTC, Great Lakes, Ill.
"H" Frank Holman	Urbandale, Moberly, Mo.	Naval Air Technical Training Center, Memphis, Tenn.
Donald F. Robinson	Danville, Ill.	Naval Hospital, NTC, Great Lakes, Ill.
James M. Smith	Mason, Ohio	Naval Hospital, San Diego, Calif.

NEW REGULAR OFFICERS

The following medical officers on active reserve status have been appointed as lieutenants (jg) to the Regular Navy Medical Corps:

Robert K. Barton, Fountain City, Ind.; James M. Cole, Cuba, N. Y.; Keith M. Coverdale, Fort Wayne, Ind.; Edward L. Mahon Jr., Kerrville, Texas, and Frank Ostapowicz, West Nanticoke, Pa.

PERSONAL

Rear Admiral Clifford A. Swanson, Surgeon General of the Navy, was awarded an honorary Doctor of Laws degree by Northern Michigan College of Education at Marquette, Mich., on June 18. Admiral Swanson, who is a native of Marquette, joined the Navy in 1925, after receiving his M.D. degree from the University of Michigan.

Dr. Lemuel T. Moorman of Florence, S. C., has been nominated for appointment as lieutenant (jg) in the Medical Corps Reserve and on acceptance will be assigned to the Medical Center, Bethesda, Md., as an intern.

AIR FORCE

TEMPORARY POSITION FOR MEDICAL
OFFICER

A vacancy exists in the headquarters of the Brookley Air Force Base, Alabama, for a Medical Officer (P-5) at a salary of \$6,235.20 per annum. Applications will be received until the needs of the service are met. Appointees will be given a temporary appointment pending the establishment of registers for regular probational appointments by the Civil Service Commission. This is a temporary interim period appointment. Applicants must be not less than 18 or more than 62 years of age, except in cases of veterans. Among the duties are: the diagnosis and treatment in internal medical cases and venereal diseases, surgery including the reduction of simple fractures, hemorrhoidectomies, blood transfusions, appendectomies, hernia, diagnosis of tuberculosis, the emergency treatment in obstetric and pediatric cases and roentgenology. The appointee must be able to supervise some 15 enlisted men

assigned as ward attendants and other personnel assigned to the laboratory or the x-ray room. Applications should be submitted on standard form 57 to the employee utilization branch, Room 117, Building T-50, Brookley Air Force Base, Alabama. Application forms may be secured from that address or from any first or second class post office.

ESTABLISH AIR FORCE MEDICAL RESERVE

General Hoyt S. Vandenberg, Chief of Staff, U. S. Air Force, announces that applications are being received for commissions in the newly created Air Force Medical Reserve. Physicians, dentists, nurses and other medical personnel who served with the Army Air Forces during the war may make application through the Air Adjutant General, U. S. Air Force, Dayton, D. C.

AIR FORCE MEDICAL SERVICE

The organization of a medical service within the Air Force has been announced, following directives issued by Secretary of Defense Louis Johnson. The new Air Force medical service, it is said, will provide better flexibility and control for Air Force medical services and requirements and will provide more efficient and equitable coordination under unification of control within the national military establishment. No duplication will exist under the new organization, since the Air Force previously had a medical service which, however, was under Army control.

The Air Force plans are designed to correct the major objections of professional persons to a career in the Armed Forces. An attractive career program will assure opportunity for medical and scientific advancement. Air Force physicians will have opportunities for advanced training in clinical medicine and

research in aviation medicine, and they will be given every possible opportunity to pursue their specialty. Professional facilities of General Hospitals and Laboratories, approved civilian institutions and Air Force facilities will be used to provide training tours. Medical officers will continue to receive the extra \$100 per month, and those who qualify for flying duties will receive additional hazard pay.

The officer personnel will consist of regular, reserve and national guard Air Force medical officers. A comprehensive plan for career development includes postgraduate training to provide the highest standard of medical care and insure the professional stature of individual officers.

Major General Malcolm C. Grow, Surgeon General of the Air Force, has been elevated to an organizational and functional position directly under the Chief of Staff of the Air Force.

PUBLIC HEALTH SERVICE

NEW ASSISTANT SURGEONS GENERAL

In ceremonies in Washington, June 7, three new Assistant Surgeons General were inducted into office by Surgeon General Leonard Scheele. They are: Otis L. Anderson, Vane M. Hoge and Lucile Petry. Dr. Hoge has been a member of the Regular Corps since 1928, and Dr. Anderson, since 1930. Miss Petry is the first woman in the 150 year history of the Public Health Service to hold the rank of Assistant Surgeon General. She is a native of Ohio, formerly was instructor at the Johns Hopkins Schools of Nursing and the Yale University School of Nursing and assistant director of the University School of Nursing.

Surgeon General Scheele also announced appointments to two newly created Public Health Service divisions: Dr. Estella Ford Warner, chief of the Division of States Grants, and Dr. Chapman, chief of the Division of Chronic Disease. Dr. Warner, who is the first woman ever to be commissioned in the Regular Corps, has been with the Public Health Service since 1931. Dr. Chapman, who has been with the Public Health Service since 1939, was former assistant chief of the Division of States Relations, and previously he served with the state health departments in New Jersey, Delaware and West Virginia, and with the Norfolk, Va., health department, of which he was commissioner.

ALL STATES NOW IN THE HOSPITAL CONSTRUCTION PROGRAM

The U. S. Public Health Service announces that the State Hospital Construction Program for Nevada has been received and approved; thus, all the states and territories are now included in the National Hospital Construction Program, whereby they become eligible for federal financial assistance to build hospitals and related health facilities. By June 1, 797 projects had been given at least initial approval by the Surgeon General; the total estimated cost for these buildings is \$483,403,883. The federal share of this cost is \$149,006,657. There are 387 of these projects actually now under construction.

SECOND WORLD HEALTH ASSEMBLY

Surgeon General Scheele has been named Chairman and Chief Delegate of the United States Delegation to the Second World Health Assembly, which will be held in Rome, June 13-July 2, 1949. Following is the list of the other United States Delegates to the Assembly:

Delegates

Edward S. Rogers, M.D., Dean, School of Public Health, University of California, Berkeley.

Mrs. Louise Wright, Chairman, Chicago Council on Foreign Relations.

Alternates

Howard B. Calderwood, Division of United Nations Economic and Social Affairs, Department of State.

H. van Zile Hyde, M.D., United States Representative on the Executive Board of the World Health Organization; Medical Director, U. S. Public Health Service, Federal Security Agency.

James R. Miller, M.D., Member, Board of Trustees, American Medical Association.

Congressional Advisers

The Honorable Allen J. Ellender, United States Senate.

The Honorable Joseph L. Pfeiffer, House of Representatives.

Advisers

R. W. Babione, Captain M.C., U.S.N., Bureau of Medicine and Surgery, Department of the Navy.

Katharine E. Faville, Dean and Professor of Nursing, College of Nursing, Wayne University, Detroit.

Robert Felix, M.D., Director, National Institute of Mental Health, U. S. Public Health Service, Federal Security Agency.

George M. Ingram, Acting Chief, International Administration Staff, Office of United Nations Affairs, Department of State.

David B. Lee, State Sanitary Engineer of Florida; President, Conference of State Sanitary Engineers.

Knud Stowman, Chief, Information and Research, Office of International Health Relations, U. S. Public Health Service, Federal Security Agency.

Mary Switzer, Assistant to the Administrator, Federal Security Agency.

Executive Secretary

William H. Dodderidge, Division of International Conferences, Department of State.

Assistant Executive Secretary

Anthony M. Tapogna.

Administrative Assistant

Elizabeth G. Prichard, Special Assistant to the Surgeon General of the U. S. Public Health Service, Federal Security Agency.

Documents Officer

Ellen M. Duggan, Division of International Conferences, Department of State.

VETERANS ADMINISTRATION

TRAINING DISABLED VETERANS

The Veterans Administration announces that during the past six years more than 94,000 disabled World War II veterans have been fully trained under Public Law 16 to earn a living. These veterans have been rehabilitated after completing their class room, on the job or on the farm training; of this number, 24,800 completed work in colleges and universities, 18,000 graduated from schools below college level, 50,800 finished their job training courses and 870 finished institutional on farm training. Public Law 16 was enacted by Congress in 1943 to restore veterans to employability lost because of a disability incurred in or aggravated by service in the armed forces between Sept. 16, 1940 and July 26, 1947. On May 1 there were 218,957 veterans in training under this law, about half of them in schools and colleges.

RESIDENCIES AVAILABLE

Three residencies in anesthesia are available beginning July 1 in the Veterans Administration Hospital at Richmond, Va.

Several residencies in neuropsychiatry will be available in the near future in the Veterans Administration Hospital, North Little Rock, Ark. Information may be obtained from the Director of Professional Education in the hospital.

PERSONAL

Dr. Major W. Gasper has been named manager of the Veterans Hospital at Wilmington, Del. He is a veteran with four years' service in the recent war and a graduate of the University of Michigan Medical School and formerly was in private practice.

Medical News

(Physicians will confer a favor by sending for this department items of news of general interest: such as relate to society activities, new hospitals, education and public health. Programs should be received at least two weeks before the date of meeting.)

ARIZONA

State Association Appoints Executive Secretary.—Mr. Carl A. Peachy, formerly of Toledo, Ohio, has been employed as executive secretary of the Arizona Medical Association. Mr. Peachy was associated with the Academy of Medicine of Toledo and Lucas County.

CALIFORNIA

Positions in Psychiatry Open.—The California State Personnel Board has scheduled a nationwide civil service examination to select candidates for positions for chief psychiatrist, correctional institution. The psychiatric duties are concerned principally with examinations of inmates and individual and group therapy. The final date for filing applications is August 6. The examination date is August 27 and the salary range is \$644 to \$782. Applications may be obtained from the State Personnel Board in Sacramento, San Francisco or Los Angeles.

Stanford Remodels Radiology Department.—Installation of six new major pieces of x-ray equipment and complete remodeling of the department of radiology in the Stanford University Hospital and Medical School in San Francisco has been announced, at a total cost exceeding \$100,000. New dark rooms, drying rooms, filing space, consultation room, a class room, and film interpretation rooms are included in the remodeling work, which has also provided two new waiting rooms. The diagnostic division of the radiology department now handles more than 1,600 patients a month. Dr. Henry S. Kaplan, professor of radiology and director of the department, has also established an experimental radiology laboratory in the Ruth Lucie Stern Research Building on Clay Street, opposite the hospital. Experimental cancer research, supported by funds from the National Cancer Institute, is being carried on by members of the radiology staff in this laboratory.

CONNECTICUT

Personal.—The University of Chicago at convocation exercises in June awarded Dr. Ross G. Harrison, Sterling professor of biology at Yale University, New Haven, the Doctor of Science degree for "his ingenious experimental methods and brilliant analysis which have signally advanced knowledge of the nervous system."

Research on Biology of Syphilis.—The New Britain General Hospital will receive a grant of \$22,302 from the National Institute of Health for the continuation of its program in research and basic study of the biology of syphilis. The program is under the direction of Paul D. Rosahn, pathologist in charge of the laboratories of the hospital. This is the fifth successive grant received for this research work, and the total amount of grants is about \$150,000.

ILLINOIS

State Medical Election.—The Illinois State Medical Society, at its recent annual meeting in Chicago, installed Dr. Walter D. Stevenson, Quincy, as president, selected Dr. Harry M. Hedge, Chicago, as president-elect and reelected Dr. Harold M. Camp, Monmouth, secretary-treasurer.

Chicago

Professor Day to Retire.—Dr. Alexander A. Day, professor of bacteriology and chairman of the department, Northwestern University Medical School, will retire August 31. A member of the faculty for 37 years, he was given a citation by the University Senate at commencement June 13. Farewell parties for him and Mrs. Day were given in June by Alpha Chapter of Phi Rho Sigma medical fraternity and by members of the bacteriology department faculty.

Personals.—Dr. Ulysses Grant Dailey, Chicago, delivered the annual Cassasa Memorial Lecture at Harlem Hospital, New York, April 13 on "Problems in Gastrointestinal Surgery."—Dr. Max Thorek has been made an officer of the *Légion d'Honneur* in appreciation from the French Government for "continuous services in the cause of amity between the United States and France."—Dr. Louis B. Newman has been appointed a member of the Medical Advisory and Consultant Board of

the Armour Research Foundation of Illinois Institute of Technology. This board is to select problems for research in the medical field and to advise an engineering staff on their medical aspects. Dr. Newman, who is chief of the physical medicine and rehabilitation service at the Veterans Administration Hospital, Hines, Ill., also has a degree in mechanical engineering.—Dr. Arthur C. Bachmeyer, assistant dean of the Biological Sciences Division, University of Chicago, received an honorary Doctor of Science degree from the University of Nebraska College of Medicine in Omaha May 28. Dr. Bachmeyer received his M.D. degree from the University of Cincinnati College of Medicine, 1911.

KANSAS

State Medical Election.—The Kansas Medical Society at its recent annual meeting installed Dr. Haddon Peck, St. Francis, as president and chose Drs. Franklin R. Croson, Clay Center, president-elect; Dale D. Vermillion, Goodland, secretary, and John L. Lattimore, Topeka, treasurer.

Dr. Hassig Honored.—Dr. John F. Hassig, Kansas City, was honored at a dinner attended by more than 100 of his colleagues at St. Margaret's Hospital May 19, the fifty-first anniversary of his first official visit to the hospital as a senior in medical school when he filled the place of interns called to duty in the Spanish-American War. Dr. Hassig has served as chief of the St. Margaret's Hospital staff; he was also secretary of the Kansas Medical Association for many years and president in 1935.

KENTUCKY

Retiring Dean Honored.—A testimonial dinner was given by the alumni of the University of Louisville School of Medicine for the retiring dean, Dr. John W. Moore, June 14 in Louisville. The new dean, Dr. J. Murray Kinsman, was introduced at the meeting. Members of the faculty and employees who had served for twenty-five years or longer were presented plaques.

Psychiatric Unit Dedicated.—Dedication ceremonies for the new psychiatric treatment and postgraduate training unit of Norton Memorial Infirmary, Louisville, were held June 14. Dr. Leo H. Bartemeier, Detroit, secretary of the American Psychiatric Association made the principal address. He stated that Louisville was the first city to build such a unit to a private general hospital with funds contributed by citizens. He credited Dr. S. Spafford Ackerly, chief of psychiatric services at the infirmary and chairman of the department of psychiatry and mental hygiene at the University of Louisville School of Medicine, with the advancement of the interest shown in this type of work since his arrival in Louisville seventeen years ago.

MARYLAND

Board of Medical Examiners.—The Board of Medical Examiners of Maryland on June 7 elected the following officers for one year beginning June: Drs. E. Paul Knotts, Denton, president; Edward M. Hanrahan, Baltimore, vice president, and Lewis P. Gundry, Relay, secretary.

Appoint Professor of Medical History.—Richard H. Shryock, Ph.D., professor of American history and since 1938 lecturer in medical history at the University of Pennsylvania, Philadelphia, has been appointed director of the Institute of the History of Medicine and William H. Welch professor of the history of medicine at the Johns Hopkins University School of Medicine, Baltimore. The new director will assume his duties in September. The Hopkins Institute of the History of Medicine was founded by Dr. William H. Welch in 1926. Dr. Welch, the first director, was followed by Dr. Henry Sigerist. Dr. Shryock became interested in medical history while serving with the Medical Corps during World War I. Returning to the University of Pennsylvania after the war, he continued training for the degree of Doctor of Philosophy.

MASSACHUSETTS

Society Elections.—At a meeting of the Massachusetts Trudeau Society June 9 Dr. Henry D. Chadwick, Waltham, became president and Dr. Edward J. Welch, Brookline, secretary-treasurer.

New Farnsworth Medical Building.—The six story Farnsworth Surgical Building of the New England Medical Center was opened May 26 in Boston. The hospital is round inside to provide outside rooms for all patients and has subterranean surgeries made possible by modern lighting. The operating suite, with six operating rooms, opens off a circular corridor. Two of the large rooms are equipped with galleries for observers above the "one way" glass. With early ambulation in mind, lounging rooms for patients have been provided for each floor.

The hospital will be available to New England physicians working through the Bingham Associates, organized in 1931 to provide better medical care for persons in small towns and rural communities. The plan of providing graduate training for doctors in up country New England, consultation in their own hospitals and diagnostic facilities in Boston while the doctor keeps his patient dates back to 1931. William Bingham II, a Cleveland millionaire, organized the Bingham Associates. It gave Boston Dispensary \$50,000 in 1931 to equip and operate a ward of 20 beds for diagnosis of conditions of patients sent in from up country. A full report was returned with the patient to his doctor for treatment. In 1933 Mr. Bingham built the Pratt Diagnostic Hospital. The new Farnsworth Building opens into Pratt hospital. The New England Medical Center is made up of the two hospitals, the Ziskind Laboratories, Boston Dispensary, Floating Hospital and the new Tufts College Medical School to be opened this fall.

MINNESOTA

Dr. Bell to Retire.—Dr. Elexious T. Bell, professor of pathology at the University of Minnesota Medical School, Minneapolis, retired June 15. He has served the university since 1910, teaching first anatomy and since 1911 pathology. He was appointed head of the department in 1921. An advisory committee has recommended the establishment of a fund of \$100,000 to create and maintain for teaching and research a Museum of Pathology in the medical school, which will bear his name. Dr. James S. McCartney Jr. is chairman of the E. T. Bell Fund Committee.

NEBRASKA

State Health Director Resigns.—Dr. Wallace S. Petty, state health director since March 1946, has resigned effective August 1. He has been associated with the department since 1942.

Medical Press Radio Conference.—The first Medical-Press-Radio Conference sponsored by the Nebraska State Medical Association was held in Omaha June 17. More than 160 newspapermen and doctors attended the all day meeting, which was designed to provide an opportunity to present mutual problems and work out a plan of cooperation. Dr. Joseph D. McCarthy, Omaha, president of the state medical association, and Dr. Harold S. Morgan, Lincoln, chairman of the association's public relations committee, played an active part in planning the meeting. The morning program was devoted to presentation of points of view by representatives of each group, and roundtable discussions were held during the afternoon. At the luncheon Mr. Alexis McKinney, managing editor, *The Denver Post*, spoke on "Obligations of the Press, Radio and Medical Profession."

NEW YORK

Personals.—Dr. Thomas R. Noonan, Rochester, N. Y., has been appointed to the staff of the Medical Division of the Upjohn Company. Dr. W. Kendrick Hare has been appointed director of the Statler Research Laboratories at Children's Hospital, Buffalo, and associate professor of pediatrics in the University of Buffalo Medical School. Dr. Hare comes from Cornell University Medical College, New York, where he has been a research associate in pediatrics since 1947.

Select Sites for Medical Centers.—The trustees of the new State University on June 16 recommended that the university locate its metropolitan medical center in Brooklyn and its up state medical center in Syracuse. The trustees adopted a resolution, subject to approval by the Board of Regents, authorizing the executive officers of the State University to enter into agreements for incorporating into the university the Long Island College of Medicine, Brooklyn, and the Syracuse University College of Medicine. The state plans to take over the colleges of medicine prior to next September and to operate them as integral parts of medical centers at that time. More than half of the \$10,000,000 appropriated by the 1949 legislature for the State University will probably be spent on the medical centers. When the State University takes over the colleges, it is expected that most of the faculty members will be retained and the faculties enlarged.

New York City

Research on Infant Blindness.—The Dunlevy Milbank Foundation had established a five year research program at Presbyterian Hospital by an initial grant of \$46,000 for the first two years to "inaugurate and carry forward a search for the cause and prevention of blindness in infants, particularly those born prematurely." The grant is to be known as a "Grant for Research in the Cause and Prevention of Retrolental

Fibroplasia." The research on this project will be carried on under the direction of Dr. John H. Dunnington, director of the ophthalmologic service at the Institute of Ophthalmology, a unit of the Columbia Presbyterian Medical Center. Dr. Algernon B. Reese, attending ophthalmologist and pathologist, will be directly in charge of the project.

Dr. Most in Charge of New Tropical Disease Clinic.—The Department of Health has expanded its tropical disease diagnostic service by opening its second clinic and laboratory in the Lower East Side Health Center, 341 East 25th Street, on June 15. Private physicians, clinics or hospitals may refer patients to the new clinic for consultation, diagnosis or treatment, and laboratory specimens may be submitted for diagnosis. Patients at the clinic will be seen by appointment only. Dr. Harry Most, director, postgraduate course in tropical medicine, New York University-Bellevue Medical Center Postgraduate Medical School, is in charge of the new laboratory and clinic. Dr. Most also serves as consultant in tropical medicine to the Surgeon General, United States Army, to the Veterans Administration and to other government agencies. He is a member of the subcommittee on tropical medicine of the National Research Council.

OKLAHOMA

Award 50 Year Pins.—Three pioneer Oklahoma practitioners were honored for their contributions in medicine in Oklahoma at special ceremonies awarding the Oklahoma State Medical Association 50 year club pin. They are Drs. Ralph W. Holbrook, Perkins, and Clarence S. Petty and Dan F. Gray of Guthrie.

Establish Grievance Committee.—The Oklahoma State Medical Association at its annual meeting in May established a Grievance Committee as a step toward better public relations for the profession in Oklahoma. The committee will provide for the people of the state an agency to consider individual complaints on medical services rendered by members of the association. Complaints will be considered from three points of view: (1) the amount of service rendered, (2) the responsibility assumed and (3) the patient's ability to pay. Membership in the committee will be composed of the five immediate past presidents still living. Members of the present committee are Drs. Clarence E. Northcutt, Ponca City; Paul B. Champlin, Enid; Louis C. Kuyrkendall, McAlester; Charles R. Rountree, Oklahoma City, and James Stevenson, Tulsa.

TENNESSEE

Dr. Packer Appointed Department Head.—Dr. Henry Packer, associate professor since 1938 in the department of preventive medicine and public health at the University of Tennessee College of Medicine, has been appointed professor and head of the department effective July 1, succeeding Dr. Frank L. Roberts, who became assistant dean July 1. Dr. Packer is a graduate of McGill University Faculty of Medicine, Montreal, 1933, received his doctorate in public health at the Yale University School of Public Health, New Haven, Conn., and has been a county health officer.

WEST VIRGINIA

License Revoked.—The Public Health Council at a meeting held in Charleston May 12 revoked Dr. Richard Bent Engle's license, no. 6196, to practice medicine in West Virginia because of the doctor's conviction on a felony charge. Dr. Engle was formerly located at Longacre, Glen White and Beckley.

Society News.—Mr. Thomas A. Deveny Jr. of Charleston has accepted appointment as executive secretary of the West Virginia Tuberculosis and Health Association, succeeding Mr. Edwin A. Wells, who resigned January 15 to accept appointment as executive secretary of the Maine Public Health Association at Augusta.

Demonstration Project in Human Relations.—The latest demonstration project of the state department of health, a course in human relations in the McDowell County schools, carried on cooperatively with the state department of education, was completed in May. Beginning in January 1949, more than 100 class rooms in the fifth to ninth grades in McDowell County were assigned the services of a trained consultant in mental hygiene for public schools. Two lessons were given each week. The object of this course is to teach children how to get along with themselves and others, meet unexpected changes, assume responsibility, make decisions and "face up" to their fears. Four thousand, six hundred and two pupils participated. McDowell County is used to give the program a trial before it is attempted in other counties. The program will be broadened in 1950 to include most of the 165 classrooms in the county.

WISCONSIN

Poliomyelitis Refresher Courses.—The University of Wisconsin Medical School, Madison, assisted by the Wisconsin State Board of Health will conduct short polio refresher courses for physicians and nurses August 1-4. The course for physicians will include the diagnosis and treatment of poliomyelitis, and the course for nurses will include the care and treatment of patients with poliomyelitis. Matriculation fee and expenses incident to attending the course will be defrayed by the National Foundation for Infantile Paralysis.

GENERAL

Wins Trudeau Medal.—Dr. Howard W. Bosworth, director of Barlow Sanatorium, Los Angeles, was presented the Trudeau Medal for outstanding work in tuberculosis research, treatment and prevention at the recent annual meeting of the National Tuberculosis Association in Detroit.

Dr. Coates Receives Awards.—The gold medal of the DeRoaldes Award of the American Laryngological Association was presented to Dr. George M. Coates, Philadelphia, in New York, May 16. The first of these awards was presented to Dr. Chevalier Jackson in 1928. There have been but six awards in 21 years. The Award of Merit, a gold medal, was given to Dr. Coates by the American Otological Society in New York on May 18. This was the first time this award has been conferred.

Gift to Promote Cultural Aspects of Medicine.—Mrs. Josiah C. Trent, Durham, N. C., is instituting an annual gift of 250 one year subscriptions to the *Journal of the History of Medicine and Allied Sciences* to be allocated to medical schools in the United States and Canada. Recipients are to be selected by the faculty from among those in the graduating class who have shown an interest in the cultural aspects of medicine. The late Dr. Trent was founder of the *Journal of the History of Medicine and Allied Sciences*, which recently came under the sponsorship of the Yale University School of Medicine, New Haven, Conn.

Bibliography on Cancer.—*The Index to Current Periodical Literature on Neoplastic Diseases and List of Current Books* is being published by the American Cancer Society, 47 Beaver Street, New York 4, beginning with the July-September, 1948 number. It has heretofore been published by the Louisiana Division of the American Cancer Society, which will continue to prepare the bibliography. The national office of the society requested the officials of the Louisiana Division to permit the transfer of financial responsibility for publication of this periodical to the national office, since it was felt that the service was of general value and wide interest.

Pan American Congress of Pediatrics.—The second Pan American Congress of Pediatrics will be held in Mexico, D. F., November 2-5. Subjects under discussion at the plenary sessions on succeeding days include Acute Diarrheas in Infancy and Hemolytic Syndromes of the Newborn; Congenital Malformations of the Heart and BCG Vaccination in America; Pediatric Surgery, and Virus Diseases in Pediatrics and Child Neuropsychiatry and Pediatrics in the Field of Social Security. Further information may be secured by writing Dr. Ismael Martinez Sotomayor, Social Secretary of the Organizing Committee, Hospital Infantil, México, D. F.

Plague Infection in the United States.—Under dates of April 28 and 29 and May 3, plague infection was reported proved in specimens of tissue and ectoparasites from rodents collected in Arizona, New Mexico, Texas and Washington as follows: In Arizona, Coconino County, in a pool of fleas from meadow mice; in New Mexico, Guadalupe, Socorro and Lincoln counties, in fleas taken from wood rats and white-footed mice; in Texas, Cochran County, fleas from grasshopper mice, one prairie dog and wood rats, and in Dawson County, fleas from wood rats. Infection in Washington was found in Grant County in fleas from meadow and white-footed mice.

Tuberculosis Association Grants for Research.—Grants to 22 investigators have been approved by the National Tuberculosis Association for investigations on the epidemiology and treatment of tuberculosis, studies of laboratory technics used in diagnosis and fundamental laboratory research. Grants became effective April 1. Of the 22 grants, four are new this year; others will permit the continuation of long term studies. The research program of the association is financed from Christmas Seal funds allocated to the association by its 3,000 affiliated associations and by special contributions from a number of affiliates. The association is continuing its policy of making grants to qualified investigators in universities and medical centers who have well equipped laboratories at their disposal.

Special Society Elections.—At the annual meeting of the American College of Chest Physicians in Atlantic City June 2-5, the following officers were elected: Dr. Joseph C. Placak, Cleveland, president; Dr. Louis Mark, Columbus, Ohio, president-elect, and Dr. Minas Joannides, Chicago, treasurer.—The American College of Radiology at its annual meeting in Atlantic City in June elected Dr. Arthur W. Erskine, Cedar Rapids, Iowa, as president; Dr. William R. Brooksher, Fort Smith, Ark., vice president, and Dr. Warren W. Furey, Chicago, treasurer.—The Southeastern Surgical Congress at its meeting late in May installed Dr. Robert J. Wilkinson, Huntington, W. Va., as president and chose Drs. Carl C. Howard, Glasgow, Ky. as president-elect and Benjamin T. Beasley, Atlanta, Ga., secretary-treasurer. Maryland and the District of Columbia were officially admitted to the congress, making 12 states and the District of Columbia in the organization.—The Medical Library Association meeting in Galveston, Texas, in April chose the following officers: Dr. Sanford V. Larkey, Baltimore, president; Miss Helen Hlavnac, New York, secretary, and Miss Edith Dernehl, Milwaukee, treasurer. The next annual meeting of the association will be held in Boston in June 1950.

Rocky Mountain Medical Conference.—This conference, a project of five Rocky Mountain states, will be held in Butte, Mont., August 2-4, with headquarters at the New Finlen Hotel. The annual session of the Montana State Medical Association will be held in conjunction with the conference. The following physicians will address the conference:

Cyrus C. Sturgis, Ann Arbor, Mich., The Etiology and Treatment of Hypertension.

Harold G. Wolff, New York, Life Situations, Emotions and Bodily Disease.

Henry L. Barnett, New York, Current Concepts Regarding the Nature and Treatment of Nephritis and the Nephrotic Syndrome in Children.

J. Englebert Dunphy, Boston, Treatment of Bleeding Gastric or Duodenal Ulcer.

Robert A. Kehoe, Cincinnati, Medical Control of Occupational Lead Absorption.

John R. Morse, Philadelphia, Correction of Long Bone Deformities by Osteotomy-Osteoclasis.

Harvey B. Matthews, Brooklyn, N. Y., Pelvic Tumors, Their Influence on Pregnancy, Labor and the Puerperium.

Charles L. Martin, Dallas, Texas, Treatment of Sterility with Hysterosalpingography.

L. Fernald Foster, Bay City, Mich., Newer Responsibilities of Organized Medicine.

Dr. Foster will also speak at the banquet Wednesday evening on "Public Relations Begin in the Doctor's Office." Roundtable luncheons will be held each noon. This conference is held on alternate years by the state medical associations of Colorado, Wyoming, Utah, New Mexico and Montana. It has no officers and does not engage in medical politics.

CORRECTION

Annual Congress on Medical Education.—In the abstract of the address by Dr. Albert B. Sabin presented before the Annual Congress on Medical Education and Licensure in February 1949 which appeared in *THE JOURNAL*, May 21, pages 352-353, the last paragraph should have read: "Although medical education in the United States is, in my prejudiced opinion, superior to that in any other country, I believe that there are some things we can learn from the Scandinavians, just as they are looking to us for improvement in their own system of education." In paragraph 5 on page 352 the reference to "Riggs Hospital" should read "Rigshospitalet," and in the same paragraph "Karl Institute" should read "Karolinska Institut."

Marriages

HAROLD FREDERICK ZIPRICK, Los Angeles, to Mrs. Marjorie A. Albert in Glendale, Calif., May 7.

FRANK B. TAYLOR to Mrs. M. Pearl Guynes, both of Madison, Wis., in Nashua, Iowa, May 28.

RUSSELL G. SMITH to Miss Mildred Lehrmann, both of Pittsburgh at Miami, Fla., April 20.

WILLIAM A. COYER, Elkton, Va., to Miss Margaret Isabella O'Keeffe of Grundy, April 18.

H. WARD RANDOLPH to Mrs. Lucy Taylor O'Neale, both of Richmond, Va., April 23.

FLOYD J. WALTER, Chambers, Neb., to Miss Geraldine Dick of Detroit, April 22.

IRVING BAYER to Miss Effie Abrams, both of Long Beach, N. Y., recently.

Deaths

Elmer Grant Horton, Columbus, Ohio; born in Horton Hill, N. Y., May 22, 1868; Ohio Medical University, Columbus, 1906; professor of hygiene and physical culture at the Wabash College, Crawfordsville, Ind., from 1893 to 1895; instructor in hygiene at the University of Pennsylvania from 1896 to 1898; in 1902 joined the faculty as an assistant professor of hygiene at his alma mater, which in 1907 merged with the Starling Medical College to form Starling-Ohio Medical College, where he was professor of pediatrics until 1912; in 1914, when the college became known as Ohio State University College of Medicine, he was made an assistant professor of pediatrics, serving in this capacity until 1924, when he was promoted to professor; later clinical professor and chairman of the department of pediatrics, retiring in 1939 with the title of emeritus professor; honorary life member and past president of the Columbus Academy of Medicine; member of the American Academy of Pediatrics and the American Medical Association; specialist certified by the American Board of Pediatrics; bacteriologist and chemist for the state board of health laboratories from 1898 to 1907 and health commissioner of Columbus from 1907 to 1909; member of the Franklin County Board of Health from 1928 to 1933; served on the staffs of the White Cross Hospital, Grant Hospital, University Hospital and Children's Hospital; died recently, aged 81.

Frederick Emil Abbott, Erie, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1921; member of the American Medical Association; on the staffs of Hamot and St. Vincent's hospitals; died May 8, aged 55.

Lewis Maitland Allen ♂ Winchester, Va.; University of Maryland School of Medicine, Baltimore, 1896; formerly on the faculty of his alma mater; served during World War I; city health officer; president of the Farmers & Merchants National Bank; on the staff of the Winchester Memorial Hospital; died May 2, aged 74, of carcinoma.

Samuel Howard Arthur, Jefferson, Iowa; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1893; surgeon for the Chicago & North Western Railroad; also a graduate in dentistry; died April 28, aged 86.

Henry Weston Benjamin, Park Ridge, Ill.; Rush Medical College, Chicago, 1933; member of the American Medical Association and the Connecticut State Medical Society; formerly managing director of the New Britain (Conn.) General Hospital; died May 3, aged 46, of bronchopneumonia and malignant hypertension.

Herbert M. Best ♂ Lapeer, Mich.; Detroit College of Medicine, 1901; county coroner; died April 27, aged 73, of carcinoma of the prostate with metastases.

Francis Abbott Birch, White Plains, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1905; died May 10, aged 68.

James Ruben Blitch, Savannah, Ga.; University of Georgia Medical Department, Augusta, 1895; member of the American Medical Association; died February 13, aged 88, of auricular fibrillation.

Maximilian David Bloomfield ♂ Philadelphia; Jefferson Medical College of Philadelphia, 1905; for many years on the staff of St. Joseph's Hospital; died in the University of Pennsylvania Hospital May 5, aged 65.

James L. Brannen, Greeley, Neb.; John A. Creighton Medical College, Omaha, 1901; county physician; for many years secretary of the school board; died April 23, aged 79.

Frank Thomas Budd, New York; Columbia University College of Physicians and Surgeons, New York, 1896; formerly affiliated with the U. S. Public Health Service; served during World War I; died May 4, aged 76, of coronary thrombosis.

Frederick De Sales Chappelle ♂ Hughesville, Md.; University of Maryland School of Medicine, Baltimore, 1905; past president of the Medical and Chirurgical Faculty of Maryland; affiliated with the Physicians Memorial Hospital in La Plata; died May 4, aged 67, of cerebral hemorrhage.

Maurice Herbert Cohn ♂ Fort Worth, Texas; Vanderbilt University School of Medicine, Nashville, Tenn., 1917; served during World War I; died April 23, aged 53.

Thomas Matthew Cole, Albany, Ga.; L. R. C. P., of Edinburgh, L. R. C. S., of Edinburgh, L. R. F. P. & S., of Glasgow, 1940; member of the American Medical Association; served during World War II; died recently, aged 47.

Cassius Clay Cottle ♂ Los Angeles; Rush Medical College, Chicago, 1889; died April 28, aged 83.

Albion Barnard Cross, Crowley, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1906; member of the American Medical Association; past president of the Acadia Parish Medical Society; past president of the Acadia Parish School Board; for many years president of the Acadia Parish Tuberculosis Association; served during World War I; died in the Baptist Hospital, New Orleans, April 22, aged 67, of arteriosclerotic heart disease and pulmonary infarction.

Carroll Church Davis, Marshall, Texas; Medical Department of Tulane University of Louisiana, New Orleans, 1910; member of the American Medical Association; served during World War I; member of the staff of the Texas and Pacific Railway Employees Hospital, where he died April 18, aged 63, of cardiac decompensation.

Edward Spence DePuy, Oakland, Calif.; Medical Department of the University of California, San Francisco, 1894; member of the American Medical Association; for many years on the staff of the Merritt Hospital, where he died May 3, aged 77.

John Jacob Dominick, Prosperity, S. C.; Medical College of the State of South Carolina, Charleston, 1900; for two terms member of the state house of representatives; served as mayor of Prosperity; died in Columbia (S. C.) Hospital April 19, aged 71, of carcinoma of the colon.

Robert Fish Dowell, Tulsa, Okla.; Missouri Medical College, St. Louis, 1881; also a pharmacist; died April 22, aged 89.

William Wallace Duncan, Aliceville, Ala.; Birmingham Medical College, 1900; member of the American Medical Association; died April 14.

Louis Reuben Edleson, Columbus, Ga.; University of Louisville (Ky.) Medical Department, 1907; member of the American Medical Association; served during World War I; died in the City Hospital April 7, aged 66.

William Lewis Ely, Fredericktown, Ohio; Cleveland Medical College, Homeopathic, 1893; died April 30, aged 83, of carcinoma.

Julius Theodore Elz ♂ St. Louis; St. Louis University School of Medicine, 1920; member of the American Academy of Ophthalmology and Oto-Laryngology; specialist certified by the American Board of Ophthalmology; on the staffs of St. Louis City, St. Anthony's and Lutheran hospitals; died April 22, aged 53, of uremia.

John Berlin Fitts ♂ Chattanooga, Tenn.; University of Georgia Medical Department, Augusta, 1927; died April 17, aged 49.

Frank Pierce Fitzgerald, London, Ohio; Medical College of Ohio, Cincinnati, 1884; died May 9, aged 91.

Alexander Vaughan Forrester, Detroit; McGill University Faculty of Medicine, Montreal, Quebec, Canada, 1924; member of the American Medical Association; affiliated with Highland Park (Mich.) General Hospital; died May 10, aged 51.

Harold Elmer Foster, Fort Mead, S. D.; Syracuse University College of Medicine, 1909; specialist certified by the American Board of Psychiatry and Neurology; served during World War I and World War II; manager of the Veterans Administration Hospital; died April 19, aged 64.

Abram E. Frantz, Wilmington, Del.; Hahnemann Medical College and Hospital of Philadelphia, 1882; formerly secretary of the state board of health and executive officer; at one time member of the Homeopathic Medical Society Examining Board; served as a member of the city board of education; died April 30, aged 90.

John White Gainey, Fayetteville, N. C.; Jefferson Medical College of Philadelphia, 1917; served during World War I; died in the Veterans Administration Hospital April 23, aged 54, of pneumonia.

William J. Gaudineer, New York; University of the City of New York Medical Department, New York, 1878; on the staff of St. Luke's Hospital; died May 6, aged 93, of cerebral hemorrhage.

Frank Roebling Geyser, East Elmhurst, N. Y.; Fordham University School of Medicine, New York, 1909; served during World War I; died in April, aged 65.

Upton Wright Giles ♂ New Orleans; Tulane University of Louisiana School of Medicine, New Orleans, 1916; on the staff of the Baptist Hospital; died in St. Petersburg, Fla., April 26, aged 57, of nephrosclerosis.

Felix Eloir Girard, Lafayette, La.; Medical Department of Tulane University of Louisiana, New Orleans, 1893; served as mayor; died May 2, aged 79, of arteriosclerotic heart disease.

Arnold Jarrett Given, Rensford, W. Va.; Medical College of Virginia, Richmond, 1927; member of the American Medical Association; served during World War I and World War II; died in Charleston May 3, aged 53.

Robert William Gover, Petersburg, Va.; University College of Medicine, Richmond, 1899; served during World War I; affiliated with the Central State Hospital, where he died April 19, aged 70, of cerebral arteriosclerosis.

Alfred Weston Gwinnell, Boston; Tufts College Medical School, Boston, 1911; member of the American Medical Association; served during World War I; died May 3, aged 70.

Eliott Moriarty Hague, Buffalo; University of Pennsylvania Department of Medicine, Philadelphia, 1897; for many years practiced in Rochester, where he was a member of the staff of the Genesee Hospital; died May 6, aged 79.

Wayman Belton Harpole, Maben, Miss.; Memphis (Tenn.) Hospital Medical College, 1909; member of the American Medical Association; died in Houston May 7, aged 69.

Thomas George Harris ♂ West Milford, W. Va.; University of Pennsylvania Department of Medicine, Philadelphia, 1903; died in a hospital at Clarksburg May 7, aged 73.

Gerhard Hecht ♂ Endicott, N. Y.; Friedrich-Wilhelms-Universität Medizinische Fakultät, Berlin, Prussia, Germany, 1926; certified by the National Board of Medical Examiners; affiliated with the Ideal Hospital; died May 2, aged 47.

Oliver Perry Henry, Mount Sterling, Ky.; Vanderbilt University School of Medicine, Nashville, Tenn., 1917; member of the American Medical Association; past president of the Montgomery County Medical Society; formerly member of the city board of education and county health officer; served overseas during World War I; died in St. Joseph Hospital, Lexington, April 30, aged 59.

John Harold Hershey ♂ Roseburg, Ore.; University of Toronto Faculty of Medicine, 1924; served as associate clinical professor of surgery at the University of Oregon Medical School in Portland; fellow of the American College of Surgeons; at one time practiced in St. Louis, where he was on the faculty of St. Louis University School of Medicine, on the staffs of St. Louis University Hospitals and Firmin Desloge Hospital; affiliated with the Veterans Administration; died March 6, aged 52.

Thomas Aldhelm Hogan, Altadena, Calif.; Rush Medical College, Chicago, 1903; on the staff of St. Luke's Hospital in Pasadena; died March 25, aged 71, of cardiac insufficiency.

Horatio Budd Hollifield, Washington, D. C.; University of Maryland School of Medicine, Baltimore, 1882; Hahnemann Medical College and Hospital of Philadelphia, 1889; died in Emergency Hospital April 26, aged 87, of cerebral thrombosis.

John Thomas Hosey, Palatka, Fla.; Memphis (Tenn.) Hospital Medical College, 1903; past president of the Putnam County Medical Society; served during World War I; died April 23, aged 70, of pulmonary tuberculosis.

Reid Owen Howser ♂ Oak Park, Ill.; Northwestern University Medical School, Chicago, 1909; past president of the Aux Plaines Branch of the Chicago Medical Society; on the staff of the West Suburban Hospital; died May 17, aged 66, of coronary occlusion.

Dwight Fenn Johnson ♂ Newark, N. Y.; Cornell University Medical College, New York, 1903; past president and secretary of the Wayne County Medical Society; health officer of the town of Arcadia; served as trustee on the board of education; died April 24, aged 70, of coronary sclerosis.

Christopher Johnston, Durham, N. C.; Johns Hopkins University School of Medicine, Baltimore, 1926; member of the American Medical Association; assistant professor of medicine at the Duke University School of Medicine; on the staffs of the Duke and Watts hospitals; died March 10, aged 48.

Charles Hollister Judd, Summerville, S. C.; University of Pennsylvania Department of Medicine, Philadelphia, 1897; for many years practiced in Detroit, where he was emeritus professor of gynecology and obstetrics at the Wayne University College of Medicine and on the staffs of St. Mary's, Deaconess, Harper, Providence, Florence Crittenton and Woman's hospitals; fellow of the American College of Surgeons; died May 11.

Charles Butcher Kaighn ♂ Atlantic City, N. J.; Jefferson Medical College of Philadelphia, 1914; member of the American College of Radiology; specialist certified by the American Board of Radiology; served during World War I; past president of the Atlantic County Medical Society; on the staff of the Atlantic City Hospital; died May 13, aged 57.

John Clarence Kincaid, Columbus, Ind.; Eclectic Medical College of Indiana, Indianapolis, 1906; member of the American Medical Association; served during World War I; on the staff of the Bartholomew County Hospital; died May 8, aged 69.

Howard Pendleton Kirtley, Salt Lake City; Rush Medical College, Chicago, 1904; member of the American Medical Association; fellow of the American College of Surgeons; past president of the Utah State Medical Association; served during World War I; on the staff of St. Mark's Hospital; died May 5, aged 71.

Herman Harry Levin, Lancaster, Pa.; St. Louis University School of Medicine, 1937; member of the American Medical Association and of the American Society of Anesthetists; served during World War II; affiliated with the Lancaster General Hospital, where he died May 4, aged 36, of coronary thrombosis.

Daniel Carel Longaker, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1881; member of the American Medical Association; specialist certified by the American College of Surgeons; died April 30, aged 90, of carcinoma of the bladder.

James Donley McClure, Wilkesburg, Pa.; Western Pennsylvania Medical College, Pittsburgh, 1892; member of the American Medical Association; died May 5, aged 83.

Carl Esselstyn McCombs, New York; Cornell University Medical College, New York, 1909; member of the American Public Health Association; for many years a member of the staff of the Institute of Public Administration; died May 6, aged 66.

Caleb Scattergood Middleton, Biloxi, Miss.; Hahnemann Medical College and Hospital of Philadelphia, 1892; died April 29, aged 80.

Homer Pease Mix, Benton Harbor, Mich.; the Hahnemann Medical College and Hospital, Chicago, 1880; at one time health officer, president of the village and president of the board of education in Highland, Wis.; died May 9, aged 97, of bronchopneumonia.

Spurgeon Boone Moore, Portsmouth, Va.; Medical College of Virginia, Richmond, 1918; formerly member of the city council; served during World War I; died May 2, aged 57, of coronary thrombosis.

John Lawrence O'Brien ♂ New York; Yale University School of Medicine, New Haven, 1925; on the staff of St. Francis Hospital; died in Buffalo May 3, aged 51, of coronary occlusion.

Robert Joseph O'Brien, Watervliet, N. Y.; Albany (N. Y.) Medical College, 1904; formerly director of the National Bank of Watervliet; died in St. Mary's Hospital, Troy, April 13, aged 72, of uremia and toxemia.

Silas Robert Posey ♂ Lititz, Pa.; Jefferson Medical College of Philadelphia, 1911; member of the school board; served during World War I; for many years director of the Farmers National Bank; died in the Lancaster (Pa.) General Hospital May 5, aged 69.

Warren Winfield Preston, Montrose, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1907; member of the American Medical Association; died May 8, aged 69.

William Henry Price ♂ Stony Ridge, Ohio; Toledo Medical College, 1897; served during World War I; president of the Farmers Savings Bank; died May 6, aged 82, of cardiovascular renal disease.

Oney Carstaffen Raines, St. Louis; St. Louis College of Physicians and Surgeons, 1897; died May 3, aged 72, of carcinoma.

Love William Raney, Houston, Texas; University of Texas School of Medicine, Galveston, 1911; member of the American Medical Association; died May 5, aged 75, of injuries received when the automobile in which he was driving was struck by a truck.

Charles Francis P. Ritchie ♂ South Portland, Maine; McGill University Faculty of Medicine, Montreal, Quebec, Canada, 1902; specialist certified by the American Board of Psychiatry and Neurology, Inc.; served in the Canadian Army Medical Corps during World War I; medical examiner for the Selective Service during World War II; formerly on the staff of Jacksonville State Hospital in Jacksonville, Ill.; died in Maine General Hospital, Portland, May 1, aged 70, of pulmonary embolus and coronary occlusion.

Andrew C. Roche ♂ Calumet, Mich.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1903;

veteran of the Spanish-American War; formerly member of the state board of registration in medicine; on the staff of the Calumet Public Health in Laurium; died April 25, aged 73, of coronary occlusion.

Walter Curtis Roller, Van Wert, Ohio; Cincinnati College of Medicine and Surgery, 1898; served during World War I; died in Dayton February 15, aged 78.

Lewis Jones Rutledge • McComb, Miss.; University of Tennessee College of Medicine, Memphis, 1921; died in the Baptist Memorial Hospital, Memphis, Tenn., April 25, aged 63.

Edwin Sauter, St. Louis; Marion-Sims College of Medicine, St. Louis, 1897; died April 17, aged 77, of coronary sclerosis.

Otto Raman Scott, Chrisman, Ill.; Starling Medical College, Columbus, 1898; district health examiner for the state of Illinois from 1933 to 1939; died April 22, aged 77, of bronchiectasis.

Ralph Justin Sewall, San Diego; University of Minnesota College of Medicine and Surgery, Minneapolis, 1895; served during World War I; died May 7, aged 75.

George Wallace Sharshon • Phoenixville, Pa.; Hahnemann Medical College and Hospital of Philadelphia, 1925; school physician; affiliated with Phoenixville Hospital; died April 9, aged 50, of coronary thrombosis.

Archibald O. Shaw, Ashland, Wis.; Rush Medical College, Chicago, 1902; died in Fort Meyers, Fla., in May, aged 81.

Joseph Pardoe Shearer • Washington, D. C.; Johns Hopkins University School of Medicine, Baltimore, 1917; fellow of the American College of Surgeons, formerly associate clinical professor of surgery at the Georgetown University School of Medicine; served during World War I; affiliated with National Homeopathic Hospital, Providence Hospital, St. Elizabeth's Hospital and the Doctors Hospital, where he died April 4, aged 55, of pericardial tamponade.

Irving Prescott Sherman, Brimfield, Mass.; New York Homeopathic Medical College and Hospital, New York, 1894; died May 6, aged 76, of heart disease.

Harrison Greenleaf Sloat, Fishkill, N. Y.; New York Homeopathic Medical College and Hospital, New York, 1901; veteran of the Spanish-American War; served overseas during World War I; for many years affiliated with the Veterans Administration; died April 30, aged 70.

Nathan Israel Slutsky • Brooklyn; Cornell University Medical College, New York, 1907; fellow of the International College of Surgeons; on the staff of the Beth Moses Hospital; died in the Jewish Hospital May 12, aged 64.

Edmond Clayton Smith, Cleveland; Eclectic Medical College, Cincinnati, 1881; died April 30, aged 92.

Lillian Richardson Smith, Harwich, Mass.; Tufts College Medical School, Boston, 1917; member of the American Academy of Pediatrics; served as director of the bureau of maternal health and child hygiene for the Michigan State Department of Health; died April 13, aged 63, of cerebral hemorrhage.

Bernard Sork, Philadelphia; Medico-Chirurgical College of Philadelphia, 1911; died April 30, aged 59 of coronary occlusion.

George Herbert Stagner, Edmond, Okla.; Eclectic Medical University, Kansas City, Mo., 1905; formerly a member of the state board of medical examiners; served overseas during World War I; died in the Veterans Administration Hospital, Amarillo, Texas, April 25, aged 72.

Paul Staman, Uniontown, Pa.; St. Louis University School of Medicine, 1933; member of the American Medical Association; killed near Canton, Ohio, April 18, aged 40, in an automobile accident.

Mary Ella Thompson Stevens, Detroit; University of Michigan Homeopathic Medical School, Ann Arbor, 1888; at one time affiliated with Grace Hospital; formerly member of the board of directors of the Detroit House of Correction, where she had been superintendent; died April 15, aged 85, of bronchopneumonia.

Earle Clement Stevenson • Gothenburg, Neb.; George Washington University School of Medicine, Washington, D. C., 1906; an officer during World War I; served as city physician and as a member of the board of education; died in Veterans Administration Hospital, Lincoln April 3, aged 70, of arteriolar nephrosclerosis.

Frederick Eugene Stockton • Birmingham, Ala.; Medical Department of Tulane University of Louisiana, New Orleans, 1911; specialist certified by the American Board of Dermatology and Syphilology; served during World War I; affiliated with

Children's, Hillman and St. Vincent's hospitals; died April 12, aged 65, of cerebral hemorrhage due to hypertension and arteriosclerosis.

Frederick H. Strauss, Milwaukee; Milwaukee Medical College, 1897; died in the Deaconess Hospital April 22, aged 76.

William Antoine L. Styles, Flushing, N. Y.; McGill University Faculty of Medicine, Montreal, Quebec, Canada, 1905; died in Stratford, Conn., April 13, aged 66, of heart disease.

Samuel O. Sublette, Versailles, Ky.; Pulte Medical College, Homeopathic, Cincinnati, 1893; Hospital College of Medicine, Louisville, Ky., 1896; first president of the Farmers' Bank of Mortonsville; member of the American Medical Association; died April 20, aged 79, of senility.

John Albert Sullivan • Tucson, Ariz.; Albany (N. Y.) Medical College, 1910; fellow of the American College of Surgeons; decorated twice for bravery during World War I; formerly practiced in Pittsfield, Mass., where he was on the staff of the Hillcrest Hospital; formerly affiliated with the Plunkett Memorial Hospital in Adams, Mass., and the Fairview Hospital in Great Barrington, Mass.; died in the Mayo Clinic, Rochester, Minn., April 15, aged 63, of hepatic insufficiency.

Willard Hamilton Sweet Sr., • Peekskill, N. Y.; Albany (N. Y.) Medical College, 1892; affiliated with the Ossining (N. Y.) Hospital; on the staff of the Peekskill Hospital, where he was president of the board; died April 24, aged 78, of cerebral accident.

Harry Arthur Tash, Butte, Mont.; University of Michigan Department of Medicine and Surgery, Ann Arbor, 1912; served on the staff of Murray Hospital; died April 21, aged 71.

Harwood Arthur Taylor, Mullens, W. Va.; Ohio State University College of Medicine, Columbus, 1929; served during World War II; died April 19, aged 44, of acute nephritis.

Moses Thorner, Bakersfield, Calif.; Columbia University College of Physicians and Surgeons, New York, 1898; member of the American Medical Association; fellow of the American College of Surgeons; formerly on the faculty of Indiana Medical College, School of Medicine of Purdue University, Indianapolis; affiliated with Cottage and St. Francis hospitals in Santa Barbara; died April 20, aged 75, of cerebrovascular hemorrhage.

Richard Elmer Tomlin, Ocean Grove, N. J.; Hahnemann Medical College and Hospital of Philadelphia, 1889; died April 20, aged 83, of heart disease.

John Wesley Tope • Oak Park, Ill.; Rush Medical College, Chicago, 1909; fellow of the American College of Surgeons; affiliated with West Suburban Hospital and Oak Park Hospital, where he died April 30, aged 64, of coronary thrombosis.

Benjamin John Voigt, Elgin, Ill.; College of Physicians and Surgeons of Chicago, School of Medicine of the University of Illinois, 1910; member of the American Medical Association; served during World War I; on the staffs of St. Joseph's Hospital and Sherman Hospital, where he died April 22, aged 68, of perforated duodenal ulcer with subphrenic abscess.

Frederick E. Ward • Easton, Pa.; Medico-Chirurgical College of Philadelphia, 1906; served as a member of the city council and for many years as medical examiner for the school district; died May 4, aged 66.

Clifton Michael Waugh • Tarkio, Mo.; Rush Medical College, Chicago, 1902; first president of the Nodaway-Atchison-Gentry-Worth Counties Medical Society; during World War I contract surgeon for the Students Army Training Corps at Tarkio College; for many years city health officer; examiner in his area of the Civil Aeronautic Authority; died in Rochester, Minn., April 21, aged 72.

Daniel E. Weber, Cambria, Wis.; Milwaukee Medical College, 1910; health officer; died in St. Joseph's Hospital, Beaver Dam, May 7, aged 64, of bronchogenic carcinoma.

J. Cornelius Weber, Olney, Ill.; Missouri Medical College, St. Louis, 1899; affiliated with the Olney Sanitarium; died May 3, aged 73, of anoxemia of brain and chronic myocarditis.

Victor Leasure Wetherby, Welch, W. Va.; Medical College of Virginia, Richmond, 1912; member of the American Medical Association; past president of the McDowell County Medical Society; died April 23, aged 62, of coronary thrombosis.

Christian George Yaeger, Philadelphia; University of Pennsylvania Department of Medicine, Philadelphia, 1895; member of the American Medical Association; died in the Jefferson Hospital May 4, aged 76, of cerebral thrombosis.

Abram Frank Ziegenfuss, Philadelphia; Hahnemann Medical College and Hospital of Philadelphia, 1879; died in the Temple University Hospital May 6, aged 93.

Foreign Letters

ITALY

(From Our Regular Correspondent)

FLORENCE, May 15, 1949.

Hemorrhagic Diseases

At the Ninth National Congress of Hematology, held in Naples, Professor Baserga discussed hemorrhagic diseases. He started with the period in which knowledge of the essential facts was acquired.

The speaker discussed the concepts of coagulation and showed himself more in favor of the recent American methods than the Swiss. He referred to his personal contributions concerning the importance of the thrombocytes, the function of calcium and the function of naphthoquinone.

He suggested a classification of the hemorrhagic diseases on a physiopathologic basis by distinguishing the changes in the thrombinogenetic factors, the changes in the fibrinogenetic factors, the formation of the thrombus and its attachment to the wall of the vessels, and finally the changes in the basal factors.

By examining some diseases belonging to the first group of his classification, i. e., those due to changes in the thrombinogenetic factors, the speaker analyzed the hemorrhagic diseases resulting from impairment of the mechanism of acceleration of coagulation (hemophilia); those resulting from hypoprothrombinemia (of the hepatogenous type; of the type due to drugs); those due to changes in the thromboplastin (presence of autothromboplastin or deficiency of thromboplastin arising from the thrombocytes, as it happens in Werlhof's disease), and changes in calcium.

The hemorrhagic diseases which depend on changes in fibrinogenesis can be linked to an excess of autothrombin or to conditions of hyperheparinemia of shock or of myelosis.

The speaker discussed particularly the pathogenesis of Werlhof's disease, in which the deficiency consists in the insufficient formation of thrombin and in which the factor of coagulation is of greater importance than the vasa factor.

In the discussion which followed, Professor Lunedei demonstrated the presence of dysergia, not of true allergy, in Werlhof's disease; Professor Torioli emphasized the splenic factor in Werlhof's disease, and he called attention to the occurrence of many types of this disease entity. This concept was approved by Professor Baserga.

Fractures of the Mandible

Surgical treatment of the mandible was discussed at the Surgical Society of Naples under the chairmanship of Professor Dominici.

Da Fazio has made a clinical contribution to this study demonstrating a new apparatus for reduction and fixation which he had constructed especially for the surgical treatment of fractures of the mandible, in the absence of the original Anglo-American apparatus for external fixation. He then reported 3 typical cases of fracture of the mandible treated by him at the Ospedale dei Pellegrini (Pilgrims' Hospital) in Naples.

Giardino, on the contrary, did not favor the surgical method of treatment; he stated that in the treatment of fractures of the mandible analogous results may be obtained with more

simple, nonsurgical methods which may not induce complications, which are often associated with surgical treatment. According to Giardino, the teeth represent the natural means of applying the forces which are intended for reduction and fixation of the bone fragments and, as a rule, it is not convenient to replace this technic by other means the application of which implies surgical procedures associated with bleeding in an area which is exposed easily to infection. According to the speaker, surgical treatment of fractures of the mandible has limited indications in fractures of the mandible deprived of teeth and in fractures of the angle resulting in the smallest stump deprived of teeth and consequently deprived of the natural means of anchorage. Therefore, he emphasized, one should not generalize such therapeutic orientation which, according to the speaker, would signify a return to the past.

Chiariello, on the contrary, stated that the procedure recommended by Professor De Fazio should have its proper place among the modern methods of treatment of fractures of the mandible but with the understanding that it should not be practiced in all cases, but rather limited to those in which the customary methods will not very likely warrant a complete success. In those cases the employment of the method may be much facilitated by the immediate use of penicillin.

Renal Depuration of Blood

At the Congress of the Italian Society of Pharmacology, Professor Santi, University of Padua, reported on the pharmacology of the kidney; he demonstrated that during the last years research in this field has made considerable progress as a result of the application of exact methods of study of the activity of the kidneys, based on the concept of "clearance."

By this term has been indicated the capacity of the kidney to clear completely, and within a short time, a certain volume of the plasma of the blood from a substance which can be eliminated by renal route.

The basis of this theory is the exact determination, practiced principally with insulin, of the volume of the ultrafiltrate, which in the unit of time passes through the capillary membrane separating the blood from the urine. The knowledge of the velocity of the glomerular filtration allows to determine the behavior of the substance in examination during its elimination, i. e., whether it may be ultrafiltered only by the glomeruli or whether it may be excreted or reabsorbed by the tubules.

In this manner the investigations concerned with the elimination of the drugs by renal route have received a vigorous impulse, and the exact answer was that, in many cases in which this new method of study was employed, it has been demonstrated that finally instruments of research have been discovered which are adaptable to the task of following the course of a substance or a drug through the anatomic and functional structures of the kidney. Thus the variations of the velocity of elimination of the free form and of the acetylated form of sulfonamide drugs may find an exhaustive explanation, as well as the great speed with which, as an example, the penicillin, the iodopyracet and the p-aminohippuric acid leave the organism. The theoretical and practical inferences derived from the application of this method always are of greatest interest; they are indispensable in order to understand the intimate mechanism of the action of the diuretic drugs.

The experimental results demonstrated that the majority of the diuretics (mercurials, xanthine) have a predominant effect on the tubules, by preventing the reabsorption of water.

Correspondence

TOXIC DRUGS AND ACCIDENTS

To the Editor:—A study is being made in the Department of Pharmacology and Toxicology of the University of Rochester School of Medicine and Dentistry, under the direction of Dr. Harold Hodge, to determine to what extent the effects of therapeutic drugs and exposure to toxic chemicals contribute to the high death and disability rates due to accidents. This study is part of a wider consideration of the medical aspects of accident control, and is concerned particularly with the problem of injuries and poisonings which occur in homes and on farms. There is special emphasis on the etiology of accidents to children between the ages of 1 and 20 years, since accidents are the leading cause of death in this age group, and second only to congenital malformations as a cause of permanent disability.

In dealing with industrial and traffic accidents some degree of mechanical and legal control is possible. In homes and on farms, where the accident rate is highest, the most authoritative influence is that of the practicing physician.

It has been shown statistically that about 20 per cent of the total population have most of the accidents. There is also considerable evidence to show that many of these accident-prone persons are suffering from physical or emotional disorders which can be diagnosed and treated clinically. The baffling problem of accident control may well find its solution in the offices of private practitioners.

A request is being made to doctors to help in the study described. The immediate need is for case histories of the following types:

1. Records of patients who have had accidents while under the effects of medications such as antihistaminics, anticonvulsants, barbiturates, sulfonamide drugs, insulin, bromide, atropine and procaine hydrochloride.

2. Records of patients who have had accidents after exposure to toxic chemicals such as carbon tetrachloride and naphtha.

3. Records of patients who have suffered liver or kidney damage after exposure to toxic chemicals. There is special interest in case histories of such damage after exposure to carbon tetrachloride used for dry cleaning, as a solvent or in water mark detectors by stamp collectors.

4. Records of patients who have had repeated small or serious injuries because of some physical disorder or disability such as limited hearing, defective vision, orthopedic impairment, epilepsy (slight petit mal or psychomotor attacks), heart failure and diabetes.

Assistance in obtaining this material will be most valuable and greatly appreciated. Please address communications to: Marion Gleason, Department of Pharmacology and Toxicology, University of Rochester School of Medicine and Dentistry, 260 Crittenden Boulevard, Rochester, N. Y.

PSYCHOSOMATICS

To the Editor:—I must point out evidences of loose writing in the otherwise excellent paper "Personality in Arterial Hypertension," by Gregory Gressel and others (*THE JOURNAL*, May 21, p. 265). I refer to the words ". . . other accepted 'psychosomatic affections' (asthma, ulcer, colitis)," and again, repeated later in the paper, ". . . did not have one of the more common accepted psychosomatic disorders (asthma, ulcer, etc.)."

Such glib statements and loose writing create the false breach between psychiatrists and allergists, wholly unwarranted, and produce a false impression on the reader. Hundreds of allergists in this country treat bronchial asthma successfully using the tools of organic medicine; these allergists, too, are aware of the psychosomatic relevance in many of their patients.

Certainly, there are psychosomatic factors present in all cases of asthma; in some it is, perhaps, a major factor. Yet there are many cases in which the emotional factor is minimal and, perhaps negligible. The interrelationship between the psychic and organic etiologic factors in bronchial asthma is very apparent and has been recognized for many years. Recently, Harris and I (*Neuropsychiatric Factors in Allergic Disease, M. Arts & Sc. 2: 119* [Oct.] 1948) have clarified this problem and have pointed out their relative importance. Perhaps the best study of psychic factors in bronchial asthma is that of Thomas French and Franz Alexander (French, T. L., and Alexander, F.: *Psychogenic Factors in Bronchial Asthma, Psychosomatic Medicine Monographs*, New York, Paul B. Hoeber, 1941, vol. 4). In the 27 cases studied and reported by French and Alexander a complete allergy workup was done by Rappoport with the findings that the patients were all allergic in the organic sense.

There is no question in the mind of any experienced allergist that there is a psychosomatic aspect in allergy—in many cases rather pronounced—but to consider bronchial asthma as a typical example of an "accepted psychosomatic affection" is misleading, especially to the physician who is treating a patient with asthma due wholly to ragweed pollen in the air. I, for one, have on numerous occasions produced an attack of asthma by giving an overdose of pollen extract. Also, on several occasions, have been able to produce an attack by emotional suggestion.

I am sure that Dr. Gressel accepts the fact that immunology plays a role in the production of asthma, as does pulmonary infection and as does emotional conflict, and that he does not mean to imply that bronchial asthma is purely a psychosomatic disease, as one might infer from the article.

NORMAN SHURE, M.D., Los Angeles.

SANDY CREEK PREFERS THE VOLUNTARY WAY

To the Editor:—The following article is being quoted word for word as it appeared in a local newspaper, *The Watertown Times*, on Wednesday, May 4, 1949.

NEW DOCTOR

As I see it in the Sandy Creek News: A new doctor is coming in July and a new dentist about the same time; we got a barber in Sandy Creek as well as one in Lacona, so our hair doesn't grow down our necks, and it goes to show you what can be done if a bunch of fellows really get busy and try to put something over.

I reproduce the item in the hope that it may be copied by newspapers all over the country, because in its few short lines there is a world of implication. In a very unassuming and straightforward manner it proclaims that the United States citizen when he becomes a community force, on even the smallest village level, can think for himself, act and take care of his needs in a very efficient manner. As shown in the above article he not only will farm, work in a factory and buy consumer goods but also get his hair cut, his teeth fixed and be provided with even more medical care. (The small village of Sandy Creek in Oswego Co., N. Y., had one physician but wanted another one—its own decision, made as such and fulfilled.) And, miracle of all miracles, he sees to it that he has these benefits without the benighted help of the Washington bureaucrat. We should be very much buoyed up in spirit as a result of these facts and feel that perhaps the American public individually and as a group will continue to care for themselves—unless of course a federal law is passed to the effect that we must give up our liberties entirely and be taken care of.

MARK L. HERMAN, M.D., Adams, N. Y.

Medical Examinations and Licensure

COMING EXAMINATIONS AND MEETINGS

NATIONAL BOARD OF MEDICAL EXAMINERS

NATIONAL BOARD OF MEDICAL EXAMINERS: *Parts I and II*. Various Centers. Sept. 12-14. Exec. Sec., Mr. E. S. Elwood, 225 S. 15th St., Philadelphia 2.

EXAMINING BOARDS IN SPECIALTIES

AMERICAN BOARD OF ANESTHESIOLOGY, INC. *Written*. Various Centers. July 15. *Oral*. Oct. 16-20. Sec., Dr. Curtiss B. Hickcox, 745 Fifth Ave., New York 27.

AMERICAN BOARD OF INTERNAL MEDICINE: *Written*. Oct. 17. Asst. Sec.-Treas. Dr. W. A. Werrell, 1 Main St., Madison 3, Wis.

AMERICAN BOARD OF OBSTETRICS AND GYNECOLOGY, INC. *Part I*. Various Centers. Feb. 3. Final date for filing application is Nov. 5. Sec., Dr. Paul Titus, 1015 Highland Bldg., Pittsburgh.

AMERICAN BOARD OF OPHTHALMOLOGY: St. Louis, Oct. 15-19; Boston, December. Sec., Dr. S. J. Beach, 56 Ivie Rd., Cape Cottage, Maine.

AMERICAN BOARD OF ORTHOPAEDIC SURGERY. *Part II*. New York City. Feb. 9-10. Final date for filing application for Part II is Aug. 15. Address: Sec.-Treas., Dr. Harold A. Sohfeld, Room 1856, 122 S. Michigan Ave., Chicago.

AMERICAN BOARD OF OTOLARYNGOLOGY: Chicago, Oct. 4-7. Sec., Dr. D. M. Lierle, University Hospital, Iowa City.

AMERICAN BOARD OF PATHOLOGY: Chicago, Oct. 7-8. Final date for filing application is Sept. 1. Sec., Dr. Robert A. Moore, 507 Euclid Ave., St. Louis.

AMERICAN BOARD OF PEDIATRICS: *Oral*. Cleveland, Sept. 16-18; New York City, Oct. 21-23; Chicago, Dec. 9-11. Sec., Dr. John McK. Mitchell, 6 Cushman Road, Rosemont, Pa.

AMERICAN BOARD OF PLASTIC SURGERY: Examinations are given in June and November of each year in the home town of applicants. Sec.-Treas., Dr. Louis T. Byars, 400 Metropolitan Bldg., St. Louis, Mo.

AMERICAN BOARD OF PREVENTIVE MEDICINE AND PUBLIC HEALTH: *Parts I and II*. New York, Oct. 22-24. Final date for filing application is July 22. Sec., Dr. Ernest L. Stebbins, 615 N. Wolfe St., Baltimore.

AMERICAN BOARD OF PSYCHIATRY AND NEUROLOGY, INC. *Special Examination*. Chicago, Oct. 24-25. Final date for filing application is July 15. December, New York City. Sec. Dr. F. J. Braceland, 102-110 Second Ave., S.W., Rochester, Minn.

AMERICAN BOARD OF SURGERY: *Written*. Various Centers, October 26. Final date for filing applications is July 1. Sec., Dr. J. Stewart Rodman, 225 S. 15th St., Philadelphia.

AMERICAN BOARD OF UROLOGY: *Written*, December. *Oral and Clinical*. Chicago, Feb. 11-15. Final date for receipt of case histories is Sept. 1, 1949. Sec., Dr. Harry Culver, 7935 Sunnyside Road, Minneapolis 18.

BOARDS OF MEDICAL EXAMINERS

ALASKA: * Juneau, Sept. 6. Sec., Dr. W. M. Whitehead, Box 140, Juneau.

COLORADO: * *Endorsement*. Denver, July 5. Sec., Dr. W. W. King, 831 Republic Bldg., Denver.

CONNECTICUT: * *Examination*. Hartford, July 12-13. Secretary to the Board, Dr. Creighton Barker, 258 Church Street, New Haven.

DELAWARE: Dover, July 12-14. Sec., Dr. J. S. McDaniel, 229 South State St., Dover.

DISTRICT OF COLUMBIA: * *Examination*. Washington, Nov. 14-15. Sec., Dr. G. C. Ruhland, 4130 E. Municipal Bldg., Washington.

GUAM: *Endorsement*. Agaña, Last Friday of each month. Sec., Capt. C. K. Youngkin, Dept. of Public Health, Guam, % F.P.O., San Francisco.

HAWAII: * *Examination*. Honolulu, July 11-14. Sec., Dr. S. E. Doolittle, 881 S. Hotel St., Honolulu.

IDAHO: Boise, July 11-13. Sec., Miss Estella S. Mulliner, Bureau of Occupational Licenses, 355 State House, Boise.

MAINE: Augusta, July 5-6. Sec., Dr. Adam P. Leighton, 192 State St., Portland.

MASSACHUSETTS: *Written*. Boston, July 12-15. Sec., Dr. George L. Schadt, 413 E. State House, Boston.

OREGON: Portland, Sept. 3 and Dec. 3. Sec., Mr. Charles D. Byrne, State Board of Higher Education, Eugene.

RHODE ISLAND: *Examination*. Providence, Aug. 10. Administrator of Professional Regulation, Mr. Thomas B. Casey, 366 State Office Bldg., Providence.

TENNESSEE: Memphis, July 8-9. Sec., Dr. O. W. Hyman, 874 Union Ave., Memphis 3.

WASHINGTON: Seattle, July 13-14. Sec., Department of Licenses, Mr. Edward C. Dohm, Olympia.

WISCONSIN: Milwaukee, Sept. 24 and Dec. 3. Sec., Prof. W. H. Barber, Ripon College, Ripon.

Medical Motion Pictures

FILM REVIEWS

Lumbar Sympathectomy. Some Clinical Applications and Physiological Principles, PMF 5076. 16 mm., color, sound, 1,100 feet (1 reel), showing time thirty-two minutes. Prepared in 1948 by and produced by the United States Army. Procurable on loan from the Army Surgeon of the Army Area in which the request originates.

This film illustrates the various applications of lumbar sympathectomy. It gives a demonstration of the types of condition likely to be benefited by this procedure. Selection of patients in whom sympathectomy might be considered is then shown. Diagnostic tests are made of which the most important is procaïnization of structure to be removed in the contemplated sympathectomy. Contents deal only with conditions involving the lower extremities, so that the clinical diagnostic block is directed to the lumbar chain. The adequacy of the block is judged by skin temperature and oscillometric studies. Skin resistance tests are not used. With a satisfactory procaine block the intended result from lumbar sympathectomy can be foreseen. Unfortunately, cases are seen in which sympathectomy gives far better results than can be anticipated by the block.

The actual operative procedure is well demonstrated; the anterolateral approach with the patient lying on his side over the kidney rest is used. A bilateral operation is done in two stages. The muscle splitting and the muscle cutting variations are shown through the incision, which extends from the tip of the twelfth rib downward and forward toward the umbilicus and to the outer border of the rectus muscle. Details of removal of the sympathetic chain are clear.

By animated drawings, the sympathetic impulses traveling over the various paths in the nervous system are presented with considerable imagination. Anatomic and physiologic defects produced by removal of certain portions of the chain are clearly shown. Vasoconstrictor drugs such as epinephrine and nicotine are reviewed, with the effects produced before and after sympathectomy. The animation clearly fixes the mechanisms of the nervous impulses in the mind. An ordinary anatomic demonstration on the cadaver is also shown.

Various conditions usually considered amenable to sympathectomy are presented in simple terms. This able film can be highly recommended for teaching purposes to general practitioners and senior medical students. It should crystallize in their minds some of the indications for this operative procedure and also the results likely to be obtained in properly selected cases.

Photography is superior in every respect.

How to Avoid Muscle Strains. 16 mm., black and white, sound, 550 feet (1 reel), showing time fifteen minutes. Prepared in 1949 and procurable on loan or purchase from Bray Studios, Inc., 729 Seventh Avenue, New York 19.

This excellent film employs views of a living model in action and also animated drawings to illustrate the mechanics of muscular activity, especially in the lifting of heavy loads. The diagrams beautifully show the analogy between the three types of lever studied in physics and certain familiar arrangements of bones and muscles in the human body. It then shows the correct and incorrect ways of lifting objects and illustrates the effects of overstrain on the vertebral column. A concluding section deals with the difficult subject of hernias. This part is less detailed and less accurate and the relation of hernia to strain is given much more emphasis than would represent current opinion among insurance statisticians and industrial hygienists. It is to be hoped that the authors will expand this last section into a more detailed and critical film which would be amply justified by the great importance of hernia today.

This film is recommended for industrial groups, first aid classes in health education, adult groups and physical education classes as an introduction to applied anatomy. The film consists of a combination of animation and straight photography which ranges from good to excellent. The narration is satisfactory. The model used is well chosen.

Bureau of Legal Medicine and Legislation

MEDICOLEGAL ABSTRACTS

Food and Drug Acts: Admissibility of Evidence of Consensus of Medical Opinion.—The defendants were charged with introducing, or delivering for introduction, into interstate commerce misbranded drugs. From a verdict of guilty, the defendants appealed to the United States Court of Appeals, seventh circuit.

Section 331 (a) of the Food and Drug Act prohibits the introduction into interstate commerce of any drug that is adulterated or misbranded. It is misbranded according to Section 352 (a) if its "labeling is false or misleading in any particular." The term labeling is defined in Section 321 (m) to mean "all labels and other written, printed, or graphic matter (1) upon any article or any of its containers or wrappers, or (2) accompanying such article." The printed matter involved in this suit consisted of a letter signed by one of the defendants, a leaflet and a circular.

The defendants contended that the misbranding must occur in the labels used and that the labels must accompany the drug into interstate commerce; that there was nothing in the three items of printed matter used in this case that informed the patient how the medicine was to be used; that the ingredients of the medicine were not given in the literature; that no therapeutic claim was made for it, nor did any statement appear that it was efficacious in the treatment of diabetes, except as to results had in prior cases.

The circumstances in which the drug and the literature were introduced or delivered for introduction into interstate commerce varied, said the court, but the general pattern was the same. A prospective patient, living outside of Indiana, would address a letter of inquiry to the defendants' clinic and, in response thereto, receive the printed circular and sometimes the form letter. The patient would thereafter attend the defendants' clinic, and, while there, would receive the leaflet containing diet recommendations and, in some instances, also receive a copy of the circular. Before leaving, the patient would have delivered

to him, or defendants would later ship to him, a three months' supply of the drug. The United States Supreme Court has already held, said the court of appeals, that the phrase "accompanying such article" is not restricted to labels that are on or in the article or package that is transported and has no specific reference to package, containers or their contents. Furthermore, it plainly includes what is contained within the package whether or not it is "upon" the article or its wrapper or container and the advertising matter need not travel with the drug. Since in this case, continued the court, it appears that the printed matter was used in the sale of the drug, that it did advertise and explain the use to be made of the drug and that the drug and the printed matter did move from Indiana to a point outside of the state, we are impelled to hold that the printed matter was "labeling" within the meaning of the Act.

The defendants also contended that the representations made in the labeling were expressions of opinion that they honestly believed. They argued that "this is a repeat of the constant quarrel existing in the medical profession as to what is proper and what is improper in the treatment of disease"; that a difference of judgment among medical men as to the best course or method of treatment does not tend to prove that either party is wholly wrong or wholly right; and that all this case reflects is that certain physicians believe in one course of treatment and other physicians believe in another course of treatment. In this case, said the court of appeals, the issue left to the jury was whether or not the labeling was false and misleading in that the statements in the printed matter represented, suggested and created in the mind of the reader, and led him to believe, that the drug was efficacious in the cure, mitigation or treatment of diabetes. The labeling represented that "there is real hope for the diabetic, and the possibility of recovery; . . . This hope is presented in the form of a method and a treatment, which is free from prolonged or continuous dieting . . . This consideration is invited in terms of what actually has been accomplished in a large number of cases of relief and recovery . . . In the majority of cases the patient resumes a normal diet within two or three weeks after beginning the treatment."

To show the ineffectiveness of the treatment, there was presented the testimony of patients who had been treated at the clinic and had subjected themselves to the recommended home treatment, as well as the testimony of relatives of former patients who had undergone the treatment and subsequently died. Each of these histories was supported by competent medical testimony. A diabetic person receiving competent medical care, taking insulin and on a regulated diet, with his disease under control, was induced to enter the clinic for the prescribed period. In accordance with the defendants' recommendations, he decreased his dosage of insulin, or discontinued it, and substituted the defendants' treatment. After subjecting himself to the defendants' treatment, he experienced results that commonly follow uncontrolled or improperly treated diabetes. The serious and irreparable injuries that followed included diabetic coma, permanent eye injuries and gangrene resulting in amputation. Outstanding medical authorities who were specialists in the treatment of diabetes testified that the treatment used and recommended by the defendants would have no effect in the treatment of diabetes; that it was worthless and absolutely of no value. These experts testified that the opinions expressed by them represented the consensus of medical opinion of the authorities on diabetes; that insulin was the only drug known to be effective in the treatment of diabetes; that a proper diet and exercise must be integrated with the dosage of insulin; and that the patient must be educated to look after his condition. We have previously held, said the court of appeals, that a consensus of medical opinion is a question of fact and provable as such. It has also been held that the conflict of medical opinion concerning the effectiveness of a drug likewise presents a question of fact. Since it is not necessary, in a prosecution under the Act, to prove guilty knowledge or wrongful intent, we think the jury's finding that the labeling was false and misleading was supported by substantial evidence.

The defendants' other contentions were also overruled, and the judgment of guilty was accordingly affirmed. *Rehearing denied January 3, 1949. United States v. Kaadt, 171 F. (2d) 600 (1948).*

Current Medical Literature

AMERICAN

The Association library lends periodicals to members of the Association and to individual subscribers in continental United States and Canada for a period of three days. Three journals may be borrowed at a time. Periodicals are available from 1938 to date. Requests for issues of earlier date cannot be filled. Requests should be accompanied by stamps to cover postage (6 cents if one and 18 cents if three periodicals are requested). Periodicals published by the American Medical Association are not available for lending but can be supplied on purchase order. Reprints as a rule are the property of authors and can be obtained for permanent possession only from them.

Titles marked with an asterisk (*) are abstracted below.

Granulomatous Nocardiosis, a New Fungus Disease.—

Cuttino and McCabe report the case of a 34 month old girl whose illness began with anorexia, nausea, vomiting and progressive loss of weight about four and a half months before her death. Shortly after the onset a mass, thought to be a lymphosarcoma, was noted in the abdomen. A transfusion and five treatments of high voltage roentgen therapy were administered. Roentgen therapy was discontinued because of unfavorable reaction, and the child was admitted to Duke Hospital for an exploratory operation. An enlarged inguinal node was removed and showed complete alteration of its architecture with proliferation of the macrophages. The cytoplasm of these macrophages appeared foamy and granular. Inasmuch as they resembled Gaucher's cells, a lipodystrophy was considered. Ziehl-Neelsen stain demonstrated that these cells contained massive numbers of an acid-fast bacilliform organism. A second biopsy showed a lesion of essentially the same type. The organism was isolated in pure culture. On protoscopic examination irregular ulcers were observed. A biopsy of one of these ulcers showed proliferation of macrophages containing many acid-fast organisms. The patient grew progressively weaker despite supportive measures, and died. The authors describe studies on the etiologic agent and stress that the morphologic, cultural and biochemical characteristics of this organism justify its designation as a new species to which the name *Nocardia intracellularis*, n. sp., has been given. This organism is assigned to the genus *Nocardia*, family Actinomycetaceae. The disease produced by this organism in man is a pure form of granulomatous inflammation, characterized by phagocytosis of the pathogen by reticuloendothelial cells and proliferation of these cells. In the spleen and lymph nodes the proliferation of macrophages is of such proportion as to displace completely the normal structure. *Nocardia intracellularis*, n. sp., produces a nonlethal disease in guinea pigs, rats and mice. The reaction produced in the experimental animal differs sharply from the reaction in man.

Primary Amyloidosis.—Dahlin says that of the 44 cases of amyloid disease in which necropsy was performed at the Mayo Clinic during the twenty-five year period 1922 through 1946, 7 were examples of primary systemic amyloidosis. In an eighth case necropsy was done in 1947. Six of these patients were men and 2 were women. Their ages varied from 40 to 75 years, the average being 56 years. The interval between the onset of

symptoms and death varied from eight months to four years. The 6 cases demonstrate the remarkable diffuse involvement of mesodermal structures in this disease. The distribution of amyloid differs from that usually described for secondary amyloidosis, especially in the constancy of involvement of the heart and the frequency of involvement of striated muscle, lungs and small blood vessels throughout the body. The cases in which involvement of the spleen, adrenal glands, liver and kidneys occurred demonstrate that amyloid distribution of the so-called secondary type is overlapped in primary systemic amyloidosis. The clinically important lesions were cardiac in 3 cases, which is in conformity with the findings in the majority of reported cases of primary systemic amyloidosis. In the 2 cases in which primary hepatic disease was simulated, the association of signs of hepatic disease and of renal disease is noteworthy. Macroglia was absent in 5 of the cases. The author concludes that this symptom does not have the diagnostic importance for primary systemic amyloidosis ascribed to it in the literature. The identity of the homogeneous, amorphous, pink-staining material seen in sections stained with hematoxylin and eosin should be confirmed by the use of special stains. In these 6 cases the amyloid showed definite metachromasia with methyl violet. The affinity of amyloid for congo red in primary amyloidosis was not as great as that observed in secondary amyloidosis. The van Gieson connective tissue stain is valuable in differentiating amyloid from hyaline or collagenous connective tissue of similar density. Biopsy of affected organs is the only certain diagnostic procedure in the cases in which the amyloid lacks affinity for intravenously injected congo red.

Intramedullary Pins for Fractures of Forearm.—Stuck and Thompson emphasize that complicated fractures of the forearm in which it is impossible to correct the displacement usually require open reduction with some type of internal fixation. The use of removable intramedullary wires and pins seems to offer a happier solution to internal fixation than anything that has been tried thus far. The technic of insertion of intramedullary wires and pins has now become well standardized. Advantages of intramedullary fixation of fractures of the radius and ulna are: (1) only a small incision is required; (2) there is only slight bleeding at the time of the operation and therefore little shock; (3) there is little dissection of the periosteum from the fracture fragments; (4) danger of infection is minimized because of the smaller wound; (5) the probability of union of the fracture is increased because the pins hold the fragments together even though some absorption of the bone ends takes place. In 19 cases in which they have treated fractures of the shaft of the bones of the forearm by the use of intramedullary wires and pins they have had only 2 failures. In general when the fragments were well reduced the wires provided perfect fixation with a minimum of interference with bony union. Solid bony union was seldom present in less than three months. Intramedullary wires or pins probably should not be used in compound fractures because of the danger of introducing infection into the

marrow cavity of the bones. In old fractures with malunion or nonunion, wires are useful for supporting bone ends after osteotomy and bone graft operations.

Disadvantages of Dicumarol.—According to Artz and his associates many clinics employ dicumarol[®] as the anticoagulant of choice in the treatment of intravascular thrombosis, chiefly because of its low cost and oral effectiveness. Disadvantages of its use such as delayed effect, necessity of daily prothrombin determinations and tendency to evoke hemorrhage have been well recognized. A study of their cases of thromboembolism leads the authors to emphasize certain other pitfalls encountered when dicumarol[®] therapy is employed. They found that too often the unpredictable response of the patient to dicumarol[®] makes it difficult to maintain the prothrombin level in the suggested therapeutic range of 10 to 30 per cent of normal and even when a prophylactic prothrombin depression has been maintained within the therapeutic range, thrombosis may occur. They cite 2 patients with thrombosis in whom the thrombotic process extended in spite of a dicumarol[®]-induced hypoprothrombinemia of less than 30 per cent of normal. A transfusion of whole blood to rectify excessive depression of plasma prothrombin by dicumarol[®] may increase the coagulability of the blood sufficiently to allow thromboembolism to occur. The dicumarol[®] effect, as evidenced by the Quick prothrombin test, may be most inaccurate if determined on blood containing moderate amounts of heparin on the end point of the test. They feel that although dicumarol[®] has been the popular anticoagulant for several years, the newer preparations of heparin in a gelatin menstruum may prove safer and more dependable.

Aortic Embolism.—Holden reports the case of a man, aged 50, who, one hour before admission, complained of severe pain in the lower portion of the back and abdomen, which proceeded into the lower extremities within a few minutes. His extremities became numb, cold and mottled blue and white. Within one-half hour, complete anesthesia developed from the mid thighs distally. The patient was taken to the operating room and given 14 mg. of weighted tetracaine hydrochloride intrathecally. A suprapubic incision was made. The patient was placed in the Trendelenburg position and the intestines packed into the upper abdominal cavity. Exposure of the aorta and the common iliac arteries showed no pulsations below the first centimeter of each common iliac artery. At these sites the vessels were distended, and rubbery intraluminal masses were palpable. The right common iliac artery was occluded by means of a small rubber tube above the palpable mass. The external and internal iliac arteries were similarly occluded below the mass. A 1 cm. longitudinal incision was then made in the common iliac artery over the mass. A 3.3 by 1 cm. organized embolus was lying free in the vessel and was easily extruded. The rubber tubes on the internal and external iliac arteries were loosened, and blood flow was obtained. The tube above on the common iliac artery was then loosened and a gush of blood obtained. An attempt was made to milk the embolus in the left common iliac artery back into the aorta and then into the right side: It could not be dislodged without undue trauma. The tubes on the right side having been retightened, the opening was closed. Before closure was completed, the lumen was filled with isotonic solution of sodium chloride. The same procedure was performed on the left side. On the eleventh postoperative day the patient's respiratory rate became rapid, and an electrocardiogram showed extension of the previous myocardial infarct. On the twelfth postoperative day, he became cyanotic and dyspneic. Peripheral vascular collapse occurred, and he died. At necropsy a recent embolus in a small pulmonary arterial branch in the lower lobe of the right lung was found. No thrombi were observed at the suture lines in the iliac arteries, and the arteries of both lower extremities were patent. The author stresses that postoperative thrombosis or embolism elsewhere should be treated as vigorously as the primary embolism. The patient whose extremity may be preserved by embolectomy should not be denied the opportunity.

Gastric Changes Accompanying Gastric Cancers in Various Locations.—The material collected by Guiss and Stewart was divided into seven groups: Group A was a control group of 48 "normal" stomachs. Group B consisted of 92 gastric specimens containing carcinoma arising in the pyloric portion. Group C was made up of 67 specimens of carcinoma of the fundus excluding the "surgical cardia." Group D was composed of 46 carcinomas of the "surgical cardia" of the stomach. Group E consisted of 32 consecutive stomachs resected for duodenal ulcer. Group F included 19 specimens of peptic ulcer located in the pyloric area. Group G was a group of 20 stomachs resected for peptic ulcer of the fundus gland area. It was found that the mean age at which cancer develops in the various areas

of the stomach is the same. The average stomach of "normal" persons reaching the cancer age (40 to 79) shows a mild generalized chronic atrophic gastritis, with perhaps a slight intensification in the pylorus. Cancer of the stomach, with the exception of cancer of the cardia, is associated with a generalized chronic atrophic gastritis of moderate degree, the gastritic changes being of equal intensity throughout the stomach without regard to the location of the cancer. Although the chronic atrophic gastritic changes found in the presence of carcinoma of the cardia might be expected to be more severe in the fundus than in the pylorus, since chronic atrophic gastritis is usually felt to be associated with the presence of carcinoma, the amount actually present is not significantly increased over that found in the "normal" stomachs of persons in the same age group and is definitely less than that found in carcinoma of the body of the stomach. Duodenal ulcer has little or no influence on the gastric mucosa. Prepyloric peptic ulcers are associated with a mild atrophic chronic gastritis limited to the pyloric mucosa. The presence of a peptic ulcer on the fundus gland area is associated with a generalized chronic atrophic gastritis of the whole stomach indistinguishable from that seen in carcinoma of the stomach.

Patella Cubiti.—According to Sachs and Degenshein, patella cubiti is a condition of the elbow wherein a patella-like bone lies proximal to the olecranon process within the investments of the triceps tendon. The patient with patella cubiti is asymptomatic except for mild limitation of extension. Discovery of this anomaly is usually coincidental. In avulsion of a patella cubiti the patient usually gives a history of an extension force on the elbow, followed by pain and inability to extend it. On palpation, a moderate-sized bony fragment may be felt posterior to the lower end of the humerus. Roentgenograms reveal a sesamoid bone which, when avulsed, lies perhaps 1 to 2 cm. proximal to the olecranon; when not avulsed, it lies immediately proximal to the olecranon and articulates with it. The most important (roentgenologic) diagnostic feature is the fact that the combined measurement of the ulna and the sesamoid is greater than that of the opposite normal ulna or, in the case of a bilateral patella cubiti, longer than would be expected from the length of the related radius. This diagnostic feature will help differentiate patella cubiti from traumatic fractures or from avulsions of the olecranon process, with which it is sometimes confused. In the case herein reported the authors used a screw to approximate the sesamoid with the head of the olecranon.

Routine Roentgen Examination of Chest in Hospitals.—Oatway has made a survey of the current program of routine roentgen examination of the chest in general hospitals of the United States. The roentgen examination of outpatients and new admissions to hospitals is established as one of the best ways to find tuberculosis and other chest lesions. A progressive increase in usage was noted on previous occasions—in 1935 the method was being tried out; in 1938, no hospital was known to have a regular program; in 1943, 56 hospitals reported use of the method. In early 1948 a hospital association found that 889 institutions of all sorts (of the 6,600 registered) had reported routine roentgen examination of newly admitted patients. The present survey, made in August 1948, included data only from general hospitals. Information was requested from the state health departments (42 of which have tuberculosis control directors) and certain other qualified sources. Admin-

istration was said to be harder to arrange than financing. The number of general hospitals with an active program of roentgen examination of the chest was 247. Numerous other hospitals either have equipment or a plan. The word "routine" is a misnomer, since only a portion of the patients are included in many hospitals. Use of the method is increasing, but it must be extended to more hospitals and a higher percentage of registrants to approach its real value.

Management of Urinary Infections.—Butt stresses that adequate clinical and bacteriologic evaluation is essential in the treatment of urinary infections. Removal of any obstruction which impedes the free flow of urine is essential for the full therapeutic benefit to be derived from chemical or antibiotic agents. Relatively small doses of sulfonamide compounds are adequate, but the combination of multiple sulfonamide compounds is more efficient and is not accompanied by any increase in renal complications. Penicillin is of greatest value in the treatment of coccic infections. It is of little value in bacillary infections and is useless in tuberculous infections. Streptomycin is valuable in the treatment of infections due to gram-negative bacilli and in the treatment of genitourinary tuberculosis. Adequate dosage of antibiotic agents should be instituted in order to preclude possible resistance to these antibiotics. The combined use of antibiotics and chemotherapeutic agents may be indicated in mixed infections. Precautions must be taken to avoid untoward sequels from sulfonamide compounds and antibiotics.

*Intranasal Application of Buffered Tripeleppamine (Pyribenzamine) Solution in Allergic Rhinitis: Preliminary Report. J. Brem and J. Zonis.—p. 70.

Intranasal Application of Tripeleppamine in Allergic Rhinitis.—Brem and Zonis used a buffered solution of tripeleppamine hydrochloride for topical application in 81 patients with allergic rhinitis and obtained satisfactory results in 90 per cent of the patients. Early in the study a 2 per cent solution of tripeleppamine was used, but it was soon replaced

with a 0.5 per cent solution, because the stronger solution caused local discomfort. No serious local or general effects were noted. Topical therapy was effective when antihistaminic drugs orally administered could not be tolerated because of drowsiness and other distressing symptoms. The local effect is temporary and the usual therapeutic measures are necessary.

Results of Surgical Treatment of Ruptured Intervertebral Disk.—Spurling and Grantham sent questionnaires concerning the results of their operations for ruptured lumbar intervertebral disk to 363 patients operated on during the eight year period ending in March 1947. The 327 replies that were received represent 90 per cent response. The 80 patients who took advantage of the opportunity for a follow-up examination offered in the questionnaire constituted a control group in that they served as a check on the reliability of the answers given by the whole group. Forty per cent of the patients who replied to the questionnaire could be regarded as completely cured, while another 39 per cent had more or less satisfactory

results. In the remaining 21 per cent the results were only fairly successful or operation had to be regarded as a failure. More than 85 per cent of the patients were able to return to their previous occupations, while only 2.2 per cent were unable to work at all. The disproportionately large number of less than satisfactory results in the patients receiving compensation was noteworthy. This series of cases shows the high proportion of cures and of satisfactory functional results that can be secured with a simple operation on the ruptured disk. Spinal fusion is therefore regarded as contraindicated at the original operation. It is recommended that it be reserved as a secondary procedure for those cases in which persistence of symptoms warrants additional surgery.

Cortical Undercutting for Modifying Frontal Lobe Function.—According to Scoville a technic of cortical undercutting has been devised which makes it possible to detach certain areas of the frontal cortex by making a line of cleavage at the relatively avascular junction of gray and white matter. Cortical undercutting constitutes a method of producing discrete cortical lesions without interference with the blood supply to adjacent areas of the brain. Three areas have been selected for cortical undercutting: partial Brodman's areas 9 and 10, the orbital surface and the cingulate gyrus. Forty patients have undergone cortical undercutting for the treatment of mental disease, and 3 patients have undergone undercutting for intractable pain. There was 1 death directly caused by the operation. Early isolated seizures have occurred in 3 patients, 2 of these having orbital undercutting. One late seizure occurred during a hypoglycemic episode. Few gross physical, visceral or autonomic sequelae have followed even the undercutting of the orbital and cingulate gyrus areas. Prolonged stupor as described by Ward did not occur in patients undergoing cingulate gyrus undercutting, although they were temporarily more somnolent than either the "9 and 10" or "orbital" patients. All were ambulatory and able to eat within twenty-four hours. The 3 patients suffering from intractable pain have been initially benefited after cortical undercutting of areas 9 and 10, especially in the relief of anxiety, addiction and anticipation and memory of pain. The duration of relief has not yet been determined. The author feels that the therapeutic results justify further investigation.

The Local Community and Mental Health.—Whitman stresses that the battle for mental health is a primary responsibility of the locality. While the state and the federal government have the over-all planning job, they can meet but a fraction of the needs. The local organization has the responsibility of promoting the development of their own resources. The local organization in Cleveland started with the improvement of conditions in the state mental hospital and the improvement of human relations. It reaffirmed the logic of promoting the training of psychiatric and auxiliary personnel; the need to develop psychiatric wards in general hospitals, to strengthen and expand child guidance and related social services, to encourage and strengthen psychiatric service in the school systems, in the courts and in industry. To provide guidance on such and other technical questions, the administrative heads of the major psychiatric facilities in Cleveland rallied to the request for a psychiatric advisory council. This group has made valuable contributions in community planning. The author stresses the importance of encouraging the application of mental hygiene principles to everyday living.

Sulfanilamide for Salt and Water Excretion.—Schwartz presents the histories of 3 patients with severe congestive heart failure who were confined to bed or chair and who were fed a diet containing 2,000 calories and 300 mg. of sodium. Daily fluid intake was constant. Digitalis was continued, but no ammonium chloride, mercurials or sodium-containing medications were permitted. Sulfanilamide was administered in amounts (4 to 6 Gm. per day) that were designed to keep the serum level at about 12 mg. per hundred cubic centimeter. All patients showed an increase in sodium and potassium excretion within the first twenty-four hours of sulfanilamide administration. The 2 patients in whom it was possible to continue the drug for a seven day period maintained a high daily output of sodium in the urine which was four to five times the control value and exhibited a loss of weight that correlated with the increase in sodium output. The pH of the urine increased. At the same time there was a sharp fall in carbon dioxide-combining power of the serum accompanied by an increase in chloride. These changes can best be explained by an inhibition of carbonic anhydrase in the renal parenchyma with retention of hydrogen ions and concomitant diminution of sodium reabsorption. The author feels that sulfanilamide is too toxic for prolonged or routine use. Other sulfonamide compounds that are also inhibitors of carbonic anhydrase are under investigation in an effort to find a compound less toxic than sulfanilamide.

Peridural and Caudal Analgesia and Early Ambulation.—Cleland describes a technic for segmental continuous peridural analgesia by means of an indwelling ureteral catheter placed at the center of the nerve involved in the operation. This method provides an excellent operating anesthesia with muscular relaxation for as long as may be desired; it makes early ambulation painless and easy; it prevents postoperative complications and depression caused by general anesthesia or narcosis; it makes ambulation effective earlier than is possible with other types of anesthesia or narcosis and thus prevents more effectively postoperative complications influenced by early ambulation. It also prevents postoperative pulmonary complications which are caused by reflex inhibition of the diaphragm and associated muscles of respiration. The method promotes healing

in leg amputations by maintaining collateral circulation at a maximum; it corrects postoperative gastrointestinal symptoms of dysfunction—e. g., a certain type of "gas pains."

Newcastle Virus Disease in Human Beings.—McGough presents observations on 10 patients who, after eating chicken, had symptoms indicative of Newcastle virus disease. Nausea, vomiting, fever, malaise, anorexia, abdominal pain, lumbar pain and headache were the usual symptoms. The neutralization index confirmed the clinical diagnosis in all 8 of the patients in whom it could be carried out. The index ranged from 100 to 17,400. Epidemiologic studies carried out on 3 of the patients suggest that the incubation period of Newcastle virus disease varies from two and one-half to five or more days. Considering the fact that the suspected chickens or chicken parts were in all instances stated to have been "thoroughly cooked," it might be well to investigate other possible preventive measures where gross appearance is not sufficient to forewarn a prospective cook or diner that the chicken has had Newcastle virus disease (avian pneumoencephalitis). If this disease should continue to cause human morbidity it might be worth while to require certification of poultry by an accredited inspector before such poultry could be sold as food.

Cough Fracture of Rib.—Cohen presents the histories of 7 tuberculous women, ranging in ages between 18 and 35, in whom "spontaneous" fracture of ribs occurred. Some gave a history of pain following violent expiratory effort as in coughing or sneezing. These cases and others reported show that it is possible for ribs to fracture as a result of respiratory effort. Cases are easily missed if roentgenograms of the chest are not carefully examined and the condition borne in mind. The mechanism of such fractures is difficult to determine. Primary tuberculous osteitis of ribs is generally believed to be so uncommon that it is unlikely to be the basic cause. There was no evidence of it in the reported cases, though it is conceivable that areas of bone rarefaction may occur in a rib adjacent to a cold abscess arising from a caseous tuberculous gland. The apparently high incidence in tuberculous subjects suggests a possible constitutional effect on bone structure, but it must also be remembered that such subjects are repeatedly getting roentgen examinations of the chests, and the lesion is therefore more likely to be discovered. The most reasonable explanation of these fractures seems to be the violent action on the ribs occurring during the expiratory effort of a cough or sneeze. Diminished use of the thoracic musculature in a patient confined to bed for long periods may lead to a mild degree of decalcification and be a contributory factor.

The Endometrium in Functional Uterine Hemorrhage.

—Sutherland made an analysis of the histologic features in 1,000 cases of abnormal uterine bleeding in the absence of gross pelvic pathology, all patients with bleeding after the menopause being excluded. In 139 instances organic pathologic lesions of the endometrium were found. Chronic endometritis occurred in 110 cases, uterine polypi in 11 cases, tuberculosis in 10 cases and malignant disease in 8 cases. These figures demonstrate the necessity for routine diagnostic curettage in all cases of presumed functional bleeding, irrespective of age. In the remaining 861 cases no organic pathologic conditions of the endometrium were found. Endometrial hyperplasia occurred 265 times, endometrial atrophy 10 times, irregular shedding of the endometrium 13 times and irregular ripening of the endometrium 26 times. In the remaining 547 specimens the endometrium appeared normal. In 9 of the organic group and 48 of the functional group the endometrium was examined

on more than one occasion. Attempts to correlate the histologic appearances with the type of bleeding and with the findings on pelvic examination failed to demonstrate any relationship. The authors conclude that almost any type of abnormal uterine bleeding can occur from any type of endometrium and that an attempt at diagnosis of functional bleeding without histologic examination of the endometrium is unjustifiable.

Penicillin and Carinamide in Endocarditis.—Stuart-Harris and his associates report the successful use of combined penicillin and carinamide therapy in 2 cases of subacute bacterial endocarditis in which there had been relapse after repeated courses of penicillin alone. In a third patient a brief course of carinamide during penicillin therapy for bacterial endocarditis caused clinical improvement, which had not occurred with penicillin alone. These cases indicate that carinamide is an important adjuvant to penicillin therapy in subacute bacterial endocarditis. The effect seems to be due to the high serum penicillin levels obtained by this combined therapy.

Vitamin B Complex and Resistance to Tumor Growth.—Scott describes experiments which demonstrated that the addition of vitamin B complex to the diet of rats, which were fed with hospital scraps, increased their resistance to the growth of Jensen's rat sarcoma. In many of the rats treated with vitamin complex the tumors eventually disappeared, and the average volume about three weeks after inoculation was often less than a quarter of the volume of the tumors in the controls.

A similar effect was obtained with a sarcoma originating in bone. Rats on a diet of hospital scraps with no additional vitamin B appeared well nourished and free from disease and had no signs of vitamin B deficiency.

Dextran as Plasma Substitute.—Thorsén states that dextran now in use in Sweden as a substitute for plasma is a 6 per cent solution of polydispersoid glycoside polymer. Most of its molecules have been given a molecular weight conforming to that of albumin, with 0.9 per cent of sodium chloride added to it. Its viscosity lies between that of blood and that of plasma, and its specific gravity somewhat exceeds that of human plasma. It is free of virus, does not lead to the formation of antigens and contains almost no nitrogen. Dextran has been given to 5,000 patients. Up to 4 liters have been given to some patients. The substance has been found valuable in the treatment and prevention of shock. At the author's hospital it has been given routinely for the prevention of shock during major operations. The incidence of postoperative complications was higher in a series of controls, in whom corresponding amounts of isotonic sodium chloride solution were given. The substance is totally eliminated from the body and is nontoxic. It is very useful as a substitute for blood and plasma in cases in which an increase in blood volume or in colloid osmotic pressure is desired.

Dextran as a Plasma Substitute.—Bull and others present the experiences with dextran in Britain. It is possible to prepare dextran with a range of molecular size similar to that of the plasma proteins. The solution is well tolerated as an infusion, is not pyrogenic, toxic or antigenic. Such dextran, after infusion into animals and man, is only slowly removed from the plasma over about a week. Dextran has proved efficacious as a plasma substitute in burns, and has produced a sustained increase in the venous return in patients with surgical shock or hemorrhage. The dextran under trial contained an appreciable proportion of material of such a molecular size that it passed the glomerular filter and could be recovered from the urine. In defining a specification for dextran for intravenous use it is desirable to keep to a minimum the proportion of dextran of low molecular weight. It is probably also important to define the upper limit of molecular size. There is still doubt about the ultimate fate of dextran in the body, and, because of this, it cannot yet be unreservedly recommended for widespread use. It has not been shown to produce harmful effects on the tissues, and further investigation is recommended.

Tuberculous Pericarditis as Forerunner of Generalized Miliary Tuberculosis.—According to Goldstein, tuberculous pericarditis has in the past been regarded as a rather rare disease, but in the light of recent experience it would seem that it is not so uncommon as was once supposed. In a recent paper Kopelman contended that all cases of pericarditis where there are no enlargement of the heart, no murmurs suggestive of valvular involvement and no rheumatic manifestations should be considered as potentially tuberculous unless proved otherwise. With the advent of streptomycin such a standpoint assumes even greater significance. The author presents the case of a girl aged 16, who had miliary tuberculosis in which the first obvious symptoms were those of tuberculous pericarditis. The fact that treatment with streptomycin resulted in a remission and brought about a complete disappearance of roentgenologic and clinical signs gives some hope that the cases of tuberculous pericarditis in the course of a miliary dissemination are those which would benefit most by the use of streptomycin. To give the patient the best chance of remission, early diagnosis would seem to be essential. A short survey of current and early literature has been given to stress the fact that tuberculous pericarditis should be suspected more often than it has been hitherto.

Sex Hormones and Leukemia.—According to Videbaek, reports in the literature indicate that inbred strains of mice usually exhibit a higher incidence of leukemia in females than in males and that estrogens accelerate leukemia, whereas androgens inhibit its development. The author made a study of the incidence of and mortality from spontaneous leukemia in 2,766 mice of the inbred strain AKA. The mice were left untreated and observed until they died spontaneously. He gained the impression that in females there are factors accelerating leukemia or else there are in the males factors delaying the development of leukemia. Correspondingly, hyperplasia of the thymus gland is found more often and at an earlier age in the females. Reviewing observations on human subjects, the author finds that there is a difference in sex ratios in the various forms of leukemia. Acute leukemia in children is more frequent in girls during the first year of life, but later shows a higher frequency in boys. Chronic lymphogenous leukemia is about twice as common in men, whereas chronic myelogenous leukemia is slightly more common in women. A study by the author in 1947 on 310 unselected cases of human leukemia gave a corresponding result, revealing the following sex ratios: men/women: for chronic lymphogenous leukemia 74/53, for chronic myelogenous leukemia 33/46 and for acute leukemia 53/49. The disease proved to occur at almost the same age in men and women. The reason why man does not exhibit the same conditions as mice of inbred strains is probably that in man it is a question

of other types of leukemia. In addition, experimental investigations emphasize the importance of the genetic constitution, which is fairly constant in the same strain of mice, whereas it is extremely varied from one human being to another.

Treatment of Ulcers of Stomach and of Duodenum by Nicotinic Acid Chloride. K. Herfort.—p. 690.

Two True Cysts of Tail of Pancreas. L. Courty.—p. 697.

Two Progressive Forms of Cancer of Stomach.—Lambling and Guillard compared the symptoms, lesions and course of cancer of the stomach in 205 patients, 114 men and 91 women, whose average age was 54 years and 5 months, with those in 50 patients, 31 men and 19 women, whose average age was 45 years and 5 months, thus presenting a difference of nine years in age. The authors suggest a dualistic concept of cancer of the stomach according to which two progressive forms of cancer of the stomach must be distinguished: 1. The "habitual" cancer comprising 80 per cent of all the cases of cancer of the stomach. The tumor has a vegetative and infiltrating tendency, its clinical signs, in the absence of pain, are not very characteristic in nearly 50 per cent of the cases, the maximum duration of its course being one year in 69 per cent of the cases. 2. Cancer resembling ulcer, comprising 20 per cent of all the cases of cancer of the stomach. In these cases of pseudoulcerous clinical type the anatomic lesions remain limited for a long time, and in the majority of them their course may take years. These two different clinical types of cancer are individualized by the average age of the patients affected, being 57 years and 5 months in those with "habitual" cancer, and 45 years and 5 months in those with "debutant" cancer. In the great majority of cases of cancer of the stomach only those resembling ulcer have been diagnosed by clinical features combined with roentgenologic examination in time to make surgical intervention effective; the "habitual" cancer is recognized too late, emphasizing the urgent need for a biologic test of cancer.

*Involvement of Eyes in Poliomyelitis: Experiences During Epidemic in Berlin in 1947. R. Collin and W. L. Bassenge.—p. 255.

Involvement of Eyes in Poliomyelitis.—Collin and Bassenge made ophthalmologic studies on 40 patients who had received treatment in the "iron lung" in the course of the epidemic of poliomyelitis in Berlin in 1947, in which a total of 2,300 cases were reported. Seventy other patients with poliomyelitis, who did not require treatment in the "iron lung," were also given a thorough examination of the eyes. The ophthalmologic examination was repeated at regular intervals, so that it was often possible to observe the appearance and rapid disappearance of symptoms. A third group of 40 patients, who had persistent spinal paralysis after an attack of poliomyelitis, were examined for late eye symptoms. Three and one-half months was the time that had elapsed after the acute attack. Involvement of the eye is not a rarity in poliomyelitis. Nuclear and supranuclear paralysis of the facial nerve, ptosis, abducens paralysis and paralysis of the internal rectus muscle of the eye were observed. There is a good prospect that these types of paralysis will subside. In the cases of poliomyelitis in which lesions exist in the upper part of the spinal cord, involvement of the sympathetics may produce disturbances in the pupils. The majority of the patients who required treatment in the iron

lung showed signs of stasis in the retinal vessels and in the optic papilla. Although optic neuritis was not encountered during this epidemic, it may be expected to occur. The authors believe that in patients with obscure paralysis of some of the cerebral nerves, poliomyelitis should be considered. It is advisable to hospitalize these patients, not only to prevent further spread of the poliomyelitis, but also because special care may become necessary, since the lesion is close to the respiratory center.

Microscopic Diagnosis of Rabies. S. J. W. Tanamal.—p. 3949.

Chamber Form of Duodenal Ulcer.—Schulte and his associates point out that Deelman, who had made detailed studies on the morphogenesis of duodenal ulcer, found that there are some ulcers which form a chamber. He believes that this type of ulcer begins with a sort of split defect in the duodenal mucosa that reaches down to the muscularis and spreads between the mucosa and the muscular layer of the duodenal wall. The defect burrows deeper into the mucosa, and thus a chamber is formed. Suren found a high incidence of these ulcers with chamber formation in patients who had undergone primary gastric resection on account of perforation of a gastric ulcer (22 of 32 cases). Schulte and his co-workers watched for the chamber formation in 251 patients with duodenal ulcer and in 165 of whom roentgenoscopy disclosed a typical niche. Of the 7 ulcers that showed chamber formation in the roentgenogram, 1 perforated during the roentgenologic examination. The authors feel that since the ulcers that show chamber formation have a decided tendency to perforate, surgical treatment would be advisable in these cases.

*Reduction of Essential Hypertension During Pregnancy. A. Löwenberg.—p. 4021.

Vaginal Extirpation of Uterus.—Hoyng stresses the advantages of vaginal over abdominal hysterectomy in cases of benign or malignant tumors of the uterus. The primary mortality, the pain and subjective disturbances and the postoperative disturbances are all less with the vaginal method. The hazard of carcinoma in the stump is avoided and the formation of cicatricial hernia is obviated. The period of hospitalization is shorter. The author reviews results obtained in 200 vaginal hysterectomies performed by himself or his assistants since August 1945. None of these patients died as the result of the operation. The author stresses that the method is simple, and he hopes that it will find a wider application so that the permanent results, particularly in carcinoma, can be judged better.

Reduction of Essential Hypertension During Pregnancy.—Löwenberg presents the case of a woman, aged 40, who had hypertension. During pregnancy her blood pressure returned to normal, but it increased again to hypertensive values after the birth of her baby. Commenting on this observation the author says that other investigators have observed that if pregnancy develops during hypertension either the elevated blood pressure persists, preeclampsia or eclampsia develops or the blood pressure decreases. This latter possibility, which was observed in the woman whose history is presented here, is the least likely of the three possibilities. The author believes that the rapid return of the hypertension after delivery suggests that mechanical rather than chemicohumoral factors

are responsible for the change in blood pressure during pregnancy. Some authors have suggested that an arteriovenous diversion in the placental vessels leads to a reduction of the peripheral resistance, which in turn may cause a reduction in blood pressure.

Treatment of Acute Pancreatitis.—Van Puyvelde describes the treatment of acute pancreatitis on the basis of 4 case histories. He performs a laparotomy in order to inspect the bile passages and to provide temporary external drainage for the bile. Following the operation he administers penicillin and institutes measures to prevent irritation of the pancreas. Nutrition is provided by the parenteral rather than the enteral route, and stimulation of the pancreas by the hydrochloric acid of the stomach is reduced by medication and by aspiration of the gastric secretion through a nasal tube. Insulin is administered to guard against stimulation of the internal secretion of the pancreas.

Heterosexual Hormones for Fractures Resulting from Metastases.—Van Gelderen presents the histories of 2 women in whom spontaneous fractures resulted from bone metastases caused by carcinoma of the breast. One had a fracture of the humerus, the other of the leg. After proper fixation of the fractures, the women were given injections of testosterone propionate, one of them 50 mg. daily and the other 100 mg. three times a week. Consolidation of the fractures took place within nearly normal time. The author concludes that this is further proof of the favorable results obtained with heterosexual hormones in the presence of skeletal metastases from "sexual" carcinomas.

Sequels of Epidemic Parotitis with Meningoencephalitis.—Of 75 patients (25 children, 50 adults) with mumps and meningoencephalitis, 15 (3 children, 12 adults) were found on a follow-up three to five years later to have permanent after-effects. One child had total unilateral deafness; another, severe epilepsy, and an adult, vestibular dizziness. In the other cases the sequels, though milder, gave constant annoyance. There were various eye and ear symptoms, symptoms of neurasthenic kind in some cases and endogenous obesity in 1 case. There were also 5 doubtful cases. Oldfelt says that the late prognosis seems to be less favorable in the cases with distinct symptoms of encephalitis in the acute stage. No relation was seen between the cell count in the cerebrospinal fluid in the acute stage and the frequency of after-effects.

Neuroblastomas.—In the 3 cases of neuroblastoma reported in children aged between 1 and 6 with typical localization in the adrenal medulla, the clinical picture was dominated by cranial metastases. Tumor cells demonstrated in the bone marrow and roentgenologically established metastases to the bone system facilitated the diagnosis. Death from cachexia occurred after two and a half to six months. Tho says that in differential diagnosis myeloblastic leukemia is first to be considered; the clinical picture together with the sternal puncture and roentgen picture as a rule clarifies the situation. In 2 of the cases signs of lively blood regeneration with high reticulo-cyte count were found; in leukemia there is most often little

tendency to blood regeneration. Wilms' tumor seldom leads to bone metastases; urography, often positive in this tumor, is usually negative in neuroblastoma. Ewing's tumor is rare in patients aged under 4. Metastases generally give the first and characteristic symptoms in neuroblastomas. The tumors are radiosensitive. In Farber's series of 40 patients 10 are living after three to eight years, and Farber would revise the earlier hopeless view of the prognosis. Irradiation cannot hinder the development of metastases, which may be latent several years, but they also are radiosensitive. Irradiation of skeletal metastases has not prevented recurrence.

Occurrence of Types of Diphtheria Bacilli in Bergen and Their Significance.—The diphtheria epidemic which took place in Bergen in 1941 reached its peak in 1943-1944 and gradually receded. Bøe and Vogelsang ascribe to diphtheria vaccination, made compulsory for school children in 1942, the gradual definite shift in the age distribution of the patients; the disease occurred with practically unchanged frequency in the age group up to 5, declined among school children and appeared increasingly often among adults, especially those over 30. They state that *Corynebacterium diphtheriae mitis* dominated in Bergen before the epidemic and continued fairly regularly throughout the epidemic; *C. diphtheriae intermedius* was the most frequent type in 1944, and, after the peak, *C. diphtheriae gravis*, not known in Bergen before the epidemic, became the dominating type and in early 1948 was the only type found. A similar shift has been seen in several other places. Simultaneously with the final change in the dominating type the disease took on a graver character. The *gravis* bacillus type persisted longer than the other types in the throats of patients and carriers. The considerably longer duration of convalescence in the cases of the *gravis* type may explain the change in dominating type and also the persistence of this type after the terminated epidemic. The occurrence of more than one diphtheria bacillus type in patients with diphtheria or of different types on repeated examinations is attributed to cross infection, which, though without special effect on the patient's health, prolongs the length of hospitalization and increases the danger of infection.

So-Called Reflex Calculus Anuria in Light of Experimental and Clinical Studies of Ureterorenal Obstruction.—Wulff says that the results of clinical investigations in 2,400 cases of renal or ureteral calculi, in over 1,500 of which urography was carried out during the attack of renal or ureteral stone colic or immediately afterward, and extensive experiments on renal-ureteral obstruction together with oncometric studies testify against the likelihood of clinical occurrence of a ureterorenal or renal reflex mechanism produced by impulses arising from the passage of ureteral stones or other acute ureteral obstruction and causing a real anuria on the contralateral side. In extremely rare cases a combination of factors might possibly cause a reflex anuria.

*Nanism and Mitral Stenosis in Members of Family. M. Schachter.—p. 471.

Acute Meningitis Caused by "Hemophilus Influenzae" Cured by Streptomycin. V. Sanchis Bayarri, J. Alcon and A. Garcia.—p. 514.

Nanism and Mitral Stenosis in Members of Family.—Association of congenital mitral stenosis and nanism in members of the same family with normal development of the genital organs is unusual. Schachter reports this association in 4 of a family of 6 living members. Those with the abnormality were the maternal grandmother, the mother and two sons, whereas the father and the youngest child were normal. The father and his family were normal. There was neither syphilis nor alcoholism in any of the members of the family. The genital organs were normal in all the members of the family. The author believes that in these cases the combined abnormality was of chromosome origin.

*New Method of Determining Streptomycin-Sensitivity or Streptomycin-Resistance of Bacillus Tuberculosis. P. Hauduroy and W. Rosset.—p. 834.

Hemorrhage Combined with Extrapleural Pneumothorax.—Bérard and Hermann report 580 patients, 180 men and 400 women, in whom an extrapleural pneumothorax was induced. A severe hemorrhage occurred in 34 of these patients, 20 men and 14 women. It was fatal in 7 patients. It did not prevent an effective and satisfactory collapse of the lung in the great majority of the cases. The hemorrhage may occur immediately after the intervention or within the first few hours and may be either mechanical, due to a spurting vessel, or of vasomotor origin, with the blood spreading like a sheet over the pocket which has been formed by stripping of the pleural layers. The mechanical hemorrhage occurs less frequently than that of vasomotor origin. These primary hemorrhages should be distinguished from the "delayed-early" hemorrhages which occur within thirty-six to forty-eight hours after the intervention and which never have a mechanical cause. Treatment of primary hemorrhage consists of puncture for removal of the blood, followed by profuse hot lavage combined with an injection of epinephrine. Repeated intervention may be required if bleeding recurs, or in cases in which removal of the blood is impossible because of clot formation. Partial axillary thoracotomy should be performed in most of the cases of "delayed-early" hemorrhage in which massive clots may prevent evacuation by means of trocar and lavage or by intercostal drainage. Transfusions and oxygenation should be employed for treatment of hemorrhage of both types.

Titration of Streptomycin.—Hauduroy and Rosset report a new method for determining the development of resistance of tubercle bacilli to streptomycin, since the classical methods used for the sensitivity determinations are too cumbersome, requiring one and a half to two months for reliable results. The technic devised by the authors consists in incubating three series of tubes in which Löwenstein's solid medium has been introduced: the first series is that of the control tubes which had been inoculated with sputum, pleural pus or pleural fluid; the second series is that in which dilutions of streptomycin with concentration of 5,000 micrograms per cubic centimeter are added to the medium, to be then inoculated with the pathologic material; the third series differs from the second only in that the concentration of the added streptomycin dilution is 500 micrograms per cubic centimeter. The new procedure was tested on pathologic material of 20 patients and the results were compared with those obtained with the aid of a liquid (Dubos) medium. A strain growing in the liquid medium in the presence

of 10 micrograms per cubic centimeter but not in the presence of 100 cc. [sic] grew in the solid medium in the presence of 500 micrograms per cubic centimeter but was prevented from growth in the presence of 5,000 micrograms per cubic centimeter, thus confirming the parallelism of the two methods. More qualitative than quantitative results may be obtained with the solid medium technic at the end of a fifteen days period. These results should be subsequently verified by titration according to the technic of adding dilutions of streptomycin to liquid mediums.

Favorable Effects of Roentgen Therapy in Progressive Cases of Rheumatoid Arthritis. J. Borak and H. K. Taylor.—p. 455.

Cutaneous and Pulmonary Manifestations of Tuberculosis.—Kalkoff and Ehrling present 2 patients with lupus vulgaris and 2 patients with Boeck's sarcoid in whom the specific skin lesions healed spontaneously, while the pulmonary tuberculosis showed a decided exacerbation. The authors discuss whether the progression of the pulmonary process under these conditions could be ascribed to the abolishment of the immunizing effect on the part of cutaneous tuberculosis. They feel that this possibility is contraindicated by the fact that there is a high mortality from pulmonary tuberculosis among patients with lupus vulgaris who have active skin lesions. That it is specifically the skin which modifies pulmonary tuberculosis is contradicted by the fact that tuberculosis of the eyes and joints likewise has been known to be accompanied by a favorable course of a coexisting pulmonary tuberculosis. The etiology of lupus vulgaris also militates against an active effect of pulmonary tuberculosis. Lupus develops as the result of a certain reactive status, but it does not produce this reactive status, which may have a favorable effect on the existing pulmonary tuberculosis. It is a sequel, not a cause, of this condition. When the reactive status changes, which may become manifest in a changed sensitivity tuberculin, spontaneous healing of the lupus lesions and an exacerbation of the pulmonary tuberculosis may result.

Roentgen Therapy in Gastric Ulcer.—Hedfeld stresses the importance of psychologic factors in the pathogenesis of gastric ulcer and points out that during the last ten or fifteen years there have been attempts to influence certain pathologic processes by irradiating elements of the sympathetic nervous system. He has used this treatment since 1935 in more than 800 patients. He applies the roentgen rays to the celiac plexus first through an abdominal field of 8 by 10 cm. and then through a dorsal field at the same level. The irradiation of both fields is repeated, and later the dorsal segments of the fifth to the twelfth thoracic vertebrae are irradiated, because the innervation of the gastric area originates here. The irradiation is produced with 200 kilovolts, 15 milliamperes and a 0.5 cm. copper filter. The skin distance is 40 cm., and 40 per cent of the unit skin dose of 760 roentgens is applied at each session. As a result of this treatment the pains subside. Ulcers that had been demonstrated by roentgenoscopy show at control examinations, from four to eight weeks later either complete healing, in the majority of cases, or great reduction of the niches. Some of the patients remained free from recurrences for several years. If symptoms persist a new course of roentgen treatments is given, but not before an interval of at least two months has elapsed. The patients were not given a special diet. Various other disorders of neurosympathetic origin may prove amenable to this form of functional roentgen therapy.

Book Notices

Neoplasms of Bone and Related Conditions: Their Etiology, Pathogenesis, Diagnosis, and Treatment. By Bradley L. Coley, M.D., Attending Surgeon, Bone Tumor Department, Memorial Hospital for Cancer and Allied Diseases, New York. Cloth. Price, \$17.50. Pp. 765, with 622 illustrations. Paul B. Hoeber, Inc., Medical Book Department of Harper & Brothers, 49 E. 33d St., New York 16, 1949.

Coley has prepared an exhaustive treatise on neoplasms of bone and related conditions based on the large material of the Memorial Hospital for Cancer and Allied Diseases and his extensive experience as attending surgeon of that institution.

The early chapters deal with the classification and proper approach to the study of neoplastic disease, including etiology, diagnostic surveys and blood chemistry studies of neoplastic and other related diseases of bone. Benign tumors are dealt with first, including osteomas, chondromas, hemangiomas and myxomas, and a number of allied conditions, as bone cysts, are correlated, especially from the standpoint of differential diagnosis. Primarily malignant tumors of bone are discussed in great detail with respect to etiology, diagnosis and treatment. Brief consideration is given both to benign and malignant tumors involving bone by extension, and to metastatic tumors involving bone. Under bone tumors in special localities, those of the skull, jaw, thoracic wall, pelvis, vertebra and hands and feet are dealt with. There are valuable chapters on radiation therapy and the effects of radiation on normal bone, including the production of sarcoma. Endocrine diseases, Paget's disease, infections and trauma are discussed in relation to the etiology of bone neoplasms.

Many valuable illustrations have been included, and the literature has been well reviewed. Medical students and practitioners should find this book most helpful.

Dental Caries: Mechanism and Present Control Technics as Evaluated at the University of Michigan Workshop. Edited by Kenneth A. Esslick, A.M., D.D.S., Professor of Dentistry (Dentistry for Children) in the School of Dentistry and Professor of Public Health Dentistry in the School of Public Health, Ann Arbor, Michigan. Cloth. Price, \$5. Pp. 234, with 11 illustrations. C. V. Mosby Co., 3207 Washington Blvd., St. Louis 3, 1948.

This book is a comprehensive report of a conference of nineteen lecturers and one hundred and fourteen other research leaders primarily interested in dental caries. The conference was sponsored in September 1947 by the Schools of Public Health and Dentistry at the University of Michigan. Six evaluating committees appraised all available information with the following conclusions:

Caries is a disease of the teeth caused by acids resulting from the action of micro-organisms on carbohydrates decalcifying the inorganic portion followed by disintegration of the organic substance of the tooth. Caries is made possible by (1) a plaque which is an organic nitrogenous mass containing multitudes of micro-organisms firmly adhering to the teeth; (2) anatomic characteristics; (3) position and arrangement of the teeth and (4) dental appliances. Lactobacilli are the only micro-organisms showing significant increase in caries. Lactic acid is always present in a caries lesion. Pregnancy and lactation are not a cause of caries. Sickness or nutritional deficiency seem to have no significant bearing on caries. Toothbrushing only removes accessible plaque and does not prevent reformation. Plaque returns from one to four days after dental prophylaxis. However, both toothbrushing and prophylaxis lower the acid level in the mouth. Chewing gum or lozenges do not seem to reduce or stimulate the number of acidogenic bacteria even when they contain anticaries agents, such as synthetic vitamin K or sodium fluoride. Brushing technic is far more important than the dentifrice in the removal of plaque. Dentifrices containing an abrasive are most effective. Dibasic ammonium phosphate dentifrices reduce the count of oral lactobacilli, but there is no evidence or clinical demonstration of their reduction of incidence of caries. Penicillin or other antibiotics have not demonstrated reduction of caries in human beings. Lactobacillus counts are lower in areas where the communal water contains fluorine. Reduction in

caries of 40 per cent has been observed in children whose teeth are topically treated with a 2 per cent solution of sodium fluoride. Vitamins A and C seem to have no effect on incidence of caries. Hanke's experiments with vitamin C were never corroborated. Vitamin D is valuable in formation of hard dental structures. Minerals are no aid against caries on fully formed teeth. Milk is the best and sufficient source of calcium during formation of tooth structures. American diet is good except for the large consumption of sugars. Harmful effects of sugars are not reduced by additions of either vitamins or minerals. All evidence points to the conclusion that the effect of currently available dentifrices is transitory. Brushing the teeth, dental prophylaxis, topical fluorine treatments for children and restrictions of refined or natural sugars are the only known effective aids in caries control.

Phylogenesis of the Ear. By Louis Guggenheim, M.D., Associate Professor of Otolaryngology, University of Southern California, Los Angeles. Cloth. Price, \$12.50. Pp. 277, with 196 illustrations. Murray & Gee, Inc., Culver City, California, 1948.

There is no adequate text of the phylogenesis of the ear. Nor is there any work similarly devoted to the embryology of the ear in man which is acceptable to otologists.

For forty years the author has devoted as much time as possible to the gathering of information on the development of the ear from the lowest forms of life up to man. This has, of necessity, meant much laborious study of the periodical literature of the world. It can be surmised that this was often difficult to obtain and presented, among other things, problems of translation.

The author calls attention to the striking similarity of all mammalian ears; he points out the descent of the ear from the balancing vesicle of the Coelenterates long before a definite organ of hearing arose. The functions of hearing and equilibrium have been closely connected from the beginning, and this is no accident, for both are dependent physiologically on their ability to sense motion; either, as in the case of the acoustic organ, as sound waves or, as in the case of the static labyrinth, as body movement. The author leads us forward in this fascinating story from simple beginnings in the lowly jelly fish to the complicated neuroepithelial mechanism of Corti's organ in the mammal.

All this is remarkably well done, and notably illustrated. No otologist would want to be without it. All must look forward with anticipation to its promised companion work, a detailed embryologic study of the hearing organ in man.

The Story of Scabies. Volume I: The Prevalence (Civil and Military), Prevention and Treatment of Scabies, and the Biology of Acarus Scabiei, from the Earliest Times to the Beginning of World War II. By Reuben Friedman, M.D., Associate Professor of Dermatology and Syphilology, Temple University School of Medicine, Philadelphia. Foreword by Carroll S. Wright, M.D., Professor of Dermatology and Syphilology, Temple University School of Medicine. Cloth. Price, \$7.50. Pp. 468, with 114 illustrations. Froben Press, Inc., 1776 Broadway, New York 19, [1949].

This interesting volume is concerned with the prevalence (civil and military), prevention and treatment of scabies from the earliest times to the beginning of the last war. This book is the first one of a series of four volumes on the subject of scabies to be published by the author. It incorporates many of his previously published works in the field.

The history of scabies constitutes a fascinating chapter in the annals of medicine, and it is well described and profusely illustrated in this book. The chapter mentioning Napoleon's affliction with scabies is one of many historical observations and studies presented in an interesting fashion. Too many histories, medical and otherwise, are merely chronologic compilations of events, whereas this story of scabies is both readable and entertaining and yet scholarly and analytic. The clinical and photomicrographic illustrations have been carefully chosen and well reproduced. Several individual plates showing the itch mite and burrows produced by its invasion of the skin are excellent.

Four volumes on the various aspects of scabies are placing undue emphasis on a comparatively unimportant problem.

Although scabies is one of the most common skin diseases of man, it does not seem of sufficient importance to merit such exhaustive study. Yet the discovery of the itch mite marked the establishment, for the first time in the history of medicine, of a definitely known cause for any of the diseases of man. This book constitutes an original contribution to the dermatologic literature and is a welcome addition to the annals of medical history.

Psychodynamics and the Allergic Patient. By Harold A. Abramson, M.D., F.A.C.A., Associate Physician for Allergy, the Mount Sinai Hospital, New York. [Including] Panel Discussion. An Official Publication of the American College of Allergists. Cloth. Price, \$2.50. Pp. 81, with 10 illustrations. The Bruce Publishing Company, 2642 University Ave., St. Paul 4, Minn.; Box 1586, Minneapolis, 1948.

This small volume comprises a panel discussion on the relationship of psychogenic factors and allergic manifestations, conducted at Atlantic City on June 8, 1947, as part of the program of the annual meeting of the American College of Allergists. In the first chapter, of 12 pages, Dr. Abramson presents photostatic and other excerpts from texts as far back as the seventeenth century or earlier in support of his thesis of the importance of psychogenic and emotional aspects as causes of asthma and hay fever. Many of these old writings are, of course, stray observations without much of the kind of evidence demanded nowadays in support of any concept. Others are veritable superstitions. Most of these records antedate the development of modern chemistry, immunology, bacteriology or even pathology, and our knowledge of specific causes of disease. The second chapter by Dr. Abramson consists of 23 pages discussing his major thesis. In the main the author follows the usual line of proponents of the idea, who claim that emotional and psychic elements can be the major and only factor in producing manifestations which resemble those produced by allergy. Some of the case reports presented in support of this view do not meet the requirements of complete scientific proof.

The panel discussion, participated in by about a dozen contributors, varies in tone from almost complete faddism to almost total nonbelief in the psychosomatic point of view. Among the most satisfactory of the discussions are those of Dr. Frank Fremont-Smith and Dr. M. Murray Peshkin. Dr. Fremont-Smith emphasizes the fact that since allergy is a physiologic change it is expected to be conditioned by nervous stimuli, and in this way it does not differ from other diseases. Dr. Peshkin presents a practical common sense discussion of the relationship between psychic and somatic factors which he says are generally known and appreciated by good practitioners. He stresses the effect of the disease (such as chronic asthma) on the emotional and psychic state of the child. Dr. Rudolf L. Baer presents a clearcut statement of his attitude. While admitting the influence of the nervous system on dermatoses, he states flatly that he has never seen a case of urticaria, atopic dermatitis or eczema in which psychic factors have been a major cause. One of the bits of advice worth remembering is, "One of the worst and most frequent mistakes made in evaluating psychosomatic factors in dermatoses is to say that if one cannot find causal allergenic factors, the causal factor must be psychic."

This book is only what it purports to be—a panel discussion—and is worthy of reading by experienced allergists and other physicians whose maturity will protect them from hasty impressionism.

Textbook for Almoners. By Dorothy Manchée, Almoner, St. Mary's Hospital, London. With a foreword by Sir Alfred B. Howitt, C.V.O., M.D., President, Institute of Almoners. Cloth. Price, \$7.50. Pp. 466, with 55 illustrations. The Williams & Wilkins Company, Mt. Royal & Guilford Aves., Baltimore 2, 1947.

Except for a brief summary of the development of medical social work in English hospitals and of the present status of practice and education, this is an enormously detailed handbook for the guidance of students and practitioners. Although directed to the practicing almoner, its tone is that of the preceptor, and the content is presented in an informal and elementary style. Instructions range from details regarding day by day job performance (including how to write letters) to specific guidance

in such basic functions as "cooperating with the medical staff." Fully half the book is devoted to summary descriptions of the social agency services and social security benefits on which the hospital social worker may need to draw to secure necessary assistance for her patients. A concluding section defines and describes the diseases most likely to be encountered by a medical social worker with specific instruction regarding the kinds of social service the patient may require.

Presumably this compilation was needed and will have value for the practicing hospital almoner in England. The fact that material of this sort has been so painstakingly accumulated attests to a need which has been met in the United States for many years through the publication of local directories of social agencies, "The Social Work Year Book" and specific agency manuals. One can, however, visualize the young almoner in the "single-handed post" turning gratefully to this compendium for information, as well as the wise counsel of a more experienced colleague.

Perhaps the point of chief significance in this careful guide is the sharp contrast implicit between medical social practice in England and in the United States. Although in certain respects similarities are evident in the approach and in the stated functions of the English hospital almoner, the fact that a volume of this sort is considered necessary points to a lack of progress that is somewhat surprising in view of the interest that has been manifested in England in the teaching of social medicine and in the correlation of social and medical research.

To the American student of medical social work—whether physician, hospital administrator or social worker—this book is valuable chiefly in revealing problems common to social work practice in any country in the development of a sound program of service in a hospital or health agency. Unfortunately these comparisons are implicit only, as there is no attempt to analyze the practice, formulate principles or offer more than general standards to guide the profession in its continued expansion. The careful analyses characteristic of studies of medical social work in the United States are absent in this text, which draws primarily on the experience of the author to set forth a somewhat motley array of precepts and procedures.

Human Embryology and Morphology. By Sir Arthur Keith. Sixth edition. Cloth. Price, \$10. Pp. 690, with 578 illustrations. The Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

The author presents the material in a survey form, and as such it may be of some use to medical students, particularly in view of the author's notes and references to original articles cited at the end of each chapter. However, because of the simple content and superficial manner of presentation, it would seem better suited for use in premedical courses, such as comparative anatomy. This book would serve to supply fundamental facts to the reader, but could not be considered as a satisfactory reference book. Numerous chapters have been revised over previous editions, and these alterations have served to bring the book fairly up to date. The figures are uniformly simple, and in this light the book lacks the impressiveness and perhaps the accuracy of its American counterparts.

Critical Studies in Neurology. By F. M. R. Walshe, M.D. F.R.S., Physician to University College Hospital, London. [Reprinted from Brain and British Medical Journal.] Cloth. Price, \$4.50. Pp. 256, with 16 illustrations. The Williams & Wilkins Co., Mt. Royal & Guilford Aves., Baltimore 2, 1948.

This book is well constructed from a pedagogic standpoint. It is impossible to give a brief résumé of the body of the book, which is a critical analysis of current teaching concerning the motor and sensory systems. That the author sometimes draws erroneous conclusions is not surprising, since he depends largely on data derived from the observations of others. Previous reviews have, on occasion, protested the author's erroneous statements in another field in which he lacked personal experience. But erroneous conclusion does not invalidate the quest. It may and should lead to correction of the data. The thesis of this book is valid and timely. It should be required reading for every young physician who is thinking of specializing in the field of clinical neurology, whether medical or surgical.

Queries and Minor Notes

THE ANSWERS HERE PUBLISHED HAVE BEEN PREPARED BY COMPETENT AUTHORITIES. THEY DO NOT, HOWEVER, REPRESENT THE OPINIONS OF ANY OFFICIAL BODIES UNLESS SPECIFICALLY STATED IN THE REPLY. ANONYMOUS COMMUNICATIONS AND QUERIES ON POSTAL CARDS WILL NOT BE NOTICED. EVERY LETTER MUST CONTAIN THE WRITER'S NAME AND ADDRESS, BUT THESE WILL BE OMITTED ON REQUEST.

TREATMENT OF TRACHOMA

To the Editor:—What are the details of modern treatment for trachoma? What is the prognosis in such therapy?

Harry J. Weber, M.D., Pakistan, Asia.

ANSWER.—Internal administration of a sulfonamide drug for an adequate period is generally accepted as the treatment of choice in trachoma. A level of at least 3 mg. per hundred cubic centimeters of blood should be maintained for fourteen days unless complete healing of the cornea has not occurred in that time. Infiltrates and punctate fluorescein-staining areas of the cornea should have disappeared before treatment is discontinued. Three to four grams of a sulfonamide compound by mouth daily is usually adequate. Healing of all stages of active trachoma usually occurs without other therapy.

The treatment of healed trachoma is the treatment of complications and is usually surgical.

HEREDITARY DEAFNESS AND MUTISM

To the Editor:—What are the possibilities of transmission of deafness and mutism by a young man whose brother is a deaf mute? His paternal great grandmother had a deaf and mute offspring. Otherwise the family history is normal. May his fiancée safely marry him?

M.D., Pennsylvania.

ANSWER.—Deaf-mutism consists in a profound loss of hearing early in life before speech has been learned. It may be acquired from an early childhood illness, from an intrauterine virus infection transmitted through the placenta as a result of a virus infection in the mother—German measles being the most frequent cause—or it may be due to an intrauterine cochlear damage from quinine, also transmitted through the placenta.

There remain the cases of true transmissible hereditary degenerative changes in the inner ear which are inherited as a recessive mendelian characteristic. Eliminating other causes, the fact that the patient's brother is a deaf mute suggests that the patient himself may be a carrier. According to mendelian law the chances are twice as great that he is a carrier than that he is not a carrier.

ESTROGEN IN GERIATRICS

To the Editor:—What is the status of use of estrogen in geriatrics? A physician discontinued use of estrogen in a patient age 72 whose uterus and ovaries had been removed thirty-five or forty years ago. He states that use of estrogen for over three or four weeks may cause congestion and inflammation in the pelvis. While taking the drug the patient experienced positive benefit in both physical and mental well-being and disappearance of a long-standing pruritus vulvae. Other medication, including tonics and vitamins, has not given comparable results. What ill effects could occur from the prolonged use of estrogen in prostatic cancer?

M.D., California.

ANSWER.—Estrogen, in the average standard dose, is both safe and useful. Old age is not a contraindication. As a matter of fact, it possesses almost specific value in the treatment of prostatic cancer, particularly if the cancer has metastasized. Estrogen rarely leads to congestion or pelvic inflammation. Occasionally it may cause a temporary enlargement and painful hypertrophy of the gland tissues of the female breast, which subsides with the discontinuance of the drug. Estrogen is therefore useful, efficient and harmless.

INJECTION TREATMENT OF VARICOSE VEINS

To the Editor:—What medication today is considered the safest for the injection treatment of varicose veins?

L. Edward Giovine, M.D., Woodside, N. Y.

ANSWER.—A desirable solution for the injection treatment of varicose veins is one which is nontoxic, not too viscous, not too caustic for the wall of the vessel and not productive of drug allergy. Potassium oleate, sodium ricinoleate (soricin®) and hypertonic sodium chloride solution are all useful. Far more important than the type of solution is a careful, truly intravenous injection in the horizontal position and the knowledge of contraindications to this form of therapy, which are many.

ESTROGENS IN CANCEROGENESIS

To the Editor:—Are there grounds for the belief that taking diethylstilbestrol over a period may produce cancer?

Howard N. Kingsford, M.D., Clearwater Beach, Fla.

ANSWER.—Cancer has been produced in certain cancer-susceptible strains of mice by the administration of sex hormones, including diethylstilbestrol. This subject has been thoroughly reviewed by W. U. Gardner in "Endocrinology of Neoplastic Diseases," edited by Twombly and Pack (New York, Oxford University Press, 1947). From the work of a large number of investigators it appears that three factors are necessary to induce breast cancer in mice: (1) a hereditary influence, (2) the presence of the ovary or its secretions (or exogenous hormone such as diethylstilbestrol), and (3) the milk agent. Nathanson, in the reference cited, has emphasized that estrogens are not in themselves carcinogenic, but merely provide the substrate on which an exciting agent may act.

Reports regarding the possible development of breast or uterine cancer in human females after prolonged administration of estrogens have appeared (Foote, F. W., and Stewart, F. W.: *Ann. Surg.* 121: 6-23, 1945; 121: 197-222, 1945; Allaben, G. R., and Owen, S. E.: *J. A. M. A.* 112: 1933, 1939; Auchincloss, H., and Haagensen, C. D.: *J. A. M. A.* 114: 1517, 1940; Parsons, W. H., and McCall, E. F.: *Surgery* 9: 790, 1941, and Stokes, E. M.: *West. J. Surg.* 56: 473, 1948). Proof that administration of estrogen was a direct cause of the cancer is lacking, but certainly there is the possibility that it was contributory. Nathanson points out that with the large number of women now receiving estrogens over long periods one would expect the development of more cases of cancer if the hormone were directly responsible. As in the mouse, it seems more likely that estrogens may be a factor in the production of neoplasms provided factors such as heredity and other exciting agents are already present.

CLEANSING OF WOUNDS

To the Editor:—Is the use of soap, water and peroxide combined recognized as an especially effective wound cleanser?

A. A. Ashby, M.D., Fairmont, Neb.

ANSWER.—An excellent treatise on the cleansing and treatment of wounds by W. L. Estes (*Ann. J. Surg.* 47: 369, 1940) summarizes: "Efforts to treat an open wound to promote rapid healing without infection must be directed first to the control of hemorrhage and then to the removal of all debris and devitalized tissue by irrigation with saline, but so gently, carefully, and thoroughly, as to wash out and rid the wound of every free necrotic bit, but not to damage the healthy tissue remaining. This is by far the most important element in the treatment. The most essential adjunct is debridement or excision of all the devitalized and contaminated tissue that is not free and cannot be washed out."

"Antiseptics are of value in skin disinfection, but in the treatment of the wound itself are seldom necessary, and their indiscriminate use may harm normal processes of repair. An antiseptic, however, would be an added safeguard in anaerobically or soil contaminated wounds. In this category, it is suggested that Dakin's solution may be used. An ideal antiseptic for use in open wounds should possess effective bactericidal action and be nontoxic to tissues and not interfere with or delay healing."

Since hydrogen peroxide solutions, in noncaustic concentrations, possess feeble and comparatively short germicidal activity, their greatest value probably lies in the ability of that oxidizing agent to remove dead organic matter from areas where mechanical removal would be difficult.

PEYOTE

To the Editor:—What can you tell me about peyote? I have read that it is being used by the Indians of the Northwest.

M.D. Massachusetts.

ANSWER.—Peyote is the name given to a species of cactus which contains a number of alkaloids, some resembling morphine and others acting like strychnine. The principal active ingredient is mescaline (trimethoxyphenylmethylamine). The symptoms arising from ingestion of this material, which consist of narcosis and cerebral stimulation, vary with dosage, and the state of the patient at time of consumption. The patient experiences visual symptoms consisting of constantly shifting flashes of brilliant color. Imperfect coordination of movements, retarded perception and errors in estimation of time also occur. An exaltation appears to be produced by the mescaline component; thus the action of peyote may resemble that of marihuana. Large doses depress respiration and may be fatal.

The drug is also alleged to produce analgesia localized in the pelvic region and has been used by Indian tribes in obstetrics. The principal use of the drug is in conjunction with certain ceremonial rites of the Indians.

A good discussion of the pharmacology of mescaline can be found in a paper by M. L. Tainter (*J. Pharmacol. & Exper. Therap.* 79: 42, 1943) and a discussion of its use and abuse by Indian tribes in the midwest will be found in the report of Braasch, Branton and Chesley, *THE JOURNAL*, January 22, page 220.

AMPHETAMINE POISONING

To the Editor:—A 23 year old man came to me after getting on a "cheap drunk" by swallowing the complete contents of a benzedrine® inhaler. In about three hours he states he felt numb all over, due to the racemic amphetamine, 250 mg. He had tetany and near convulsions in the following few hours. In a few days tachycardia developed, with extra systoles. He complained of inability to get his breath. A severe anxiety depression followed for several days. Eventually he improved on large doses of barbiturates and reassurance. What treatment would you use? Have fatal cases been reported?

G. A. Curry, M.D., Morgantown, W. Va.

ANSWER.—The amount of amphetamine ingested by this patient is uncertain. Although the inhalers, when packed, contain 250 mg. of the volatile racemic amphetamine base, it is possible that the inhaler may have been in use for some time and hence contained much less than the original amount. Detailed information on the misuse of amphetamines and other inhalers is provided in the comprehensive report of Monroe and Dreil, "Oral Use of Stimulants Obtained from Inhalers," (*THE JOURNAL*, Dec. 6, 1947, page 909). Individual response to the effects of amphetamine varies widely: Although collapse after large doses (30 to 450 mg.) has been reported, some patients have tolerated as much as 160 to 200 mg. a day, while several apparently normal subjects have collapsed after taking 30 mg. at one dose. Fatalities following the ingestion of amounts ranging from an estimated 40 mg. to 120 mg. have been reported by Hertzog and associates (*THE JOURNAL*, Jan. 23, 1943, page 256), Smith (*THE JOURNAL*, Sept. 9, 1939, page 1022), and Gericke (*THE JOURNAL*, Aug. 11, 1915, page 1098). Barbiturates are recognized as useful in controlling overdosage of amphetamine and related compounds.

PERSISTENT URETHRAL DISCHARGE

To the Editor:—A 36 year old white man contracted gonorrhea one year ago. He was treated with 2,400,000 units of penicillin because of persistent discharge which contained many pus cells but no organisms. He has consulted several physicians, including a competent urologist who diagnosed it as chronic prostatitis. He has received massive doses of penicillin, streptomycin, sulfonamide compounds, several injections of oxophenarsine hydrochloride and prostatic massages and has used urethral irrigations of unknown type. Since all treatment known to me had been exhausted I gave him a trial course of aureomycin, which apparently was without benefit. He still has a purulent exudate several mornings a week, but I have never found intracellular organisms. Streptomycin apparently temporarily arrests the condition, but it recurs when the drug is stopped. I would appreciate any aid you can give in the treatment of this patient.

Gale D. Johnson, M.D., Dunn, N. C.

ANSWER.—The patient who presents a persistent urethral discharge, which is nonspecific and does not respond to chemotherapeutic measures, should have a careful check of his urethra.

If there is a meatal atresia, a meatotomy should be performed. The caliber of the urethra must be established. The presence of a small urethra or of urethral strictures will require sounds. Poor drainage of the urethra is probably the cause of the urethral discharge. An infected urethral diverticulum may give such symptoms. Cystourethrograms should be made. Trichomonads are at times the cause of persistent urethritis. Finally, allergic urethritis may be present, which should be treated with antihistaminics.

RUTIN IN CORONARY DISEASE

To the Editor:—Is rutin indicated in the treatment of coronary disease? Will its continued use have a tendency to prevent future attacks?

M.D., Pennsylvania.

ANSWER.—We do not have knowledge to the effect that rutin is indicated in the treatment of coronary heart disease or that it has a tendency to prevent future attacks. Although hemorrhagic lesions in the coronary artery wall may on occasion precipitate coronary occlusion, it is probable that thrombosis is produced more often by other factors which would not be helped in any way by the administration of rutin. Since it is not possible as a rule to differentiate these etiologic factors, there is no justification at the moment for advising its routine use in coronary heart disease.

CURARE IN PARKINSONISM

To the Editor:—Please furnish information on use of curare in symptomatic treatment of Parkinson's disease.

M.D., Minnesota.

ANSWER.—Using a standardized preparation of curare (intocostin,® Squibb) Bennet (*Am. J. M. Sc.* 202: 102, 1941) found that the rigidity in Parkinson's disease is lessened as tremors disappear. The effects of the drug wear off within 2 hour and the former rigidity and tremors return. To achieve this transient result a curarizing dose had to be given which caused the patient to be unable to carry out any active movements. In order to prolong the curare effect a suspension of curare in oil has been used recently (d-tubocurarine chloride in peanut oil [Squibb]). Using this preparation Schlesinger (*Bull. New York Acad. Med.* 22: 520, 1946) found a wide disparity in response and in dosage tolerated. Tremor was effected but rigidity was partially alleviated.

Curare in aqueous solution as well as curare in oil has been used by skilled neurologists in the treatment of Parkinson's disease with disappointing results. Alarming toxic effects occurred before therapeutic results were noted. At present the atropine group of drugs is superior to curare or any of the recently reported drugs with similar action.

JOINT NOISES

To the Editor:—A former patient states: "I creak in the joints and it getting me down. It started last spring and gets worse. My joints, especially pelvic and hip joints, crunch when I move or turn over in bed. Roentgenograms are negative. My feet are getting longer all the time. What do you suggest?"

M.D., Oregon

ANSWER.—Snapping, popping, clicking or crunching of joints in which the roentgenograms are normal, has no clinical significance. Just why this should occur in certain persons is definitely known. It is most common in patients approaching middle age, but may occur occasionally in younger people. In most instances, it is intermittent and the disturbing symptom may entirely disappear with time. Unless there is pain, there is no reason for alarm. The consistency of the synovial fluid as well as the amount of this lubricating material varies from time to time in any normal person. Only patients who are introspective are bothered much by such symptoms. A statement can be verified that the feet are becoming longer; larger, the possibility of a pituitary tumor with beginning development of acromegaly should certainly be investigated.

CONSTRUCTION OF PENIS

To the Editor:—Is the construction of an artificial penis possible by amputative or partial amputation?

M.D., Massachusetts

ANSWER.—The construction of a new penis has been successfully performed by Drs. R. T. Bergman, H. Howard and I. Barnes, of Los Angeles. However, Dr. Bergman and his associates were unable to do more than construct a penis served as a water carrier; it had no active erectile function. The wimpus made by the late Reinhold Wappler was satisfactory in some cases in permitting of penetration.

The only way to enlarge the organ and make it effective by the operation of Lawsley, which consists of shortening ischiocavernosus (erector penis) muscles and the bulbocavernosus muscle with chromic ribbon gut, which permits the slightest constriction with the maximum of erection.

OBLITERATING ARTERIOSCLEROSIS

To the Editor:—A male patient aged 68, with Buerger's disease, has received intravenous injections of typhoid vaccine, without any important chills or fever, in triweekly doses of 5, 10, 20, 20, 80, 100, 200, 300, 400 and 500 million organisms. What modifications of therapy do you suggest? The patient has had tetraethylammonium in 5 cc. doses.

M.D., New York.

ANSWER.—A male aged 68 has obliterating arteriosclerosis with or without diabetes, in the overwhelming majority of cases. A diagnosis of Buerger's disease at this age would have to rest on a thirty to forty year history of vascular occlusions, attacks of migrating phlebitis and absence of arteriosclerosis in the retina, kidney or heart. Typhoid vaccine at this age may bring on acute vascular occlusions anywhere in the body. Tetraethylammonium is equally inadvisable because it may lower blood pressure and cause an extension of existing thrombotic processes at this age without sufficiently releasing vasomotor tone. The data presented do not permit a diagnosis and hence do not allow therapeutic suggestions. Consultation with men especially interested in vascular disease is suggested.
